MS. LOCKER: As a resident of Fort Collins, I am aware that the City of Thornton has bought water rights from the Poudre River and wishes to build three pipelines in the future to carry the water from Fort Collins to Thornton and back.

As I understand it, most of the farms from which Thornton bought the water in Weld County and they're presently receiving the required water to the farm via a ditch north of Douglas Road. The Poudre River is the reason that Fort Collins was built in this place. To it's 160,000-plus residents, it's part of our identity. We value it for its life-giving water, it's possibilities for recreation and its beauty. Yet, to my knowledge, no persons living in Fort Collins have

been contacted about this project, nor have there been any public meetings to discuss this by either Thornton or the County -- Larimer County Commissioners.

However, taking water out of the river before it ever gets to Fort Collins and putting it through a pipeline will certainly have no benefit to any benefit any citizen of Fort Collins or Larimer County. In fact, it will have negative effects.

The Poudre River has recently received a grade of C-minus, and as the pipeline is put in, it will likely degrade it further, especially the returned water to the Water Supply Storage system of the reservoirs and ditches from Thornton.

Please consider very strongly allowing the Thornton water to run its course in the Poudre River.

MR. DOUGHERTY: Thank you, Ms. Locker.

Rick Steadman, you are up. Sandy Helser is on deck and then Lynn Nichols.

MR. STEADMAN: Members of the Commission, thank you for your attention tonight. My name is Rick Steadman and I live about 50 feet off of Douglas Road on the west side of Highway 1. Many of my points tonight have already been covered, so I will not repeat those for you.

The one point that I wanted to make sure that

the Commission was aware of is that Thornton has done a really good job of telling you how much outreach they made, down to emails and things like that. They didn't suggest how many of those emails were negative versus positive, but my bigger point is that as a resident along the Douglas Road corridor, there was absolutely zero outreach to any of the constituents on the whole Douglas Road corridor.

The first time that we were presented with any information like that was at the meeting after the No. 1 choice of Douglas Road had been made. They mentioned that met with HOAs, et cetera, et cetera. There are plenty of HOAs along the Douglas Road corridor. There was no outreach by Thornton to any of those HOAs and in fact, we did not know that that was even a possibility to talk to Douglas because one of the members of a community on Douglas Road did try to attend one of the other meetings and was denied access to that meeting.

MR. DOUGHERTY: Thank you, Mr. Steadman.

MR. STEADMAN: Thank you very much.

MR. DOUGHERTY: Sandy Hellser, then Lynn Nichols and then Jerry Palt.

MS. HELLSER: Hi. Good evening. I'm Sandy Hellser and I live at 6301 Larimer County Road 1, also

County Road 13, also County Line Road. I don't live on Douglas Road, but I wanted to mention to you that there are other residents in Larimer County that this project affects and that we, as I -- and my neighbors and I have sent a letter to the County Commissioners back in February. I resent it to Mr. Helmick to be included in your packet tonight, so I hope that you saw that.

We visited with representative from Western States. My neighbors and I held a neighborhood meeting to see how this project was going to impact us. My neighbors would prefer that the water be sent down the Poudre until it reaches down past Windsor, but in likelihood, we know that it's probably coming down our way.

I see that you've made agreements or Thornton has made agreements with the Town of Tinmouth (phonetic) to come down County Line Road until their town limit stops, and then it zigzags across our properties, and it affects our irrigation. It affects our property values. It affects our egress and ingress to our properties. And it would be our preference that it stays in the right-of-way of the road versus zigzagging across our portion of County Line Road.

MR. DOUGHERTY: Okay. Thank you very much, Ms. Hellser.

Lynn Nichols is up, Jerry Palt, and then Scott Glick.

MS. NICHOLS: Hi. I just wanted to revisit why Douglas Road was chosen as the pipeline route. As Rob said, the pipeline route was changed from a mile north through Eagle Lake due to neighborhood objections. That was the result of private meetings prior to the route selection with the Eagle Lake neighborhoods. That's about maybe 200 affluent people living up in Eagle Lake, compared to a good -- that was more who have signed petitions against the Douglas Road route. We have about 600 signed petitions online with No Pipe Dream and 400 more that I believe are in your packet from a paper one.

Since a precedent has been set to change the route due to neighborhood objections, I ask you to reject this 1041 due to a large public objection. Douglas Road was not scientifically analyzed. It was selected as a reaction to Eagle Lake's objections. So the 1041 should be denied.

I also just want to point out that in a presentation in 2014 Thornton gave to their own City Council, they stated that the reason why they rejected the Poudre River route was because they wanted to avoid long federal permitting process.

Thank you.

MR. DOUGHERTY: Thank you very much, Ms. Nichols.

Jerry Palt, then Scott Glick, and then Jim Camben.

MR. PALT: Mr. Chairman, thank you. Commissioners and overworked staff of the County, thank you for allowing us to speak. My name is Jerry Palt. I'm president of the Hill Community Association and also president of the Cobb Lake Preservation and Recreation Association.

I'm here tonight. I represent combined membership of 167 families. You don't hear a whole bunch from us in this presentation. We are east of I-25. A lot of discussion, and rightly so, from the fine citizens along Douglas, but we feel impacts, too, and I'm here. We've met as our group and united in our resolve in opposition to this proposal

And we'd ask you to vote no.

We got not outreach from the Applicant. We saw maps about mailings and all that. He didn't show any maps from over there. We got our first notice after reading in the paper. We got a notice back in January, you know, for a February meeting, and got a map associated with this and limited information.

We were elated to read in the papers that the Commissioners had decided to reject that proposal for the lack of specificity. Well, we were excited to hear that, but we were very disappointed to get our new notice in April with exactly the same map.

And as it relates to County Road 56, which our properties and our lake directly abutt, the Applicant is asking for a quarter mile swath to do whatever they want to construct this pipeline. There's no schedule provided. There's no specificity where they would be. Some of the things that could impact our community are we have two main entries. That's one of our main entries to the Hill Community Association. Mature landscaping, fencing, entry structures.

As it relates to the lake, we have only one access to Cobb Lake and that is directly off of County Road 56.

We have Osprey nests constructed within 100 feet of County Road 56. And we have no idea what these impacts would be.

I heard the Applicant say, and I think maybe a staff comment that, you know, environmental concerns, wildlife concerns were discussed and no major concerns were identified. Well, I want to tell you that we are responsible for managing collectively 1300 acres of

open space, conservation space, and preservation space, both on land and water in this lake in this adjacent community.

We have -- we're really not that well-known jewel in Northern Colorado in terms of the wildlife.

We have all kinds of wildlife, but we're really known --

MR. DOUGHERTY: Thank you, Mr. Palt.

MR. PALT: -- for our birds.

MR. DOUGHERTY: Thank you very much. Appreciate it.

MR. PALT: Thank you.

MR. DOUGHERTY: Next up is Scott Glick, then we have Jim Camben and Patricia Corb (phonetic). I'd ask you two to please come up and sit up front here so we can keep this going.

Thank you.

Mr. Glick, the floor is yours.

MR. GLICK: Most of the things I wanted to talk about have been stated, but just a few things if you're looking for conditions. The first one would be No. 25 in your packet here which talks about pump station to be designed be consistent with the character of the neighborhood. The sizes and things like that, compatibility is a huge issue in the Land Use Code.

It's one of those nebulous terms.

10,000 square feet probably isn't compatible. Industrial lighting and things like that, especially close proximity to Douglas Road instead of back further by the base of the dam on Reservoir No. 4.

The next one would be No. 6. No. 6, you talk about Thornton be responsible for arranging pay for cost utility relocations. If they came up with a way to not relocate utilities, especially Elko's (phonetic) water line, which is more than 50 years old, concrete asbestos pipe, it's outlived it's usefulness and it's very soft. Compaction vibration could cause unintended consequences and damage that pipe at the cost of Elko water users.

And No. 2, you have the term "significant," "Significant alterations throughout should be evaluated by the County." You don't define "significant" and that takes the public process out of that significant, whatever that definition is. That should be a little bit more defined.

No. 10, we talked about how long this could take. As Mr. Palt said, there's no schedule here. Highway 287 is gone for four years and it's still not done and we don't want to be inconvenienced that long.

And I should have another minute and a half

because my neighbor ceded his time for me, but that's all right. I'll not have the due process that I'm deserved.

Thank you.

MR. DOUGHERTY: Thank you, Mr. Glick.

All right. Next we have Jim Camben and then Patricia Corb and then Nancy Terry.

MR. CAMBEN: Hi. My name is Jim Camben. I live in Terry Point with my wife and about 100 other families. We're part of the 311 families on Douglas Road that have only one access in and out from our homes. That is Douglas Road.

So that means during the duration of this project, we may or may not be able to leave our home at all or in any case, if we can, we'll be delayed every single time we do.

In addition to that, the utilities that are located along Douglas Road are the only utilities that we have access to, so when the inevitable construction mistake occurs and water line is cut or electric line is cut or something else is cut, we will be without power.

The requirements are that the construction be done under traffic, which means allowing normal traffic flow with constraints during construction. Well, there

will be plenty of constraints since they need to dig at least a 12-foot trench that's 9-feet wide with 2 feet on either side to put a trench wall in. And then they're going to dig that out, put the pipe in and move this thing forward slowly as they go along.

They're estimating that this will take a year or so, but our guess is that it will take a lot longer. So during that entire time, we will be massively inconvenienced, in addition to the 6,000 people every year who turn right onto Douglas Road when they're southbound on Highway 1. That's 6,000 cars per day that are going to have to find some other route.

Due to all the questions that have been raised with this 1041 Application, the incompleteness of it, the -- oh, non-transparency and dare I say "dishonesty" of it. In Terry Point we were never contacted. There was no outreach to us.

I really would hope that you would recommend that this be returned to them for further definition.

Thanks very much.

MR. DOUGHERTY: Thank you, Mr. Camben.

Patricia Corb and then Nancy Terry and then Sean Shelly (phonetic).

MR. CORB: Mark Corb, my wife and I exchanged time because I was at another meeting.

MR. DOUGHERTY: Okay.

MR. CORB: So our statement is presented jointly on behalf of ourselves and we live right at the corner of Highway 1 and Douglas Road.

Let's get to the concern on the table. Distrust. Thornton's Water Project was borne in deceit. The farms and the water purchased were not purchased on the premise that the land would revert to dry land and the water would be conveyed away from supporting agriculture or population growth in Larimer and Weld Counties. That was not so stated.

The proposal was to take Larimer County water to Thornton via pipeline at 54 is not Thornton's first proposal. As you heard from others, 56 was a primary consideration.

Thornton's original 1041 Application was so deficient in detail that it ran roughshod over the impacted property owners. The supplemental information has helped some, especially representing that the pipeline would be held totally within the existing County Road 54 boundary.

But all of these additional pages are not a certainty. Throughout, Thornton has refused to take seriously its obligation to be a good neighbor, to be cognizant of the ways of which its diversion of water

from the Poudre River Watershed to provide environmental, aesthetic, and cultural benefits to the peoples of the communities along the Poudre River.

A simple solution, so stated by many, is to leave the flow in the river and change the point of diversion. Like other alternatives, this may have economic costs, but the 2014 study done by Thornton does not indicate that such costs outweigh the benefits to our way of life.

And then there is the coziness of Thornton and Larimer County Planning and Engineering. Larimer County stands to gain a major road upgrade, largely financed by Thornton. See Conditions 4 and 5.

Even worse, the conditions proposed by the Planning Department leave the reality of construction up to the -- I call them "elite" of the two governmental engineering departments, again without input from the affected citizens. Because plans are still conceptual, incredible discretion is granted to the County Planning and Engineering Departments without any citizen input. This is exceedingly dangerous and potentially damaging to all of the neighboring property owners. See Conditions 2 and 3.

We believe that the plan as submitted and amended remains incomplete and lacking in specificity

and ought to be rejected on its merits. However, the best you could do is send it back for the kind of detail that would avoid the kind of conflicts that are inherent when there is inadequate engineering study ahead of time, as was evidenced by the demand of the County Planning Department to have them go back and do pothole testing to locate where they would actually put the road -- or the pipeline.

We ask you to disallow the request. Thank you.

MR. DOUGHERTY: Thank you, Mr. Corb.

Nancy Terry and then Sean Shelly and Christine Craft.

MS. TERRY: Hi. I'm Nancy Terry. I live at Eagle Lake and I've been there for 26 years. I accept as fact -- I'll just focus on the 1041. I accept as fact that Thornton owns 47 percent of the stock in -- water stock in Water Supply and Storage and that the Water Court gave them the diversion point at the south end of Reservoir No. 4.

And of the ten plans that Thornton has looked at, I do think Douglas Road is the best because it is in the right-of-way, a public right-of-way instead of plowing through people's yards and through wetlands and mature landscaping. So I think of the choices that

Douglas Road is the best.

MR. DOUGHERTY: Thank you, Ms. Terry.

Sean Shelly, then Christine Cracked and the Jason Kinable.

MR. SHELLY: Yes. Sean Shelly, thank you. Thank you for taking the time and volunteering for what you're doing tonight. Appreciate that.

I just wanted to let you know that I do live on Eagle Lake South and there have been no private meetings that I'm aware of. I was aware of this project happening in December of 2016 when it was in the newspaper and we reached out to both the -- first, we reached out to Thornton because they were having the meeting, and then we reached out to the County when Thornton told us this is what the restrictions were.

And so we reached out to the County. We've had meetings in our community. We haven't had Thornton people in our community meetings. We've had other communities. Woody Creek was involved quite a bit, Christine Cracked and her area was involved.

So this idea that you hear about secret meetings and stuff like that is a -- well tell you for what it is, but our involvement with the County people has been -- the people that actually worked on this, has always been -- they've given us good feedback and

they've told us where to look and where to look at, and it's been positive in that respect.

And our interaction with Thornton has been the same. We don't necessarily agree with everything that Thornton does or how they do it, but they are trying and you either have to believe them, or you don't. And so it's up to you to decide whether you're going to believe people or not.

Thank you.

MR. DOUGHERTY: Thank you, Mr. Shelly.

Christine Cracked, then Jason Kinable and Gloria Edwards.

MS. CRACKED: Hi. My name is Christine Cracked, it's spelled with a C-H-R-I-S-T-I-N-E, and the last name is with a K.

I just wanted to thank you, Mr. Chairman, and Members of the Planning Commission for the opportunity to speak today.

Thornton's acquisition of valuable water in Larimer County is truly a huge disappointed to residents, and I hope that we, as a County moving forward, work a little harder on trying to preserve our precious land and water.

But knowing that Thornton is legally able to take the water out of the County, I still ask you to

preserve the rights of the rights of the residents in protecting their properties and their homes.

The ideal alternative would be running water farther down the Poudre and taking it out at Windsor, like people have already discussed. However, knowing that this is our opportunity to express ourselves and knowing that that may not be an option, I wanted to request that if a pipeline is required that you ask Thornton, as they've proposed here tonight, to leverage the use of existing roadways where utilities already exist, that they utilize their Thornton owned lands as best they can.

And as we heard earlier through this hearing, I would ask to get a little more clarity on this concept of understanding the big picture. That's something that I was not made aware of. I don't know. I'm seeing one side, I'm not seeing the other, so perhaps during the question and answer period, we can get a little more clarity and understand the truth behind the multiple phases of this project.

If, in fact, there is intention to create more pipelines, I would ask that we ask Thornton to tell us if it is correct that they wouldn't need to do anything else until '65 and take a moratorium for that period of time and accept no additional applications.

So with that, let's assume that a pipeline is required. I am opposed to plowing cross-country through existing properties and neighborhoods as the impact to home and landowners would be catastrophic. It would include the disruption of underground currently stable water tables, the destabilization of structural foundations, the loss of years of investment and enhancements to homes and properties, drops in market value of properties, alterations and sub-irrigated farm land, destruction of sensitive wildlife habitat and conservation developments and more.

MR. DOUGHERTY: Thank you, Ms. Cracked. Appreciate it.

Jason Kinable, are you still here?

(No audible response.)

MR. DOUGHERTY: All right. Gloria Edwards, then Mark Hyden, then Lauren Sager. And if I called your name, please come on up front.

MS. EDWARDS: Good evening. My name is Gloria Edwards. I am a coordinator for a wildfire information network that is hosted by Colorado State University and is part of a nationwide wildfire information network, and I'm here based on my knowledge with that group and also as a private citizen that lives one lot away from Douglas Road.

I'd like to honor you for all your effort and time in this tonight and all your review with our information packets, and honor all the participants that took time out of their personal life today.

I'm here to implore the County Commissioners to take a comprehensive landscape view and reject this 1041 Application. One point that continues to come up is that this water has been diverted from the river for over 100 years, but we're not in the conditions of 100 years ago.

Thousands of people are dependent on just two watersheds, the Big Thompson and the Cache La Poudre River characterized by declining forest health, reduced and over-allocated flows, imminent and repeated wildfires, subsequent erosion and drastic population growth.

Our decisions have to be waived by factors beyond this 1041 process and consider the context of future pipeline, northern integrated supply project, and related infrastructure, and the quality of return flows and associated cumulative impacts.

I'm running out of time.

This pipeline is the first of a series of impacts and subsequent crisis management of mitigation issues that will definitely arise. Please reject this

1041 and anything elss undermines the Larimer County commitment to excellence.

Thank you.

MR. DOUGHERTY: Thank you, Ms. Edwards.

Mark Hyden, Lauren Sager -- yes?

MR. HYDEN: I already spoke earlier. I didn't know where that came from.

MR. DOUGHERTY: Okay. Thank you.

Lauren Sager, Mike McGlocklin (phonetic), Teresa Rose.

MS. SAGER: I wrote for a local newspaper and I've been covering this story. And I believe I understand both sides of the story pretty well. And the black hole in my understanding at this point is how Larimer County can benefit from this? You know, why would Larimer County want to do this for Thornton?

And that's the one thing that I just haven't been able to get through and so some day I'd kind of like to find out and that's about all.

Thank you.

MR. DOUGHERTY: Thank you very much, Ms. Rose.

Is there anyone in the audience who did not get a chance to speak, did not get a chance to sign up?

(No audible response.)

MR. DOUGHERTY: Thank you. At this -- oh, please come on up, ma'am.

MS. SALLO: My name is Nan Sallo. I had no intention of doing this.

MR. LAFFERTY: I'm sorry. Could you speak into the mic a little better?

MS. SALLO: Yes, thank you.

MR. DOUGHERTY: And please spell your last name for us.

MS. SALLO: Salo, S like Sam, O-L-L-O.

MR. DOUGHERTY: THANK YOU.

MS. SOLLO: I thank you. You're in a difficult position.

The biggest issue facing the American West in Colorado is water. You have this opportunity to do this right. You have the opportunity. I feel bad for people about construction, but construction comes and goes. Water is our issue.

Thornton is crying for our water. We have the opportunity to make sure that everything is done in a way that makes sure that our quality of life, because we chose Larimer County, not Thornton, is preserved and that there's water and things for everybody to enjoy in the future.

You get to be good stewards. Please take

that opportunity to make sure this legislation sets a precedent for good relationships and water use in the future. We depend on you.

Thank you.

MR. DOUGHERTY: Thank you, Ms. Sollo.

Ma'am -- no, I'm sorry. We had somebody else with their hand up.

(Laughter.)

MR. DOUGHERTY: Come on up.

Is there anyone else? If so, please come on up and sit in the front here, if you have not yet spoken and want to.

MS. BRICKMAN: Hi. My name is Lucy Brickman, and my question is -- I know that we're only supposed to be looking at this phase that's in front of us today, but don't we also have to look at the phases that are coming? Because if we approve the pipeline, but then deny the pump house, wouldn't there be a legal battle where they would come back for the money that it cost them to build the pipeline?

So even though I think you're only looking at one phase, you almost have to look at every aspect of it, which would also include the pump house. And I guess tonight is the first time I ever heard anything about the return pipe.

So are we looking at the fact that we will have Douglas be one pipeline? And then another pipeline goes where?

MR. DOUGHERTY: These are questions we're going to have to think about, as well.

Thank you very much.

Anyone else?

(No audible response.)

MR. DOUGHERTY: Going once, going twice.

Ma'am, are you coming up to speak?

MS. SHELLY: Yes.

MR. DOUGHERTY: All right.

MS. SHELLY: And like her, I didn't plan on doing this, okay?

MR. DOUGHERTY: Well, okay.

MS. SHELLY: But I do want to thank everybody here.

MR. DOUGHERTY: And your name, please?

MS. SHELLY: My name is Rebecca Shelly and I live in Eagle Lake. And I am a member of the Save the Poudre, okay?

But I -- when I moved to our part of the world, I didn't know the story of this water. I just knew about the beautiful water and the area of the landscape around us and the wetlands or the deer or all

the animals come and play, and I saw it in my yard, okay?

And I love it, and I know that several people from all over Terry Lake and everywhere come there and enjoy it. That's just one side of what I'm thinking.

I do want you to look at this very carefully and perhaps it does need a lot more -- you need a lot more information. But those reservoirs were there and we have all benefitted from them and enjoy them immensely. And I just want that to be remembered that that is -- you know, it's in the back of our houses. However much you paid for your home, it's your home and you worked hard to get it.

And I just want people to recognize that all over the area, that we're in this together and somehow, there's got to be something good and wise come out of this.

So thank you.

MR. DOUGHERTY: Thank you, Ms. Shelly.

Going once, going twice. I know you're tentative. Have you spoken already? Okay.

FEMALE SPEAKER: I have, but when can we ask a question about the presentation that the Planning Commission put on? When do we get to ask a question about that?

MR. DOUGHERTY: You don't. Public comment is about public comment. If you had had a question when you were up for public comment, that could have been something that could have been asked. Trust me, we have a ton of questions up here and Thornton will be able to come back up and answer our questions, as well, and yours.

So folks, thank you. At this point I'm going to close public comment and I am going to invite Mr. Koleber back up. If he would like to rebut anything that he had heard, and also to answer our questions.

MR. KOLEBER: I just got some random notes. I'm going to try to go through these best I can.

There was a comment about that irrigation water comes during one season and municipal use is all season long, so that's really kind of an incapability, but the diversion from the river will continue as it always has during the irrigation season. The water then goes into reservoirs and it's stored, then it's sent to the municipality to cover the year-long demand.

So the diversions from the river will stay the same. They won't change because it's going to municipal use.

So that was one point I had.

There was some comments about three pipelines

and additional diversions coming on. There was a graph showing about how water conversation plan, those bars that you saw were segments of water associated with this pipeline only and only our Water Supply and Storage Company shares. We have an initial block that will come online in 2025. One in about 2035, and one later. Again, we won't need anything past or anything more past 2065.

And in regards to looking out that far, and other pipelines and things, what they're referring to is our water rights decree. It gives us the permission to divert water. It doesn't give us permission to build pipelines, doesn't give us permission for anything associated with construction. It's only a water rights decree associated with diverting water.

If we're going to build additional pipelines, we would come back to the process. We would look at the impact. Some of those future pipelines are associated with returns from the South Platte River back up to the Larimer County Canal, not to the Poudre River, so that other water would go in. That's intended to serve other farmers and re-irrigate lands so that we can continue to keep some farms in irrigation.

All of those pipelines would be subject to

additional regulation. Addressing the concerns and communities at the time, looking down the road 50-plus years and trying to speculate on what the community concerns will be and how to address those, are things that -- again, I think that's speculation and we can address that more fully at the time that that's proposed.

MR. DOUGHERTY: Those would be additional 1041 Applications, correct, for pipelines?

MR. KOLEBER: Correct, or whatever the regulations are at the time. They might be more stringent. I can't speculate on what that would look like at the time, but yes, 1041-type regulations is what I would envision that would be applied to our project at that time.

MR. DOUGHERTY: And none of those would be a given? They would not be expected, grandfathered or able to be put into place without going through another hearing?

MR. KOLEBER: That's correct.

MR. DOUGHERTY: Thank you.

MR. KOLEBER: I don't know if there's any other questions. That was the main points that I had that I wanted to make sure were clear about that graph in particular, and those bars that were shown as

representatives of additional pipelines. Those are just additional blocks of this same water.

MR. DOUGHERTY: Commissioner Jensen is jumping, ready to go.

MR. JENSEN: Can you please explain why this pump, pumping station was not part of this 1041 Application?

MR. KOLEBER: When we had our pre-application meeting with staff, they suggested that that was going to go through a separate permitting process. My understanding now -- and I maybe would call on Mr. Helmick, that the permit or the pump station is part of this permit and it's subject, in addition to the permit regulations, a site plan review.

MR. HELMICK: That's correct. The staff has always taken the position this is an appurtenance to the pipeline and, therefore, is a part of this 1041 Application.

There will be a subsequent site plan application for the -- prior to the construction of the structure, which will have to show that it does, in fact, meet all standards, regulations, and ordinances of Larimer County: Noise, air quality, all of those things would be part of that review, the detailed review.

MR. JENSEN: I just wanted to clarify that, that this was not left out of this Plan. That it is an additional requirement over and above the 1041 for the pumping station to meet additional requirements of a special review, per our Land Code.

MR. HELMICK: It's our position that Director Terry, Director Gilbert's letter asking for additional information. I specifically identified the additional information necessary to make a determination as a part of the 1041 Application. That information was supplied. It is a part of the supplemental materials provided by the City of Thornton and it was evaluated by staff as a part of this request.

MR. KOLEBER: Thank you.

MR. DOUGHERTY: Go ahead, Commissioner Miller.

MR. MILLER: I was curious. We've heard several people state to the fact that you're going to need more than one pipeline to do what you need to do with this water.

Is that correct? Are you going to have two pipelines go down Douglas Road?

MR. KOLEBER: Short answer is no. The additional pipelines would be to be fully implement a Water Court Decree when we get to the point where we

need that additional water, but that's not -- all we're requesting right now is one pipeline that will be used only for delivery of the water associated with our Water Supply and Storage Company and Jackson Ditch Company shares. That's all.

MR. MILLER: Okay. Is I keep hearing, or I heard, too, that you're going -- you're planning to deliver polluted water into Larimer County. Is that something you plan to do down the road?

MR. KOLEBER: As part of the Water Court Decree, the Water Court allows us, nobody else, just the Water Court allows us to take water off of the South Platte River. The idea is that we would pump that water up to the Larimer County Canal and do one of two things with that.

The first thing would be that we supplied that water, which would be suitable for agricultural use, to farmer farther down on the Larimer County Canal and in exchange, we would take the water that was going past our reservoirs into our pipeline. So it's just a water trade, instead of -- well, it's just a water trade. So they get the water from the Platte, instead of the water from the Poudre.

MR. MILLER: Okay.

MR. KOLEBER: This other part of that is we

would pump water that's Thornton's coming down the South Platte River. We would pump that up to the Larimer County Canal and we would re-irrigate -- the extent we could at the time -- Thornton's farms. Again, we can't re-irrigate it with our -- we can't re-irrigate those farms with our Water Supply and Storage Company shares. We could re-irrigate those with other water from down on the river.

But that's, again, more than 50 years in the future.

MR. MILLER: Okay. I've only got two more questions.

MR. KOLEBER: Sure.

MR. MILLER: It was stated that -- or a question was raised by one of the residential people that they were wondering if what you're going to be doing with your reservoirs? Will they lower the lakes downstream or downline from the current reservoirs when you start pumping like this?

MR. KOLEBER: The reservoirs -- there are four reservoirs in close association by where our pump station would be. Water Supply and Storage Company No. 3, No. 4, Rocky Ridge including the reservoir.

The way municipal systems operate is that they generally will try to carry water from year to

year, so our analysis from back 2012, 2013, something like that, showed that the water levels on average would stay higher in those four reservoirs. The other three reservoirs, Richards Lake, Lyndon Myer, Long Pond, those are operated by making trades with other ditch companies.

So in those reservoirs in particular, we trade with the Larimer and Weld Canal and they give us water back out of Cobb or Douglas Reservoir. That's a system-wide operation for the Water Supply and Storage Company not really associated with Thornton's Pipeline Project.

MR. MILLER: Okay. All right. Thank you.

And my last question is: Where are you currently pulling water to feed to Thornton from the Poudre supply line?

MR. KOLEBER: At the Larimer County Canal headgate.

MR. MILLER: Okay. Up by Horsetooth?

MR. KOLEBER: No. It's just up by Ted's place.

MR. MILLER: Okay.

MR. KOLEBER: Just a little ways up river from where 287 crosses the Poudre.

MR. MILLER: Okay. All right. Thank you.

MR. DOUGHERTY: Other questions from the Planning Commissioners?

Commissioner Gerard.

MR. GERARD: I'll ask the question that maybe I think all of us are kind of thinking.

What would happen if your pumping station wasn't approved in the future and you've got this water line ready to go?

MR. KOLEBER: Well, we wouldn't start construction on our water line until we have also gone through the site plan review process and public input on the pump station. So those would be approved concurrently so we could design and construct them concurrently. We wouldn't have one without the other.

MR. GERARD: Why didn't you wait and do both of them at the same time?

MR. KOLEBER: I think because it was -- the site plan review process was a separate process. We wanted to make sure that the County was okay with the pipeline where we proposed it to be, before we worked through the process of designing a pump station.

MR. GERARD: Okay. And then one more question, just so I completely understand. Right now you're trying to get a corrido, but once you have a corridor approved by the County Commissioners, then you

go back and decide the exact location of the pipeline and easement; is that correct?

MR. KOLEBER: Correct. Either in the right-of-way or in an easement.

MR. GERARD: Okay.

MR. KOLEBER: And after that, once we have it identified, the corridor concept goes away.

MR. GERARD: So the lines on the map go away, and everything narrows to the 50-foot easement -- well, it narrows to the 50-foot plus the construction easement if it's off of right-of-way and then it ends up narrowing to 50 feet if it's off the right-of-way?

MR. KOLEBER: Correct.

MR. GERARD: Okay. Thank you.

MR. DOUGHERTY: Other questions?

Mr. Koleber, I've got a couple of questions.

MR. KOLEBER: Yes.

MR. DOUGHERTY: We heard something about four-hour closures, and I'm sticking with basically west of Highway 1 on Douglas Road. We heard about four-hour closures. We heard on our site trip today that there was always going to be one lane opened, but we also had heard that there's a possibility of a requirement to have two lanes while not under construction or off hours.

Can you tell me a little bit more about that?

MR. KOLEBER: Well, that kind of detailed traffic planning and construction staging would happen as we get into design and we can make sure that we can meet all of the County's conditions as we complete the design and the project planning, so that those conditions are met.

MR. DOUGHERTY: And see, I've got a small problem with that --

MR. KOLEBER: Okay.

MR. DOUGHERTY: -- because we're trying to talk about affecting private properties and property rights and citizens and to not have that information doesn't -- I mean, that makes it really hard for me to see how they're going to be affected.

Another piece is access to private properties. While I have seen quite a bit of interesting ways for people to access private properties with the debacle that 287 has been, so I know that there will be access but, you know, I'd really like to know a little bit more about that, you know. I need to know that there's going to be a lane always open or things along those lines.

MR. KOLEBER: If that's a condition of approval for the permit, there will always be a lane

open.

MR. DOUGHERTY: Commissioner Helmick or -- okay.

MR. HELMICK: I was going to address that because those are specific conditions that are coming from Public Works or Engineering and so we would be identifying or working with Thornton to handle this as we would any construction project in terms of identifying, based on the project needs, what we've just said here that we would entertain or potentially allow maximum closures up to four hours on an infrequent or as-needed basis because there are potentially aspects of construction that are going to require some limited closure, but we're not going to -- we're going go -- insofar as possible, we're going to, you know, develop -- work with them to develop a plan that maintains, you know, accessibility that minimizes impact on people, but we know there are going to be some impacts.

MR. DOUGHERTY: Is there any way to tighten that up? I mean, you know, having a partial closure and then having an emergency vehicle not be able to get through -- we know what it's like inside the City of Fort Collins with the trains. It's not acceptable to me to know that there's a possibility an emergency

vehicle could not be able to access as neighborhood.

MR. KOLEBER: And again our -- even on our construction projects that we do in the County, it's a stipulation or requirement that the contractor has to be able to ensure accessibility, that you know, emergency responders can get to properties.

MR. DOUGHERTY: Okay. All right. Commissioner --

MR. KOLEBER: So we don't have the specificity to get to that level of detail at this point in time.

MR. DOUGHERTY: But this is standard with all projects within the County. Okay.

Commissioner Jensen.

MR. JENSEN: Mr. Koleber, just one more question and it's addressing several comments that people made that there wasn't enough specificity in this Application. The difference between an application and a design process, I get that you get much more detail, but it begs the question without doing the design work to come in front of Larimer County and ask for a 1041 Application to be approved without that specificity. Explain to me how and why you don't put the cart before the horse in doing that.

MR. KOLEBER: I think it comes down to going

out, acquiring easements, designing a pipeline and then coming in for a permit, there could potentially be things that we haven't considered yet that we would need to consider and could be part of a 1041 process.

By going with a corridor, we know those conditions, we know what the County's looking for when we go out to acquire easements, plan the design, everything else and we can accommodate those as we plan and design the project. If we did all that up front, we might miss something and have to start all back over again.

MR. JENSEN: Of the -- of this corridor that you're asking for, how much of that easement do you currently own and how much do you need to go out and acquire still? And in that acquisition, are you considering eminent domain as a way to get that property in Larimer County?

MR. KOLEBER: So we haven't acquired any easements yet in Larimer County. We do have access to road right-of-way in Timnis (phonetic), as was mentioned earlier, and so part of the alignment we've narrowed down. Douglas Road would be narrowed down where we wouldn't need easements. If we can use other areas -- County Road 56 was mentioned earlier as a potential route around the north side of Cobb Lake, in

particular, the road would be probably the best route, an area down just north of 392.

Ms. Hellser was here talking about wanting to stay in the right-of-way. So those would be where we want to be in the right-of-way.

When we go out to acquire easements, again, our goal is to negotiate for the easements everywhere we can until we exhaust all reasonable alternatives. And with a corridor, we can move the pipeline alignment to accommodate landowner concerns, infrastructure. I was talking with a resident during one of the breaks about irrigation wells. With a corridor, we can put the pipeline around irrigation wells. We don't have to mess with those. So that's what the reason is for the corridor and I hope I answered your question. I think I may be lost parts of that and I apologize.

MR. JENSEN: Well, the last part of that was: your use of eminent domain to acquire that easement, how would you apply that or is that part of your plan?

MR. KOLEBER: We would use that as a last resort. We want to try to negotiate the easements. Even if we use eminent domain, we still pay fair compensation, we work with them as best we can.

MR. JENSEN: Okay.

MR. DOUGHERTY: Just to tag on to that,

somebody had made a comment earlier, have you used eminent domain in Larimer County at all?

MR. KOLEBER: No.

MR. DOUGHERTY: Thank you.

I had one other question pertaining to the change of routes and I understand it was very, very preliminary. The route through Eagle Lake, was that changed -- I guess, I don't when to lead, but why did you change from that, was it private property, was it wetlands, what facilitated that?

MR. KOLEBER: We never really had a route through Eagle Lake or anywhere. We had a corridor from Douglas Road about a half mile north. There was a map during my presentation that showed a balloon over by West No. 4 and then going east. That was where we were looking for an alignment when we had our public meetings.

After we had our public meetings, then the Eagle Lake residents went back to the County and talked to them about the direction that we had received to not count on county line -- or, I'm sorry -- on county road right-of-way for construction.

After that, we had our meetings with Larimer County staff that said, "Go out and do this alternatives analysis that can now include the Douglas

Road alignments or any other county road rights of way and look at the alignments that the residents have suggested during our open houses." And so that's how we came up with those 10 alternatives is the feedback that we had from the residents.

We looked at all of those including Douglas Road both in and out of the right-of-way and that's how we came up with Douglas Road. It wasn't because we had an alignment specifically through Eagle Lakes and there was an uproar. We didn't have that. We had a corridor that we were working with at our open houses.

MR. DOUGHERTY: Thank you.

Any further questions?

Commissioner Cox.

MS. COX: Do you not consider the proposal by the Save the Poudre Committee that that is a reasonable approach to take it further down from the Poudre, the request that they're making?

MR. KOLEBER: To take it --

MS. COX: Is that not considered a reasonable alternative?

MR. KOLEBER: Which one, all the way down to Windsor?

MS. COX: Uh-huh.

MR. KOLEBER: I don't.

MS. COX: Could you tell me why?

MR. KOLEBER: Yeah. There are a number of reasons why. It was already mentioned that our Water Court Decree currently allows us only to divert at the Larimer County Canal.

MS. COX: But could you go back and request that?

MR. KOLEBER: We could, but there's a high likelihood that our water rights would be further reduced if we did that and so there's an issue there. Running the water down the Poudre River, you lose -- for that 18 miles roughly of stream, you'll lose about 9 percent of your water. That's what the State charges you in losses to run the water down there. So out of the average 14,000-acre feet that we plan on running, that's tens of millions of dollars' worth of lost water.

We would lose the use of the reservoir storage that's there in the Water Supply and Storage Company system. We just put the water right back into the Poudre, ran it down. Those reservoirs, have no value.

Could we build other reservoirs? Certainly, but we invested, we've already purchased this reservoir storage. Building additional reservoir storage

somewhere else, as you've probably seen with NISP and other places, is not an easy prospect. The cost to not only construct a treatment plant that could treat that water, but then operate it, additional power and chemical costs are very expensive and it's really a safety issue for our residents. That water is below three wastewater treatment plants, urban runoff where you have oil coming off parking lots and all sort of things. That water is not as safe to drink as upstream. It's not a water supply classified stream in Windsor and there's -- without that water supply classification, you don't have the protections upstream.

Yes, we could go to the Commission, the Water Quality Control Commission, and ask for a water supply designation, but having everybody upstream from that including the wastewater plants increase their treatment could be decades before that happens.

MS. COX: It could be, but what if that was your only alternative? What if you're denied and that was an alternative? You would then pursue that alternative, correct?

MR. KOLEBER: We would take a step back and look at all other alternatives.

MR. DOUGHERTY: Any other questions for Mr.

Koleber?

MR. GERARD: Yeah, I've got one.

MR. DOUGHERTY: Commissioner Gerard.

MR. GERARD: So what does your -- what does this easement look like if it goes through my property? Is it -- what am I not allowed to do with this property? Do you own the property completely or is it a right-of-way or how does it work?

MR. KOLEBER: We just -- the easement gives us the right to put a pipeline under the ground. Once we're done, you can farm over the top, put non-permanent structures over the top. All we ask is you don't build things like houses and garages, put in vegetation with deep roots that might get down and affect the pipeline or impact the ability to do maintenance on the pipeline. But other than that, the use is pretty much the same as what you had before.

MR. DOUGHERTY: All right. Commissioner Cox?

MS. COX: Could you explain a little more clearly the slide that showed where there was a 50 million to $100 million benefit to Thornton to go this other alternative route than the one that you guys have chosen? Why --

MR. KOLEBER: It was on a different presentation, but that didn't look at the value of lost

water, the value of lost storage, the cost for treatment, additional cost for treatment capacity both initial capital costs, but also long-term O&M costs so that was just purely pipeline and pump stations.

Plus one thing I had mentioned before, the way the Water Supply and Storage Company Reservoir operates, the water comes into Thornton on its shares at about 70 million gallons a day -- and this is when all of our shares are converted, not sort term -- and then the reservoir storage buffers that so we can build a 40-million-gallons-a-day pump station. If we were to take that water down the Poudre River and have to take it as available, we'd have to build a much larger 70-million-gallons-a-day pump station and a much larger pipeline going south. And so those kinds of size impacts weren't included in those figures.

MS. COX: Okay. But somewhere you guys talk about being good stewards, correct?

MR. KOLEBER: Yes.

MS. COX: So if you're -- I mean, from a neighbor perspective, that was much more beneficial to your neighbor.

So how do you balance what's beneficial to your neighbor and the cost to you? How did you determine that that was --

MR. KOLEBER: And really it was cheaper to go downstream because you weren't building pipelines, but that's -- the issue really is all of the other costs. And the way we balance that is: it's really a safety issue. Providing safe drinking water for our residents is really the overlying factor on all of this. Fort Collins, Greeley, Elko, North Weld, all of those districts divert water upstream from Fort Collins because that's the prudent safe place to divert water for providing a drinking water supply.

MR. DOUGHERTY: Any other questions for Mr. Koleber?

(No audible response.)

MR. DOUGHERTY: Thank you very much.

MR. KOLEBER: Thank you.

MR. DOUGHERTY: I think we may have some questions for staff.

Commissioners? Yes, no, maybe?

(No audible response.)

MR. DOUGHERTY: Well, I've got a couple.

So we're talking about a 1041 here, but we're also talking about the fact that the pumping station is a part of this Application.

Can one of you address the FA-zone and whether or not this pump would be allowed in that zone

and also about spot zoning and things that were brought up?

MR. HELMICK: The 1041 Application is for a 26-mile-long, 48-inch pipeline and all of the appurtenant facilities.

MR. DOUGHERTY: Okay.

MR. HELMICK: Pump station, water tank, blow-offs, access ways, all of that's the package. All of that trumps zoning, so ignore the FA-1 zoning and the pump station. There's no correlation between the two. This is a public facility subject to 1041 and the pump station is allowed through that process. Don't look at zoning.

MR. DOUGHERTY: Okay.

MR. LAFFERTY: An analogy, Commissioner Dougherty, would be similar to that of placing trailheads in Larimer County and other things. Those are uses that are not prescribed by zoning, but are generally covered through a location and extent process or through a 1041 process and that's why we have those processes. They supersede zoning and therefore, we're allowed to look at them through those processes without having to change zoning and do what-not.

MR. HELMICK: To follow on Matt's previous presentation, a power line is not -- a transmission

power line is subject to 1041 as is the substation. Neither of those are identified in zoning -- in most of the zoning districts in the County. Same general premise, a power line and a substation.

MR. DOUGHERTY: Okay. I'd like to ask one of you just to quickly go over again the outreach because I've heard a number of times tonight that folks did not get notification on this. I'd like you just to give us a quick one. I know you had the page up before with the red line around it showing the map area.

MR. HELMICK: Their early outreach looked mostly north of Douglas Road. We identified an issue after one of the neighborhood meetings and said, "Well, drawing a line through the middle of Terry Point wasn't very smart nor through Terry Shores." So subsequent outreach incorporated all subdivisions accessing off of Douglas Road or within that corridor so that's -- and all notice subsequent to the receipt of the Application incorporated all of these properties as well. So early days, yes, some of the folks in Terry Point and Terry Shores may not have received notice of one of those meetings. That was not intentional. It was just an artifact of how we drew the line.

Ultimately we notified over 2600 property owners in Larimer County both in unincorporated Larimer

County and in all of those cities that this pipeline goes through that -- but for within that quarter-mile corridor.

MR. DOUGHERTY: Thank you.

Any other questions for staff from the Planning Commissioners?

MR. JENSEN: Yes.

MR. DOUGHERTY: Commissioner Jensen.

MR. JENSEN: In the review criteria that we have to look at, compatibility and harmonious is part of this.

Can you explain that? And I would assume we then have to look at -- even though we're going to see a special review for the pumping station, we still have to consider the compatibility and harmonious nature of that in this Application with the neighborhood, correct?

MR. HELMICK: No. Actually harmony and compatibility are not a standard for 1041 review.

MS. COX: Right.

MR. HELMICK: They are in the zoning review and in the subdivision review, but they are not a standard of review in a 1041 review. And you will not see a special review for the pump station. That is an administrative process. We may tell Thornton that they

need to do some public outreach on the design, but it is not -- you won't see the pump station again. So the standards review are a master plan: reasonable, siting and design alternatives, conformance with the standards of review, average impact or effect on or adequately mitigate those impacts, affecting historic sites, impacts public health and safety, no significant risk from natural hazards, adequate public facilities, mitigate construction impacts, benefits outweigh losses to natural resources and agricultural land and a reasonable balance between the cost of the applicant mitigates significant adverse the benefits achieved by that mitigation as well as then the recommendations of staff and referral agencies. Compatibility is not one of the questions.

Our review looked at a pipeline, not a water supply. We didn't look at alternatives for water supply. We looked at the alternatives proposed for a pipeline. That's what the Code provides for.

As pointed out earlier, there are questions about how broad the reach can be? Well, without knowing the criteria the City of Denver had in their 1041 Regulations, it's almost impossible to know what the Supreme Court decision was really based on from my standpoint. We evaluated the request. The law

requires we adopt criteria for the Application. We reviewed the request pursuant to our locally-adopted criteria of review.

MR. DOUGHERTY: Commissioner Carraway?

MR. CARRAWAY: Yeah, I just want to clarify. I'm confused because earlier it seemed like the question was asked about the pumping station. I guess I just misunderstood, but I'd understood that would come back through the process. And then I think I just heard you say, in other words, that that would be a special review process which would come before --

MR. HELMICK: Site plan review, not special review.

MR. CARRAWAY: But now -- okay. So I just heard you say it's just an administrative review. So we're done with the pump station after tonight, right?

MR. HELMICK: In our evaluation, what we looked at is a six to 10,000-square-foot building and information they provided to us. They're proposing to pursue a redundant power supply so a diesel generator would ideally not be part of that.

I would note that within a mile of this -- of where they're proposing a pump station, there are structures in excess of 10,000 square feet. So a structure that size -- in fact the house immediately

adjacent to this property, based on a rough estimate, is 12,000-square-feet footprint, so a footprint of a structure that big is not out of character for the neighborhood whether it is --

(Loud audience noise.)

MR. DOUGHERTY: Folks, excuse me please. Folks, excuse me, please. Thank you.

MR. HELMICK: So it is an administrative review site plan for the pump station. From our perspective, we believe we had enough information to make an evaluation at the level of the 1041 request knowing the site plan was going to happen to be able to evaluate the proposal.

MR. DOUGHERTY: Commissioner Cox?

MS. COX: (No audible response).

MR. DOUGHERTY: Okay.

MR. CARRAWAY: To me, it just seems like that's incomplete.

MS. COX: Yeah.

MR. CARRAWAY: If this is part of this and we do not have specificity of Phase I of what they intend to do immediately, it's incomplete. Tell me how I'm wrong.

MR. HELMICK: We have a footprint. We know that there's height limit in a zoning district so, I

mean, it's a 50x120-foot building with four pumps inside it and some other stuff.

MR. CARRAWAY: But, Rob, you just told us we have to ignore the zone district. I'm sorry, I'm just --

MR. HELMICK: We would attempt to apply the height limit of 40 feet.

MR. CARRAWAY: Okay.

MR. LAFFERTY: That's universal throughout the county.

MR. HELMICK: And that's the universal height limit throughout the county. So in none of our regulations across the board do we evaluate aesthetic. Aesthetic is not a part of any Code language in Larimer County. So we have a footprint of a building in a location proposed. That's no different than a lot of stuff.

I mean, we don't look at -- someone proposes a dog kennel. You look at the fact that there's a footprint on the site plan that shows there's a dog kennel there. You don't look at anything else.

MR. LAFFERTY: We look at noise --

MR. HELMICK: Noise.

MR. LAFFERTY: -- we look at light --

MS. COX: Yeah.

MR. LAFFERTY: -- we look at impact, we look at --

MR. HELMICK: And those are all standards in the Code that are --

MS. COX: And compatibility.

MR. HELMICK: -- subject to the site plan review.

MR. LAFFERTY: The site process requires compliance with all of those things administratively. That's the only difference. It doesn't require us to go to hearing. And if they choose to not follow the body of regulation of those standards, then they would have to come forward to the Board of County Commissioners and appeal those standards. And so it's black and white in that case. There is no give or take about whether it's compatible or not. You meet the standard, that's it, or appeal that standard.

MR. CARRAWAY: During the site plan review, what is the public comment available during the site plan review and what is the appeal process for the neighbors in question if they have issues with that?

MR. HELMICK: The normal code standard is: there is no public comment nor is there any public appeal, but if you want to modify reality, the Code, for this particular to include either some public

outreach and/or some potential for appeal, we can figure out how to craft that language for you if you want.

MR. LAFFERTY: The site plan process in the Larimer County Land Use Code was intended to address non-residential uses except for four-plexes, you know, things -- larger apartment complexes, things like that, but basically was to look at commercial industrial type uses in commercial and industrial type settings where the zoning already exists and what-not and then we just look at it as a setting. So those are considered use-by-right activities and as such, we only apply the standards to it. There is no public notice, there is no public review, there's none of that. It's just an administrative review to make sure that standards are complied with.

I think it would be fair in this instance, given that this is not in an industrially-zoned property or any of those types of things and that there might be some things that if the Board felt that it was necessary, that there'd be some at least public notice. And if there was -- and the director would still have the right to administratively approve this, but if somebody felt that the director was operating outside of their limits or the purview of approving it, then

they can appeal that to the Board of County Commissioners for a decision. I don't think that that's out of your realm to ask that question here tonight. I think that that would be fine. It's not normal, but --

MR. CARRAWAY: Yeah. One more thing, just please for the folks in the audience and those that may still be awake on TV, the -- or those that may still be awake in the room here, the other option that was what we had prior to us accepting the 1041 process in Larimer County was location and extent. Address or please tell us why or what the differences would be, if we were still under and L&E, this meeting would be drastically different and we wouldn't have a seat at the table anymore with that.

Can you please talk about that process and why 1041 exists and what it would look like if we did not have a 1041 in Larimer County.

MR. HELMICK: Prior to the adoption of 1041, location, extent review was the only review that Larimer County had for public facilities. That is a master plan review by the Planning Commission with 30 days to review, 30 days. Submit the Application, decision rendered within 30 days by the Planning Commission, no Board of County Commissioners review or

decision.

The Planning Commission decision could impose conditions or requirements on an applicant. However, the taxing entity responsible for the project by a majority vote can tell the County to go pound sand on a 1041 and do as they see fit.

MR. LAFFERTY: On an L&E?

MR. HELMICK: And that's it. Huh?

MR. LAFFERTY: On an L&E.

MR. HELMICK: On an L&E. On a 1041, the entity is considered a person and a person is required to obtain a permit to engage in the activity. Thornton is a person. The Board of County Commissioners has the authority to say "Yes" or "No" or impose conditions on their request. The Board, in adopting 1041, did it with some trepidation, understanding that the ability to say "No" was a big stick and it was principally a big stick to make those public entities act in good faith with Larimer County and Larimer County citizens.

MR. LAFFERTY: And that's why our 1041 Regulations have review criteria. It is to keep us honest and have to answer the questions and keep those agencies coming and talking to us having to prove up why we think that should be. So if you don't find that somebody complies with one of the review criteria,

that's the merits for denial of an application.

The 1041 process, just so you guys are aware, it didn't just come into being. It's been around in state statute for a number of years. Larimer County has -- as the statute is written, all counties or agencies that are subject to state statute have the option to implement them in their jurisdiction. They could choose not to. We could have chose not to implement 1041 regulation on waterline projects in Larimer County and this would have just been -- slipped right through under an L&E with very little scrutiny or opportunity to drill into the details on it.

And that's what happened, if we all recall, with the Greeley waterline and that left our Planning Commission in an awkward position and it felt really unaddressed for our community. They felt that they did not get an opportunity to dispel their concerns on that. And so we chose to adopt this Regulation so that we could have this exact hearing so that we could have the detailed evaluations that are staff performs on these things and make sure that we're making the right decisions. If this isn't the right decision, then I think that's -- you-all need to make the decision.

MR. CARRAWAY: I just want to, you know, expound on that a little bit. This body -- several

years ago when we were looking at 1041s, we spent two years looking at this. This was not an overnight decision to implement 1041 in Larimer County, but I think -- and I'll speak for the Commission at the time. There was an overriding desire and need and responsibility that we felt that we had to have a seat at the table and that's why these Regulations were brought about, it's why we put them on what put them on and I just -- I want people to understand that this was something that we decided to do in Larimer County for just this purpose. This is exactly why we did this process.

MR. DOUGHERTY: Commissioner Cox?

MS. COX: I'd like to ask Mr. Koleber something, too.

So there was a proposal that if we were to consider this pipeline, that there would be two conditions, one condition being that you would be limited to a single pipeline forever, and the other condition was that you would not -- you know, if there was some other type of need that Thornton had, they would not come back to the table till '66.

Are those acceptable conditions to you?

MR. KOLEBER: If the condition is a pipeline under this 1041 permit, yes, that's an acceptable

condition. We would come back for another permit and review --

MS. COX: I think you know that's not what they were asking for, okay?

MR. KOLEBER: Okay. I just -- let me clarify --

MS. COX: So let's just be square.

MR. KOLEBER: Yeah.

MS. COX: Okay.

MR. KOLEBER: I think --

MS. COX: They were asking -- you know what they were asking --

MR. KOLEBER: Yes.

MS. COX: -- that you were not coming back under another 1041 or any other type of -- that we're just talking about a single pipeline coming out of Larimer County for Thornton and that was the end of the story between Larimer County and Thornton.

MR. KOLEBER: No, because we have a Water Rights Decree and future plans way down the road that we may need to implement depending on the Thornton growth, density, growth in the entire North Colorado -- Northern Colorado area, so that's not something that I could just unilaterally give up a water right and that's in essence what I'd be doing there.

As far as coming back in 2066, that's our current planning horizon and just like transportation plans and everything else, those change. I believe that 2065 is a good date, but I don't believe that I could commit the City to say "No" to any future plans in Northern Colorado. If we grow faster or get more dense than what we expect, we would come back and go through the process and request again for the County to review our plans.

MS. COX: Thank you.

MR. DOUGHERTY: Do you have questions for staff or?

MR. LAFFERTY: I have a comment just before we get too long --

MR. DOUGHERTY: Yes, sir.

MR. LAFFERTY: -- and it just only goes to when you make your motion. When you choose to make a motion depending upon which way it goes, if you choose to act in favor of this, the pump house was a hot topic. I think that we could formulate a, quote, "condition," to add to this Application that would allow for the public notice, any evaluation of the site plan process. So we'll notice them. They can come in and look at the plans and do that and then, of course, we'd allow an opportunity for appeal if they choose to

do that. So if you want me to come up with a condition, I can do that right now.

MR. CARRAWAY: I think that would be appropriate please.

MR. HELMICK: I would like that too.

(Voice from the audience.)

MR. DOUGHERTY: I think it was just mentioned that there would be public comment; is that not correct, Matt?

MR. LAFFERTY: I don't know why we wouldn't allow people to make a public comment, but if -- I think we need to be careful with that. If Thornton decides to paint the building sky blue, I think Rob makes a good point, our Code doesn't regulate pretty. We're not going to be able to say just because you made a comment, we can address the problem. We can only address people's comments that relate to us administering our Code requirements.

MR. DOUGHERTY: Okay. Thank you.

Any other questions for staff?

Commissioner Carraway.

MR. CARRAWAY: Yeah. Just because we were talking about 1041, I just think it's important to note that Weld County has also -- it'll be a 1041 process for the Thornton pipeline in Weld County.

MR. HELMICK: I think actually it's use by special review in Weld County.

MR. CARRAWAY: That's not my understanding.

MR. HELMICK: But there is an ongoing review process of some part in Weld County, yes.

MR. CARRAWAY: Okay.

MR. DOUGHERTY: Any other --

MR. LAFFERTY: Weld County is not a statutory county. Weld County is a home-ruled county and they may not have adopted 1041 regulations because they're not subject to the State standard, so they may be using an alternate approach to the review process. That's what we're saying.

MR. DOUGHERTY: Other comments or questions for staff?

(No audible response.)

MR. DOUGHERTY: All right. I think I'm going to close it and open it up for discussion amongst ourselves.

And, Commissioner Jensen, you had talked a little bit about going through some of the review criteria for us.

MR. JENSEN: Yeah, we touched on the --

MR. DOUGHERTY: Mic.

MR. JENSEN: We touched on the review

criteria a couple of times, but just for us, we'll go through this very quickly again. There are 12, not 14, as originally stated.

The proposal is consistent with the Master Plan and applicable intergovernmental agreements affecting land use and development. That's Criteria 1.

Criteria 2, the Applicant has presented reasonable siting and design alternatives or explained why no reasonable alternatives are available.

No. 4, the proposal will have a -- will not have a significant adverse effect on or will adequately mitigate significant adverse --

MR. DOUGHERTY: You skipped No. 3.

MR. JENSEN: Oh, I'm sorry, I missed one.

The proposal conforms with adopted county standards, review criteria, mitigation and requirements concerning environmental impacts, including but not limited to those contained in Section 8 of this Code. Mr. Helmick has spent time with that and did a very good job explaining Section 8 to us, so I won't go through those again.

The proposal will not have a significant adverse effect on or will adequately mitigate significant adverse effects on the land on which the proposal is situated and on lands adjacent to the

proposal.

The proposal will not adversely affect any sites or structures listed on the state or national registers of historic places.

The proposal will not negatively impact public health and safety.

The proposal will not be subject to significant risks from natural hazards including floods, wildfire or geological hazards. Adequate public facilities and services are available for the proposal and will be provided by the Applicant and the proposal will not have a significant adverse effect on the compatibility --

MR. DOUGHERTY: Capability.

MR. JENSEN: -- capability, sorry, of local government to provide services or exceed the capacity of service delivery systems.

No. 9, the Applicant will mitigate any construction impacts to country roads, bridges and relates facilities. Construction access will be re-graded and re-vegetate to minimize environmental impacts.

No. 10, the benefits of the proposed development outweigh the loss of any natural resources or reduction of productivity of agriculture lands as a

result of the proposed development.

The proposal demonstrates a reasonable balance between costs to the applicant to mitigate significant adverse effects and benefits achieved by such mitigation.

And No. 12, the recommendations of staff and referral agencies have been addressed to the satisfaction of the County Commissioners.

Those are the 12 review criteria that we have to look at this with.

And I'll go ahead and make a statement. When asked, Mr. Koleber, if they looked at the protections that would be necessary to the lower Poudre to be used as a municipal water supply, we were told that they did not look at this. There were alternatives presented to us. I just do not feel that they were thoroughly vetted and I think that it appears to me that there could be other alternatives.

The lack of specificity in some of this, which I think could have been addressed to allay some of the concerns of the neighbors and of Larimer County as a whole were not done and so I really don't think that this is as complete as it should have been and I would not support passing this at this time.

MR. DOUGHERTY: Commissioner Cox?

MS. COX: I would like -- I would propose -- I would like to make a motion, then have discussion.

MR. JENSEN: And then have discussion?

MS. COX: Yes.

MR. JENSEN: Okay.

MS. COX: And I would like to make a motion.

MR. DOUGHERTY: All right. Go right ahead.

MS. COX: I'd like to move that the Planning Commission recommend to the Board of County Commissioners denial of the 1041 Application. Let me give you the number.

MR. DOUGHERTY: 18-ZONE2305.

MS. COX: Thank you.

So I'll lay that motion right there.

MR. DOUGHERTY: I have a motion.

Do I have a second?

MR. LAFFERTY: I'll second.

MR. DOUGHERTY: The motion is seconded. I'll open it up for discussion.

Commissioner Cox, would you like to --

MS. COX: The reason I moved to do that is: I also -- I'm looking at the review criteria and the No. 2 and -- pull my notes here -- and No. 11.

I also concur with Commissioner Jensen that I don't feel that the alternatives were fully -- I'll use

his term -- "vetted," nor that a reasonable balance has really been applied here.

I think it was really looked purely from Thornton's position. I think the neighborhood meeting where the County has presented that let's do things in the right-of-way, very good. So I think that addressed one very specific situation.

But from an overall alternative and a true good corridor and to really understand which neighbors, which people are really ultimately going to be affected by not being able to stay in a right-of-way or not, I just -- I'm used to seeing -- in fact, I dealt with a pipeline situation where it was very clear all along the pipeline what was going to have to be purchased, what was going to have to be not purchased, what was going to be in right-of-ways, what wasn't going to be in right-of-ways. I don't understand how people that are along this pipeline corridor are going to understand their impact to them without having much more specificity than I'm seeing today.

So I just don't see them meeting the criteria for No. 2 and No. 11.

MR. DOUGHERTY: Commissioner Carraway, did you want to weigh in?

MR. CARRAWAY: Well, first I just want to say

I think that -- you know, I certainly understand the City of Thornton has purchased these water rights over several decades. These are your water rights. You have a right to your water rights and I totally get that. But I agree with the comments that have been made. I think there's a tremendous amount of lack of specificity.

I think that more than anything else, I really feel like the City of Thornton has missed an opportunity to be creative, to look at other alternatives, to work with different interests and to bring people together in a way that can be done and I really believe an opportunity has been missed.

I think the issue about water law to me is very concerning. I think the only water law expert we heard from tonight was through public comment, Mr. Donovan, and he stated there were gross misrepresentations of Colorado water law on both sides. That's very disturbing to me.

And I also think we're operating under an assumption that water law is irrelevant, that some of the issues that would come under water law are irrelevant and I'm not sure that I believe that's accurate.

So for all those reasons, I think that, you

know, most -- first and foremost, I think just the level of mitigation is wholly inadequate and that this is not in the best interest of the citizens of Larimer County.

MR. DOUGHERTY: Commissioner Gerard, thoughts?

MR. GERARD: (No audible response).

MR. DOUGHERTY: No? Commissioner Miller?

MR. MILLER: I really struggle with the whole thing tonight. I do want to see the waterline go through. I don't think it was well planned. I was very disappointed that the pipe -- or that the pump station wasn't included that we could look at that.

I think Douglas Road is a good alternative. However, there's just a lot of unfinished business that I saw, too, and so I've got to agree with everyone except with the fact that I'm just not quite convinced that I'm going to vote "Yes" for this denial.

MR. DOUGHERTY: Thank you.

Commissioner Jensen, anything else you want to add?

MR. JENSEN: Well, I struggled a little bit with this and I'm not sure where I'm going to land either because I saw a lot of positives to this waterline. At the risk of going against what some of

the other Planning Commissioners have mentioned, I saw a formula for stopping future waterlines. I heard about future waterlines that had nothing to do with this project and, I'm sorry, I've been told -- I was told directly by another organization that there is no waterline going through this road last week.

We can't say no more work on a project until 2065, I'm sorry. That's like telling somebody that you can never have another permit to do an addition to your home. Things change. Future 1041 applications would have to be approved. This is -- what I saw was this was probably the best alternative because it was not taking any private property.

I do think -- at least from what I saw, I do think that the lack of specificity of where this pipeline was going to go within a right-of-way actually gave a lot more ability for the applicant to mitigate and bypass found deterrents to go along up the hill at Cobb Lake the roadway instead of having to go into either the reservoir up there or the wetlands.

I really thought that there was -- this was a good project and it was laid out and it was a project that, when it was complete, nobody would know was there and that was the thing that got me. I don't like people saying there was going to be eminent domain when

obviously it is a last resort, but I don't like fearmongering and I saw some of that with this. But I don't know where this is for me right now. It's not taking any more water out of the Poudre.

And just the fact that there are groups of people who say, "I don't want this," well, there's a lot of things I don't want. There's certain cars I don't like seeing driving down the road. I don't have that right just to unequivocally say, "No." So I don't know where this is going to go at this point, but we have -- Commissioner Gerard, go right ahead.

MR. GERARD: Yeah, it just occurred to me --

MR. JENSEN: Do you have your mic on?

MR. GERARD: It occurred to me as we were talking about this -- and I do struggle with the specificity part of it, but I understand also the corridor concept and being able to move it and I've seen that done. I'm an excavator. I've put pipelines in the ground and this isn't a project that I would work on, but this is -- I understand how that works and I understand the necessity to do that.

But I think everybody in here tonight, me included, that isn't on a well for their house has exactly the same system feeding their potable water to their home. There's a reservoir probably somewhere,

there's a diversion off the river, there's a water tank, there's a water treatment plant and maybe not quite to this scale, but there's a pipeline system that feeds the water to their house. It goes down a road or it goes down a right-of-way, it goes through somebody's property.

I myself have laid pipelines through people's property that have had -- given easements or sold easements, right-of-ways and other types of pipelines. And the fact they're in Thornton, I mean, it's not like they're Russians.

(Laughter.)

MR. GERARD: They are our neighbors and they speak the same language. They've got a little bit more of a southern accent than we do, but they're people just like us. They need water. And clean potable water is important to all of us. It's not just something that we get here or we have here.

And I think that -- I think the staff has done an excellent job. And I've got to say, based on what I know about Weld County -- what Weld County is doing, that the staff has done a great job of allowing us to put this line in the right-of-way. If we don't do that, we have a right-of-way and then we're forced to take property from the neighbors as well and I think

that's kind of what they're doing in Weld County. I'm not sure, but that's kind of what I heard.

So I'm very pleased that the staff has done that. That's a big concession. It's a big deal to tear up the roads. It's a maintenance issue. But I don't feel like that I have a right to stand in the way of this anymore than someone would have a right to stand in the way of me getting water at my house.

And somebody had to give up somewhere something to see a water tank that feeds my home and several other thousands of homes around me and someone's got a pipeline going through their yard. I know I have electric lines that went through my property that someone else uses that I don't use. So it's kind of the part of living together, I guess, that we have to put up with each other, even people from Thornton.

So I'm going to vote "No" on the denial.

MR. DOUGHERTY: Thank you.

Commissioner Jensen?

MR. JENSEN: Commissioner Gerard, I agree you and you're -- it's absolutely right. I've been very consistent with my time on this Commission to ask for additional information, to get more specificity. When the ranch master plan came in front of us, I asked that

it go back and we find out more about the economic impact that we had for Larimer County. I did exactly the same thing when the Parks Master Plan came in front of us and I'm doing it here. I just don't think that there is enough specificity for us to sit here with the opposition that we have and say that it's complete.

I commend the staff. You guys have done a phenomenal job. In the last six months, this Planning Commission has probably seen some of the biggest and most contentious issues that have come before us and you guys are hanging in there.

Rob, thank you very much for that.

But I think to be consistent in what we saw tonight, there's just not enough there for me to say that we can move forward.

Somebody ran a pipeline to my house. I've stood in ditches and laid pipeline myself. I've run equipment and dug the holes the put those pipelines in. I've fixed that cement pipe that Alco has their water running in, in the middle of the night, you know, stood chest deep in sewage fixing a sewer line, too. So I've been in the trenches, no pun intended. So I get what it takes to get there.

With the issues in this, without being convinced that every other option was looked at and

dismissed or conveyed to Larimer County, I think we land on the side of the people of Larimer County and say, "City of Thornton, go back and give us more information." We need more information. That's my stance.

MR. DOUGHERTY: Commissioner Cox?

MS. COX: Commissioner Jensen pretty much said it for me. I was not saying by the motion I was making that it's denial forever. It was that the way this 1041 and the information that we have in front of us, I just don't think it's -- I'll use the term "ripe" enough that we should be making a decision to see -- that we should make a recommendation at this point. I think it needs more work.

MR. LAFFERTY: Chairman Dougherty, so having heard what you guys are just talking about, it might be more of a prudent decision or recommendation, if you will, to ask the Board of County Commissioners -- because the Board of County Commissioners -- we have to finish this and then we have to go to the Board of County Commissioners. That's what the rules are. The Board has to act on it.

This Board can tell the Board that at this point, you're inclined not to support it as it stands because you don't have adequate information.

Therefore, you ask that the Board table the project to some future date and direct the Applicant to provide additional details and go back through the public hearing process.

MR. CARRAWAY: I'm in favor of that.

MS. COX: Yeah.

MR. LAFFERTY: But you need to -- what you need to do is: give the Board of County Commissioners some indication of what details you want them to -- the town to address. We just can't be, "Well, we want them to address more." You've got to give them some direction.

MR. DOUGHERTY: Okay. But, Mr. Lafferty, a recommendation of denial and our comments here at the end, shouldn't that give them some direction?

MR. LAFFERTY: Maybe.

MR. DOUGHERTY: I mean --

MR. LAFFERTY: But what I heard from you all is that you're not wanting to send just a denial recommendation for it. You were sending forward a recommendation that you might support this alternative if you had the proper -- you had the right amount of detail in front of you. And so I would say that maybe you reconsider your vote. You don't have to. It's up to you guys. It's just an option that is a different

way of saying something before --

MR. DOUGHERTY: Well, I can ask the person who made the motion if she's like to make a friendly amendment to it or --

MS. COX: I don't necessarily need to make that in a motion. I think if -- I think we can make the motion and then make the comments like we've done in the prior, which is, here's the -- we could have a good discussion about the criteria that we want to maybe ask the Board to take -- to look at.

MR. HELMICK: From the staff point guy's perspective, I'm hearing an awful lot of "I need specificity," but I'm not hearing what you --

MR. LAFFERTY: That is --

MR. HELMICK: -- you need more specificity on.

Is it the alternatives?

MS. COX: Yes.

MR. LAFFERTY: Alternatives.

MR. HELMICK: Is the corridor widths?

MR. LAFFERTY: I think putting this pipeline in the road is the right thing to do.

MS. COX: Yeah.

MR. HELMICK: I agree.

MR. LAFFERTY: I think that the corridor

plan --

MS. COX: But which roads?

MR. LAFFERTY: -- is conceptually the right thing to do.

What I did not get was when I asked a direct question about the options of what -- of why we would have to look or why they could not consider taking water out in Windsor or on the other side of Fort Collins, why it cannot be used for water -- municipal water supply, the answer was, "We did not look at it." That tells me immediately that all of the options were not looked at.

MR. DOUGHERTY: But I have a problem with that because you just gave two different answers. You think that the waterline in the road is correct, yet --

MR. LAFFERTY: No, no, no, I -- he's asking for specificity. He's asking for what would we like them to look at. There are alternatives out there. We talked about one thing tonight. We did not explore the additional alternatives and why they were not -- why they could not be used other than here we are in Douglas Road and the 10 other whatever it was options that we looked at.

Here's Option 1, here's what we looked at and why we could not do that. Here's Option 2, this is

what we looked at. We could not do that. And bring it down to a reason why Larimer -- why Douglas Road is the only and best option left when right off the bat a question was asked about why it couldn't be -- why the water couldn't be used for municipal out on -- in Fort Collins, was told "We didn't look at it." That tells me that they were not totally vetted in the options or it was not an option. But I think I heard it was an option.

So I want to see what those options were, why they were considered to start with, why they were dismissed to end with and why ultimately Douglas Road corridor is the only option left.

MR. DOUGHERTY: Commissioner Carraway, you had some comments?

MR. CARRAWAY: Yeah, I just -- you know, it's 11:00 o'clock at night and I think the idea that we need to outline, you know, what exactly we're looking for is kind of crazy. I mean, I think the burden is on the City of Thornton and I think we should vote on the motion the way it is.

MR. LAFFERTY: I'll end the question then.

MR. DOUGHERTY: Well, are you calling the question?

MR. LAFFERTY: No, I'm asking him if he's

calling the question.

MR. DOUGHERTY: Commissioner Carraway, are you --

MS. COX: You're calling it.

MR. DOUGHERTY: -- calling the question? You want to vote?

MR. CARRAWAY: Yes.

MR. DOUGHERTY: Okay. The question has been called then and we have a motion that the Larimer County Planning Commission recommend to the Board of County Commissioners denial of the Thornton Water Project, File No. 18-ZONE2305. Please know, Planning Commissioners, that a "Yes" vote is to deny, to recommend denial.

Ms. Ruball, may be please have a voice vote?

MS. RUBALL: Commissioner Jensen?

MR. JENSEN: Yes.

MS. RUBALL: Commissioner Cox?

MS. COX: Yes.

MS. RUBALL: Commissioner Carraway?

MR. CARRAWAY: Yes.

MS. RUBALL: Commissioner Gerard?

MR. GERRARD: No.

MS. RUBALL: Commissioner Miller?

MR. MILLER: No.

MS. RUBALL: Chair Dougherty?

MR. DOUGHERTY: I believe that since we are missing one piece on this that it doesn't demonstrate the reasonable balance between the costs and the benefits, I am going to vote "Yes."

(Applause.)

MR. DOUGHERTY: Motion passes.

Folks, thank you all for coming this evening. We still have some work to do, so if I could please ask you, as you're filing out, please keep the chatter to a minimum for a couple of minutes?

Final report -- final item on the Agenda is the report from staff.

MR. LAFFERTY: Staff has nothing to report, but we'll be on our normal agenda with a work session next month and normal proceedings with the Planning Commission Hearing.

Next month on the work session, there will be discussion around the comp plan, so we ask that you all attend because we want --

MR. DOUGHERTY: Folks? Folks, I'm sorry, we can't hear what's going on right now. Please. Thank you.

MR. LAFFERTY: So we just ask that you all consider attending. I know it's coming the summer

months, it's fun to be outside these kind of things, but you're going to put on the comp plan and other issues are important to us so keep in mind that we do have the work session next month and it will involve discussion around the comp plan.

MR. DOUGHERTY: All right. And next, we've got a Board of County Commissioners Planning Commission work session on June 13th, Wednesday, and then we've got our next Planning Commission Hearing on June 20th.

Thank you all for your participation.

We are adjourned.

(Hearing adjourned at 9:49 p.m.)

WORD INDEX

FINDINGS AND RESOLUTION DENYING THE THORNTON WATER PROJECT 1041 PERMIT

The Petition of the City of Thornton for approval to allow 26 miles of 48-inch waterline, pumping facility and other appurtenant facilities in the location initially described on Exhibit "A" attached hereto has been filed with the Board of County Commissioners of the County of Larimer.

The Planning Commission reviewed the proposed 1041 permit on May 16, 2018 and having duly considered the same recommended that it be denied.

On July 9, 2018, July 23, 2018, August 1, 2018, December 17, 2018, January 28, 2019, February 4, 2019 and February 11, 2019, in the County Board Hearing Room of the Larimer County Courthouse, Fort Collins, Colorado, the Board of County Commissioners conducted public hearings on the 1041 Permit Application. The Board of County Commissioners, having heard the testimony and evidence adduced at said hearing and having considered and carefully weighed the same, now makes the following findings:

I. Notice and Property

1. The 1041 Permit request upon the route described on Exhibit "A" was advertised in a local newspaper of general circulation.

2. Written notice of the initial hearing was delivered or mailed, first class, postage prepaid, to landowners within 500 feet of the proposal.

3. The general characteristics of the property are as follows:

a.	Location:	New water line easement and construction along approximately 26 miles in the County in new easements of 50 feet, and/or in existing ROW
b.	Area:	New water line easement and construction along approximately 26 miles in the County in new easements of 50 feet, and/or in existing ROW
c.	Proposed Land Use:	48-inch waterline, pump station, 1 MG tank and appurtenant facilities
d.	Existing Zoning:	Various
e.	Adjacent Zoning:	Various
f.	Adjacent Land Uses:	Residential, agricultural
g.	Services:	
	Access:	County Roads 54, 56 & Larimer County Road 1/Weld County Road 13
	Water:	N/A
	Sewer:	N/A
	Fire Protection:	Several authorities
h.	No. Trips Generated by Use:	Construction activity

II. Nature of the Application

1. C.R.S. Sections 24-65.1-101 *et seq.* titled Areas and Activities of State Interest was adopted by the Colorado General Assembly in 1974 and is generally referred to as "1041 powers." This statute provides:

> (2) It is the purpose of this article that:
>
> (a) The general assembly shall describe areas which may be of state interest and activities which may be of state interest and establish criteria for the administration of such areas and activities;
>
> (b) Local governments shall be encouraged to designate areas and activities of state interest and, after such designation, shall administer such areas and activities of state interest and promulgate guidelines for the administration thereof; and
>
> (c) Appropriate state agencies shall assist local governments to identify, designate, and adopt guidelines for administration of matters of state interest.

C.R.S. Section 24-65.1-204, Colorado Revised Statutes, states components of water facilities "shall be constructed in areas which will result in the proper utilization of existing treatment plants and the orderly development of domestic water systems…of adjacent communities;" and "emphasize the most efficient use of water…including recycling and reuse of water."

2. As authorized by this statute, Larimer County adopted 1041 regulations in 2008. (Larimer County Land Use Code (LUC), Chapter 14 attached as Exhibit B). Among the areas and activities regulated by Larimer County are transmission pipelines:

> Siting and development of new or extended domestic water or sewer transmission lines which are contained within new permanent easements greater than 30 feet or within new permanent easements greater than 20 feet that are adjacent to existing easements. Domestic water transmission lines include those used to transport both raw and treated water. This designation shall not include the maintenance, repair, adjustment or removal of an existing pipeline or the relocation, replacement or enlargement of an existing pipeline within the same easement or right-of-way, provided no additional permanent property acquisitions are required. The designation shall also not include the addition,

replacement, expansion or maintenance of appurtenant facilities on existing pipelines. LUC 14:4 (J).

3. In the 1980's the City of Thornton, Colorado, (Thornton) purchased farms and water rights in Larimer County and other counties for municipal purposes, including provision of drinking water to the residents of the City. To further this purpose, Thornton pursued court proceedings in District Court Water Division No. 1, State of Colorado, Consolidated Cases Nos. 86CW401, 86CW402, 86CW403, and 87CW332, and ultimately obtained a decree dated March 9, 1998. This decree imposed on Thornton a number of conditions and restrictions for use of the water rights.

4. The City of Thornton now seeks approval of a 1041 permit for the construction of a 48-inch diameter water line, a 40 million gallon per day pumping facility, one million gallon above-ground water tank and other appurtenant facilities.

III. Procedural History

1. 2014-May 2016: Thornton begins preliminary discussions with County Community Development, Engineering and Health Department staff about its proposed pipeline project, including possible alignments and corridors.

2. May 2016: A pre-application conference for a 1041 permit is held with Thornton and County staff. Public outreach through a series of mailings and open houses begins in late 2016 and continues through 2017.

At the time of the pre-application conference and during the initial development of alternatives the location of public facilities such as this are not contemplated to be located within a County Right of Way (ROW). At some of the early public meetings there is significant concern about proposed alignments through subdivisions. As a result, County staff meets with Thornton and its consultants and encourages them to review multiple alternatives in the western most area of the proposed corridor (the Douglas Road Corridor). At that time County staff also indicates that alignment in the existing ROW will be considered. In the case of Douglas Road there are sections which are designated on the Transportation Master Plan for future improvement. Although, no plans for improvements to this section of road are contemplated in the near term, if those plans change and improvements are scheduled to be made earlier, Thornton will need to coordinate its work in the ROW with Larimer County.

In the "Douglas Road Corridor" (CR17-Turnberry) the original alignment identifies a ¼ mile. This is subsequently reduced to a 500-foot-wide corridor. This creates a significant concern for many property owners in the area--specifically, that their homes, improvements and/or landscaping will be at risk with the final easements and construction.

For the balance of the segments, the alignment is still 500 feet to ¼ mile in width. The intent is to allow for easement negotiation which would avoid property conflict and not require revisiting the application. There may be locations which will require or necessitate the use of roadway ROW.

3. January 5, 2018: Thornton submits its application for 1041 approval of water conveyance pipelines and a pump house. The application is initially scheduled for hearing with the Larimer County Planning Commission in February and March 2018. However, the hearings are postponed to allow additional information requested by the County to be developed and submitted by Thornton. That additional information specifically relates to the proposed alignment in Douglas Road.

4. May 16, 2018: The Planning Commission holds a public hearing to consider Thornton's application. At the conclusion of the hearing the Commission votes 4-2 to deny the application. The Commission's decision and a summary of the information presented was set out in the Commission's minutes.

5. July 8, and 23, and August 1, 2018: The Board holds public hearings to consider Thornton's application. Thornton identifies its proposed route and/or corridor for its pipelines and location of a pump station. The proposed locations are shown on Exhibit C (referred to as the Douglas Road Route). Thornton testifies why the proposed project meets the applicable review criteria. Many area residents appear and testify in opposition to the project. Residents, including owners of properties south of Douglas Road, assert Thornton had no to minimal outreach or notice to them and they had little or no opportunity for input into the project in advance of the hearings. Citizens further testify that negative impacts from the project, including impacts of construction on area properties and landscaping, limitations on the future use of property, restricted and limited access for them and for emergency and school buses, and unwanted and unneeded improvements to Douglas Road are untenable. Citizens opine that the project fails to meet the County's 1041 review standards, including standards 2, 4, 8 and 9.

The Board makes initial verbal findings that Thornton has inadequately engaged the public in an effort to reach a preferred alternative and address adverse impacts from the project, that the Douglas Road route brings with it many adverse impacts as described by citizens, and that insufficient information has been presented as to alternative routes (including routes initially presented to the Thornton City Council), the pros and cons of other routes and why the other routes are not viable. In lieu of denying Thornton's application, the Board elects to continue the hearing to December 17, 2018 and directs Thornton to engage in a public outreach process to better address area residents' concerns and to present alternative project routes at the December hearing.

6. August through November 2018: A working group (Group) is formed to examine the project. A public engagement webpage (larimerwaterprojects.org) is also created and two

public meetings are held. The Group reviews possible alignments. Matters discussed by the Group include alternative alignments for the pipelines. The Group also questions the legal and practical feasibility of using the Poudre River and canals for conveyance of the water. About half of the Group advocate for an alignment that would require Thornton to use the Poudre River in lieu of pipes to convey the water for a portion of the project.

7. December 10, 2018: Thornton submits Supplement 3 to the Application. The route for the pipeline is now proposed to be from Reservoir 4 to a pump station north of Douglas Road, then north to the southeast corner of the Braidwood community following optional routes along the west shore of Reservoir #4 or Lake Vista Drive to Travis Road, then north to the dam for Reservoir 3, then east to the east shoreline of Reservoir 3 to the north edge of the Eagle Lake subdivision, then east to Highway 1, then south east to CR 56 then following the ROW for CR 56 to I-25. The proposed location is shown on Exhibit D (referred to as the County Road (CR) 56 Route). Thornton states that this route is a 500 feet wide corridor anywhere within which the pipes will potentially be laid. The location for the pumphouse remains the same.

8. December 17, 2018, January 28, 2019, February 4, 2019 and February 11, 2019: The Board holds public hearings to consider Thornton's Supplemental Application. (The Board also considers Thornton's additional supplemental materials entitled "City of Thornton Rebuttal Statement(s)). After considering all information provided by Thornton and the public, the Board votes to deny Thornton's application.

IV. Standards of Review and Findings

1. In order to approve a 1041 application, the Board must find that Thornton has met each of the twelve review criteria set out in LUC 14:10 (B) and (D)(1-12). The Board finds that Thornton has or has not met each of the twelve review criteria as follows:

i. *The proposal is consistent with the master plan and applicable intergovernmental agreements affecting land use and development.*

Not met.

The Larimer County Master Plan (Master Plan) is a policy document that establishes goals, visions and a long-range framework for the unincorporated area of Larimer County. The Master Plan identifies as one of its missions: "Larimer County is developing the Partnership Land Use System to maintain and enhance our county's quality of life and to be fundamentally fair to all our citizens and to respect their individual rights.

The Master Plan has many themes and principles implicated by Thornton's application, including:

a. Natural and cultural resources shall be identified, conserved and protected, and long-term cumulative impacts shall be monitored;

b. Agriculture will remain a viable long-term segment of Larimer County's economic, cultural and social fabric;

c. Logical settlement patterns that reflect the existing character of Larimer County and protect existing neighborhoods will be supported;

d. The planning and development review process shall be fair, open and predictable, and meet the needs and interest of the community without infringing on the rights of individuals.

e. Agriculture shall be recognized as an important economic, cultural and environmental resource value-provider for the County;

f. Agricultural land and water in Larimer County shall be protected through incentives, voluntary participation and measures to strengthen viable agriculture.

Thornton's proposed pipeline route is a yet-to-be-determined location within a 500 foot to ¼ mile wide corridor. The Board's ability to assess specific impacts to private property along the route is unreasonably limited because of the breadth of the corridor. Testimony was provided about the pipeline potentially splitting a private property in two, going through front or backyards, and traversing through significant amounts of private property.

The CR 56 route will have "[m]ost of the alignment . . . constructed in private easements . . . ." Unless an owner is willing to sell his/her private property to Thornton, Thornton will be required to acquire the property by eminent domain—a process generally disfavored by property owners.

Within these private easements, Thornton has noted that property owners will not be permitted to construct permanent structures or other improvements or install landscaping with deep roots that may interfere with the pipeline and its future maintenance. Testimony from private property owners along potential pipeline routes expressed concern about short-term construction impacts in addition to long-term impacts from maintenance crews on private property. One citizen noted concern about her children being exposed to strangers and equipment on her private property.

Thornton's water currently flows through the Water Supply and Storage Company (WSSC) canal system and is used to irrigate farms in Larimer County. Thornton owns approximately 47% of the water shares in the WSSC. Much of the remaining water in WSSC is also owned by municipalities, and WSSC expects that most of the water will be removed from farms in Larimer County in the future. While the fate of Thornton's application does not rest on

how other municipalities use their water in the future, the Board finds it important to have information about and consider the cumulative impacts of irrigated farmland turning to dryland. A significant reduction in the amount of irrigated farmland is concerning to the Board and conflicts with the goals of the Master Plan. The long-term viability of Larimer County's agricultural communities, and the economic, cultural and environmental impacts of drying up irrigated farmland are valid considerations under the Master Plan. As these impacts are not adequately described or analyzed by Thornton, the Board cannot conclude that Thornton's proposal is consistent with the Master Plan.

ii *The applicant has presented reasonable siting and design alternatives or explained why no reasonable alternatives are available.*

Not met.

Prior to applying for a 1041 permit from Larimer County, Thornton considered and presented to its council, a number of possible alternatives for conveyance of its water. Several of the pipeline routes had water being withdrawn from Reservoir 4 and proceeding east to the County line, then south through several corridors east and west of I-25, as well as the possibility of withdrawing water from other points along the Cache La Poudre River including as far as Windsor.

In its initial application materials, Thornton discussed its broad analysis of alternatives to convey the water to the City. These were then refined based on conversations with all of the affected jurisdictions to three generalized corridors all which commenced at Water Supply and Storage Reservoir 4 (WSS 4) thence east to the Weld Larimer County line thence south following alignments proceeding south to the City. Thornton defined three distinct corridors to review. Thornton examined the three alternatives from which the Douglas Road Route was chosen and presented to the Board. The Board was not convinced that this Route was the best option. Douglas Road is a high traffic generator. For some adjacent residential subdivisions, Douglas Road serves as the only access out of the subdivision. The Thornton project would take approximately 2-5 years to complete during which traffic would have to be diverted causing considerable inconvenience to area residents. There were no guarantees that the pipeline construction would remain within the right-of-way. Additionally, there would be safety and emergency access conflicts during construction. Area residents opposed the resulting improvements to Douglas Road (widening it) which they believed would increase traffic and speeds.

Thornton's Supplemental Application was based on the CR 56 Route. This Route was problematic in its imprecision, identifying a 500-foot corridor in some places where the pipeline might ultimately be installed. The corridor of 500' to ¼ mile in width prevents meaningful evaluation of the two alternatives presented. Impacts can vary

significantly depending where within this corridor the pipeline is actually located, and at a minimum Thornton should identify where the 50' wide permanent pipeline easement will be located. Without this level of specificity, the siting alternatives proposed by Thornton are not reasonable and cannot be sufficiently evaluated by the Board.

With respect to design, Thornton identified the use of tunneling rather than open-ditch construction as the primary method of installation and proposes to bore under certain sensitive areas. Some alternative design options were mentioned, such as lake taps to avoid private property and other construction disruptions, but were not presented as design alternatives.

The Board finds Thornton failed to present reasonable siting alternatives. Thornton self-selected two routes and then summarily concluded other possible alternatives (including those presented to the Thornton City Council) were not feasible. At the August 1, 2018 hearing, the Board specifically mentioned interest in the Shields Street alternative. Options vetted and rejected by Thornton have positive attributes which, in combination with the two alternatives presented, could lead to a route that satisfies the approval criteria by better mitigating adverse impacts and ensuring the orderly and efficient development of Thornton's water pipeline.

iii. The proposal conforms with adopted county standards, review criteria and mitigation requirements concerning environmental impacts, including but not limited to those contained in Section 8 of this Code.

Not met.

8.2. Wetland Areas:
Thornton proposes to bore under all designated wetland areas. Wetland areas that are affected by the proposal are non-jurisdictional. A Nationwide Permit from the Army Corps of Engineers may be required for the City to confirm that no jurisdictional wetland areas are affected by construction.

8.3. Hazard Areas:
There are hazard areas, flood plains on the Poudre and Big Thompson Rivers and Boxelder Creek identified along the preferred route. The City of Thornton proposes to bore under these river corridors.

8.4. Wildlife:
Thornton's environmental analysis for the preferred route identifies that there were possible conflicts with wildlife both listed and other species of concern, including disruption of nesting birds. The Board is not convinced that mitigation, including avoidance, seasonal limitations or prohibitions on activities is adequate.

8.8. Irrigation Facilities:
There are multiple irrigation ditches which will need to be bored or cut with this proposal. Thornton may be required to obtain agreements or licenses associated with this activity. The Board would seek alternative alignments that eliminate or reduce impacts on irrigation ditches.

8.11. Air Quality Standards:
Given the potential disturbed area of this request, an Air Quality permit will be necessary which permitting will require compliance with the standards.

8.12. Water Quality Management Standards:
Thornton will need to obtain a storm water quality permit for the construction impacts.

iv. The proposal will not have a significant adverse affect on or will adequately mitigate significant adverse affects on the land on which the proposal is situated and on lands adjacent to the proposal.

Not Met.

Portions of Thornton's proposed routes are in areas with significant residential development. There will be adverse impacts to thirty-six properties on the east side of Reservoirs 3 and 4. There will be adverse impacts on eight homes and private properties along County Road 56 and eight homes and private property in Eagle Lake. There will be typical construction impacts to vegetation in the project area or adjacent to the pipeline. There will also be impacts on groundwater and drainage in the area of any bore or cut. The pipelines will not be able to be installed solely within County public right-of-way. This will necessitate acquisition of private property which may result in eminent domain proceedings. Neighbors are unclear as to whether Thornton will acquire their property as an easement or as a fee interest. There are rattlesnakes in the area of the proposed CR 56 Route. These snakes will likely be driven into adjacent subdivisions as a result of construction. Noise and visual impacts from the pumphouse are of concern. Well established trees exist along the east side of Reservoir 4. These trees will be lost or their health threatened as a result of construction. These impacts will significantly impair residents' quality of life and use of their properties.

The Douglas Road route would require an unreasonably lengthy construction cycle, up to four years, which neighbors of the route testified would cause significant disruption to their homes and daily lives. Traffic detours along this route would funnel additional traffic to some intersections that are already overburdened. The added detour traffic would further degrade the function of these intersections to an unacceptable level.

The CR 56 route would have less impact on traffic because current volumes are much lower than Douglas Road. However, the CR 56 route will have a greater detrimental impact on private property because less public right of way is available. Also, as the pipeline moves north from Reservoir No. 4, the Braidwood Neighborhood and Eagle Lake neighborhoods will suffer significant disruption to private property. Further along this route, a private property will be bisected by the pipeline between the house and the barn. The sheer size and uncertainty of the proposed 500' to ¼ mile wide corridor prevents the Board and private property owners from reasonably considering all impacts. This uncertainty is, in itself, a significant impact of this project.

The particular impacts on the Braidwood and Eagle Lake neighborhoods could potentially be mitigated through use of a lake tap to tunnel the pipeline under certain reservoirs, but Thornton did not propose this as an available mitigation option. Robin Dornfest, an engineer with Lithos Engineering, was hired as a consultant to Larimer County and concluded lake taps, while more expensive and having certain risks, are feasible for Thornton's project and are increasingly more common for water conveyance projects in Colorado and across the United States.

Thornton's application addresses a single 48" water pipeline, however, two additional pipelines are part of Thornton's overall project plan. Thornton acknowledges the full extent of its project, which includes three phases with one pipeline per phase. Thornton believes its current 48" pipeline, phase I, is all that is relevant now. The problem with this approach is it does not account for cumulative impacts of the project as a whole. Thornton has a specific plan that includes three water pipelines in Larimer County that will collectively operate as a single water supply system. A purpose of Larimer County's 1041 permit process is to consider the broad impacts of public projects, and this purpose is also reflected in 1041 state statutes. By presenting phase I in isolation, Thornton deprives the Board and public of the opportunity to consider cumulative impacts and the effectiveness of mitigation. A route that may be appropriate for a single pipeline may be inappropriate for additional pipelines. If this information is not considered now, future pipelines may not be able to co-locate which would result in the disorderly development of Thornton's project and compound the impacts on Larimer County through multiple different pipelines in separate locations. An important factor in Thornton preferring the CR 56 route over the previously preferred Douglas Road route is that Douglas Road may be insufficient for co-location of multiple pipelines. This does not mean Douglas Road could not be a viable route, but consideration of the adverse impacts and a balancing of those impacts with benefits must be performed.

v. *The proposal will not adversely affect any sites and structures listed on the State or National Registers of Historic Places.*

Met.

The environmental analysis includes a review of all known and designated historic structures or places within the proposed alignments. There are not historic structures known to exist along or in the alignment of this pipeline that would be negatively affected by the construction of these facilities.

vi. *The proposal will not negatively impact public health and safety.*

Not Met.

Residents adjacent to Douglas Road spoke of safety concerns related to limited access from their neighborhoods which could delay emergency services. Other residents spoke of concerns arising from strangers on their property during both initial construction and future monitoring.

vii. *The proposal will not be subject to significant risk from natural hazards including floods, wildfire or geologic hazards.*

Met.

The preferred alignment has mitigated any risks principally by avoidance, or there are no risk factors associated with the preferred alignment.

viii. *Adequate public facilities and services are available for the proposal or will be provided by the applicant, and the proposal will not have a significant adverse effect on the capability of local government to provide services or exceed the capacity of service delivery systems.*

Met.

Thornton presented evidence showing it has the physical and financial capability to carry out and complete the project. The project will not impair Larimer County's ability to provide needed governmental services.

ix. *The applicant will mitigate any construction impacts to county roads, bridges and related facilities. Construction access will be re-graded and re-vegetated to minimize environmental impacts.*

Met.

Thornton has represented it will mitigate construction impacts to County roads, bridges and related facilities and that construction access will be re-graded and re-vegetated to minimize environmental impacts. Notwithstanding these representations, construction will significantly inconvenience and disrupt citizens.

Met.

x. *The benefits of the proposed development outweigh the losses of any natural resources or reduction of productivity of agricultural lands as a result of the proposed development.*

Not met.

Thornton's proposal will cause significant reduction in the productivity of agricultural lands within Larimer County. The benefits of Thornton's proposal are also significant, as clean and sufficient water supply is of critical importance. At this time, the Board finds the significant detrimental impact to agricultural productivity in Larimer County outweighs the benefits of Thornton's current proposal. Additional mitigation may help Thornton satisfy this criterion, but the current proposal falls short.

As part of Thornton's acquisition of water rights in Larimer County in the 1980's, Thornton bought approximately 21,000 agricultural acres on which its water rights were historically used for irrigation. Over time, Thornton has dried up some of the irrigated acreage to meet the needs of its growing population, leaving approximately 53% of its acreage in irrigated agriculture production in 2018. Thornton's proposal is designed to convey more of Thornton's water from these remaining irrigated acres to residents in Thornton, resulting in the irrigated farms being dried up and converting to dryland grasses. The shift of irrigated farmland to dryland grass will significantly reduce the agricultural productivity of those lands and will, unless sufficiently mitigated, jeopardize the long-term viability of the agricultural segment of Larimer County from an economic, cultural and social perspective.

Thornton's proposal considers any agricultural impacts to be temporary- the Board disagrees. The conversion of irrigated agricultural land to dryland grasses is not temporary and the resulting reduction in productivity of such lands is lasting. It appears Thornton's focus has been on physical impacts on agricultural lands caused by construction activity, but the Board's considerations go beyond those temporary impacts.

xi. *The proposal demonstrates a reasonable balance between the costs to the applicant to mitigate significant adverse affects and the benefits achieved by such mitigation.*

Not met.

Thornton has stated that certain functions related to other alternatives will be cost prohibitive and/or result in degradation in the quality of water. The Board is not convinced that the costs associated with an improved alignment or associated adverse impacts with such alignment will outweigh the benefits to Thornton of receiving water of sufficient quality and quantity. Thornton is currently treating water downstream of the Denver Metro area from the Platte River by ultra filtration, a 50-million gallon/day plant (the Wes Brown Water Treatment Plant. The Board finds there would be less degradation of the water through Fort Collins than through the Denver metro area.

The Board further finds that other alternative routes may result in fewer adverse impacts to the County which would reduce or equal the costs of mitigating impacts to the CR 56 Route or Douglas Road Route.

xii. *The recommendations of staff and referral agencies have been addressed to the satisfaction of the county commissioners.*

Met.

In large part the agency referral comments are directed to the need for Thornton to obtain additional permits, permissions and coordination. There is no evidence that Thornton will not seek all necessary permits and permissions and coordinate as needed at the relevant time.

2. The Board is cognizant that it may not deny Thornton the use and benefit of its water rights and that the Board's authority is limited to approving the siting and development of pipelines. The Board is not yet convinced, however, that the two proposed routes for the pipelines and the location for the pump house are the only and/or best and least impactful and that other routes are not viable.

V. Resolution

WHEREAS, the Board of County Commissioners has made its findings upon the petition and upon the recommendation of the Larimer County Planning Commission, which findings precede this Resolution, and by reference are incorporated herein and made a part hereof; and

WHEREAS, the Board of County Commissioners has carefully considered the petition, evidence and testimony presented to it, and has given the same such weight as it in its discretion deems proper, and is now fully advised in the premises;

Findings and Resolution
Thornton Water Project
1041 Permit Denial
Page 14

NOW, THEREFORE, BE IT RESOLVED that the petition of the City of Thornton for approval of a 1041 permit to allow a 26 mile 48-inch diameter waterline, pumping facility and other appurtenant facilities for the Douglas Road Route and the County Road 56 Route be and the same hereby is denied.

Commissioners Johnson, Donnelly and Kefalas voted in favor of the Findings and Resolution, and the same were duly adopted.

DATED this 19th day of March, 2019.

NOTICE OF PUBLIC HEARING

TO ALL INTERESTED PERSONS:

Please take notice that on Monday, July 9, 2018, at 6:30 pm, the Larimer County Board of County Commissioners will hold a public hearing in the Hearing Room of the Larimer County Courthouse Offices, 200 West Oak, Fort Collins, Colorado, concerning the following:

Applicant: City of Thornton Water Project

Request: To locate and construct a raw water pipeline and appurtenant facilities including pump stations and storage tanks. The pipeline commences north of Fort Collins at WS&S reservoir #4 following along the alignment of Douglas Road to CR 9/Turnberry Rd. thence north to CR 56 thence east to the County line to a water tank thence south along the county line to the Weld County through Timnath, Windsor and Johnstown.

Property Description: A pipeline route commencing at Water Storage and Supply reservoir # 4 proceeding east along the Douglas Road alignment to CR 9 north to CR 56 East to the Larimer County Line thence south along the County line to the Weld County line at Johnstown.

File Name/Number: Thornton Water Project 1041, 18-ZONE2305

The File and relevant documents may be examined in the Office of Planning Services of the County of Larimer at the Larimer County Courthouse, Fort Collins, Colorado during regular business hours.

FINDINGS AND RESOLUTION DENYING THE THORNTON WATER PROJECT 1041 PERMIT

The Petition of the City of Thornton for approval to allow 26 miles of 48-inch waterline, pumping facility and other appurtenant facilities in the location initially described on Exhibit "A" attached hereto has been filed with the Board of County Commissioners of the County of Larimer.

The Planning Commission reviewed the proposed 1041 permit on May 16, 2018 and having duly considered the same recommended that it be denied.

On July 9, 2018, July 23, 2018, August 1, 2018, December 17, 2018, January 28, 2019, February 4, 2019 and February 11, 2019, in the County Board Hearing Room of the Larimer County Courthouse, Fort Collins, Colorado, the Board of County Commissioners conducted public hearings on the 1041 Permit Application. The Board of County Commissioners, having heard the testimony and evidence adduced at said hearing and having considered and carefully weighed the same, now makes the following findings:

I. Notice and Property

1. The 1041 Permit request upon the route described on Exhibit "A" was advertised in a local newspaper of general circulation.

2. Written notice of the initial hearing was delivered or mailed, first class, postage prepaid, to landowners within 500 feet of the proposal.

3. The general characteristics of the property are as follows:

a.	Location:	New water line easement and construction along approximately 26 miles in the County in new easements of 50 feet, and/or in existing ROW
b.	Area:	New water line easement and construction along approximately 26 miles in the County in new easements of 50 feet, and/or in existing ROW
c.	Proposed Land Use:	48-inch waterline, pump station, 1 MG tank and appurtenant facilities
d.	Existing Zoning:	Various
e.	Adjacent Zoning:	Various
f.	Adjacent Land Uses:	Residential, agricultural
g.	Services:	
	Access:	County Roads 54, 56 & Larimer County Road 1/Weld County Road 13
	Water:	N/A
	Sewer:	N/A
	Fire Protection:	Several authorities
h.	No. Trips Generated by Use:	Construction activity

***Re-recorded to correct Exhibits**

RECEPTION #20190014585, 3/25/2019 4:23:49 PM, 2 of 26,
Angela Myers, Clerk & Recorder, Larimer County, CO

II. Nature of the Application

1. C.R.S. Sections 24-65.1-101 *et seq.* titled Areas and Activities of State Interest was adopted by the Colorado General Assembly in 1974 and is generally referred to as "1041 powers." This statute provides:

> (2) It is the purpose of this article that:
>
> (a) The general assembly shall describe areas which may be of state interest and activities which may be of state interest and establish criteria for the administration of such areas and activities;
>
> (b) Local governments shall be encouraged to designate areas and activities of state interest and, after such designation, shall administer such areas and activities of state interest and promulgate guidelines for the administration thereof; and
>
> (c) Appropriate state agencies shall assist local governments to identify, designate, and adopt guidelines for administration of matters of state interest.

C.R.S. Section 24-65.1-204, Colorado Revised Statutes, states components of water facilities "shall be constructed in areas which will result in the proper utilization of existing treatment plants and the orderly development of domestic water systems…of adjacent communities;" and "emphasize the most efficient use of water…including recycling and reuse of water."

2. As authorized by this statute, Larimer County adopted 1041 regulations in 2008. (Larimer County Land Use Code (LUC), Chapter 14 attached as Exhibit B). Among the areas and activities regulated by Larimer County are transmission pipelines:

> Siting and development of new or extended domestic water or sewer transmission lines which are contained within new permanent easements greater than 30 feet or within new permanent easements greater than 20 feet that are adjacent to existing easements. Domestic water transmission lines include those used to transport both raw and treated water. This designation shall not include the maintenance, repair, adjustment or removal of an existing pipeline or the relocation, replacement or enlargement of an existing pipeline within the same easement or right-of-way, provided no additional permanent property acquisitions are required. The designation shall also not include the addition,

RECEPTION #20190014585, 3/25/2019 4:23:49 PM, 3 of 26,
Angela Myers, Clerk & Recorder, Larimer County, CO

replacement, expansion or maintenance of appurtenant facilities on existing pipelines. LUC 14:4 (J).

3. In the 1980's the City of Thornton, Colorado, (Thornton) purchased farms and water rights in Larimer County and other counties for municipal purposes, including provision of drinking water to the residents of the City. To further this purpose, Thornton pursued court proceedings in District Court Water Division No. 1, State of Colorado, Consolidated Cases Nos. 86CW401, 86CW402, 86CW403, and 87CW332, and ultimately obtained a decree dated March 9, 1998. This decree imposed on Thornton a number of conditions and restrictions for use of the water rights.

4. The City of Thornton now seeks approval of a 1041 permit for the construction of a 48-inch diameter water line, a 40 million gallon per day pumping facility, one million gallon above-ground water tank and other appurtenant facilities.

III. Procedural History

1. 2014-May 2016: Thornton begins preliminary discussions with County Community Development, Engineering and Health Department staff about its proposed pipeline project, including possible alignments and corridors.

2. May 2016: A pre-application conference for a 1041 permit is held with Thornton and County staff. Public outreach through a series of mailings and open houses begins in late 2016 and continues through 2017.

At the time of the pre-application conference and during the initial development of alternatives the location of public facilities such as this are not contemplated to be located within a County Right of Way (ROW). At some of the early public meetings there is significant concern about proposed alignments through subdivisions. As a result, County staff meets with Thornton and its consultants and encourages them to review multiple alternatives in the western most area of the proposed corridor (the Douglas Road Corridor). At that time County staff also indicates that alignment in the existing ROW will be considered. In the case of Douglas Road there are sections which are designated on the Transportation Master Plan for future improvement. Although, no plans for improvements to this section of road are contemplated in the near term, if those plans change and improvements are scheduled to be made earlier, Thornton will need to coordinate its work in the ROW with Larimer County.

In the "Douglas Road Corridor" (CR17-Turnberry) the original alignment identifies a ¼ mile. This is subsequently reduced to a 500-foot-wide corridor. This creates a significant concern for many property owners in the area--specifically, that their homes, improvements and/or landscaping will be at risk with the final easements and construction.

RECEPTION #20190014585, 3/25/2019 4:23:49 PM, 4 of 26,
Angela Myers, Clerk & Recorder, Larimer County, CO

For the balance of the segments, the alignment is still 500 feet to ¼ mile in width. The intent is to allow for easement negotiation which would avoid property conflict and not require revisiting the application. There may be locations which will require or necessitate the use of roadway ROW.

3. January 5, 2018: Thornton submits its application for 1041 approval of water conveyance pipelines and a pump house. The application is initially scheduled for hearing with the Larimer County Planning Commission in February and March 2018. However, the hearings are postponed to allow additional information requested by the County to be developed and submitted by Thornton. That additional information specifically relates to the proposed alignment in Douglas Road.

4. May 16, 2018: The Planning Commission holds a public hearing to consider Thornton's application. At the conclusion of the hearing the Commission votes 4-2 to deny the application. The Commission's decision and a summary of the information presented was set out in the Commission's minutes.

5. July 8, and 23, and August 1, 2018: The Board holds public hearings to consider Thornton's application. Thornton identifies its proposed route and/or corridor for its pipelines and location of a pump station. The proposed locations are shown on Exhibit C (referred to as the Douglas Road Route). Thornton testifies why the proposed project meets the applicable review criteria. Many area residents appear and testify in opposition to the project. Residents, including owners of properties south of Douglas Road, assert Thornton had no to minimal outreach or notice to them and they had little or no opportunity for input into the project in advance of the hearings. Citizens further testify that negative impacts from the project, including impacts of construction on area properties and landscaping, limitations on the future use of property, restricted and limited access for them and for emergency and school buses, and unwanted and unneeded improvements to Douglas Road are untenable. Citizens opine that the project fails to meet the County's 1041 review standards, including standards 2, 4, 8 and 9.

The Board makes initial verbal findings that Thornton has inadequately engaged the public in an effort to reach a preferred alternative and address adverse impacts from the project, that the Douglas Road route brings with it many adverse impacts as described by citizens, and that insufficient information has been presented as to alternative routes (including routes initially presented to the Thornton City Council), the pros and cons of other routes and why the other routes are not viable. In lieu of denying Thornton's application, the Board elects to continue the hearing to December 17, 2018 and directs Thornton to engage in a public outreach process to better address area residents' concerns and to present alternative project routes at the December hearing.

6. August through November 2018: A working group (Group) is formed to examine the project. A public engagement webpage (larimerwaterprojects.org) is also created and two

RECEPTION #20190014585, 3/25/2019 4:23:49 PM, 5 of 26,
Angela Myers, Clerk & Recorder, Larimer County, CO

public meetings are held. The Group reviews possible alignments. Matters discussed by the Group include alternative alignments for the pipelines. The Group also questions the legal and practical feasibility of using the Poudre River and canals for conveyance of the water. About half of the Group advocate for an alignment that would require Thornton to use the Poudre River in lieu of pipes to convey the water for a portion of the project.

7. December 10, 2018: Thornton submits Supplement 3 to the Application. The route for the pipeline is now proposed to be from Reservoir 4 to a pump station north of Douglas Road, then north to the southeast corner of the Braidwood community following optional routes along the west shore of Reservoir #4 or Lake Vista Drive to Travis Road, then north to the dam for Reservoir 3, then east to the east shoreline of Reservoir 3 to the north edge of the Eagle Lake subdivision, then east to Highway 1, then south east to CR 56 then following the ROW for CR 56 to I-25. The proposed location is shown on Exhibit D (referred to as the County Road (CR) 56 Route). Thornton states that this route is a 500 feet wide corridor anywhere within which the pipes will potentially be laid. The location for the pumphouse remains the same.

8. December 17, 2018, January 28, 2019, February 4, 2019 and February 11, 2019: The Board holds public hearings to consider Thornton's Supplemental Application. (The Board also considers Thornton's additional supplemental materials entitled "City of Thornton Rebuttal Statement(s)). After considering all information provided by Thornton and the public, the Board votes to deny Thornton's application.

IV. Standards of Review and Findings

1. In order to approve a 1041 application, the Board must find that Thornton has met each of the twelve review criteria set out in LUC 14:10 (B) and (D)(1-12). The Board finds that Thornton has or has not met each of the twelve review criteria as follows:

i. *The proposal is consistent with the master plan and applicable intergovernmental agreements affecting land use and development.*

Not met.

The Larimer County Master Plan (Master Plan) is a policy document that establishes goals, visions and a long-range framework for the unincorporated area of Larimer County. The Master Plan identifies as one of its missions: "Larimer County is developing the Partnership Land Use System to maintain and enhance our county's quality of life and to be fundamentally fair to all our citizens and to respect their individual rights.

The Master Plan has many themes and principles implicated by Thornton's application, including:

RECEPTION #20190014585, 3/25/2019 4:23:49 PM, 6 of 26,
Angela Myers, Clerk & Recorder, Larimer County, CO

a. Natural and cultural resources shall be identified, conserved and protected, and long-term cumulative impacts shall be monitored;

b. Agriculture will remain a viable long-term segment of Larimer County's economic, cultural and social fabric;

c. Logical settlement patterns that reflect the existing character of Larimer County and protect existing neighborhoods will be supported;

d. The planning and development review process shall be fair, open and predictable, and meet the needs and interest of the community without infringing on the rights of individuals.

e. Agriculture shall be recognized as an important economic, cultural and environmental resource value-provider for the County;

f. Agricultural land and water in Larimer County shall be protected through incentives, voluntary participation and measures to strengthen viable agriculture.

Thornton's proposed pipeline route is a yet-to-be-determined location within a 500 foot to ¼ mile wide corridor. The Board's ability to assess specific impacts to private property along the route is unreasonably limited because of the breadth of the corridor. Testimony was provided about the pipeline potentially splitting a private property in two, going through front or backyards, and traversing through significant amounts of private property.

The CR 56 route will have "[m]ost of the alignment . . . constructed in private easements . . . ." Unless an owner is willing to sell his/her private property to Thornton, Thornton will be required to acquire the property by eminent domain—a process generally disfavored by property owners.

Within these private easements, Thornton has noted that property owners will not be permitted to construct permanent structures or other improvements or install landscaping with deep roots that may interfere with the pipeline and its future maintenance. Testimony from private property owners along potential pipeline routes expressed concern about short-term construction impacts in addition to long-term impacts from maintenance crews on private property. One citizen noted concern about her children being exposed to strangers and equipment on her private property.

Thornton's water currently flows through the Water Supply and Storage Company (WSSC) canal system and is used to irrigate farms in Larimer County. Thornton owns approximately 47% of the water shares in the WSSC. Much of the remaining water in WSSC is also owned by municipalities, and WSSC expects that most of the water will be removed from farms in Larimer County in the future. While the fate of Thornton's application does not rest on

RECEPTION #20190014585, 3/25/2019 4:23:49 PM, 7 of 26,
Angela Myers, Clerk & Recorder, Larimer County, CO

how other municipalities use their water in the future, the Board finds it important to have information about and consider the cumulative impacts of irrigated farmland turning to dryland. A significant reduction in the amount of irrigated farmland is concerning to the Board and conflicts with the goals of the Master Plan. The long-term viability of Larimer County's agricultural communities, and the economic, cultural and environmental impacts of drying up irrigated farmland are valid considerations under the Master Plan. As these impacts are not adequately described or analyzed by Thornton, the Board cannot conclude that Thornton's proposal is consistent with the Master Plan.

ii *The applicant has presented reasonable siting and design alternatives or explained why no reasonable alternatives are available.*

Not met.

Prior to applying for a 1041 permit from Larimer County, Thornton considered and presented to its council, a number of possible alternatives for conveyance of its water. Several of the pipeline routes had water being withdrawn from Reservoir 4 and proceeding east to the County line, then south through several corridors east and west of I-25, as well as the possibility of withdrawing water from other points along the Cache La Poudre River including as far as Windsor.

In its initial application materials, Thornton discussed its broad analysis of alternatives to convey the water to the City. These were then refined based on conversations with all of the affected jurisdictions to three generalized corridors all which commenced at Water Supply and Storage Reservoir 4 (WSS 4) thence east to the Weld Larimer County line thence south following alignments proceeding south to the City. Thornton defined three distinct corridors to review. Thornton examined the three alternatives from which the Douglas Road Route was chosen and presented to the Board. The Board was not convinced that this Route was the best option. Douglas Road is a high traffic generator. For some adjacent residential subdivisions, Douglas Road serves as the only access out of the subdivision. The Thornton project would take approximately 2-5 years to complete during which traffic would have to be diverted causing considerable inconvenience to area residents. There were no guarantees that the pipeline construction would remain within the right-of-way. Additionally, there would be safety and emergency access conflicts during construction. Area residents opposed the resulting improvements to Douglas Road (widening it) which they believed would increase traffic and speeds.

Thornton's Supplemental Application was based on the CR 56 Route. This Route was problematic in its imprecision, identifying a 500-foot corridor in some places where the pipeline might ultimately be installed. The corridor of 500' to ¼ mile in width prevents meaningful evaluation of the two alternatives presented. Impacts can vary

RECEPTION #20190014585, 3/25/2019 4:23:49 PM, 8 of 26,
Angela Myers, Clerk & Recorder, Larimer County, CO

significantly depending where within this corridor the pipeline is actually located, and at a minimum Thornton should identify where the 50' wide permanent pipeline easement will be located. Without this level of specificity, the siting alternatives proposed by Thornton are not reasonable and cannot be sufficiently evaluated by the Board.

With respect to design, Thornton identified the use of tunneling rather than open-ditch construction as the primary method of installation and proposes to bore under certain sensitive areas. Some alternative design options were mentioned, such as lake taps to avoid private property and other construction disruptions, but were not presented as design alternatives.

The Board finds Thornton failed to present reasonable siting alternatives. Thornton self-selected two routes and then summarily concluded other possible alternatives (including those presented to the Thornton City Council) were not feasible. At the August 1, 2018 hearing, the Board specifically mentioned interest in the Shields Street alternative. Options vetted and rejected by Thornton have positive attributes which, in combination with the two alternatives presented, could lead to a route that satisfies the approval criteria by better mitigating adverse impacts and ensuring the orderly and efficient development of Thornton's water pipeline.

iii. The proposal conforms with adopted county standards, review criteria and mitigation requirements concerning environmental impacts, including but not limited to those contained in Section 8 of this Code.

Not met.

8.2. Wetland Areas:
Thornton proposes to bore under all designated wetland areas. Wetland areas that are affected by the proposal are non-jurisdictional. A Nationwide Permit from the Army Corps of Engineers may be required for the City to confirm that no jurisdictional wetland areas are affected by construction.

8.3. Hazard Areas:
There are hazard areas, flood plains on the Poudre and Big Thompson Rivers and Boxelder Creek identified along the preferred route. The City of Thornton proposes to bore under these river corridors.

8.4. Wildlife:
Thornton's environmental analysis for the preferred route identifies that there were possible conflicts with wildlife both listed and other species of concern, including disruption of nesting birds. The Board is not convinced that mitigation, including avoidance, seasonal limitations or prohibitions on activities is adequate.

RECEPTION #20190014585, 3/25/2019 4:23:49 PM, 9 of 26,
Angela Myers, Clerk & Recorder, Larimer County, CO

8.8. Irrigation Facilities:
There are multiple irrigation ditches which will need to be bored or cut with this proposal. Thornton may be required to obtain agreements or licenses associated with this activity. The Board would seek alternative alignments that eliminate or reduce impacts on irrigation ditches.

8.11. Air Quality Standards:
Given the potential disturbed area of this request, an Air Quality permit will be necessary which permitting will require compliance with the standards.

8.12. Water Quality Management Standards:
Thornton will need to obtain a storm water quality permit for the construction impacts.

iv. The proposal will not have a significant adverse affect on or will adequately mitigate significant adverse affects on the land on which the proposal is situated and on lands adjacent to the proposal.

Not Met.

Portions of Thornton's proposed routes are in areas with significant residential development. There will be adverse impacts to thirty-six properties on the east side of Reservoirs 3 and 4. There will be adverse impacts on eight homes and private properties along County Road 56 and eight homes and private property in Eagle Lake. There will be typical construction impacts to vegetation in the project area or adjacent to the pipeline. There will also be impacts on groundwater and drainage in the area of any bore or cut. The pipelines will not be able to be installed solely within County public right-of-way. This will necessitate acquisition of private property which may result in eminent domain proceedings. Neighbors are unclear as to whether Thornton will acquire their property as an easement or as a fee interest. There are rattlesnakes in the area of the proposed CR 56 Route. These snakes will likely be driven into adjacent subdivisions as a result of construction. Noise and visual impacts from the pumphouse are of concern. Well established trees exist along the east side of Reservoir 4. These trees will be lost or their health threatened as a result of construction. These impacts will significantly impair residents' quality of life and use of their properties.

The Douglas Road route would require an unreasonably lengthy construction cycle, up to four years, which neighbors of the route testified would cause significant disruption to their homes and daily lives. Traffic detours along this route would funnel additional traffic to some intersections that are already overburdened. The added detour traffic would further degrade the function of these intersections to an unacceptable level.

RECEPTION #20190014585, 3/25/2019 4:23:49 PM, 10 of 26,
Angela Myers, Clerk & Recorder, Larimer County, CO

The CR 56 route would have less impact on traffic because current volumes are much lower than Douglas Road. However, the CR 56 route will have a greater detrimental impact on private property because less public right of way is available. Also, as the pipeline moves north from Reservoir No. 4, the Braidwood Neighborhood and Eagle Lake neighborhoods will suffer significant disruption to private property. Further along this route, a private property will be bisected by the pipeline between the house and the barn. The sheer size and uncertainty of the proposed 500' to ¼ mile wide corridor prevents the Board and private property owners from reasonably considering all impacts. This uncertainty is, in itself, a significant impact of this project.

The particular impacts on the Braidwood and Eagle Lake neighborhoods could potentially be mitigated through use of a lake tap to tunnel the pipeline under certain reservoirs, but Thornton did not propose this as an available mitigation option. Robin Dornfest, an engineer with Lithos Engineering, was hired as a consultant to Larimer County and concluded lake taps, while more expensive and having certain risks, are feasible for Thornton's project and are increasingly more common for water conveyance projects in Colorado and across the United States.

Thornton's application addresses a single 48" water pipeline, however, two additional pipelines are part of Thornton's overall project plan. Thornton acknowledges the full extent of its project, which includes three phases with one pipeline per phase. Thornton believes its current 48" pipeline, phase I, is all that is relevant now. The problem with this approach is it does not account for cumulative impacts of the project as a whole. Thornton has a specific plan that includes three water pipelines in Larimer County that will collectively operate as a single water supply system. A purpose of Larimer County's 1041 permit process is to consider the broad impacts of public projects, and this purpose is also reflected in 1041 state statutes. By presenting phase I in isolation, Thornton deprives the Board and public of the opportunity to consider cumulative impacts and the effectiveness of mitigation. A route that may be appropriate for a single pipeline may be inappropriate for additional pipelines. If this information is not considered now, future pipelines may not be able to co-locate which would result in the disorderly development of Thornton's project and compound the impacts on Larimer County through multiple different pipelines in separate locations. An important factor in Thornton preferring the CR 56 route over the previously preferred Douglas Road route is that Douglas Road may be insufficient for co-location of multiple pipelines. This does not mean Douglas Road could not be a viable route, but consideration of the adverse impacts and a balancing of those impacts with benefits must be performed.

v. *The proposal will not adversely affect any sites and structures listed on the State or National Registers of Historic Places.*

Met.

RECEPTION #20190014585, 3/25/2019 4:23:49 PM, 11 of 26,
Angela Myers, Clerk & Recorder, Larimer County, CO

The environmental analysis includes a review of all known and designated historic structures or places within the proposed alignments. There are not historic structures known to exist along or in the alignment of this pipeline that would be negatively affected by the construction of these facilities.

vi. *The proposal will not negatively impact public health and safety.*

Not Met.

Residents adjacent to Douglas Road spoke of safety concerns related to limited access from their neighborhoods which could delay emergency services. Other residents spoke of concerns arising from strangers on their property during both initial construction and future monitoring.

vii. *The proposal will not be subject to significant risk from natural hazards including floods, wildfire or geologic hazards.*

Met.

The preferred alignment has mitigated any risks principally by avoidance, or there are no risk factors associated with the preferred alignment.

viii. *Adequate public facilities and services are available for the proposal or will be provided by the applicant, and the proposal will not have a significant adverse effect on the capability of local government to provide services or exceed the capacity of service delivery systems.*

Met.

Thornton presented evidence showing it has the physical and financial capability to carry out and complete the project. The project will not impair Larimer County's ability to provide needed governmental services.

ix. *The applicant will mitigate any construction impacts to county roads, bridges and related facilities. Construction access will be re-graded and re-vegetated to minimize environmental impacts.*

Met.

RECEPTION #20190014585, 3/25/2019 4:23:49 PM, 12 of 26,
Angela Myers, Clerk & Recorder, Larimer County, CO

Thornton has represented it will mitigate construction impacts to County roads, bridges and related facilities and that construction access will be re-graded and re-vegetated to minimize environmental impacts. Notwithstanding these representations, construction will significantly inconvenience and disrupt citizens.

Met.

x. *The benefits of the proposed development outweigh the losses of any natural resources or reduction of productivity of agricultural lands as a result of the proposed development.*

Not met.

Thornton's proposal will cause significant reduction in the productivity of agricultural lands within Larimer County. The benefits of Thornton's proposal are also significant, as clean and sufficient water supply is of critical importance. At this time, the Board finds the significant detrimental impact to agricultural productivity in Larimer County outweighs the benefits of Thornton's current proposal. Additional mitigation may help Thornton satisfy this criterion, but the current proposal falls short.

As part of Thornton's acquisition of water rights in Larimer County in the 1980's, Thornton bought approximately 21,000 agricultural acres on which its water rights were historically used for irrigation. Over time, Thornton has dried up some of the irrigated acreage to meet the needs of its growing population, leaving approximately 53% of its acreage in irrigated agriculture production in 2018. Thornton's proposal is designed to convey more of Thornton's water from these remaining irrigated acres to residents in Thornton, resulting in the irrigated farms being dried up and converting to dryland grasses. The shift of irrigated farmland to dryland grass will significantly reduce the agricultural productivity of those lands and will, unless sufficiently mitigated, jeopardize the long-term viability of the agricultural segment of Larimer County from an economic, cultural and social perspective.

Thornton's proposal considers any agricultural impacts to be temporary- the Board disagrees. The conversion of irrigated agricultural land to dryland grasses is not temporary and the resulting reduction in productivity of such lands is lasting. It appears Thornton's focus has been on physical impacts on agricultural lands caused by construction activity, but the Board's considerations go beyond those temporary impacts.

xi. *The proposal demonstrates a reasonable balance between the costs to the applicant to mitigate significant adverse affects and the benefits achieved by such mitigation.*

Not met.

RECEPTION #20190014585, 3/25/2019 4:23:49 PM, 13 of 26,
Angela Myers, Clerk & Recorder, Larimer County, CO

Thornton has stated that certain functions related to other alternatives will be cost prohibitive and/or result in degradation in the quality of water. The Board is not convinced that the costs associated with an improved alignment or associated adverse impacts with such alignment will outweigh the benefits to Thornton of receiving water of sufficient quality and quantity. Thornton is currently treating water downstream of the Denver Metro area from the Platte River by ultra filtration, a 50-million gallon/day plant (the Wes Brown Water Treatment Plant. The Board finds there would be less degradation of the water through Fort Collins than through the Denver metro area.

The Board further finds that other alternative routes may result in fewer adverse impacts to the County which would reduce or equal the costs of mitigating impacts to the CR 56 Route or Douglas Road Route.

xii. *The recommendations of staff and referral agencies have been addressed to the satisfaction of the county commissioners.*

Met.

In large part the agency referral comments are directed to the need for Thornton to obtain additional permits, permissions and coordination. There is no evidence that Thornton will not seek all necessary permits and permissions and coordinate as needed at the relevant time.

2. The Board is cognizant that it may not deny Thornton the use and benefit of its water rights and that the Board's authority is limited to approving the siting and development of pipelines. The Board is not yet convinced, however, that the two proposed routes for the pipelines and the location for the pump house are the only and/or best and least impactful and that other routes are not viable.

V. Resolution

WHEREAS, the Board of County Commissioners has made its findings upon the petition and upon the recommendation of the Larimer County Planning Commission, which findings precede this Resolution, and by reference are incorporated herein and made a part hereof; and

WHEREAS, the Board of County Commissioners has carefully considered the petition, evidence and testimony presented to it, and has given the same such weight as it in its discretion deems proper, and is now fully advised in the premises;

RECEPTION #20190014585, 3/25/2019 4:23:49 PM, 14 of 26,
Angela Myers, Clerk & Recorder, Larimer County, CO

Findings and Resolution
Thornton Water Project
1041 Permit Denial
Page 14

NOW, THEREFORE, BE IT RESOLVED that the petition of the City of Thornton for approval of a 1041 permit to allow a 26 mile 48-inch diameter waterline, pumping facility and other appurtenant facilities for the Douglas Road Route and the County Road 56 Route be and the same hereby is denied.

Commissioners Johnson, Donnelly and Kefalas voted in favor of the Findings and Resolution, and the same were duly adopted.

DATED this 19th day of March, 2019.

RECEPTION #20190014585, 3/25/2019 4:23:49 PM, 15 of 26,
Angela Myers, Clerk & Recorder, Larimer County, CO

NOTICE OF PUBLIC HEARING

TO ALL INTERESTED PERSONS:

Please take notice that on Monday, July 9, 2018, at 6:30 pm, the Larimer County Board of County Commissioners will hold a public hearing in the Hearing Room of the Larimer County Courthouse Offices, 200 West Oak, Fort Collins, Colorado, concerning the following:

Applicant: City of Thornton Water Project

Request: To locate and construct a raw water pipeline and appurtenant facilities including pump stations and storage tanks. The pipeline commences north of Fort Collins at WS&S reservoir #4 following along the alignment of Douglas Road to CR 9/Turnberry Rd. thence north to CR 56 thence east to the County line to a water tank thence south along the county line to the Weld County through Timnath, Windsor and Johnstown.

Property Description: A pipeline route commencing at Water Storage and Supply reservoir # 4 proceeding east along the Douglas Road alignment to CR 9 north to CR 56 East to the Larimer County Line thence south along the County line to the Weld County line at Johnstown.

File Name/Number: Thornton Water Project 1041, 18-ZONE2305

The File and relevant documents may be examined in the Office of Planning Services of the County of Larimer at the Larimer County Courthouse, Fort Collins, Colorado during regular business hours.

EXHIBIT "A"

RECEPTION #20190014585, 3/25/2019 4:23:49 PM, 16 of 26,
Angela Myers, Clerk & Recorder, Larimer County, CO

14.1. - PURPOSE AND INTENT

The purpose of this section is to facilitate the identification, designation and regulation of areas or activities of state interest consistent with applicable statutory requirements.

(Res. No. 11182008R012, Exh. A, 11-18-2008)

14.2. - APPLICABILITY

These regulations shall apply to all proceedings concerning the designation and regulation of any development in any area of state interest or any activity of state interest which has been or may hereafter be designated by the board of county commissioners, whether located on public or private land.

(Res. No. 11182008R012, Exh. A, 11-18-2008)

14.3. - DESIGNATION PROCESS FOR MATTERS OF STATE INTEREST

A. The board of county commissioners may in its discretion designate and adopt regulations for the administration of any matter of state interest.

B. *Public hearing required.*

1. The board of county commissioners shall hold a public hearing before designating any matter of state interest and adopting regulations for the administration thereof. No less than 30 calendar days but no more than 60 calendar days before the designation hearing, the board shall publish notice in a newspaper of general circulation in the county.
2. The planning commission shall hold a hearing and provide a recommendation to the board on the proposed designation prior to the board hearing. Notice of any hearing before the planning commission shall be published no less than 14 days before the planning commission hearing date in a newspaper of general circulation in the county.

C. *Criteria for designations.* At the public hearings(s), the planning commission and board of county commissioners shall consider such evidence as they deem appropriate, including, but not necessarily limited to testimony and documents addressing the following considerations.

1. The intensity of current and foreseeable development pressures.
2. The reasons why the particular area or activity is of state interest, the dangers that would result from uncontrolled development of any such area or uncontrolled conduct of such activity, and the advantages of development of such area or conduct of such activity in a coordinated manner.
3. Applicable policies of the Larimer County Master Plan and any duly adopted intergovernmental agreements affected by the area or activity under consideration.
4. The extent to which other governmental entities regulate the area or activity proposed to be designated.
5. The testimony, evidence and documents taken and admitted at the public hearing.
6. The recommendations of staff and the planning commission.

D. *Adoption of designation and regulations.*

1. At the conclusion of the hearing, or within 30 days thereafter, the board may, by resolution, adopt, adopt with modification, or reject the proposed designation and accompanying guidelines or regulations.
2. Each designation order adopted by the board shall, at a minimum:
   a. Specify the activity or area of state interest to be designated;
   b. Specify the boundaries of the designated area of state interest, if applicable;

EXHIBIT "B"

RECEPTION #20190014585, 3/25/2019 4:23:49 PM, 17 of 26,
Angela Myers, Clerk & Recorder, Larimer County, CO

c. State reasons why the designation is appropriate in light of the review criteria considered at the public hear above section; and

d. Specify the regulations applicable to the designated matter of state interest.

(Res. No. 11182008R012, Exh. A, 11-18-2008)

14.4. - DESIGNATED MATTERS OF STATE INTEREST

The board of county commissioners, having conducted a public hearing consistent with the requirements of Section 24.65.1-404 C.R.S. and having considered the intensity of current and foreseeable pressures on and within Larimer County; the dangers that would result from uncontrolled conduct of such activity or development in an area of state interest; and the advantages of conduct of such activity in a coordinated manner, does hereby find and declare the following to be matters of state interest. A 1041 permit shall be required prior to any of the following activities, unless specifically exempted.

A. Siting and development of any electrical power plant with a generating capacity of 50 megawatts or more, or any addition to an existing power plant which increases the existing design capacity by 50 megawatts or more. This designation shall not include use of temporary generators at an existing electrical power plant in an emergency situation.

B. Conversion of an existing electrical power plant to a new type of fuel or energy, but not including a change from coal to natural gas, and also not including a change in start-up fuel.

C. Siting and development of a nuclear power plant of any size, or any addition thereto.

D. Siting and development of a wind power plant in which there are more than three wind towers or where any wind generator tower exceeds a hub height of 80 feet, or any addition thereto increasing the existing design capacity of the facility by ten percent or more or expanding the area of the plant.

E. Siting of electric transmission lines and appurtenant facilities that are designed to transmit electrical voltages of 69,000 volts or greater, whether erected above ground or placed underground.

F. Any existing transmission line upgrade that involves expanding an easement or right-of-way or increases the height of transmission structures by more than ten feet.

G. Siting of an electrical substation or transition site designed to provide switching, voltage transformation or voltage control required for the transmission of electricity at 69,000 volts or greater.

H. Siting and development of new pipelines designed for transmission of natural gas or other petroleum derivatives of ten inch diameter or larger. This designation shall include appurtenant facilities such as compressor stations, pipe valves and other mechanical controls that are part of the pipeline project. This designation shall not include the maintenance, repair, adjustment or removal of an existing pipeline or the relocation of an existing pipeline within the same easement or right-of-way. The designation shall also not include the addition, replacement, expansion or maintenance of appurtenant facilities on existing pipelines.

I. Siting and development of new or expanded storage facilities of 50,000 cubic feet or more of natural gas or 35,000 barrels or more of petroleum derivatives.

J. Siting and development of new or extended domestic water or sewer transmission lines which are contained within new permanent easements greater than 30 feet or within new permanent easements greater than 20 feet that are adjacent to existing easements. Domestic water transmission lines include those used to transport both raw and treated water. This designation shall not include the maintenance, repair, adjustment or removal of an existing pipeline or the relocation, replacement or enlargement of an existing pipeline within the same easement or right-of-way, provided no additional permanent property acquisitions are required. The designation shall also not include the addition, replacement, expansion or maintenance of appurtenant facilities on existing pipelines.

K. Site selection and construction of a new water storage reservoir or expansion of an existing water storage

RECEPTION #20190014585, 3/25/2019 4:23:49 PM, 18 of 26,
Angela Myers, Clerk & Recorder, Larimer County, CO

reservoir resulting in a surface area at high water line in excess of 50 acres, natural or manmade, used for the storage, regulation and/or control of water for human consumption or domestic use and excluding a water storage reservoir used exclusively for irrigation. A water storage reservoir shall also include all appurtenant uses, structures and facilities, roads, parks, parking, trails and other uses which are developed as part of the water storage reservoir. This designation shall not include the maintenance and operation of irrigation ditches, canals or laterals nor shall it include the normal maintenance and operation of a reservoir solely used for irrigation or a reservoir serving both irrigation and domestic customers.

L. Siting and development of any solar energy power plant, including solar energy collectors, power generation facilities, facilities for storing and transforming energy and other appurtenant facilities, that together disturb an area greater than five acres, or any addition thereto that expands the disturbed area. This designation shall not include roof mounted solar systems located on existing permitted principal and accessory buildings.

(Res. No. 11182008R012, Exh. A, 11-18-2008; Res. No. 08182009R001, Exh. A, 8-18-2009; Res. No. 01192010R004, 12-21-2009; Res. No. 01192010R00S, 1-4-2010; Res. No. 08042015R001, § 1, 8-4-2015)

14.5. - EXEMPT DEVELOPMENT ACTIVITIES

A. *Statutory exemptions.* These regulations shall not apply to any development in an area of state interest or any activity of state interest if any one of the following is true as of May 17, 1974.
   1. The specific development or activity was covered by a current building permit issued by the county.
   2. The specific development or activity was directly approved by the electorate of the state or the county, provided that approval by the electorate of any bond issue by itself shall not be construed as approval of the specific development or activity.
   3. The specific development or activity is on land which has been finally approved by the county, with or without conditions, for planned unit development or land use similar to a planned unit development.
   4. The specific development or activity is on land which was either zoned or rezoned in response to an application which contemplated the specific development or activity.
   5. The specific development or activity is on land for which a development plan has been conditionally or finally approved by the county.

B. *Specific exemptions.* The regulatory provisions of this section shall not apply to any of the following.
   1. Any activity which, as of the date of designation as a matter of state interest, meets one of the following criteria.
      a. The activity is part of a final discretionary county land use approval and protected by a site specific development plan or agreement whose vesting period has not expired.
      b. The activity has a complete application filed and in process for a discretionary county land use approval, provided the applicant (if a public entity) commits to being bound by any conditions of a final county approval or by denial of the application.
      c. The specific activity has been acted upon by the planning commission as a location and extent application.
   2. An interstate natural gas utility regulated by the Federal Energy Regulatory Commission or its successor, provided the following requirements and procedures are complied with by the utility whenever site selection and construction of major facilities within Larimer County are proposed:
      a. Copies of all materials (i.e., environmental impact statement, application for certification of public convenience and necessity) filed with a federal and/or state regulatory agency shall also be filed with the county commissioners within five days;

RECEPTION #20190014585, 3/25/2019 4:23:49 PM, 19 of 26,
Angela Myers, Clerk & Recorder, Larimer County, CO

b. Written notice of all scheduled public proceedings before the federal and/or state regulatory agency shall b commissioners not less than 30 days prior to the proceedings, provided further, however, that if the public than 30 days' notice it shall give written notice to the county commissioners within five working days after it

3. A reservoir used exclusively for irrigation is not considered to be a water storage reservoir.
4. An entity that has an approved intergovernmental agreement with the county specific to the project in question, as provided for in Section 14.8 below.

(Res. No. 11182008R012, Exh. A, 11-18-2008; Res. No. 08182009R001, Exh. A, 8-18-2009; Res. No. 01192010R004, 12-21-2009; Res. No. 08042015R001, § 2, 8-4-2015)

14.6. - RELATIONSHIP TO OTHER COUNTY, STATE AND FEDERAL REQUIREMENTS

A. If a 1041 permit is required under this section 14, other sections of the Code shall not apply unless specifically stated in this section 14, or unless applied by the county commissioners as conditions of approval. If an appeal to the requirement for obtaining a 1041 permit is granted pursuant to section 14.7 below, other requirements of the Land Use Code shall apply.

B. Review or approval of a project by a federal or state agency does not obviate, and will not substitute for, the need to obtain a 1041 permit for that project under this section.

C. These regulations shall not be applied to create an operational conflict with any state or federal laws or regulations.
   1. The applicant may request that the county application and review process be coordinated with the applicable state or federal agency review process
   2. To the extent practicable and appropriate, the county may coordinate its review and approval of the application, including the terms and conditions of such approval, with that of other agencies.

(Res. No. 11182008R012, Exh. A, 11-18-2008)

14.7. - APPEAL OF 1041 PERMIT REQUIREMENT

An applicant may appeal the requirement for obtaining a 1041 permit.

A. Appeal process.
   1. Initiation of appeal. A written application for appeal must be submitted to the planning director on a form provided by the planning department. An application fee established by the county commissioners must be paid when the appeal is submitted.
   2. Contents of appeal. The appeal application must include a description of the scope of the proposed activity and evidence that supports the appeal including evidence that demonstrates how section 14.7.B. review criteria are met.
   3. Scheduling. Upon receipt of the appeal, the planning director will schedule the appeal on the next available agenda of the county commissioners, no later than 60 days after the date on which a properly completed application is filed.
   4. Notice. Notice shall be consistent with the requirements of section 12.3, notice of public hearing. Notice of the time and place of the appeal hearing must be published in a newspaper of general circulation at least 14 days before the hearing date.
   5. Action by the county commissioners.
      a. At the appeal hearing the county commissioners will take relevant evidence and testimony from the person who filed the appeal, county staff and any interested party.
      b. The applicant shall have the burden of proving that granting the appeal is consistent with the intent and purpose of this section 14.

R006862

RECEPTION #20190014585, 3/25/2019 4:23:49 PM, 20 of 26,
Angela Myers, Clerk & Recorder, Larimer County, CO

c. The county commissioners may refer an appeal to the planning commission for a recommendation. The decision to refer an appeal to the planning commission will be made by the county commissioners within 14 days of the date the appeal was submitted.

d. The decision of the county commissioners shall be final.

B. The county commissioners shall consider each of the following review criteria and make findings pertaining to each one which, in their discretion, applies to the appeal.

1. Approval of the appeal will not subvert the purpose or intent of this section 14.

2. The development or activity has received approval through a state or federal permitting process which has utilized review criteria substantially the same as those contained in this regulation, and which has afforded a similar or greater amount of input by affected citizens and property owners of Larimer County.

3. In the case of siting and development of a new domestic water or sewer transmission pipeline, evidence has been provided that:

a. The proposed pipeline is located entirely on property owned by the entity proposing the activity and/or within easements or rights-of-way that have been acquired from willing sellers, or

b. The proposed pipeline is located entirely within a special district organized under C.R.S. Title 32, or a public or local improvement district organized under C.R.S. 30-20-Parts 5 and 6, and

(1) The pipeline is intended to provide water or sewer service to properties located within that district in Larimer County; and

(2) Written notice of all scheduled public meetings of the district concerning the siting and development of the new pipeline has been given to all property owners who may be directly affected by the activity, and to the county commissioners, not less than 14 days prior to the meeting.

(Res. No. 11182008R012, Exh. A, 11-18-2008; Res. No. 01192010R004, 12-21-2009)

14.8. - INTERGOVERNMENTAL AGREEMENTS

A. Upon request of the State of Colorado or a political subdivision of the state proposing to engage in an area or activity of state interest, the requirements of this section 14 may be met by the approval of an intergovernmental agreement between the county and such applicant. The county commissioners may, but shall be under no obligation to do so, approve such an intergovernmental agreement in lieu of a permit application and review as provided by this section. In the event such an agreement is approved by the county commissioners, no 1041 permit application to conduct the activity or area of state interest shall be required, provided that all of the following conditions are met.

1. The state or political subdivision applicant and the county must both be authorized to enter into such an agreement.

2. The purpose and intent of this section 14 must be satisfied by the terms of the agreement.

3. A public hearing must be conducted by the county commissioners. Notice of the hearing must be published once in a newspaper of general circulation in Larimer County not less than 30 nor more than 60 days before the date set for the hearing. Prior to the hearing, the county commissioners shall approve the form of any proposed intergovernmental agreement, subject, however, to final approval of the agreement at the conclusion of or subsequent to the public hearing and based upon the evidence presented there. The public hearing shall be for the purpose of taking comment upon the proposed intergovernmental agreement, the provisions of which have been determined to be acceptable to the applicant and to the county.

RECEPTION #20190014585, 3/25/2019 4:23:49 PM, 21 of 26,
Angela Myers, Clerk & Recorder, Larimer County, CO

4. Both the county commissioners and the state or the governing body of the political subdivision applicant must ap agreement in the manner required of each of them by the state constitution, statutes and any applicable charter, resolution.
5. Memorandum of understanding (MOU). The county and the applicant shall execute a memorandum of understanding, prior to engaging in the process of forming an intergovernmental agreement, the purpose of which is:
   a. To acknowledge the intent of the parties to begin joint discussions which may result in the approval of an intergovernmental agreement.
   b. Establish the timeframe for those discussions and any significant milestones agreed upon.
   c. Establish the timeframe for review, public input and public hearing before the county commissioners.

B. Exercise of the provisions of this section by the state or an applicant that is a political subdivision of the state shall not prevent that entity from electing at any time to proceed under the permit provisions of this regulation. Additionally, any entity which has previously proceeded under the permit provisions of this regulation may at any time elect to proceed instead to seek the establishment of an agreement.

(Res. No. 11182008R012, Exh. A, 11-18-2008; Res. No. 08042015R001, § 3, 8-4-2015)

14.9. - 1041 PERMIT APPLICATION AND REVIEW PROCESS

A. No person may engage in development in a designated area of state interest or conduct a designated activity of state interest without first obtaining a 1041 permit, unless the county commissioners have granted an appeal to the requirement for a 1041 permit or have adopted an intergovernmental agreement per section 14.8 such that a permit is not required.
   1. If a development or activity subject to these regulations is proposed as an integral part of a land division process, the applicant shall comply with this section prior to obtaining final plat approval.
   2. No building permit shall be issued by the county for an activity or development subject to this section without the applicant having first obtained a 1041 permit, unless the county commissioners have granted an appeal to the requirement for a 1041 permit or have adopted an intergovernmental agreement per section 14.8 such that a permit is not required.
   3. 1041 permits issued under this section shall not be considered to be a site specific development plan and no statutory vested rights shall inure to such permit. A 1041 permit may specify a period of time for which the permit is valid or state additional criteria related to future validity of the permit.

B. *General process outline.* The following is a general outline of the steps required for any permit decision under this section. More specific information regarding these referenced steps is contained in section 12 common procedures for development review and in the technical supplement to the Land Use Code.
   1. Pre-application conference.
   2. Complete and sufficient application received.
   3. Referral to affected agencies.
   4. Public hearing before the planning commission and county commissioners.
   5. Post-approval requirements.

C. *Notice of 1041 permit hearing.* Notice shall be consistent with the requirements of section 12.3, notice of public hearing.
   1. Not later than 30 days after receipt of a completed application for a 1041 permit, the planning director shall set and publish notice of the date, time and place for a hearing before the county commissioners. The notice shall be published once in a newspaper of general circulation in Larimer County, not less than 30 nor more

RECEPTION #20190014585, 3/25/2019 4:23:49 PM, 22 of 26,
Angela Myers, Clerk & Recorder, Larimer County, CO

than 60 days before the date set for the hearing.

a. The planning director shall be responsible for the determination that a complete and sufficient application has been received.

b. Not later than 60 days after receipt of the application, the planning director shall provide a written description of any application materials that are determined to be not complete and the additional materials that are necessary before application processing may begin.

2. Within the time constraints above, the planning director shall schedule the application for a hearing before the planning commission. Notice of the planning commission hearing shall be published in a newspaper of general circulation for the county at least 14 days before the hearing date.

3. A notice will be mailed to property owners in the vicinity of the proposal at least 14 days prior to the hearing(s) according to the procedures and requirements of section 12.3.3 mailed notice.

4. C.R.S. §§ 30-28-133(10) and 24-65.5-103(1) require an applicant for development to notify all owners and lessees of a mineral interest on the subject property of the pending application. The applicant must submit, to the planning department, a certification of compliance with this notice requirement, prior to the initial public hearing for a 1041 permit, except for those types of development applications specifically excluded below. Failure to submit the required certification of notice will result in the public hearing being rescheduled to a later date. According to C.R.S. §§ 24-65.5-102(2) an application for development does not include applications with respect to electric lines, crude oil or natural gas pipelines, steam pipelines, chilled and other water pipelines, or appurtenances to said lines or pipelines; therefore notification of mineral interest owners and lessees is not required for those activities.

D. Any application for a 1041 permit which relates to the location, construction or improvements of a major electrical or natural gas facility as contemplated by 29-20-108 C.R.S. as amended shall be subject to the terms of that statute. In the event of an inconsistency between the statute and these regulations, the statute shall control.

E. The planning director may, when necessary, decide that additional expertise is needed to review a project, according to the procedure detailed in Section 8.01.A of this Code.

(Res. No. 11182008R012, Exh. A, 11-18-2008; Res. No. 01192010R004, 12-21-2009)

14.10. - GENERAL REQUIREMENTS FOR APPROVAL OF A 1041 PERMIT APPLICATION

A. The applicant must submit a complete and sufficient application that is consistent with the submittal requirements that are stated at the pre-application conference.

B. A 1041 permit application may be approved only when the applicant has satisfactorily demonstrated that the proposal, including all mitigation measures proposed by the applicant, complies with all of the applicable criteria set forth in this section 14. If the proposal does not comply with all the applicable criteria, the permit shall be denied, unless the county commissioners determine that reasonable conditions can be imposed on the permit which will enable the permit to comply with the criteria.

C. If the county commissioners determine at the public hearing that sufficient information has not been provided to allow it to determine if the applicable criteria have been met, the board may continue the hearing until the specified additional information has been received. The commissioners shall adopt a written decision on a 1041 permit application within 90 days after the completion of the permit hearing. The 1041 permit will be in the form of a findings and resolution signed by the board of county commissioners. The effective date shall be the date on which the findings and resolution is signed.

D. Review criteria for approval of all 1041 permits.

1. The proposal is consistent with the master plan and applicable intergovernmental agreements affecting land use and development.

RECEPTION #20190014585, 3/25/2019 4:23:49 PM, 23 of 26,
Angela Myers, Clerk & Recorder, Larimer County, CO

2. The applicant has presented reasonable siting and design alternatives or explained why no reasonable alternativ
3. The proposal conforms with adopted county standards, review criteria and mitigation requirements concerning environmental impacts, including but not limited to those contained in this Code.
4. The proposal will not have a significant adverse affect on or will adequately mitigate significant adverse affects on the land or its natural resources, on which the proposal is situated and on lands adjacent to the proposal.
5. The proposal will not adversely affect any sites and structures listed on the State or National Registers of Historic Places.
6. The proposal will not negatively impact public health and safety.
7. The proposal will not be subject to significant risk from natural hazards including floods, wildfire or geologic hazards.
8. Adequate public facilities and services are available for the proposal or will be provided by the applicant, and the proposal will not have a significant adverse effect on the capability of local government to provide services or exceed the capacity of service delivery systems.
9. The applicant will mitigate any construction impacts to county roads, bridges and related facilities. Construction access will be re-graded and re-vegetated to minimize environmental impacts.
10. The benefits of the proposed development outweigh the losses of any natural resources or reduction of productivity of agricultural lands as a result of the proposed development.
11. The proposal demonstrates a reasonable balance between the costs to the applicant to mitigate significant adverse affects and the benefits achieved by such mitigation.
12. The recommendations of staff and referral agencies have been addressed to the satisfaction of the county commissioners.

(Res. No. 11182008R012, Exh. A, 11-18-2008; Res. No. 08042015R001, § 4, 8-4-2015)

14.11. - ADDITIONAL SPECIFIC REVIEW CRITERIA AND STANDARDS

A. *Additional review criteria for power plants.*
   1. Proposed transmission facilities have been identified and included as part of the power plant project.
   2. Wind power plants must meet the following standards:
      a. All towers must be set back at least 750 feet from property lines and public rights-of-way.
      b. The wind generator turbines and towers must be painted or coated a non-reflective white, grey or other neutral color.
      c. Facilities must not be artificially illuminated unless required by the FAA.
      d. Facilities must not be used to display advertising.
      e. Electrical controls must be wireless or underground and power lines must be underground except where the electrical collector wiring is brought together for connection to the transmission or distribution network, adjacent to that network.
      f. Noise generated from the wind power plant must be in compliance with the Chapter 30, Article V. Noise of the Larimer County Code.
      g. The operator of the plant must minimize or mitigate any interference with electromagnetic communications, such as radio, telephone or television signals caused by the plant.
      h. Towers for wind generators must be constructed of a tubular design and include anti-climb features.
      i. The facility design must use best practices available to protect wildlife.

B. *Additional review criteria for electrical transmission lines.*

RECEPTION #20190014585, 3/25/2019 4:23:49 PM, 24 of 26,
Angela Myers, Clerk & Recorder, Larimer County, CO

1. The siting and design of the proposal addresses potential levels of electrical and magnetic fields (EMFs) by exerci avoidance" to limit exposure.

(Res. No. 11182008R012, Exh. A, 11-18-2008)

14.12. - POST APPROVAL REQUIREMENTS

Prior to the issuance of a 1041 permit approved under this section the follow conditions must be met, if applicable.

A. The applicant may be required to obtain a construction permit from the county engineer.
B. A development agreement may be required as a condition of approval of the 1041 permit and may include requirements for performance guarantees.
C. An agreement concerning decommissioning, abandonment or reuse of the permitted facility may be required as a condition of approval of the 1041 permit.

(Res. No. 11182008R012, Exh. A, 11-18-2008)

14.13. - TECHNICAL REVISIONS AND 1041 PERMIT AMENDMENTS

A. Any change in the construction or operation of the project from that approved by the county commissioners shall require staff review and a determination made by the planning director in writing as to whether the change is a technical revision or 1041 permit amendment.
B. A proposed change shall be considered a technical revision if the planning director determines that there will be no increase in the size of the area affected or the intensity of impacts as a result of the proposed change(s); or any increase in the area or intensity of impacts is insignificant.
C. Changes other than technical revisions shall be considered 1041 permit amendments. A permit amendment shall be subject to review as a new permit application.

(Res. No. 11182008R012, Exh. A, 11-18-2008)

INTRODUCTION

This case is about whether there is any competent evidence to support the Board of Larimer County Commissioners' (Board) decision that a water pipeline proposed by the City of Thornton (Thornton) does not satisfy all of Larimer County's 1041 permit review criteria. Thornton's Opening Brief argues a multitude of other issues such as whether its water decree, and its innate authority to construct water projects and to condemn property eclipses Larimer County's 1041 permitting authority. The Court need not reach these collateral arguments because they are based on incorrect premises. The Board's only decision was that Thornton's 1041 permit application failed to satisfy Larimer County's 1041 review criteria. The Board has not mandated or forbid any diversion point for Thornton's water. The Board has not prohibited Thornton from exercising eminent domain power. The Board has not prohibited Thornton from constructing a water project in Larimer County.

While this Answer Brief touches on all arguments presented by Thornton, the true scope of this action is much narrower than the Opening Brief portrays. This Answer Brief first addresses Thornton's claim for judicial review pursuant to C.R.C.P. 106(a)(4). The Board next addresses Thornton's purported declaratory judgment claim, however, as argued herein, such claim is essentially a re-packaged Rule 106 claim.

ANSWER BRIEF

I. ISSUES ON REVIEW

a. Whether the Board's decision infringes on Thornton's water rights and authority to construct water projects and to condemn property.

b. Whether there is any competent evidence to support the Board's decision that Thornton did not satisfy all 1041 permit criteria.

c. Whether the Board exceeded its jurisdiction by misapplying criterion 11 of the 1041 permit criteria.

d. Whether the Court's review includes the Board's written Findings and Resolution or is limited to the Board's verbal deliberation.

e. Whether Thornton can proceed under Location and Extent Review and disregard the Board's decision made pursuant to Larimer County's 1041 regulations.

II. STANDARD OF REVIEW AND 1041 AUTHORITY

a. C.R.C.P. 106 Review Standard. A court's review of a quasi-judicial action under C.R.C.P. 106(a)(4) "shall be limited to a determination of whether the body or officer has exceeded its jurisdiction or abused its discretion, based on the evidence in the record before the defendant body or officer." As with any quasi-judicial action, the Board has broad discretion in evaluating the information presented at the public hearing and determining what weight to afford that information. The object of a C.R.C.P. 106 proceeding is not to settle or determine disputed facts, but to investigate and correct errors of law of a jurisdictional nature and abuses of discretion. *Doran v. State Bd. of Medical Exmrs.,* 78 Colo.153, 240 P. 335, 337 (1925). The merits of the case are not involved. *State Bd. Of Medical Exmrs. v. Noble*, 65 Colo. 410, 177 P. 141 (1918). Actions under C.R.C.P. 106(a)(4) provide for a deferential review that gives credence to an agency's own interpretations and application of its policies and regulations. *Langer v. Board of County Commissioners of Larimer County,* 2020 CO 31, ___ P.3d ___*;* citing *Stor-N-Lock Partners #15, LLC v. City of Thornton,* 2018 COA 65, Para. 22, ___ P.3d ___ ("In conducting our review under C.R.C.P. 106(a)(4), we apply a deferential standard, and we may not disturb the governmental body's decision absent a clear abuse of discretion.").

An abuse of discretion occurs only when there is **no** competent evidence to support the decision. *Ross v. Fire & Police Pension Ass'n.,* 713 P.2d 1304, 1305 (Colo. 1986). "No competent evidence" means that the ultimate decision of the lower tribunal is so devoid of evidentiary support that it can only be explained as an arbitrary and capricious exercise of authority. *Bentley v. Valco, Inc.,* 741 P.2d 1266, 1267 (Colo. App. 1987). A Board's "findings may not be set aside merely because the evidence was conflicting or susceptible of more than one inference." *Arndt v. City of Boulder*, 895 P.2d 1092, 1095 (Colo. App. 1994), *cert. denied* (1995); *see also Bristol v. County Court*, 352 P.2d 785, 786 (Colo. 1960) (finding that mere disagreement with a ruling is not a sufficient showing of abuse of discretion). The proper function of a district court under Rule 106 is to affirm a lower tribunal where there is **any** competent evidence to support the tribunal's decision. *Bauer v. City of Wheat Ridge*, 182 Colo. 324, 513 P.2d 203, 204 (1973). The reviewing court cannot consider whether the lower agency's findings are right or wrong, substitute its judgment for that of the agency, or interfere in any manner with the agency's judgment if there is any competent evidence to support those findings. *State Civil Serv. Comm'n v. Hazlett*, 119 Colo. 173, 201 P.2d 616 (1948). A court cannot weigh anew the credibility of witnesses. A mere disagreement with a ruling is not a sufficient showing of abuse of discretion. *Bristol v. County Court,* 143 Colo. 306, 352 P.2d 785, 786 (1960).

"In determining whether the administrative agency abused its discretion, the reviewing court may consider whether the agency misconstrued or misapplied the law. If there is a reasonable basis for the agency's application of the law, the decision may not be set aside on review." *Platte River Envtl. Conservation Organiz. v. Nat'l Hog Farms*, 804 P.2d 290, 292 (Colo. App. 1990) (citations omitted). Furthermore, the construction of ordinances by administrative officials charged with their enforcement "should be given deference by the courts." *Abbott v. Bd. of County Comm'rs,* 895 P.2d at 1167. When a regulation is clear and unambiguous, it should be construed as written so as to carry

out the intent of the legislative body; however, "[i]f the language of an administrative rule is ambiguous or unclear, [the court] give[s] great deference to an agency's interpretation of a rule it is charged with enforcing, and its interpretation will be accepted if it has a reasonable basis in law and is warranted by the record." *Sierra Club v. Billingsley,* 166 P.3d 309, 312 (Colo. App. 2007). "Administrative interpretations are most helpful when the subject involved calls for the exercise of technical expertise or when the statutory language is susceptible of more than one reasonable interpretation." *Id.* "Generally, a reviewing court should defer to the construction of a statute by the administrative officials charged with its enforcement. If there is a reasonable basis for an administrative board's interpretation of the law, [the reviewing court] may not set aside the board's decision." *Lieb v. Trimble,* 183 P.3d 702, 704 (Colo. App. 2008); *see also Langer v. Board of County Commissioners of Larimer County,* 2020 CO 31, ___ P.3d ___ (…[I]ndeed we might have reached a different conclusion than the BOCC were we deciding this case in the first instance, under our applicable standard of review, we do not do so.").

b. Remedy. Thornton requests the court, in lieu of remanding to the Board, reweigh the evidence, substitute its judgment for that of the Board, and order the Board to issue a 1041 permit. Such relief is not available. As explained above, the purpose of a C.R.C.P. 106 action is to review the record and determine if the lower body abused its discretion or exceeded its jurisdiction. The sole remedy for an abuse of discretion or act in excess of jurisdiction is a remand for further proceedings: "Once a court finds that an administrative body has abused its discretion, how to address the deficiency on remand is within the discretion of the administrative body." *Wolf Creek Ski Corp. v. Bd. Of County Com'rs of Mineral County*, 170 P.3d 821, 831 (Colo. App. 2007).

c. 1041 Overview. The intent of Colorado's Land Use Act is the protection, utility, value and future of all private and public lands. §24-65.1-101(1), Colo. Rev. Stat. The Act identifies

land use, planning, and the quality of development as matters of state responsibility for the health, welfare, safety and protection of Colorado's environment. *Id.* To accomplish these objectives the Act designates specific development activities as matters of state responsibility and authorizes local governments to supervise such activities through local regulations. *Denver v. Grand County*; at 755; §24-65.1-101(2), Colo. Rev. Stat. This dual regulation by the state and local government is deemed necessary because the designated development activities may impact the people of Colorado beyond the immediate scope of the project. *Denver v. Grand County*; at 755.

The siting and construction of a Domestic Water System, which includes water pipelines[1], is identified as an activity of state interest for which local governments may designate for local regulation. §24-65.1-203(1)(a), Colo. Rev. Stat. The criteria for administering the siting and construction of a Domestic Water System is provided in §24-65.1-204(1), C.R.S., which requires such systems properly utilize existing treatment plants and orderly develop with water systems of adjacent communities. The Board has designated site selection and construction of new domestic water pipelines that are within new permanent easements greater than 30 feet[2] as an activity of state interest and adopted regulations therefore (1041 Regulations). Larimer County Land Use Code, §§ 14.0; 14.4(J). The 1041 Regulations require those who want to construct new domestic water pipelines in Larimer County to apply for and obtain a 1041 permit (1041 Permit). Larimer County Land Use Code, § 14.9(A). To be issued a 1041 Permit the applicant must complete certain procedural steps and demonstrate at a public hearing before the Board that the project satisfies the permit review criteria. Larimer County Land Use Code, §§ 14.9(B), 14.10. The review criteria for

[1] Per § 24-65.1-104(5), Colo. Rev. Stat., Domestic Water System includes a Water Distribution System as defined in § 25-9-102(6), Colo. Rev. Stat., which includes any combination of pipes, tanks, pumps or other facilities that deliver water from a source or treatment to the consumer.
[2] It is undisputed that Thornton's water pipeline proposes new permanent easements greater than 30 feet. Opening Brief, pp 4, 18.

approval of a 1041 permit are as follows:

1. The proposal is consistent with the master plan and applicable intergovernmental agreements affecting land use and development.

2. The applicant has presented reasonable siting and design alternatives or explained why no reasonable alternatives are available.

3. The proposal conforms with adopted county standards, review criteria and mitigation requirements concerning environmental impacts, including but not limited to those contained in this Code.

4. The proposal will not have a significant adverse affect [sic] on or will adequately mitigate significant adverse affects [sic] on the land or its natural resources, on which the proposal is situated and on lands adjacent to the proposal.

5. The proposal will not adversely affect any sites and structures listed on the State or National Registers of Historic Places.

6. The proposal will not negatively impact public health and safety.

7. The proposal will not be subject to significant risk from natural hazards including floods, wildfire or geologic hazards.

8. Adequate public facilities and services are available for the proposal or will be provided by the applicant, and the proposal will not have a significant adverse effect on the capability of local government to provide services or exceed the capacity of service delivery systems.

9. The applicant will mitigate any construction impacts to county roads, bridges and related facilities. Construction access will be re-graded and re-vegetated to minimize environmental impacts.

10. The benefits of the proposed development outweigh the losses of any natural resources or reduction of productivity of agricultural lands as a result of the proposed development.

11. The proposal demonstrates a reasonable balance between the costs to the applicant to mitigate significant adverse affects [sic] and the benefits achieved by such mitigation.

12. The recommendations of staff and referral agencies have been addressed to the satisfaction of the county commissioners.

Larimer County Land Use Code, §§ 14.10(D).

Following a hearing on a 1041 permit application, "[t]he local government may approve an application for a permit to conduct an activity of state interest if the proposed activity complies with the local government's regulations and guidelines for conduct of such activity. If the proposed activity does not comply with the guidelines and regulations, the permit shall be denied." §24-65.1-501(4), Colo. Rev. Stat. The denial of a 1041 permit by a local government is subject to judicial review in the district court for the judicial district in which the activity is to occur. §24-65.1-502, Colo. Rev. Stat.

III. STATEMENT OF FACTS

Thornton's description of the course of proceedings is largely undisputed and follows the Procedural History laid out by the Board in its Findings and Resolution. In places Thornton sets out some facts and characterizes others in ways with which the Board disagrees. For example, in describing the alternative pipeline routes it considered, Thornton frequently references four "reasonable" routes. Use of the word "reasonable" is a qualitative description, not a statement of fact. The Board appreciates the clear distinction between fact and argument, and therefore generally disputes all argumentative/qualitative descriptors within Thornton's recitation of facts. Otherwise, the Board provides the following limited factual disputes and supplemental facts:

a. The Board disputes Thornton's statements that the Board considered and rejected four pipeline routes. Thornton's initial application presented to the Board for decision a single "preferred route" for which it sought a 1041 permit (the Douglas Road Route). R0007-0008, 7234:4-6.[3] During the course of proceedings Thornton submitted a third supplement to its application identifying a different—but singular—preferred pipeline

[3] References to the quasi-judicial record are to the Third Amended Certified Record filed on January 10, 2020. Citations to the record are "R" followed by the page number (i.e. R8067). When citing to a transcript, the specific line will be referenced after the page number (i.e. R8015:20).

route that uses County Road 56 (the CR 56 Route). R2032-2035, 4967, 7537:23-7539:3. The other routes referenced in Thornton's application materials were alternatives it considered but did not advance to the Board. R2032-2035. The Board's Findings and Resolution addresses the two preferred routes presented by Thornton—the Douglas Road and CR 56 Routes—and measured them against the applicable 1041 permit criteria. R6827-6869.

b. The Board disputes Thornton's assertion that the proceedings were continued on August 1, 2018 "without any specific guidance." Opening Brief, p 5. The transcript shows a lengthy discussion by the Board about the need and purpose for continuing the hearing. Specifically, Commissioner Donnelly commented that additional information was needed about mitigating traffic impacts on the roads under construction and alternative routes that will see increased traffic. R7499:5-7500:21. Commissioner Gaiter stated he was not convinced Thornton had presented reasonable siting and design alternatives as required by the 1041 review criteria, and more information about alternative routes needed to be discussed with people living along those routes. R7503:22-7504:3, 7508:8-7509:12-21. Commissioner Johnson echoed the comments of the other Commissioners and highlighted the need for more information about the alternative routes that were considered by Thornton. R7518:5-24. Commissioner Johnson also reviewed the Land Use Code's reference to continuation of 1041 permit proceedings if additional information is needed to determine if the approval criteria are met. R7519:14, 7521:13-20. When the hearing resumed on December 17, 2018, Thornton confirmed its understanding of the purpose for the continuance with the following statement:

> You provided direction that Thornton needed to provide the specific additional information as discussed by the Board of County Commissioners, and then you directed Larimer County staff to

> involve the public in the information gathering process through public meetings or public open houses. We heard loud and clear that communication was a concern for you, and that further opportunities for your residents to communicate their interests was needed. We understand that communication is about listening as much or more than it is about talking or providing information. Thornton took your direction to heart and we dedicated additional resources to the public outreach effort you asked for. We had a team of Communication Professionals at all of the working group meetings and at all of the public meetings. And we listened and gathered information from those speaking at the events and those that chose to speak with us directly at those events. Thornton believes firmly that this process was beneficial and included a great deal of wisdom to undertake. The information we gathered and evaluated from the outreach efforts you directed indeed led us to what we believe is a better preferred route for our project and for Larimer County. R7573:4-7574:3.

c. Within its recitation of facts Thornton frames the Board's decision as consisting of only a few oral statements by individual Commissioners during deliberation and argues the Board's decision is limited to what was said during deliberation rather what is in the Findings and Resolution. Opening Brief, p 16-17. The Board's deliberation should be considered in its entirety rather than only select soundbites. The transcript reflects the entire deliberation and is in the record at Vol. 7(e), pp 8067:7-8082:20. Further, with respect to Thornton's argument that the written Findings and Resolution does not count, the Board's responsive argument is in Section V(d) below.

IV. ARGUMENT

a. Whether the Board's decision infringes on Thornton's water rights and authority to construct water projects and to condemn property.

Thornton asserts Larimer County's 1041 authority impermissibly infringes on the terms of its water decree and authority to construct water projects and condemn property. Specifically, Thornton argues its water decree "requires and entitles Thornton, as a matter of law, to install a

water pipeline to deliver its water to Thornton" and the Board "must choose one of the four reasonable routes Thornton presented and saying 'no' to all four amounted to unlawful interference with Thornton's powers to construct a water pipeline across Larimer County." Opening Brief, pp. 13, 25.

Similar arguments were rejected by the Colorado Supreme Court in *City and County of Denver By and Through Board of Water Com'rs v. Board of County Com'rs of Grand County*, 782 P.2 753, 761-765 (Colo. 1989). In that case, Denver argued 1041 regulations infringe on its governmental powers to, *inter alia*, construct, operate and condemn for water projects. *Id.* at 762. The Court rejected this argument after finding 1041 statutes confer the power to regulate not prohibit, and Denver's condemnation and utility powers "do not prevent other local governments from regulating the activities…" *Id.*

In *Denver v. Grand County*, Denver also argued it should not be subject to 1041 regulations because its water project was necessary to implement its established water rights. *Id.* at 756, 764. In rejecting this argument, the Court noted that Denver's established water rights did not give it a blanket exemption from 1041 regulation, and such a reading would ignore the plain language in the 1041 statutes that subject water projects to regulation. *Id.* at 764-765. The Court recognized that local government regulation is valid even when it impacts established water rights, so long as such rights are not undermined. *Id.* at 765.

The Board has not required Thornton forgo any water rights or its authority to construct water projects and to condemn property. Further, the Board has not mandated or excluded any specific diversion point for Thornton's water and has not required any particular route of conveyance. Nothing prohibits Thornton from returning to the Board with a revised proposal for the pipeline that better addresses the unmet criteria.

Thornton speculates that the Board's decision disapproving the Douglas Road and CR 56 Route proposals was an attempt to force Thornton to convey its water via the Poudre River. The record shows that the Board was fully aware that the project was a proposed pipeline. "The Board is cognizant that it may not deny Thornton the use and benefit of its water right and that the Board's authority is limited to approving the siting and development of pipelines." R6839. Further, the Planning Staff informed all that the Board's authority was to decide the siting and development of a water pipeline, not tamper with water rights. R4971, 7169:18-19 ("Its about a pipeline. It's not about where the water comes from or where the water is going to."). The Board's decision did not require or otherwise condition the conveyance of water using the Poudre River. True, Commissioner Johnson inquired about the so-called Shields Street alternative by referencing how Thornton staff had initially presented it to Thornton City Council as an option to consider and questioned if it was a reasonable alternative. R7514:5-20, 7784:18-25. That inquiry was the result, however, of Thornton initially proposing this alternative to its council. R7611:11-7612:11.

After reciting the basis for its eminent domain authority, Thornton asserts the Board was required to approve one of the proposed pipeline routes, and its failure to do so, impermissibly interfered with Thornton's condemnation power. Opening Brief, pp 12-13. Thornton argues its condemnation of private property is immaterial, should not have been a topic of discussion, and any findings by the Board that mention eminent domain are invalid. Opening Brief, pp. 59, 75. Public testimony included opposition to Thornton's possible taking of certain landowner's private property. R7022:4-6, 7420:6-9, 7856:20-7857:6, 7906:10-14, 7973:10-12, 7997:17-21. The Board appreciates that its citizens have private property rights and seeks to balance governmental power against those rights. The Board did not state, however, that it would approve no route that required Thornton to condemn private property. Thornton cannot be and was not precluded from using eminent domain.

It was not arbitrary or improper for the Board to express a preference for Thornton to use a route that prefers (not requires) pipes be installed in public right of way or other public property when feasible, rather than taking private property.

b. Whether there is any competent evidence to support the Board's decision that Thornton did not satisfy all 1041 permit criteria.

Thornton invites the Court to reweigh the evidence in the record and reach a different decision than the Board. In doing so, Thornton ignores the role of a reviewing court in a C.R.C.P. 106 proceeding, which is to search the record for any competent evidence in support of the Board's decision. *Ross v. Denver Dep't of Health and Hosp.*, 883 P.2d 775, 778 (Colo. App. 1994) (citing *Sundance Hills Homeowners Assoc. v. Bd. of County Comm'rs*, 534 P.2d 1212, 1216 (Colo. 1975)). The number of revisions to Thornton's plan, the number of public hearings, and the evidence in favor of granting Thornton's permit are not relevant.

The Board found Thornton's application failed to satisfy seven of the twelve review criteria. R6831-6839. Pursuant to §14.10(B) of the Larimer County Land Use Code, a 1041 permit application must satisfy all review criteria to be approved. R6892. If the Court finds record support for any single criterion not being satisfied, it need not review any remaining criteria because denial is required even if only one criterion is unmet.

The record in this proceeding is vast, consisting of over 8,000 pages. With respect to the Board's decision that seven criteria were not satisfied, the record includes the following examples of competent supportive evidence:

i. Criterion 14.10(D)(1)[4] *The proposal is consistent with the master plan and applicable*

[4] The 1041 review criteria are in Section 14.10(D) of the Larimer County Land Use Code which can be found in the Record at R6892.

intergovernmental agreements affecting land use and development.

In finding this criterion was not met the Board summarized relevant principles from Larimer County's Master Plan such as settlement patterns that protect existing neighborhoods; a fair, open and predictable land planning and development process that does not infringe on the rights of individuals; and preservation of agricultural as a viable and valued economic, cultural and social resource. R6831-6832; 8103-8105. Thornton's pipeline is proposed to be constructed in a yet-to-be-determined spot within a corridor of 500' to ¼ mile wide in places. R0006, 6934:11-14; 7070:23-7071:13; 1223-1224. This vast corridor, the Board found, unreasonably limited the ability to assess specific impacts to existing neighborhoods and on the property rights of those living along the corridor. R6829-6836. This uncertainty interferes with the Master Plan's goal of a fair and predictable development process because property owners must speculate about the impacts on their property. The record has the following competent evidence in support of the Board's finding that the proposed 500' + corridor fails to meet the Master Plan principles of protecting existing neighborhoods, and fair and predictable development that does not infringe on individual rights:

1. Testimony from a farmer who explained the 500' corridor covers essentially his entire 40-acre farm and Thornton's proposal "is not a specific plan, and this map [of the pipeline] doesn't show the route." R7908:3-11.

2. Testimony from a representative of 12 property owners along the corridor who explained their confusion about where the pipe would actually go; changes in the preferred route with the most current depiction running the pipe potentially between a home and barn; an undetermined route through a 100-acre area

with three separate owners; and a 35-acre parcel within the corridor that the pipeline will cut across, which may limit buildable area beyond current limitations due to existing wetlands. R7853:12-7856:8.

3. Testimony about uncertainties for the redundant power source for the pumphouse, such as whether it will require additional power lines or new substations. R7960:21-7961:1.

4. Testimony questioning the reasonableness of Thornton's proposal because it is "replete with qualifiers like 'may,' 'could,' and 'up to,'…" rather than concrete terms. R7973:18-20.

5. Testimony that "[t]he description of the pipeline route is currently very vague. If [the Board] approves it as it is currently written, Thornton will assume that they can place the pipeline wherever they want in that corridor, irrespective of how it harms the landowner, and [the Board would] have stripped the landowner of any negotiating ability." R7981:18-24.

6. Testimony from a citizen who explained: "[m]y concerns for the Thornton water pipeline lie in the fact that so much of Thornton's water project is undefined, unknown, unavailable. According to Thornton's water project website, detailed designs for the water pipeline have not been completed. The details of the construction of the pipeline are not yet known. The design of the source water pump station is not finalized…everything involved in this project should be much more clearly and specifically defined before approval of the 1041 application is granted…." R7345:8-7346:1.

7. A representative of a home owners association for a neighborhood

on the east side of I-25 along Thornton's proposed CR 56 Route testified that approval of the ¼ mile wide corridor leads to speculation about whether trees, structures or other improvements on their private property would be injured by the chosen location of the pipeline. R7864:13-16.

8. Findings of different Planning Commission members concerned about the lack of a specific pipeline location: "I don't understand how people that are along this pipeline corridor are going to understand their [sic] impact to them without having much more specificity…" (R7105:8-20); "we're trying to talk about affecting private properties and property rights and citizens and to not have that information doesn't —I mean, that makes it really hard for me to see how they're going to be affected" (R7072:11-15); and "The lack of specificity in some of this, which I think could have been addressed to allay some of the concerns of the neighbors and of Larimer County as a whole were not done and so I really don't think that this is complete as it should have been and I would not support passing this at this time." (R7103:19-24).

9. Testimony about the Master Plan purposes of maintaining quality of life and fundamental fairness, and compatibility of new development with existing uses. R7262:5-8; 7272:13-20.

The above competent evidence supports the Board's decision that Thornton's proposal does not satisfy the Master Plan principles of protecting existing neighborhoods and fair and predictable land development that respects individual rights.

With respect to the Master Plan principle to preserve viable agricultural in Larimer County, the Board found "it [is] important to have information about and consider the

cumulative impacts of irrigated farmland turning to dryland. A significant reduction in the amount of irrigated farmland is concerning to the Board and conflicts with the goals of the Master Plan. The long-term viability of Larimer County's agricultural communities, and the economic, cultural and environmental impacts of drying up irrigated farmland are valid considerations under the Master Plan. As these impacts are not adequately described or analyzed by Thornton, the Board cannot conclude that Thornton's proposal is consistent with the Master Plan." R6833. In support of these findings, the record show that over time Thornton has purchased about 20,000 acres of irrigated farmland in northern Colorado, of which eight farms totaling 1,509 irrigated acres are in Larimer County. R7640:23-7641:8; 7759:11-14. Thornton has already dried up three of these eight farms, turning the irrigated acreage into native grasses. R7759:19-21. Thornton does not provide any supplemental irrigation on farms that it has dried up. R7764:1-2. Thornton's other five farms continue to be used for irrigated agriculture and are described by Thornton as "very good producing farms, and they're important parts of—that farmers that farm these properties of their overall business." R7759:24-25, 7768:1-4.

The water for Thornton's irrigated agricultural acreage flows through the Water Supply and Storage Company (WSSC) canal system in which Thornton owns 289 of the 401 municipal use water shares. R7924:4-12. The 401 municipal water shares represent 2/3 of all water shares in WSSC, and all but 21 of the 401 municipal shares remain currently used for agricultural irrigation. R7924:4-8. But, as WSSC testified, the agricultural use of municipal shares is changing, presumably as they are pulled from agricultural use for municipal use. R7924:7-8. Thornton's plan is to begin drying up its irrigated acreage in 2030, starting with two farms it refers to as the "I-25 farms.". R7767:24-7768:6. WSSC

testified that as Thornton and other municipalities divert their water shares for municipal use "it's going to be a struggle for us to be able to take care of all of rest of those farms for…as long as they want to keep farming, because the total amount of water in the [WSSC] system, obviously is going to be dropping." R7934:13-24.

This sample of competent evidence in the record supports the Board's finding that Thornton's proposal, in its current form, is inconsistent with the Master Plan principle of preserving agriculture as a viable long-term segment of Larimer County's economic, cultural and social fabric. The irrigated farms described by Thornton as "very good producing farms" that are important to the overall business of the farmers who farm them, are going to be dried up in the coming years. R7759:24-25, 7768:1-4. That impact has not been evaluated by Thornton. And, as WSSC testified, Thornton is one of many municipalities who have converted water shares in Larimer County from agricultural to municipal use. Currently, the vast majority of those converted shares—380 of 401 shares—are still used for agriculture, but that is changing. R7924:5-8. The Board is justified in questioning the significance of this change within the scope of Thornton's pipeline project—the pipeline is the conduit that will enable Thornton to implement this change. The Board understands that it cannot prohibit Thornton from using its water for municipal purposes, but without an analysis of impact on the agricultural fabric of Larimer County, the Board found Thornton's project was not consistent with the applicable Master Plan principles.

After arguing the weight of the evidence, Thornton turns to the validity of the Board's reliance on provisions in the Master Plan. In *Board of County Commissioners of Larimer County v. Condor,* the Colorado Supreme Court confirmed that master plan provisions are regulatory (rather than advisory only) when the master plan is adopted within land use

regulations and its provisions are sufficiently clear. *Bd. of Cty. Comm'rs v. Conder*, 927 P.2d 1339, 1350-1351 (Colo. 1996). While not expressly stated, it appears Thornton concedes that the Master Plan is regulatory rather than merely advisory. To be clear on this point, in *Condor* the Court concluded that Larimer County's Master Plan was regulatory rather than advisory because subdivision regulations incorporated the Master Plan through statements such as "[t]he Board of County Commissioners shall use the Master Plan as a guideline in the evaluation of each development proposal." *Id.* at 1346. Here, Larimer County's 1041 regulations similarly mandate compliance with the Master Plan in Section 14.10(D)(1) by requiring the applicant show "[t]he proposal is consistent with the master plan…" R6892.

As mentioned above, the Court in *Condor* explained that regulatory master plan provisions must be sufficiently clear to ensure application will be rational and consistent and allow for judicial review. *Id.* at 1348. In evaluating for such clarity, the *Condor* Court explained that flexibility should not be undercut, and broad master plan provisions requiring "[c]ompatibility with the surrounding area" and "[h]armony with the character of the neighborhood" are sufficient when applied in conjunction with more specific criteria. *Id.* Using this measure, the record shows the Board relied on specific Master Plan principals as outlined in its Findings and Resolution such as development patterns that protect existing neighborhoods, a fair, open and predictable land planning and development process that does not infringe on the rights of individuals, and preservation of agriculture as a viable and valued economic, cultural, and social resource in Larimer County. R6831-6832. The provisions are clearly spelled out in the Master Plan as follows:

1. Master Plan §1.5, TH-3 "**Agriculture will remain a viable long-term segment of Larimer County's economic, cultural and social fabric.**"

R8103.

2. Master Plan §2,7, GM-8 "**Agriculture shall be recognized as an important economic, cultural and environmental resource value-provider for the County."**

3. Master Plan §1.5, TH-4 "**The Master Plan shall support logical settlement patterns that reflect the character of the Open West, i.e. the existing character of Larimer County, and protect existing neighborhoods.** Proposed uses shall be compatible with adjacent uses and help create sustainable communities. Performance standards shall be used to protect existing uses from adverse impacts to ensure that new uses are 'good neighbors.'…" R8103.

4. Master Plan §1.5, TH-13 "**The planning and development review process shall be fair, open and predictable, and meet the needs and interest of the community without infringing on the rights of individuals.**" R8105.

5. Master Plan §4.3, PF-8 "**The location and design of new public facilities shall be consistent with the Master Plan.**" R8145.

6. Master Plan §6.1.3 "**Cumulative Impacts**" explains the need to consider cumulative impacts from development, including temporal and spatial. R8155.

The Master Plan principals relied on by the Board are sufficiently clear to allow for rational and consistent application, as was done by the Board here. As explained above, these Master Plan principals were evaluated against specific attributes of Thornton's proposal such as its 500' to ¼ mile wide corridor, and the conversion of irrigated agricultural acreage into dryland that will result from the project.

ii. Criterion 14.10(D)(2) *The applicant has presented reasonable siting and design alternatives or explained why no reasonable alternatives are available.*

The Board found this criterion was not met because the two routes proposed by Thornton identified large corridors of 500' or more which made evaluation of the pipeline siting unreasonably imprecise. R6833-6834. The Board also found the impacts of the pipeline could vary significantly depending on where within the corridor the pipeline is physically located. R6833-6834. The lack of a specific location for the pipeline and the inability to assess specific impacts led the Board to conclude that reasonable alternative routes were not presented. R6834. Further, the Board found that Thornton had internally considered and rejected many siting alternatives, but only presented two options to the Board. R6834.

The record shows the two routes proposed by Thornton had 500' to ¼ mile wide corridors within which the pipeline would be located. R6934:11-14; 7070:23-7071:13; 1223-1224. The physical location of the pipeline was not identified, which elicited substantial testimony from property owners who were frustrated that they could not determine the specific impacts on their properties. Without knowing the physical location of the pipeline, the Board found Thornton's two proposed routes did not present reasonable alternatives. Testimony in support of this finding is referenced in this Answer Brief in Sections V(b)(1)-(9) above, which is incorporated by reference rather than repeated here. In addition, the following testimony supports the Board's decision:

1. Planning Commission member found that Thornton did not present reasonable alternative routes because the project "was really looked [at] purely from Thornton's position." This member also commented about her experience with a

pipeline project where the location of the pipe "was very clear all along the pipeline…" R7104:24-7105:17.

2. Testimony summarizing Thornton's presentation of routes that were not really reasonable alternatives because Thornton had already ruled them out: "Thornton would like to say, well, we've presented reasonable alternatives. But in the next breath they say, but they're unreasonable." R7822:14-16.

3. Testimony from Thornton that it narrowed down 10 possible routes for the pipeline to a single route, and then started public outreach for that singular route. R7233:8-7234:8. Thornton further testified it created its own criteria for evaluating route alternatives and different location options for the pumphouse. R7205:3-14.

4. Testimony that during the community open house/working group meetings to evaluate routing options "Thornton at no time took any interest whatsoever in considering any route by the pipeline off of Douglas or County Road 56. In fact, throughout the working group, Thornton never showed themselves to be open to any viable alternatives." R7891:1-16.

While Thornton internally vetted many potential routes, it unilaterally deemed most were impractical and only presented two routes to the Board. The Board found Thornton's self-evaluation of alternative routes was insufficient to satisfy Thornton's obligation to present reasonable alternatives to the Board. R6834. That finding is supported by competent evidence and should be affirmed.

With respect to reasonable design alternatives, the Board found that Thornton identified tunneling and boring as the methods for constructing the pipeline as it goes north

by WSSC reservoirs No.3 and No.4. R6834. Robin Dornfest, an engineer with over 18 years of experience in geologic and geotechnical engineering with a main focus on pipeline infrastructure, was hired by the County to evaluate the use of a lake tap as a possible alternative to installing the pipe around the perimeter of the reservoirs. R1476-1479, 4757. Mr. Dornfest noted that lake taps are more expensive and have inherent risks but are becoming more common in water storage and conveyance projects. R1479, 4759-4760. Reasons to consider a tunnel/lake tap rather than digging a trench, per Mr. Dornfest, are to minimize impacts to third parties and avoid impacts to infrastructure and environmentally sensitive areas. R4759. Mr. Dornfest found nothing about Thornton's project that would preclude the use of lake taps as Thornton itself had initially contemplated. R4760. Mr. Dornfest also concluded there "is room for optimization for each lake tap option. Further development of the lake tap options could include shortening tunnel lengths, conducting geotechnical investigations, refining tunnel and shaft designs, and refining the intake riser design." R4760.

The Board found the potential use of lake taps may mitigate significant impacts on established neighborhoods around reservoirs, such as the Braidwood and Eagle Lake neighborhoods. R6836. The Board does not dispute that lake taps cost more and have some inherent risks, but Thornton dismisses them as even an option to evaluate because they do not believe they are warranted. Thornton's Opening Brief criticizes Mr. Dornfest's comments as a "superficial opinion of an engineer…who admitted that more information was needed…" Opening Brief, p. 53. The Board agrees that more information about the reasonableness and viability of lake taps is needed. Commissioner Gaiter asked County staff during the August 1, 2018 hearing whether a lake tap is feasible without resorting to the

"draconian measure" mentioned by Thornton. R7495:6-9. County staff responded that technical experts would need to get involved to evaluate the options because "we don't have that information available to us at this time." R7495:10-13. It could be that a lake tap is not a reasonable alternative design, but the Board is not required to take Thornton's word on that point.

iii. Criterion 14.10(D)(3) *The proposal conforms with adopted county standards, review criteria and mitigation requirements concerning environmental impacts, including but not limited to those contained in Section 8 of this Code.*

This criterion requires the proposal conform with development criteria in Section 8 of the Larimer County Land Use Code. The Board found Thornton's proposal did not meet two of the applicable Section 8 criteria: Section 8.4 Wildlife and Section 8.8 Irrigation Facilities.[5] R6834-6835.

With respect to Section 8.4 Wildlife, County staff noted the environmental analysis identified possible conflicts with wildlife. R7180. The Board heard testimony with general concern about the potential removal of established trees in the area that are used for nesting and perching by raptors (R7444:13-17); disruption of rattlesnake dens and osprey nesting sites that could occur given the ¼ mile wide corridor identified as Thornton's proposed route (R7865:15-25); disruption of hawks, ospreys and other federally protected raptors that live along the reservoirs in Thornton's pipeline corridor (R7958:4-7); and displacement of wildlife that use the property proposed for Thornton's pumphouse (R7887:15-25).

With respect to Section 8.8 Irrigation Facilities, County staff testified many irrigation ditches will need to be crossed, some more than once. R7180. With respect to the Douglas

[5] The Board's argument addresses only the Section 8 criterion that it found were not met.

Road Route, the already lengthy construction period could be extended for yet unknown delays related to, among other things, permits to cut across ditches. R4758. The Board found it prudent to consider alternatives that reduce these impacts involving ditch crossings. R6835.

iv. Criterion 14.10(D)(4) *The proposal will not have a significant adverse affect (sic) on or will adequately mitigate significant adverse affects (sic) on the land on which the proposal is situated and on lands adjacent to the proposal.*

As a preliminary matter, Thornton's argument with respect to this criterion is founded on its belief that only "permanent" effects from its project count. Opening Brief, p 47-48. In evaluating this criterion, the Board applied it as written. A significant amount of testimony addressed long and short-term adverse impacts from Thornton's project, and Thornton's application and presentation similarly addressed temporary and permanent impacts. There is simply no basis on which to now, on judicial review, stray from the express language in the criterion by looking only at "permanent" impacts. When a regulation is clear and unambiguous, it should be construed as written so as to carry out the intent of the legislative body; however, "[i]f the language of an administrative rule is ambiguous or unclear, [the court] give[s] great deference to an agency's interpretation of a rule it is charged with enforcing, and its interpretation will be accepted if it has a reasonable basis in law and is warranted by the record." *Sierra Club v. Billingsley,* 166 P.3d 309, 312 (Colo. App. 2007).

The Board found Thornton's proposal will have a significant adverse effect on the land on which the pipeline will be constructed and on adjacent lands. R6835-6836. The Board specifically highlighted an unreasonably long construction cycle that will cause significant impacts on those along the route; traffic intersections that will perform at

unacceptable levels with the addition of traffic from those avoiding construction areas; impacts on private property where the pipeline will go through neighborhoods and areas with limited public right of way; and impacts caused by the uncertainty of the physical location of the pipeline and future pipelines contemplated by Thornton's long-range water plans. R6835-6836. In support of these findings the record has the following:

1. Testimony about the negative visual, noise and quality of life impacts of the pumphouse being located within a residential area where sound travels, and replacing what is currently open fields, trees, wildlife, peace and quiet. R7887:15-25, 7883:20-15, 7301:18-25, 7953:13-7954:4, 8013:1-8014:14.

2. Testimony about a narrow and dead-end residential dirt road only 10-15 feet wide that is a possible location for the pipeline; and concerns about existing foundation and structural problems being exacerbated by installation of the pipeline. R7885:18-15. This person also testified that the use of his residential street as a possible location for the pipeline had not been discussed with him and was mentioned for the first time during the hearings on the application. R7885:18-21.

3. Testimony about how the pipeline will introduce commercial features like large breather tubes, inspection ports, manhole covers, and a 48" pipe into his residential neighborhood and injure quality of life and property values. R7956:1-17.

4. Testimony from a resident who currently has two pipelines on his property that have ongoing impacts. R7972:8-10.

5. Testimony about the proposed pipeline bifurcating a home and barn. R7854:24-7855:5.

6. Testimony about a vacant investment parcel within Thornton's

corridor that has wetlands and limited building area that will be negatively impacted by installation of a pipe. R7859:1-12.

7. Testimony about disruption of rattlesnake dens within Thornton's corridor that may drive the snakes into the neighboring residential area. R7865:21-25.

8. Testimony that pipeline projects in addition to Thornton's are in the works and there is no evaluation on the cumulative impacts of multiple pipelines traversing Larimer County from west to east, which could subject the area to repeat impacts over many years. R7948:9-16, 7832:8-13, 7314:11-7315:18, 7337:7-11, 7441:14-7442:15.

9. Testimony that the pipeline, even in concept, has negatively affected the marketability and value of property in the area. R7852:7-13; 7909:14-19; 803:11-17.

10. Testimony that road construction for the project may last two years, and the traffic impacts will be significant and unacceptable. R7195:5-24, 7344:11-16, 7405:8-25, 7420:24-7421:11, 7439:17-7440:2.

11. Testimony from the owner of an assisted living facility located along the Douglas Road Route with residents an average age of 90 years old who will be significantly impacted by a lengthy construction period. R7354:24-7356:8.

12. Testimony from Thornton that less than 50% of the pipe to be installed for the CR 56 Route will be within road rights of way. R7807:8-22.

13. Testimony, as cited in Section IV(b)(i)(1)-(9) above, about the impacts of uncertainty about the actual physical location of the pipeline given the

imprecise corridors proposed by Thornton.

14. Testimony about the uncertainty of Thornton's proposed pipeline route, specifically that the initial part of the CR 56 Route would travel north from a pumphouse located "somewhere" below Reservoir No. 4, and "either" go through residential lots in the Braidwood neighborhood or along the residential subdivision road Lake Vista Drive. R7724:21-7725:3.

The above evidence in the record supports the Board's finding that the Douglas Road and CR 56 Routes, as proposed, would have significant adverse impacts to the property in the area.

Thornton next argues the Board "never stated that the corridor approach was unacceptable, and thereby waived this objection." Opening Brief, p 54. In support, Thornton cites *Crawford v. Mcaughlin*, 473 P.2d 725 (Colo. 1970), however that case addresses facts that are not present here. In *Crawford*, the Court outlined the doctrine of equitable estoppel and explained where a building permit is issued and relied on by a property owner, a property right vests and the local government may be estopped from contesting the validity of the permit after the fact. *Id.* at 731. Here, no aspect of Thornton's project has been approved and it has no vested right to construct its pipeline project. Further, the Board's concern with the uncertainty of Thornton's 500' to ¼ mile wide corridor arose during the hearing on the application based on testimony from concerned property owners. Shortly thereafter the Board's concern with the breadth of the corridor was communicated to Thornton and the public in the Findings and Resolution.

v. Criterion 14.10(D)(6) *The proposal will not negatively impact public health and safety.*

The Board found this criterion was not met because Thornton's proposal includes a lengthy construction cycle that may delay (not prevent) emergency services. R6837. In support of these findings the record shows testimony that there are a significant number of single-entrance residences where delayed emergency services could be problematic. R7006:23-7007:4, R7023:11-14.

vi. Criterion 14.10(D)(10) *The benefits of the proposed development outweigh the losses of any natural resources or reduction of productivity of agricultural lands as a result of the proposed development.*

The Board found Thornton's proposal will cause a significant reduction in the productivity of agricultural lands in Larimer County that outweighs the benefits of the development. R6838. More specifically, without further mitigation, the Board found the project will divert water from irrigated agricultural land and injure the agricultural segment in Larimer County. R6838. The record has the following competent support for these findings:

1. Since the 1980s, Thornton has purchased about 20,000 acres of irrigated farmland in northern Colorado, of which eight farms totaling 1,509 irrigated acres are in Larimer County. R7640:23-7641:8; 7759:11-14.

2. Thornton has already dried up three of these eight farms, turning the irrigated acreage into native grasses. R7759:19-21. Thornton does not provide any supplemental irrigation on farms that it has dried up. R7764:1-2.

3. Thornton's other five Larimer County farms continue to be used for irrigated agriculture and are described by Thornton as "very good producing farms, and they're important parts of – that farmers that farm these properties of their overall business." R7759:24-25, 7768:1-4.

4. The water for Thornton's irrigated agricultural acreage flows through the Water Supply and Storage Company (WSSC) canal system in which Thornton owns 289 of the 401 municipal use water shares. R7924:4-12.

5. The 401 municipal water shares represent 2/3 of all water shares in WSSC. R7924:4-8. Despite having been converted for municipal use, these water shares have continued to be used mostly for agricultural irrigation (all but 21 of the 401 municipal shares remain currently used for agricultural irrigation). R7924:4-8.

6. The historical agricultural use of the majority of WSSC water shares is changing as municipalities need the water for municipal purposes. R7924:7-8.

7. Thornton's plan is to begin drying up its irrigated agricultural acreage in 2030, starting with two farms it refers to as the "I-25 farms." R7767:24-7768:6.

8. WSSC testified that as Thornton and other municipalities divert their water shares for municipal use "it's going to be a struggle for us to be able to take care of all of rest of those farms for…as long as they want to keep farming, because the total amount of water in the [WSSC] system, obviously is going to be dropping." R7934:13-24.

Thornton's pipeline project will enable it to commence further removal of water from irrigated farmland in Larimer County. While Thornton's focus has been that its water decree authorizes such use, that was not the focus of the Board. It is the *impacts* of Thornton's removal of significant water from agricultural use in Larimer County that is relevant to the Board, not whether Thornton has secured the right to use its water for municipal purposes. The Board, relying on the above competent evidence, decided the conversion of significant irrigated farmland to non-irrigated dryland grass will reduce the

productivity of such agricultural lands that, without further mitigation, outweighs the benefits of Thornton's proposal.

In addition to re-weighing the evidence, Thornton argues the Board could only consider the physical impacts of installing the pipeline and therefore impacts on irrigated agriculture was outside the Board's authority. Opening Brief, p 63. First, Thornton's argument is based on an unreasonably narrow reading of the criterion. The criterion looks at the balance of benefits of the proposed development with its impacts on natural resources and the productivity of agricultural lands. There is no express or implied limitation that only physical impacts from digging a hole in the dirt can be considered. Further, Thornton's narrow interpretation conflicts with the purposes of 1041 regulations which are to manage land development impacts on the health, welfare, safety and protection of Colorado's environment and "to supervise land use which may have an impact on the people of Colorado beyond the immediate scope of the land use project." §24-65.1-101(1), Colo. Rev. Stat.; *City and County of Denver By and Through Board of Water Com'rs v. Board of County Com'rs of Grand County*, 782 P.2d 753, 755 (Colo. 1989).

vii. Criterion 14.10(D)(11) *The proposal demonstrates a reasonable balance between the costs to the applicant to mitigate significant adverse affects (sic) and the benefits achieved by such mitigation.*

The Board inquired about options that Thornton initially considered that involved a combination of pipes and use of the Poudre River to convey water to Thornton. Thornton testified it believes conveyance options that include the Poudre River would degrade the quality of water and cause loss through evaporation, and therefore these options did not advance past initial consideration. R7606:14-7613:7. Thornton also testified its water court decree requires diversion of its water from a specific point, WSSC Reservoir No. 4, and

therefore any conveyance option must abide by the water decree. R7597:21-25.

The record has contrary testimony from a water lawyer, Ryan Donovan, who opined Thornton's water decree allows for a change in the diversion point with certain agreements and notice to the Division Engineer, and providing such notice is relatively routine. R7379:1-7380:15. Thornton acknowledged a change to the water decree would be an option, albeit an unattractive one in its estimation. R7079:6-8. And further, Mr. Donovan testified there is no legal barrier to Thornton seeking changes to its water decree that would allow it to store its water in "new buckets" closer to Thornton that would significantly reduce the length of pipeline. R7017:14-7018:23.

The Board also heard testimony from attorney John Barth who referred to an expert report from Lisa Buchanan, LRB Hydrology & Analytics, which refutes Thornton's claim that water quality would be degraded if taken out downstream on the Poudre River. R7269:23-7270:4. The report from Ms. Buchanan is in the record at R8396-8432, and concludes that water taken from the Poudre River downstream and above the Mulberry Water Reclamation Plant would be at least as clean as the water taken from WSSC Reservoir No. 4. R8422. Further, Ms. Buchanan opined that even water taken below the reclamation plant would satisfy safe drinking water standards and recommendations more than 50% of the time without treatment, and otherwise would satisfy the standards with some treatment. R8422.

Thornton acknowledged that it currently treats its water at a treatment plan, and such water is similar in quality to what would be found in water that has traveled via the Poudre River through the City of Fort Collins. R7589:13-17. Thornton did not evaluate the cost of treating water withdrawn from downstream on the Poudre River, and could only venture a

guess of $10 million per year when asked by the Board to "spitball it" and "just guess." R75911-17.

To be clear, the Board did not find Thornton must withdraw its water from a location other than WSSC Reservoir No.4 or use the Poudre River as a means of conveyance. However, Thornton's project will have significant impacts as outlined in other sections of this Answer Brief, and the Board must evaluate the balance of costs to mitigate those impacts with the benefits of the mitigation. A cost/benefit analysis of mitigation steps proposed by citizens—namely involvement of the Poudre River—could not be performed because Thornton rejected such mitigation steps are even possible. There was conflicting evidence about the feasibility of Thornton's use of the Poudre River in any respect, and regardless of whether its diversion point remains at WSSC No. 4 as provided in Thornton's water decree. After considering the conflicting evidence, the Board concluded Thornton failed to satisfy the criteria requiring a balance of the costs to mitigate impacts with the benefits of achieved by such mitigation. R6839.

c. Whether the Board exceeded its jurisdiction by misapplying criterion 11 of the 1041 permit criteria.

Thornton argues that its pipeline project will have no adverse effects, only short-term temporary impacts. Opening Brief, p 66-67. This argument is premised on a faulty assumption that Thornton's proposal will not have any long term or permanent adverse impacts. As outlined elsewhere in this Answer Brief[6], there is competent evidence that Thornton's proposal will have substantial and permanent impacts in Larimer County. The Board's evaluation of the costs to mitigate those impacts with the benefit of the mitigation is not an exceedance of jurisdiction but

[6] Sections IV(b)(i); IV(b)(iv).

required by the 1041 permit review criteria.

d. Whether the Court's review includes the Board's written Findings and Resolution or is limited to the Board's verbal deliberation.

Thornton states (i) the Board's decision is limited to the verbal statements each Commissioner made at the close of the hearing on February 11, 2019; (ii) only those statements or reasons shared by two or more of the Commissioners (i.e. a majority) constitute the "decision" to be considered by the Court; and (iii) any facts, analyses, rationales, etc. verbally articulated by the Board must be set out in the written decision (Findings and Resolution), meaning the Court cannot consider anything in the Findings and Resolution that was not verbally stated when the Board announced its decision on February 11, 2019.

This position hoists Thornton on its own petard. To adopt Thornton's argument means the Board's decision was full and final at the conclusion of the hearing on February 11, 2019. Under this premise, the jurisdictional deadline for Thornton's Rule 106(a)(4) complaint was March 11, 2019 (28 days from the final decision pursuant to C.R.C.P. 106(b)). Thornton filed its complaint on April 16, 2019, far past this deadline, meaning the Court would have no jurisdiction over Thornton's Rule 106 claim. *3 Bar J. Homeowners Ass'n v. McMurry,* 967 P.2d 633, 634 (Colo. App. 1998) (the mandatory time period under C.R.C.P. 106(b) begin to run at the point of "administrative finality," which occurs when the "action complained of is complete, leaving nothing further for the agency to decide. The date of the public vote by the Board of County Commissioners, and not the date final plats were approved and recorded, was the point of administrative finality that triggered the 30-day time limitation."); *Park County v. Board of County Commissioners,* 969 P.2d 711 (Colo. App. 1998)(when a tribunal announces its decision in a quasi-judicial proceeding, a party seeking judicial review under Rule 106 must file the complaint within 30 days after the ruling is announced).

Contrary to its own arguments, Thornton recognized the Findings and Resolution as the final decision of the Board when it filed its Rule 106 complaint exactly 28 days from the date the Board signed its Findings and Resolution (March 19, 2019). R6840. Thornton takes no exception to the parts of the Findings and Resolution describing the course of events or that it met five of the twelve criteria, even though a majority of the board did not comment on any of those criteria at the conclusion of the hearing. Thornton cites to and otherwise relies on many parts of the Findings and Resolution that were not verbally discussed by the Board. Thornton cannot have it both ways.

Further, Section 12.4.3 of the Land Use Code sets out the order of proceedings for a public hearing. Step "G" states: "*Decision of board of or commissioners.* The board or commission makes its decision or recommendation to approve, approve with conditions or deny the application. The decision must be in writing." This makes clear that the commissioners will issue a written decision. The Board announces a decision verbally at the conclusion of the hearing in the interests of transparency and out of respect to the public who often have attended and listened to hours of testimony. The public deserves to know the outcome sooner than later. Moreover, this custom and practice is observed by other county commissioners in Colorado.

In *Wilson v. Bard of County Commissioners of Weld County,* 992 P.2d 668 (1999), the Board adopted a verbal resolution denying plaintiffs' requested permit at the conclusion of a public hearing. The decision was subsequently reflected in a written resolution that detailed its findings and conclusions. The Board's actions in entering the written resolution and later revising it demonstrates that the Board's verbal decision was not the final decision.[7]

[7] This Court addressed the issue of verbal pronouncements at the conclusion followed by a written decision in *Estes Valley Recreation and Park District v. Joshua Tobey, et.al,* Larimer county District Court Case No. 1955CV11918, Order Denying Motion to Dismiss (December 12, 2019) appended to this Brief as Exhibit "A".

Colorado courts have also variously addressed this practice within the judicial context. In *Koontz v. Rosener,* 787 P.2d 192 (1989), the court, at the conclusion of the trial, made remarks and opinions. The court then directed defendant's counsel to prepare written findings, conclusions, and judgment. Plaintiffs argued that because the court's written findings varied from those it announced earlier on the record in open court, the inconsistent written findings must be set aside. The Court rejected this argument: "A court's remarks or expressions of opinion made during or at the end of a trial are not necessarily formal findings of fact prepared as the basis for a judgment . . . . [T] findings that serve as the basis for the court's judgment are those it formally approved and adopted contemporaneously with the entry of judgment." Id. at 195

In *Jones v. Boyer,* 193 P. 568, 569 (Colo. 1920) the Court noted, "the judge, as judges often do, after the argument had been made, discussed the case at length but his remarks, as is usual in such cases, were informal and desultory, consisting mostly of comments on the evidence and the witnesses, and we cannot regard them as of the force of formal findings, prepared as a basis for a judgment; there is nothing to indicate that they were so regarded by the judge." *See also, In re Marriage of West,* 94 P.3d 1248, 1250 (Colo.App. 2004); *Rock Mountain Health Maintenance Organization, Inc. v. Colo. Dept. of Health Care Policy and Financing,* 54 P.3d 913, 918.

In addition, Thornton's assertion that the Board acted covertly in violation of the Colorado Open Meetings Act when it voted on and approved the written Findings and Resolution is wrong. The Findings and Resolution approval occurred at a duly advertised meeting open to the public on March 19, 2019. R008681. This meeting fully complied with the Open Meetings Act. Thornton confuses a public **hearing** where the Board takes testimony with an open **meeting** where the Board typically does not take testimony. Thornton had constructive, if not actual, notice of this open meeting and could have attended. Because the taking of testimony had closed just prior to the

Board's vote on February 11, 2019, it was not error for the Board to sign the written decision as part of the consent agenda at the open meeting on March 19, 2019. This action did not deny Thornton due process any more than a judge who issues his or her written decision after a trial has concluded.

Moreover, quasi-judicial decision makers are not required to express every fact and reason for their decision, and even the findings themselves can be implied. *Hudspeth v. Bd. of County Comm'rs*, 667 P.2d 775, 778 (Colo. App. 1983) ("The absence of express findings by a lay board does not affect the validity of the decision where the necessary findings are implicit in the action taken.") (citing *Sundance Hills Homeowners Assoc. v. Bd. of County Comm'rs*, 534 P.2d 1212, 1216 (Colo. 1975)). Since an administrative board's findings may be express or implied, its decision should be upheld if there is support in the record for the decision. *Ross v. Denver Dep't of Health and Hosp.*, 883 P.2d 516, 518 (Colo. Ct. App. 1994), *cert. denied* (1994). Where necessary, the reviewing court should search the record to uphold the board's decision, and should "hold, in the absence of an express finding . . ., that there is an implicit finding in the decision of these prerequisite facts when the state of the evidence is such as would warrant the making of such finding by the board." *Sundance*, 534 P.2d at 1216 (quotation marks omitted); *Colo. Office of Consumer Counsel v. Public Util. Comm.*, 786 P.2d 1086, 1091 (Colo. 1990). Thornton's argument that the Board's written Findings and Resolution should be ignored or discounted is inconsistent with the court's function of reviewing the entire record in search of credible evidence to support the Board's decision.

e. Whether Thornton can proceed under Location and Extent Review and disregard the Board's decision made pursuant to Larimer County's 1041 regulations.

At page 71 of the Opening Brief, Thornton states:

> Given the unique facts of this case, the Court should also revisit the ability of municipalities to rely on C.R.S. § 30-28-110(1)(c) and find that Thornton can overrule the BOCC's denial of its 1041 permit in

> this case. Under this provision, a municipality constructing a utility in another jurisdiction can override the planning commission's decision in the extraterritorial jurisdiction by a majority vote of the municipality's council.

The statute to which Thornton refers provides for what is commonly known as a "location and extent" review. It is a mechanism by which one governmental entity project is reviewed by another governmental entity in whose jurisdiction the project is to be constructed. The advisory review is performed by the local planning commission to determine if the project is in sync with the master plan of the hosting jurisdiction. The planning commission's decision may be overruled by the project entity's governing body. This perfunctory review does not apply, however, where a county has elected to adopt 1041 regulations which allow for a detailed review of the project and possibly denial. The allowance of a 1041 process by the General Assembly was a means to allow local governments more authority over large projects that could significantly impact them.

Thornton's attempt to distinguish *City of Colorado Springs v. Board of County Commissioners of Eagle*, 895 P.2d 1105 (Colo. App. 1994) is unavailing. The Court's decision did not turn on the voluntariness or involuntariness of the cities' agreement to follow Eagle County's 1041 regulation. That was dicta. The decision turned on the conclusion that the 1041 statute, though adopted before the location and extent statute (later statute controls principle), was more specific (specific controls over general principle). The Court's decision also recognized that the Colorado Supreme Court had decided years earlier that the location and extent statute did not exempt a municipality from complying with a county's 1041 regulations. *City & County of Denver v. Bd. of County Com'rs of Grand County,* 782 P.2d 753, 763-764 (Colo. 1989).

By its own admission, Thornton spent years, hundreds of man-hours and significant expense pursuing a 1041 permit. Those actions belie its new argument that the truly applicable process is a location and extent review. As such the argument rings hollow.

RESPONSE TO MOTION FOR DECLARATORY JUDGMENT

Thornton's Complaint includes twelve claims for relief, the first eleven of which seek judicial review under C.R.C.P. 106(a)(4) and are addressed by the Board in the Answer Brief above. The twelfth claim is brought for a declaratory judgment pursuant to §13-51-101 C.R.S. *et seq*., C.R.C.P. 57, and Colo. Const. Art. III. ("Rule 57 Claim"). This claim sets out four allegations:

> 182. Thornton incorporates into this claim for relief all of the allegations in the preceding paragraphs.
>
> 183. The Board misconstrued its criteria and the scope of its powers under the 1041 Act in denying Thornton's 1041 application.
>
> 184. Thornton is entitled to the Court's determinations and declarations that Thornton complied with the 1041 criteria. A ruling from the court will resolve a current dispute.
>
> 185. Thornton has no other plain, speedy and adequate remedy otherwise provided by law; therefore, Thornton is entitled to declaratory relief.
>
> Complaint, p 30.

As presented in its Complaint, Thornton's Rule 57 Claim is a reiteration of its Rule 106 Claim and seeks the same relief: declare the County's decision was wrong, set it aside, and order the County to issue the 1041 permit. Without more, this duplicative claim should be dismissed as a matter of law. *Fairall v. Frisbee,* 104 Colo. 553, 92 P.2d 748 (1939) (Where in the pleadings in an action for a declaratory judgment, no question is presented which is properly cognizable under the uniform declaratory judgment act, the suit should be dismissed).

But now there is more. On February 24, 2020, Thornton filed a Motion for Declaratory Relief and Determination of Questions of Law pursuant to C.R.C.P. 57 (declaratory judgment) and 56(h) (summary judgment on a question of law). This Motion requests the Court:

> 1. Rule that the County cannot consider, condition or deny Thornton's 1041 permit application for a pipeline based on any alternative that would change, impair, infringe, take or condition:
>
> (a) Thornton's constitutional right to build a pipeline and its property rights;
>
> (b) Water matters already determined under the exclusive jurisdiction of the Water Court, such as Thornton's water diversion point, delivery point, water quality, water quantity, and use, or alter Thornton's requirement to cease irrigation on Thornton-owned farms; and
>
> (c) Thornton's delivery point in violation of the WSSC Contract.
>
> 2. Rule that the County cannot diminish the quantity and degrade the quality of Thornton's water rights in violation of the 1041 Statute.
>
> 3. Rule that the County cannot fall outside of its authority under the LUC.
>
> *Motion*, p 36.

Thornton's Motion then goes on to provide a detailed history of the acquisition of its water rights, the nature of its water rights, the holdings of the Water Court, and a synopsis of applicable water law.

Section 13-51-106, C.R.S., states:

> Any person interested under a deed, will, written contract, or other writing constituting a contract or whose rights, status, or other legal relations are affected by a statute, municipal ordinance, contract, or franchise may have determined any question or construction or validity arising under the instrument, statute, ordinance, contract, or franchise and obtain a declaration or rights, status, or other legal relations thereunder.
>
> *See also,* Rule 57 (b) C.R.C.P. (same language).

By its explicit terms, the declaratory judgment statute and rule require the Court to determine parties' rights, status and legal relationship with respect to a document. In this case, the document is the decree entered by the Water Court. Thornton's Motion is premised entirely on its speculative supposition that the County denied Thornton's pipeline in an effort to alter Thornton's water decree and cause Thornton to use the Poudre River as a means of conveyance of its water.[8] Thornton's supposition is wrong.

In Section II(c) of its Rule 106 Answer Brief above, the County sets out its authority to regulate matters of state interest under 1041, including installation of pipelines, notwithstanding there is a collateral effect on Thornton's water. This collateral effect does not translate to surreptitious motive to deny Thornton's use of its water. The County expressly acknowledged Thornton's right in its Findings and Resolution. The County's decision does not interpret, apply, or change Thornton's water rights or its point of diversion. Most importantly, the County has not taken any position with respect to Thornton's water decree.

A "court may refuse to render or enter a declaratory judgment or decree where such judgment or decree if rendered or entered, would not terminate the uncertainty or controversy giving rise to the proceeding. §13-51-110 Colo. Rev. Stat.; C.R.C.P. 57(b). The hallmark of a declaratory judgment action is an actual case or controversy. In *Beacom v. Board of County Com'rs of Adams County,* 657 P.2d 440 (Colo. 1983), the board of county commissioners denied certain of the district attorney's budget requests. The district attorney filed a petition for writ of mandamus to require the board fund the full amount of his budget and for a declaratory judgment that the employees of his office were employees of the

[8] Thornton's Rule 57 Motion includes many of the same facts and arguments set out in its Rule 106 Opening Brief. The County has addressed these in the Rule 106 part of its Answer Brief and incorporates those arguments rather than repeat them here.

judicial district and not county employees subject to county administrative requirements.

The court passed on the budget question and then turned to the question of the status of the district attorney's employees. As to that question, the court held:

> The only actual controversy before the district court was the board's denial of certain budgetary items. We view the remaining requests for declaratory judgment—that of the district attorney for a declaration that the employees of his office are employees of the 17th Judicial District, and that of the county for a declaration that the employees of the district attorney's office are county employees for purposes of a variety of insurance and retirement programs and the county pay, classification and benefit plan—as requests for advisory opinions.
>
> The Uniform Declaratory Judgments Law, section 13–51–101 *et seq.,* C.R.S.1973 and C.R.C.P. 57 give the district court the power to declare rights, status, and other legal relations affected by a statute when the court is presented with a question of construction or validity arising under the statute, but the court may refuse to render or enter a declaratory judgment or decree where such judgment or decree would not terminate the uncertainty or controversy. **A proceeding for declaratory judgment must be based upon an actual controversy and not be merely a request for an advisory opinion.** *Farmers Elevator Company v. First National Bank,* 176 Colo. 168, 489 P.2d 318 (1971); *Heron v. City and County of Denver,* 159 Colo. 314, 411 P.2d 314 (1966); *Ahern v. Baker,* 148 Colo. 408, 366 P.2d 366 (1961); *Taylor v. Tinsley,* 138 Colo. 182, 330 P.2d 954 (1958). In addition, for a declaratory judgment to be binding, the necessary parties must be before the court. *City and County of Denver v. Denver Land Co.,* 85 Colo. 198, 274 P. 743 (1929). Here, neither party adduced evidence as to a number of the purposes for which the county requested a declaration of employee status nor were the individual employees joined in order that they might be bound by the court's determination. Consequently, it was inappropriate for the district court to rule that the employees of the district attorney's office were employees of the 17th judicial district or to imply that they were employees of the county for a variety of purposes.

Id. 446-447. (Emphasis added).

Beacom is only one of a plethora of cases where the court has asserted the need for a case or controversy in order to act. *See e.g., Associated Master Barbers, Local 115 v. Journeyman Barbers, Local 205*,

132 Colo. 52, 285 P.2d 599 (1955) (The supreme court will not render an advisory opinion in declaratory judgment actions.); *Gabriel v. Board of Regents*, 83 Colo. 582, 267 P. 407, 408 (The real question is, "have such questions 'arisen' "? This act was not intended to repeal the statute prohibiting judges from giving legal advice, nor to impose the duties of the profession upon the courts, nor to provide advance judgments nor to settle mere academical questions. . . . Court is not required to reply to mere speculative inquiries.); and *Mulcahy v. Johnson,* 80 Colo. 499, 512, 252 P. 816 (1927) (We decline to determine those questions which have not yet arisen, and which may never arise. Courts are not required to give general advice and instructions upon matters which have not arisen at the time their jurisdiction is invoked. The court should refuse to answer speculative inquiries.).

Here there is no controversy. Thornton says: ". . . [T]he [County] by its own admission has only the limited authority granted to it by the 1041 Statute 'to approv[e] the siting and development of pipelines.' R6839. This limited authority does not allow the [County] to deny Thornton's chosen means of its water delivery – a pipeline – as that right is granted by the Constitution. Nor does the [County's] limited authority allow it to determine where the pipeline starts or what water Thornton can take through the pipeline." *Motion*, p 4. The Board agrees! The Board's decision was that Thornton's proposal does not satisfy certain of Larimer County's 1041 permit review criteria— it did not deny Thornton the use of a pipeline nor dictate a starting point for it.[9] Thornton, with speculation and argument cannot turn the Board's decision into a water controversy requiring intervention by this Court.

[9]Thornton admits in its Rule 57 Motion, Footnote 7, Page 5 that the ideas of conveying the water by the river or canal were "proposed by the **public.**" Thornton notes that the County Staff advised the County that the 1041 regulations only covered the siting and design of pipelines and did not allow Larimer County to regulate Thornton's water rights, source water, or amend Thornton's Water Decree and that the County acknowledged this. Rule 57 Motion, p 7-8. Thornton's assertion that the County acted contrarily is fiction.

Thornton also strenuously argues the Water Court is the only entity with jurisdiction as to its water rights. Thornton then contrarily asks this Court to intervene and interpret and apply the water decree. This Court cannot do so. The Water Court entered the decree after a decade of litigation that involved numerous parties in interest. The Water Court retains exclusive jurisdiction over the case and its decree. This Court cannot alter, amend, interpret, or supplement that decree without notice and involvement of all parties to the Water Court litigation. §13-51-115, Colo. Rev. Stat. (When declaratory relief is sought, all persons shall be made parties who have or claim any interest which would be affected by the declaration); *City & County of Denver v. Denver Land Co.,* 85 Colo. 198, 274 P. 743, (1929) (As desirable as it might be to have an announcement of the court upon a question, it would be improper for it to decide in the absence of the necessary parties).

Thornton seeks an advisory ruling to direct the County to act in a particular manner should this case be remanded. Equally, Thornton seeks to limit the nature of the evidence that may be presented to the County should a further hearing on remand occur. "The Court's declarations or rulings protecting Thornton's constitutional and property rights are also critical to providing the appropriate guidance and side-boards to the [County] in the event that the Rule 106 appeal is remanded, or if Thornton has to re-apply. Otherwise, the [County] will again improperly consider, condition or deny Thornton's 1041 permit application based on matters that are outside its authority." Motion, p 6. Thornton directs this Court to control the County's future actions should they arise. On this point, precedent is clear: declaratory judgment proceedings may not be invoked to resolve a question which is nonexistent, even though it can be assumed that at some future time such question may arise. *Heron v. City & County of Denver,* 159 Colo. 314, 411 P.2d 314 (1966); *Taylor v. Tinsley,* 138 Colo. 182, 330 P.2d 954 (1958).

There simply is no judicial Rule 57 claim here. Thornton does not seek this Court's interpretation of the Water Decree. Thornton asks this Court to read the decree, obey it according to Thornton's terms, and enforce it.

CONCLUSION

For the reasons herein the Board respectfully requests the Court affirm its decision denying Thornton's 1041 permit application.

DATED: June 1, 2020.

Re: Request for reconsideration of March 18, 2020 completeness determination for Northern Colorado Water Conservancy District, Northern Integrated Supply Project 1041 Application

Ms. Ellis:

On behalf of No Pipe Dream Corporation, Save Rural NoCo, and Save the Poudre, we are writing to ask you to reconsider, and reverse, your March 18, 2020 determination that that the NISP 1041 application is complete. Exhibit 1 hereto. As highlighted below, there are numerous significant deficiencies with Northern Colorado Water Conservancy's District's ("Northern") 1041 application for the Northern Integrated Supply Project ("NISP") as posted by the County at the following website: (https://www.larimer.org/planning/NISP-1041). In light of these numerous deficiencies with the application identified herein, we believe your interpretation and/or administration of the Land Use Code ("LUC") and your completeness determination is in err and should be reversed. Thus, we are asking to reconsider and reverse your March 18, 2020 interpretation and determination. LUC §3.5.A. As per LUC §22.2.2.A.1, we also request a 30-day extension of the deadline for appealing your March 18, 2020 completeness determination to the Board of County Commissioners. Also, please provide us with a copy of the appeal form, as referenced in LUC §22.2.2.A.2, and inform us of any applicable appeal application fee in the event you do not reverse your March 18, 2020 interpretation/determination and we are forced to file such an appeal with the Board.

Below, this letter identifies both substantive deficiencies with the application and deficiencies with the documents posted to the County's website.

Substantive Deficiencies with application

1) The application is incomplete as to the relocation of Highway 287. The relocation of 7 miles of a major federal highway would not occur "but for" the NISP project, so attempting to bifurcate major components of NISP and treat the highway relocation as a separate "CDOT" project would unacceptably leave out major impacts to Larimer County

resources and residents. The relocation of U.S. Highway 287 is part and parcel of NISP, it must be included in the 1041 application.

- The NISP application states "Larimer County in its designation of areas and activities of state interest and associated 1041 permitting process declined to regulate state highways." A memo included in the application states:

  The County land use code regulates the construction of Glade Reservoir and all appurtenant uses, including appurtenant roads, however U.S. Highway 287 is not an appurtenant use of Glade Reservoir. The County's land use code does not define "appurtenant" or "appurtenant road," but "appurtenant" means "annexed to a more important thing" and an "appurtenance" is "something that belongs or is attached to something else." See Black's Law Dictionary. A use is the privilege or benefit of using something. See Use, Webster's Online Dictionary. Together, appurtenant and use refer to the secondary or tertiary benefits derived from the construction of Glade Reservoir. Appurtenant roads at Glade Reservoir will be the roads subordinated to and used for the benefit of Glade Reservoir and recreation at the reservoir. The relocation of U.S. Highway 287 is a one-time consequence of the reservoir's construction, not an ongoing benefit provided by it. Glade Reservoir will not be "used" to relocate U.S. Highway 287 - rather the highway is an impediment to Glade's development and must be realigned.
- The current 1041 regulations do not list "state" or "federal" highways as exemptions from Designated Matters of the State.
- The relocation would have significant impacts on land uses in Larimer County, disturbing up to 145 acres of open land.
- Elevating the highway out of it's current valley-bottom alignment and turning it up and over a hogback would create significant visual impacts and noise because the topographic screens would be lost and these impacts will significantly degrade quality of life and impact property values. The impacts of increased noise and aesthetics on rural residents must be evaluated.
- U.S. Highway 287 has a high number of motor vehicle accidents each year. The NISP project has forced CDOT to identify a new alignment (and CDOT has selected a preferred alignment) that involved taking a straight alignment along a valley bottom and turning it up and over a high hogback. How will that curvy realignment affect the accident rate on the highway, and how will local emergency services be affected? How will the noise of traffic, especially the heavy truck traffic, be mitigated? The new alignment will increase emergency response times by at least 5 minutes, critical minutes in a life-threatening emergency. These are key public health and safety concerns that are not addressed in the application.
- NISP and Larimer County publicly stated that the realignment of US Highway 287 would be included in the County's analysis, first when the proponent was proposing an Intergovernmental Agreement, and then for several months after it opted to complete a full 1041 permitting process. So, up until a few months ago,

the public was led to believe that the Highway 287 relocation would be part of the permit.

2) The application is incomplete because it doesn't provide sufficient and necessary information on the feasibility of the project, specifically with regards to water rights. The project is relying on a farm-buying scheme that 1) the Corps of Engineers has deemed doesn't meet the purpose and need for the project and 2) will have significant environmental and socio-economic impacts which aren't analyzed in any environmental document.
3) The application states, "Plans and designs presented in this 1041 Permit application have been developed at a conceptual level." The project has had 2 major changes in the past year, since the final EIS was published. The application does not, therefore, provide a complete project description. Because significant impacts from the project as currently proposed to the County have not been fully disclosed and mitigation has not been appropriately developed, determinations regarding evaluation criteria cannot be made.

Criterion 1. The proposal is consistent with the master plan and applicable intergovernmental agreements affecting land use and development.

4) The application is incomplete because it relies on an outdated County Master Plan. The application refers to the 1997 Master Plan and provides rationale for project compliance with that plan. However, the County adopted The Larimer County Comprehensive Plan in 2019. , Based on our correspondence with the County, this is the appropriate governing document for this 1041 permit application (and the existing land use code is still in effect, although it is being revised). If the County is choosing to use the 1997 Master Plan for the evaluation of this project, it must clearly provide this information to the public so the public can provide input regarding the conformance of the project with land use plans. However, it would appear that the 2019 Comprehensive Plan is in effect and applies, rather than the 1997 Master Plan.

   The application <u>does not address</u> the questions posed by The Larimer County Comprehensive Plan for the Mountains and Foothills and Natural Resource Areas that Glade Reservoir would occupy:
   - *How does the project adequately protect air and water quality, cultural and natural resources, and minimize fragmentation of the landscape?* The application defers each of these issues to some later permitting/planning effort.
   - *How does the project avoid impacts to the open character of rural areas, unique or highly visible viewsheds, landforms and ridgelines?* The project does not avoid such impacts.
   - *How does the project consider the natural terrain in its design and siting to minimize environmental impacts and avoid or reduce hazard risk to an acceptable level?* The project severely alters the natural terrain and appears to exacerbate hazard risks.

- *How does the project mitigate risks and reduce economic costs of natural hazard events to increase resiliency?* The projected influx of up to 500 people during construction and almost 400,000 people during operations to this high fire risk area only increases the potential for fires. More human activity increases the likelihood and frequency of human-caused fires, putting local homeowner's lives and property at risk.
- *How does the project comply with County policy, Code, Master Plans, and initiatives in relation to hazard risk reduction?* It doesn't. The application presents only conceptual plans (see section 12.0 in the application); a massive construction project, with huge infrastructure and the potential for hoards of visitors only increases hazard risk, especially fires and medical emergencies.

Larimer County has had land use and zoning regulations for decades, going back to 1963. These regulations set the rules for developing land in the unincorporated areas of the County and are intended to protect landowner rights while also looking out for overall community interests. The application does not provide sufficient information to evaluate impacts to landowner rights and in fact provides much misinformation and deferred promises about mitigation. Furthermore, the application does not demonstrate how the project promote "overall community interests" because most of the benefits of the project would accrue to communities outside Larimer County, and the proposed recreational benefits are unlikely to materialize because water to fill the reservoir is not available and the reservoir would often be mostly empty. Finally, current events require a wholesale re-evaluation of the purpose and need for the project and the financial ability to proceed.

Criterion 2. The applicant has presented reasonable siting and design alternatives or explained why no reasonable alternatives are available.

5) The application is incomplete because it presents no alternatives. The application refers to the alternatives analysis conducted for the federal EIS process, which is unnecessarily limited to a water storage project and is out of date. There are many less costly and less environmentally destructive alternatives for water development now available. Finally, the application is for an alternative that involves both the Glade Reservoir and a farm-buying scheme that has not been evaluated in any of the federal EIS or Clean Water Act Section 4040 documents. Failing to present alternatives is a "my way or the highway" approach that would preclude informed decision-making contrary to the letter and spirit of the LUC.

Criterion 4. The proposal will not have a significant adverse affect on or will adequately mitigate significant adverse affects on the land or its natural resources, on which the proposal is situated and on lands adjacent to the proposal.

6) The application is incomplete because it does not adequately identify environmental impacts, analysis of key impacts to the land and natural resources is incorrect or inadequate, is not specific enough for local land use decision-making, or is deferred to some later permitting/approval process.

- The noise analysis did not identify sensitive receptors in the residential areas around the proposed dam or reservoir and did not monitor or model expected noise increases due to construction or recreation at these sensitive receptors.
- The air quality impact analysis is incorrect because it is based on a faulty calculation that it would take an 80-mph wind to raise any dust off the lakeshore. Misguidedly, the proponent used a stockpile in an industrial yard, with partially compacted surfaces and large particle sizes, as a surrogate for the sediments along the lakeshore, and concluded that fugitive dust during operations would not be an issue. In reality, many of the native soils are prone to wind erosion. Furthermore, the waves and ice and fluctuating water levels in the reservoir would work together to deposit fine materials on the lakeshore that would readily blow up and down the valley. This part of Larimer County is designated a very high wind area. Larimer County must conduct an independent analysis of impacts to air quality.
- Visual/aesthetic impacts would be significant. The construction of Glade Reservoir would change the character of the area. The EIS states that the scenic quality of residential areas near the reservoir would increase because the water would provide "texture". The application, however, fails to evaluate the extreme negative visual impacts of a partially filled reservoir and a barren shoreline. The existing scenic quality of Hook and Moore Glade is overlooked. The avoidance and mitigation measures (re-vegetation and planting) don't even begin to address this issue – once it's gone, it's gone.
- Visual impacts from the relocation of Highway 287 would also be significant. The elevated highway would be visible for miles, and the light pollution from nighttime headlights, also elevated to be seen for miles, would also severely impact visual resources in and around the reservoir.
- Noise associated with the elevation of highway 287 is not addressed. Once the highway rises above the topographic screens, the noise from over 14,000 vehicle trips per day, much of it large trucks, would have a unobstructed path into the surrounding hills.
- The effects on property values of dam and a partially full reservoir with exposed, un-vegetated lakeshores have not been disclosed.
- Section 7.1 of the application fails to mention the Bonner Peak residential area, whose landowners will be negatively affected by this project.
- The potential for trespassing and its associated impacts are not addressed. Rural residential landowners experience trespass already; an influx of non-owners to this area will only exacerbate the problem.
- The application fails to address how the rural character of the Hook and Moore Glade and its surrounds would be affected. Larimer County recognizes that its residents may choose to live in non-urban settings for any number of reasons that do not include an industrial project of this magnitude. These settings are becoming more and more rare and difficult to find.

- Most of the mitigation planning is deferred to a later date, to another agency, to another process, etc. The application provides concrete mitigation only for wildlife (which must also be reassessed since the water for a fishery is likely unavailable), which the applicant developed with the Colorado Division of Wildlife, but for air quality, for cultural and historic resources, for fire, and other impacted resources, the mitigation plans are "conceptual" or "will be developed", are grossly inadequate (e.g., planting trees to screen a 300-foot tall dam), or are simply not proposed (e.g., noise or aesthetics). Unbelievably, the air quality mitigation plan states that a mitigation plan is not needed. The fire mitigation plan ignores two of the affected fire protection districts. The fugitive dust mitigation plan is incomplete by simply calling for application of wastewater for dust suppression. The project relies on the permitting authorities of many other agencies (e.g., Colorado Department of Health and Environment), and the result is a piecemealed project.

Criterion 5. The proposal will not adversely affect any sites and structures listed on the State or National Registers of Historic Places.

7) The Final EIS states there are 82 eligible or potentially eligible cultural sites present in the Glade Reservoir APE. Eight of the sites are officially eligible and 74 require additional data and formal evaluation. There are numerous additional sites in the APEs of the 287 reroute and other proposed project facilities. The FEIS then states that all unavoidable adverse effects on historical properties would be mitigated following the process described in an as yet to be developed Final Programmatic Agreement. The Corps anticipates the Final Programmatic Agreement will contain a number of provisions for cultural resources mitigation. The Corps then anticipates that Northern Water would implement all feasible and prudent measures to avoid and minimize effects on historic properties and to mitigate all adverse effects. With all these yet to be conducted evaluations, Programmatic Agreement, and anticipations, the Corps (FEIS p.4-527: *Section 4.19.14 Effect Determination)* reaches the conclusion: "*Consequently, effects on directly affected historic properties would be either minor or moderate. Effects on indirectly affected historic properties would be either minor or moderate."* According to the definition of moderate provided by the Corps in that same section: "*In accordance with criteria in 33CFR325, Appendix C, the following terms are used to describe potential effects on cultural resources:……..Moderate: The effect on a designated historic property would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association. Measures identified in the Programmatic Agreement to minimize or mitigate adverse effects reduce the intensity of impacts under NEPA from major to moderate. The determination of effect for Section 106 would be an adverse effect"* Thus, the determination of effect for Section 106 of Northern Water's proposed action on those affected historic properties that consequently end up post-mitigation as moderate as concluded by the Corps will by definition be adverse effects. The application is incomplete because it does not contain an adequate analysis of Criterion #5.

Criterion 6. The proposal will not negatively impact public health and safety.

8) The application is incomplete because it does not adequately analyze wildfire impacts. Public safety may be adversely affected by wildfire.
    - While the fire mitigation plan states that wildfire mitigation will follow Larimer County's Recreation Regulations, none of the documentation addresses the real danger of the people who don't follow the regulations and the consequences thereof. With a reservoir of this size, and a trail along the edge, visitors may build fires, smoke and inappropriately discard still burning cigarettes/cigars and/or discharge fireworks outside of the campground, disregarding regulations, and inadvertently start fires. The application fails to analyze these reasonably anticipated actions.
    - Many wildfires are started by people. The County cannot encourage almost 400,000 people to one of the most fire-prone areas in the state and simply hope for the best. It is also one of the windiest areas in the County. The fires that have recently occurred in this area have cost tens of millions of dollars to suppress and have resulted in hundreds of millions of dollars of private property damage, and one fatality.
    - Increased fire risk will impose costs and risks for nearby affected residents and communities that have not been addressed.
    - The application focuses on the Poudre Fire Authority as the primary fire response agency (see fire mitigation plan), but both Livermore and Wellington Fire Protection Districts overlap with the proposed reservoir (e.g., the north end of the reservoir and the proposed trail). Both fire protection districts are rated as having high potential for wildfires. The application doesn't address this.
    - The suppression costs are paid for by taxpayers. The application fails to fire risk and the costs associated with suppression, loss of life and property.
    - Section 7.0 of the application states that the Natural Hazard Mitigation Plan for Glade Reservoir (Technical Memo No. 8) addresses wildfire hazard and mitigation, but this memo does not address wildfire at all.

9) The application is incomplete because it fails to evaluate the possible public health issues the project's many air emissions may exacerbate.
    - The public health and aesthetic issues surrounding fugitive dust, which, as noted above, the application erroneously concludes would not be an issue during project operations. The application must address these potential impacts, especially in light of the lack of water, and a regular (if not permanent) low-water situation, which will result in frequently exposed, barren shores.
    - The public health issues associated with the emissions of ozone precursors (VOCs and NOx) from recreational uses are not disclosed. Larimer County is frequently a severe non-attainment area for ozone. Most recreation would occur during the hot summer months, when ozone is readily formed. It might move up the valley, to the rural properties, or down, into Bellevue, Laporte, and Fort Collins. The application doesn't address this issue.

- The pumping stations would emit over 30,000 tons per year of CO2 and ozone forming compounds. Colorado's climate change policies are calling for large reductions in greenhouse gas emissions. The application must clearly state how the emissions of CO2, water vapor, and other greenhouse gases will comply with Colorado's policies.
- Black carbon emissions (from motorized boating), and their potential to affect public health, are not addressed.

Criterion 8. Adequate public facilities and services are available for the proposal or will be provided by the applicant, and the proposal will not have a significant adverse effect on the capability of local government to provide services or exceed the capacity of service delivery systems.

10) Larimer County would pay 25% of the $21.8 million cost to develop the recreational facilities, or $5.5 million. The application predicts that total economic benefits would be between $13 and $30 million, but these estimates are incorrect because they are based on the 1) a full compliment of water rights, which Northern Water does not possess, 2) the proponent's modeling (which does not account for future hydrologic conditions and therefore likely overstates reservoir fill levels, and 3) the proponents faulty calculations regarding revenue. The application, therefore, lacks a realistic forecast of recreational income. Operation of Horsetooth Reservoir costs over $1.7 million per year, and most of the costs are paid for by entrance fees. If Glade would rarely be "full enough" to provide recreational (especially in the form of motorized watercraft with its high entrance fees), then who will pay the operational fees? The risks and costs to taxpayers must be thoroughly explained in the application.

11) The FEIS does not assess potential impacts form the range of risks to water supplies to Glade. Climate change, including rising temperatures and the very real threat of increasing frequency of prolonged droughts, and uncertainties in future water policy and water rights acquisitions, represent plausible risks to water supplies to Glade. A robust water supply vulnerability study that considers the range of plausible risks to water supplies at Glade should be part of the County's review process. As it stands, the FEIS does not provide decision-makers and the public the information necessary to evaluate the feasibility, levels of service, and potential value of proposed recreation at Glade.

12) The application fails to disclose how the siting, construction, and operation of an industrial facility in a rural setting will impact sheriff, fire, and other emergency services. For example, the fire mitigation plan states that fires won't be an issue because the campgrounds will be operated in accordance with Larimer County regulations. But this ignores the fact that wildfires are often started by accident, or even by arson, and in this area, one wrong fire in the right conditions could be devastating. In addition, how will the LCSO deal with a 14% increase (for example, 2,000 vehicles traveling to the reservoir on a summer day) in the number of vehicles (currently about 14,000 per day) on

highway 287? How will the emergency services teams (some of which are all volunteers) that protect these rural areas compensate for the increased number of calls? What is the expected increase in number of calls? How will service to existing communities be impacted by the need to serve visitors?

Criterion 10. The benefits of the proposed development outweigh the losses of any natural resources or reduction of productivity of agricultural lands as a result of the proposed development.

13) The application is incomplete because it does not identify the farms that will be purchased to acquire the water needed to implement the project. Without information on the location of the farms and water rights to be purchased in Larimer County, it is impossible to determine whether the benefits of the proposed development outweigh the losses of any natural resources or reduction of productivity of agricultural lands as a result of the proposed development.
14) The application incorrectly assumes that rural landowners view huge reservoir-based recreation as a benefit, and it fails to address how the natural aspects of the quality of life adjacent to Hook and Moore Glade would be irrevocably destroyed by the project.
15) The application is incomplete because it fails to analyze the negative impact to the Cache la Poudre River from removing vast quantities of water from the watershed. There is no analysis of the "benefit" of draining the River and storing water in Glade Reservoir versus keeping the water in the River.

Criterion 11. The proposal demonstrates a reasonable balance between the costs to the applicant to mitigate significant adverse affects and the benefits achieved by such mitigation.

16) The application is incomplete because there is no discussion of costs and adverse impacts to the River versus the benefit of such mitigation.
17) The application defers much mitigation planning to a later permit or process, so for many resources, insufficient information has been provided to assess whether this criterion is met. The applicant must provide concrete, not conceptual, mitigation plans and the costs thereof and the benefits to be achieved. The application should also disclose which adverse affects cannot be mitigated.

Deficiencies with application materials posted to the County's webpage

The NISP application materials the County posted to its website (https://www.larimer.org/planning/NISP-1041) on or about March 18, 2020 contain numerous errors, do not allow the public to access the actual 1041 application, and underscore the fact that your completeness determination of March 18, 2020 is incorrect. We have identified the following errors of completeness with the application posted to the County's website.

1. "1st Sub. No. 1 Attachment D Mapbook Poudre Map 4 Topography" is not the correct document.
2. "1st Sub. No. 1 Attachment D Mapbook Poudre Map 5A Wildlife WT Deer" is not the correct

document.
3. "1st Sub. No. 1 Attachment D Mapbook County Line Map 5A Wildlife WTDeer" is not the correct document.
4. "1st Sub. No. 1B Attachment B U.S. Highway 287 Memo" is not the correct document.
5. "1st Sub. No. 10 Glade Unit Stormwater Memo" is not the correct document.
6. "1st Sub. No. 10 Pipeline Stormwater Memo" is not the correct document.
7. "1st Sub. No. 11 Glade Unit Floodplain Study Pipeline" is not the correct document.
8. "1st Sub. No. 12 Pipeline Groundwater Report" is not the correct document.
9. "1st Sub. No. 13 Glade Dam Visual Simulation" is not the correct document.
10. "1st Sub. No. 14 Conveyance Pipeline Noise Analysis" is not the correct document.

Please review and respond to all of the deficiencies identified in this letter. If you disagree with any deficiency, please state why. Further, we ask that you reconsider and reverse your March 18, 2020 completeness determination. Please respond in writing to this request. Thank you,

Sincerely,

Re: Submission of Public Comments and Request for Public Hearing on the Northern Integrated Supply Project Draft Section 401 Water Quality Certification.

Dear Ms. Konowal and Mr. Garncarz:

On behalf of the Save the Poudre, a non-profit organization dedicated to the protection of the waters and environment of the Cache La Poudre River, and its individual members including its members who work, reside, and recreate in the vicinity of the above-referenced proposed project, we are respectfully submitting written comments set forth below on the above-captioned application of the Northern Colorado Water Conservation District ("Northern") for a Clean Water Act ("CWA") Section 401, 33 U.S.C. § 1341, water quality certification ("401 Certification") for the proposed Northern Integrated Supply Project ("NISP"). Save the Poudre also hereby requests a public hearing in response to the Public Notice issued by the Colorado Department of Public Health and Environment ("CDPHE"), Water Quality Control Division (the "Division") in the Water Quality Information Bulletin dated March 1, 2019 and documented in the Division's letter to the Army Corps of Engineers ("Corps") the same day. The Division granted Save the Poudre until April 22, 2019 to submit written comments.[1]

[1] Exhibit 1 hereto (Email correspondence between the Division and Save the Poudre dated March 14, 2019 granting extension until April 22, 2019 to submit comments).

Save the Poudre respectfully requests that the Division deny Northern's 401 Certification Application for the proposed NISP pursuant to 5 COLO. CODE REGS. § 1002-82.5(A)(5) ("Regulation 82") because the proposed project, as currently configured, will not comply with applicable state water quality standards and requirements as discussed in detail below.

Save the Poudre also formally requests to be placed on the Division's mailing list to receive notice of actions taken by the Division in response to the 401 Certification Application pursuant to C.R.S. § 25-8-302(1)(e) and receive a written analysis of the Division's basis for certification, if granted, including all actions to prevent, reduce, or mitigate water quality impacts pursuant to 5 COLO. CODE REGS. § 1002-82.5(C)(1). Save the Poudre also requests that the Division extend the public comment period and leave the administrative record open, pending the determination by the U.S. Army Corp of Engineers ("Corps ") to further supplement its Final Environmental Impact Statement ("FEIS"), extend its public comment period, and hold a public hearing. Finally, in the event the Division grants a conditional certification containing conditions to prevent, reduce or mitigate water quality impacts identified, Save the Poudre requests that the Division hold a public hearing to allow the Division to develop the mitigation conditions "in concert with commenters to the certification proceeding" pursuant to 5 COLO. CODE REGS. § 1002-82.5(A)(6).

Save the Poudre has previously submitted extensive comments on the Draft, Supplemental Draft, and Final Environmental Impact Statement ("DEIS," "SDEIS," and "FEIS" respectively) for the NISP proposal. These comment letters address existing and potential violations of water quality standards resulting from NISP. Save the Poudre attaches these documents to this comment letter and incorporates all arguments contained therein by reference.[2] The expert reports of Lisa Buchanan (Attachment A) and John Woodling (Attachment E) to Save The Poudre's October 4, 2018 FEIS comment letter address water quality issues and are particularly relevant to Northern's 401 Certification Application.

I. LEGAL BACKGROUND

Section 401 of the Clean Water Act states:

> "[a]ny applicant for a Federal license or permit to conduct any activity including, but not limited to, the construction or operation of facilities, which may result in any discharge into navigable waters, shall provide the licensing or permitting agency a certification from the State in which the discharge originates…that any such discharge ***will comply*** with the applicable provisions of the sections 1311, 1312, 1313, 1316, and 1317 of this title…No license or permit shall be granted until the certification required by this section has been obtained or has been waived…No license or permit shall be granted if certification has been denied by the State…"

[2] Exhibit 2 (October 4, 2018 FEIS comment letter); Exhibit 3 (March 12, 2019 Request for Supplemental NEPA Review); and Exhibit 4 (September 3, 3015 Supplemental DEIS comment letter).

33 U.S.C. §1341(a)(1)(emphasis added).

Similarly, the term "certification" is defined in the State regulations as, "… that determination by the Division that the Project ***will comply*** with the Basic Standards and Methodologies for Surface Water, Regulation No. 31 (5 CCR 1002-31), the Basic Standards for Ground Water, Regulation No. 41 (5 CCR 1002-41), surface and ground water classifications and water quality standards, and all other applicable water quality requirements for the affected waters. Such certification is subject to section 25-8-104, C.R.S." Regulation 82.2(5)(emphasis added).

The purpose of Section 401 is to ensure that "applicable water quality requirements will not be violated." 33 U.S.C. §1341(4). Under federal law, the Division has up to one year to issue a decision after receipt of a 401 certification application. *Id.* In this case, the NISP 401 certification application was submitted on January 31, 2019 and the Division has until January 30, 2020 to render its decision on the application.

II. THE PUBLIC COMMENT PERIOD SHOULD BE EXTENDED AND HELD IN ABEYANCE PENDING THE DETERMINATION OF THE CORPS TO FURTHER SUPPLEMENT THE FEIS AND EXTEND THE PUBLIC COMMENT PERIOD AND HOLD A PUBLIC HEARING ON THE CWA § 404 PERMIT APPLICATION FOR THE PROPOSED NISP.

The Corps provided the public with the opportunity to submit written comments on the FEIS for the CWA § 404 permit application for the proposed NISP. Save the Poudre submitted its comments to the Corps on the Draft Environmental Impact Statement, Supplemental Draft Environmental Impact Statement, and Final Environmental Impact Statement.[3]

Since the issuance of the FEIS, Northern announced a significant change in the way NISP would acquire and utilize the water rights upon which the Project is dependent. The FEIS is based on the premise that Northern's acquisition and implementation of water rights would be accomplished via water "trading" in which Northern would trade South Platte River water for cleaner Cache La Poudre River water. However, since the issuance of the FEIS, Northern announced a significant change in its acquisition and implementation of water rights called the "Water Secure" program. Under this new program, Northern, rather than pursuing exchanges with agricultural land owners, would have to purchase outright agricultural land to secure rights to 25,000 acre feet of water from willing sellers in the New Cache La Poudre Irrigating Company and the Larimer and Weld Irrigation Company ditch and reservoir systems in Weld County.[4] It is anticipated that Northern would have to approximately 100 farms and that this would take 10 years to accomplish.[5] This new program could fundamentally change how water from the South Platte and Cache La Poudre Rivers are utilized, thereby rendering useless the entire water quality analysis in the FEIS. In addition, the Water Secure program will significantly increase the cost of the NISP project, thereby requiring a new analysis of other less expensive alternatives through the NEPA process. Because of these fundamental changes

[3] See footnote 2 above.
[4] Article from the Fort Collins Coloradoan, April 1, 2019 attached hereto as Exhibit 5 and Press Release from Northern attached hereto as Exhibit 6.
[5] *Id.*

in the acquisition and implementation of water rights upon which the NISP FEIS is based, Save the Poudre has requested that the FEIS be re-opened for an analysis of Northern's new water rights scheme.[6] In summary, it would be arbitrary and capricious for the Division to proceed with a 401 certification decision relying on an FEIS water quality analysis that no longer represents how water will be acquired and utilized from the South Platte and Cache La Poudre Rivers. Instead, the Division should either deny the 401 Certification Application or hold the public comment period in abeyance and direct Northern and the Corps to conduct a new NEPA analysis based on the new Water Secure program for acquiring and implementing water rights for NISP.

Save the Poudre will also be asking the Corps to conduct a public hearing on its CWA Section 404 permit. Corps regulations at 33 C.F.R. § 327.4(c) articulate a strong presumption in favor of holding a public hearing and specifically provide that "[i]n case of doubt, a public hearing shall be held." 5 COLO. CODE REGS. § 1002-82.5(C)(4) provides that if the federal permitting agency (in this instance the Corps) determines that a public hearing or other action is needed to supplement the body of information for the application, the Division may delay the issuance of a certification decision until a time not later than sixty (60) days following the close of the administrative record. Save the Poudre respectfully requests that the Division stay issuance of the requested CWA § 401 certification and leave the Division's administrative record open under this provision until the Corps holds a public hearing on the CWA Section 404 permit. A public hearing would most likely "produce information relevant to the certification decision" as provided by Regulation 82.5(C)(4). Moreover, if the Corps grants an extension for additional comments, supplemental information will be received by the Corps which may assist the Division's CWA § 401 certification determination. The Division, therefore, should hold the issuance of the CWA § 401 certification process in abeyance and leave the administrative record open for additional comments until the Corps decides how to proceed on the FEIS supplementation request and public hearing issue.

In addition, Regulation 82 requires that the Division apply its Best Management Practices ("BMP") Policy to 401 certification applications.[7] The Division is process of developing a new BMP policy that will be finalized in the next several weeks.[8] The new policy will include updates to BMPs that could be applied to NISP. The Division should hold the draft 401 certification public comment period in abeyance until the BMP Policy is finalized and the public has the opportunity to comment on the policy and its application to NISP.

III. IF A CONDITIONAL CERTIFICATION IS GRANTED, THE DIVISION SHOULD HOLD A PUBLIC HEARING TO ALLOW THE PUBLIC TO PARTICIPATE IN THE DEVELOPMENT OF MITIGATION PLANS

Assuming *arguendo* the Division grants a conditional certification containing conditions as

[6] Exhibit 3 hereto, Save the Poudre's letter dated March 12, 2019 requesting a new NEPA analysis of Water Secure Program.
[7] Regulation 82.6(B).
[8] Email correspondence between John Barth, attorney for Save the Poudre and Annette Quill, Colorado Attorney General's Office dated March 18, 2019 attached hereto as Exhibit 7.

to various means to prevent, reduce or mitigate water quality impacts identified, Save the Poudre respectfully requests that the Division hold a public hearing to allow the Division to develop the mitigation conditions "in concert with commenters to the certification proceeding" per 5 COLO. CODE REGS. § 1002-82.5(A)(6). Save the Poudre asserts that the 401 certification should be denied because the proposed Project will not comply with applicable water quality standards and requirements even with the development of mitigation plans. However, the Division has indicated in the draft certification that the Division intends to issue a conditional certification with the development of best management practices. There are numerous complex issues and pitfalls associated with developing mitigation plans for the proposed Project particularly in light of the Division's initial determination as set forth in the March 1, 2019 Draft 401 Water Quality Certification, which states that the proposed Project has "[p]otential long-term water quality impacts" and the "potential for significant degradation for one or more segments listed in this notice."

Colorado's 401 Certification Regulation contemplates that mitigation plans be developed with input from the public along with the applicable federal agencies pursuant to 5 COLO. CODE REGS. § 1002-82.5(A)(6). The best method of ensuring public engagement in the development of mitigation plans is to hold a public hearing in Fort Collins to receive comments from the affected and potentially aggrieved persons about the proposed Project and hold work group sessions in which interested members of the public may participate in the development of mitigation plans including clear and enforceable BMPs.

IV. THE STATE 401 CERTIFICATION REGULATIONS ARE UNCONSTITUTIONALLY VAGUE ON THEIR FACE AND CANNOT BE APPLIED CONSISTENT WITH COMMON NOTIONS OF DUE PROCESS

As discussed below, the applicable State 401 certification regulations are unconstitutionally vague on their face and cannot be applied to this application in a manner consistent with common notions of due process.

Regulation 82.5(A)(1)(a) states,

> "[f]or USACE 404 permits and FERC licenses, 'significance determinations' for reviewable waters under section 31.8(3)(c) shall be made with respect to the ***net effect*** of the new or ***increased water quality impacts*** of the proposed Project, taking into account ***any environmental benefits*** within the Project area, including any ***water quality improvements***, or ***mitigation measures*** proposed to be implemented within the Project area." (emphasis added).

The terms "net effect", "increased water quality impacts", "any environmental benefits" "water quality improvements", and "mitigation measures" are not defined in Regulation 82 or the Colorado Water Quality Control Act.

Regulation 82.5(A)(3) also states,

> "The Division may condition water quality certification on ***adaptive management*** to address changes in the Project's predicted impacts and/or future changes in applicable water quality classifications and standards.

Again, the term "adaptive management" is not defined in Regulation 82 or the Colorado Water Quality Control Act.

Because the above-referenced terms are undefined, neither the Colorado Water Quality Control Act ("CWQCA") nor Regulation 82 provide a predictable, repeatable, and objective administrative and/or quasi-judicial test or framework by which the Division, or the Colorado Water Quality Control Commission ("WQCC"), can determine whether a 401 Certification application should be approved without conditions, denied, or approved with conditions. Colorado's 401 Certification process under the CWQCA and Regulation 82 is facially unconstitutionally vague and provides the Division (and WQCC on appeal) with unfettered discretion to approve, deny, or approve with conditions a 401 Certification application. The controlling principle in a constitutional void for vagueness challenge is whether the questioned law:

> "either forbids or requires the doing of an act in terms so vague that men of ordinary intelligence must necessarily guess as to its meaning and differ as to its application. Two basic interests underlie this principle. First, the interest in fair notice requires the law to be sufficiently definite to alert the populace to the nature of the proscribed conduct so that they may control their actions accordingly. Second, the interest in even-handed treatment requires that the law provide specific standards for those charged with its enforcement so that arbitrary and discriminatory application will be avoided.
>
> *People ex rel. City of Arvada v. Nissen*, 650 P.2d 547, 550 (Colo. 1982) (citations omitted).

Both the CWQCA and Regulation 82 fails to provide specific standards so that arbitrary and discriminatory application will be avoided in processing 401 Certification applications. Instead, the CWQCA and Regulation 82 give unfettered discretion to the Division and WQCC.

In light of these facial deficiencies with the CWQCA and Regulation 82, the Division and WQCC may not "apply" these regulations to the NISP 401 Certification Application in a manner that complies with common notions of due process under the law. Thus, Save the Poudre also objects to the application of the CWQCA and Regulation 82, as written, to the NISP 401 Certification Application.

The NISP 401 Certification Application should be denied or held in abeyance until such time that the Commission revises Regulation 82 to provide definitions of the above-referenced terms including specific standards that ensure a predictable, repeatable, and objective administrative and/or quasi-judicial framework for processing 401 Certification applications.

V. THE DIVISION SHOULD DENY THE CWA § 401 CERTIFICATION REQUEST FOR THE PROPOSED PROJECT.

Northern seeks a Corps permit under section 404 of the CWA, 33 U.S.C. § 1344, for discharges into waters of the United States relating to construction and operation of a water collection, storage, and conveyance system. As presently proposed, NISP would consist of miles of raw water pipelines that will cross jurisdictional waters of the United States, require new and/or modified irrigation intake diversion structures, and require the construction of two new reservoirs.

A CWA 401 certification from the Division is a condition precedent to the issuance of a CWA § 404 permit from the Corps to allow for the discharge into waters of the United States. Applicable state regulations at 5 COLO. CODE REGS. § 1002-82.5(A)(1) require the Division to consider the following criteria in determining whether to issue a CWA § 401 certification for the proposed Project:

- An antidegradation review under Regulation No. 21, COLO. CODE REGS. § 1002- 21, section 21.16;
- Compliance with the Basic Standards and Methodologies for Surface Water Regulation No. 31, 5 COLO. CODE REGS. § 1002-31 and the Basic Standards for Ground Water Regulation No. 41, 5 COLO. CODE REGS. § 1002-41;
- Classifications and water quality standards assigned to the affected waters; Applicable effluent limitations or control regulations;
- Best management practices or "BMPs" as set forth in subsection 82.6(B), 5 COLO. CODE REGS. §1002-82.6(B);
- Stormwater discharge provisions;
- Public comments; and,
- Any project-specific conditions.

The Division may grant a CWA § 401 certification if the proposed project complies with all applicable requirements as set forth above. 5 COLO. CODE REGS. § 1002-82.5(A)(2). Alternatively, the Division must deny the application for CWA § 401 certification if the proposed project will not comply with all applicable requirements even with the application of conditions. 5 COLO. CODE REGS. § 1002- 82.5(A)(5). Save the Poudre asserts that in light of the Regulation 82.5(A)(1) criteria, the Division should deny the CWA §401 certification of the permit for the proposed Project because NISP as presently configured will not comply with all applicable state water quality requirements even with the addition of conditions. Alternatively, Save the Poudre asserts that Northern's 401 Certification Application and anti-degradation analyses are fatally flawed and cannot be relied upon to serve as the basis for approval of the Application.

Save the Poudre asserts the following reasons as basis for the denial of the CWA § 401 certification request for NISP:

A. The Division Must Deny The CWA § 401 Certification Application Because The Proposed Project Will Not Comply With Colorado's Water Quality Standards for Surface Water Regulation No. 31, 5 COLO. CODE REGS. § 1002- 31

State regulations at 5 COLO. CODE REGS. § 1002-31 require the Division to deny CWA § 401

certification application for the proposed Project because it will not comply with Colorado's numeric water quality standards. The Division may not allow discharges that cause non-attainment of a narrative water quality standard as contained in 5 COLO. CODE REGS. § 1002-31 including discharges that "are harmful to the beneficial uses or toxic to humans, animals, plants or aquatic life." 5 COLO. CODE REGS. § 1002-82.6(A)(17)(d).

Northern's Application admits that "[w]ater diversions and releases…on the scale of the Proposed Action are likely to have environmental consequences…" including altered stream flow, pollutant concentrations, and heat balance.[9] Northern's Technical Report supporting the 401 Certification Application also admits that there are existing impairments and water quality issues for arsenic, temperature, E. coli., and selenium.[10] The Technical Report also acknowledges "additional concerns about the internal release of phosphorus, iron, manganese, and arsenic brought on by low concentrations of DO in the hypolimnion" of the existing and proposed reservoirs.[11]

Save the Poudre retained Lisa Buchanan of LRB Hydrology and Analytics to conduct a critique of Northern's 401 Certification Application and Technical Report. The attached report of Lisa Buchanan identifies significant deficiencies with Northern's 401 Certification Application and anti-degradation review with respect to the project. These deficiencies include, but are not limited to Buchanan's finding that:

- Water quality data from reservoirs located near the proposed Upper Galeton Reservoir and from South Platte water near Kersey show low to no assimilative capacity of arsenic, nutrients, selenium, and iron. Information from these reservoirs also indicates that Upper Galeton Reservoir is likely to stratify for the summer months prompting release of contaminants in the deoxygenated hypolimnion. The 401 Application states that water quality standards for many contaminants will likely be exceeded over the long term in Galeton Reservoir. However, the 401 Application fails to address the impact of these exceedances on surface water runoff or deep percolation to groundwater from farms included in the exchange program.[12]

The WQCD should deny the 401 Certification Application and direct Northern to analyze these potential exceedances on surface water and groundwater standards.

B. The 401 Application's Anti-Degradation Analysis is Deficient

Ms. Buchanan's critique of the 401 Certification Application also found significant deficiencies with Northern's anti-degradation analysis. These deficiencies include, but are not limited to:

[9] Northern's Technical Report, p. 15.
[10] *Id.*
[11] *Id.*
[12] Exhibit 8 hereto (Buchanan Report) p. 2.

- The 401 Application fails to include focus locations-locations where modeled water quality results are summarized in the 401 Application- in the stretch of river between the PRI and Boxelder Creek. Water quality model results focus on seven locations between the proposed Glade Reservoir outlet and the Greeley Gage. A focus location is not included in Segment 11 between the Lincoln Street Gage and Boxelder Gage to fully evaluate water quality impacts downstream of the MWRP and at the Timnath Inlet diversion structure. Hardness values of Poudre River water quality data, obtained from CDPHE for the time period 2008 to 2013, show that Segment 11 is comprised of three distinct subsections due to influence of Boxelder Creek at its downstream end and rapidly changing water quality in this Segment. This is important in the calculation of Table Value Standards (TVS) for hardness dependent metal standards, evaluation of the Baseline Available Increment (BAI), and assessment of potential significant water quality degradation. *The Water Quality Control Division ("WQCD") should deny the 401 Certification Application and direct Northern to use representative hardness data, particularly in Segment 11, for hardness dependent water quality standards, and include additional water quality focus locations in the upper and middle sections of Segment 11 in its anti-degradation analysis.*[13]

- Water quality data from reservoirs located near the proposed Upper Galeton Reservoir and from South Platte water near Kersey show low to no assimilative capacity of arsenic, nutrients, selenium, and iron. Information from these reservoirs also indicates that Upper Galeton Reservoir is likely to stratify for the summer months prompting release of contaminants in the deoxygenated hypolimnion. The 401 Application states that water quality standards for many contaminants will likely be exceeded over the long term in Galeton Reservoir. However, the 401 Application fails to address the impact of these exceedances on surface water runoff or deep percolation to groundwater from farms included in the exchange program.[14]

- The 401 Certification Permit Application does not address the risk of significant degradation of Poudre River water quality, particularly for metals and phosphorus which currently have low or no assimilative capacity in the Poudre River. If Glade Reservoir waters are re-introduced to the river from the hypolimnion of the reservoir, it could cause greater water quality degradation than was modeled and could cause significant degradation of the Poudre River for these pollutants. Based on data from Horsetooth Reservoir, it is likely that Glade Reservoir will stratify in late summer through October and cause release, particularly of arsenic, iron, manganese, and phosphorus caused by anoxic conditions in the lower levels of the reservoir. *Prior to approval by WQCD, the 401 Application needs to identify potential contaminant concentrations and anticipated frequency of discharges from the hypolimnion of Glade Reservoir and the impact to Poudre River water quality.*[15]

For the above-stated reasons, Northern's anti-degradation analysis is technically deficient. The WQCD should deny the 401 Certification Application and direct Northern to address the anti-

[13] Exhibit 8 at p. 2.
[14] *Id.*
[15] *Id.*

degradation deficiencies identified in Ms. Buchanan's report.

C. The 401 Application Contains Other Significant Technical Omissions and Deficiencies and Cannot Be Relied On To Issue a 401 Certification.

Ms. Buchanan's 401 Certification Application review also identified other significant technical omissions and deficiencies. A summary of these additional technical omissions and deficiencies is provided below:

- The 401 Application fails to evaluate the MWRP effluent data to identify which, and at what concentrations, emerging contaminants are present in the MWRP discharge. These parameters combined with summertime reduction in river flows caused by NISP would also affect water quality and potentially be deleterious to fish and macro-invertebrate populations downstream of the MWRP. *Emerging contaminant compounds and concentrations in wastewater discharges from the MWRP and other wastewater plants on the Poudre River need to be evaluated along with potential instream impacts to fish and micro-invertebrate populations.*[16]

- The CDPHE 10-year Roadmap includes voluntary reduction in nutrient and selenium loads from agricultural lands. Monitoring of agricultural runoff will evaluate the effectiveness of Best Management Practices (BMPs) and determine if further nonpoint regulation is necessary from agricultural lands. The combination of the poor water quality anticipated in Upper Galeton Reservoir, the presence of emerging contaminants in South Platte water, and efforts required for the 10-year roadmap will likely prevent farmers from agreeing to exchange Upper Galeton water for their ditch water supply. Approximately 50 percent of the Glade Reservoir water supply is to come from exchanges to farms on the Larimer Weld and New Cache Canals. Water quality of storage in Upper Galeton Reservoir will likely hinder acquisition of the full 20,000 AF in exchanges needed to operate and fill Glade Reservoir. The 401 Permit Application fails to address this possibility and does not provide an alternate source of water for Glade Reservoir if exchanges with agricultural entities on the Larimer Weld and New Cache Canals are insufficient. *Prior to WQCD approval of the 401 Application, Northern needs to identify farms and water volumes that would be exchanged for Galeton irrigation water – since this source of water is an important component of the project – and if sufficient farms are not amenable to exchange, what other source of water will be utilized instead. Northern needs to evaluate how high levels of nutrients and metals in Galeton Reservoir water would impact stream water quality - through both surface water runoff and groundwater discharges from farms - and specify what, if anything, it plans to do to assure farmers on properties amenable to the exchange that Upper Galeton Reservoir water will not impede their ability to reduce non-point nutrient and selenium loading to streams per state requirements in the 10-year Roadmap (2017 to 2027).*[17]

- The CTP model and therefore water quality modeling in the 401 Application also fails to:

[16] *Id.*
[17] *Id.* at p. 3.

- Evaluate impacts of different distributions of SPWCP exchanges into the Larimer Weld and New Cache Canals: exchange volumes depend on the land acreage of farms associated with each ditch that are willing to enter into an exchange contract with Northern Water – as yet to be determined.

- Account for climate change impacts that likely will reduce annual flow and alter the monthly distribution of streamflow – altering historical daily flow patterns on which daily disaggregation of monthly flows and water quality models depend.

- Omit outlier 1983 model output in calculation and comparison of monthly averages.[18]

- Additional CTP and water quality modeling needs to be conducted to evaluate potential scenarios of:

  - Diversions to Glade Reservoir, for instance during fill, without additional demand.

  - Refined conveyance system flows between Glade Reservoir and the PRI are reduced; for instance prior to the need for the full 40,000 AF additional water supply.[19]

All of these technical omissions and deficiencies need to be addressed before the WQCD can rely on Northern's 401 Certification Application to issue a certification. Accordingly, Save the Poudre requests that the WQCD deny Northern's 401 Certification Application and direct Northern to address these deficiencies.

D. Northern Has Not Proven That The Adverse Impacts Will Be Mitigated To Provide Reasonable Assurance Of Compliance With Water Quality Standards And Requirements.

Northern's 401 Certification Application fails to provide reasonable assurance that the numerous documented violations of water quality standards in the affected watershed segments will be fully mitigated. For example, Ms. Buchanan's review of the 401 Certification Application found:

- The modeling of the water quality impacts of NISP, Alternative 2M, depend entirely on assumptions made in the hydrologic model, the Common Technical Platform (CTP), and the projected water demands of the 15 NISP participants. The modeling of the refined conveyance system represents a best-case scenario as it reflects the full and consistent delivery of 40,000 AF to NISP participants. This presents a significantly more optimistic outcome than is expected in reality as the mitigation will not operate at the same level when participants utilize less water than the maximum, which is the expected case. Specifically, the CTP modeling of the refined conveyance system fails to:

[18] *Id.* at p. 4.
[19] Exhibit 8, pp. 12 and 3 respectively.

- Account for the 20- to 30-year or greater period before the full additional demand of 40,000 AF is required by NISP Participants in even some years.

- Account for approximately one-fourth of the total demand that would not be delivered via the North Tier Pipeline or through the Poudre River Intake.

- Adequately evaluate the daily, seasonal, and annual variation in water demand and therefore the expected variability in water deliveries to NISP Participants.

- An independent demand study also indicates that NISP participant additional demands may not reach 40,000 AF by 2060.[20]

- The CTP model, and therefore water quality modeling in the 401 Application, also fails to:

  - Evaluate impacts of different distributions of SPWCP exchanges into the Larimer Weld and New Cache Canals: exchange volumes depend on the land acreage of farms associated with each ditch that are willing to enter into an exchange contract with NISP – as yet to be determined.

  - Evaluate water quality impacts between the Poudre River Intake and Boxelder Creek – several miles of the Poudre River that will not benefit from the refined conveyance system flows and reduce streamflow upstream of the MWRP.

  - Account for climate change impacts that likely will reduce annual flow and/or alter the monthly distribution of streamflow – altering historical daily flow patterns on which daily disaggregation of monthly flows and water quality models depend.

  - Omit outlier 1983 model output in calculation and comparison of monthly averages. [21]

Further, the 401 Certification Application relies on an outdated Fish and Wildlife Mitigation and Enhancement Plan (FWMEP). More specifically, the 401 Water Quality Certification Technical Report (Technical Report) is reliant on the FWMEP, approved by the Colorado Wildlife Commission on September 7, 2017 and adopted by the Colorado Water Conservation Board on September 20, 2017. See Technical Report at 21, 33, and Appendix B. The FWMEP was prepared and adopted prior to the publication of the Final EIS and is based on project proposal that incorporated a Colorado-Big Thompson Project (C-BT) exchange to provide 10,000 acre-feet of water to some NISP participants. For example, the FWMEP states:

> Conveyance to the Participants will be made from Glade Reservoir via a Colorado-Big Thompson Project (C-BT) exchange, Poudre River intake, and pipelines.

FWMEP at 5 (emphasis added).

[20] *Id.* at p. 3.
[21] *Id.* at p. 4.

The FWMEP also states:

> Due to locations of their existing and projected future demands and water supply infrastructure, some Participants require delivery of NISP yield from C-BT facilities to effectuate deliveries to their water supply systems. A C-BT exchange volume of 10,000 acre-feet per year would allow delivery for these participants, and would also fall within a volume that could be reliably delivered from C-BT facilities. The C-BT exchange would work by delivering up to 10,000 acre-feet per year of C-BT deliveries that are currently made to the Poudre River from Glade Reservoir instead. In exchange, the NISP exchange participants would be delivered 10,000 acre-feet of water from C-BT facilities. This exchange would require a conveyance contract and special use permit from the Bureau of Reclamation for this operation.

FWMEP at 8 (emphasis added).

The C-BT exchange was eliminated from the preferred alternative in the FEIS and is not considered in the proposal being considered in this certification process. The FEIS states:

> Water quality analyses completed for the FEIS (Hydros 2018h; 2018i) indicated that Alternative 2M without C-BT exchanges had less effect on water quality and aquatic habitat in the Poudre River and in Horsetooth Reservoir than the Reclamation Action Option. Based on the FEIS water quality analyses, the Corps eliminated the Reclamation Action Option, including the use of the Glade-to-Horsetooth Pipeline, in Alternative 2. In Alternative 2, water would be conveyed to the Participants through the Carter Pipeline discussed in Section 2.7.5.2. Any further pursuit of a Reclamation contract for storage or conveyance of NISP water would require separate environmental compliance and federal agency approval.

FEIS 2-32 (emphasis added). Further, the FEIS also states:

> The Reclamation Option and Glade Reservoir to Horsetooth Reservoir pipeline option were eliminated from Alternative 2M. Horsetooth Reservoir and any exchanges with CBT water are no longer in the Applicant's Preferred Alternative.

FEIS A-174 (emphasis added). The Technical Report admits that:

> Operations of both Horsetooth Reservoir and Carter Lake would be not be modified under NISP operations, as the proposal for a C-BT exchange for delivery of NISP water to some NISP participants is not being carried forward at this time as part of the Proposed Action.

Technical Report at 62 (emphasis added).

The 401 Certification Application must not base its consideration of mitigation of the numerous and significant impact of NISP on the already outdated FWMEP that is based on the 10,000 acre-foot exchange that is no longer an element of the project proposal. Before considering certification for this project, the Division must critically evaluate the mitigation and enhancement measures proposed in the FWMEP, determine their efficacy, relevance, and appropriateness in light of this significant change to the project, and must independently determine to what extent, if any, the FWMEP mitigates the impacts of NISP. The WQCD should deny the 401 Certification Application

and direct Northern to address the above referenced deficiencies.

E. Northern Water Has Not Proven That Water Quality Degradation Is Necessary To Accommodate Important Economic Or Social Development In The Area In Which The Waters Are Located.

In the draft application, Northern asserts that even if the Division finds that the Proposed Action will cause a net harm to the environment, the Division should grant a 401 certification:

> Operation of the Proposed Action is likely to result in some water quality degradation not all of which is directly amenable to mitigation. The significant determination by the WQCD will reach a conclusion about the net effect of mitigation and enhancement measures on the environment. Should the WQCD conclude that these measures are not sufficient to yield net environmental benefit, it is Northern Water's view that "the degradation is necessary to accommodate important economic or social development in the area in which the waters are located."

Technical Report at 165 (emphasis added).

Although Northern does not specifically reference the regulation, this assertion appears to be based on the WQCC regulations which state:

> An intermediate level of water quality protection applies to waters that have not been designated outstanding waters or use-protected waters. These waters shall be maintained and protected at their existing quality unless it is determined that allowing lower water quality is necessary to accommodate important economic or social development in the area in which the waters are located.

5 CCR 1002-31.8(1)(b) (emphasis added).

Appropriately, the Division has requested public comment on both the economic or social development importance of the Proposed Action and the availability of alternatives that would result in the same or less degradation of state waters. Draft Conditional Certification at 2.
STP and others have, throughout the Federal review of NISP, provided a preponderance of evidence that:

- NISP is not important for economic or social development because the water that it would drain from the Poudre River is not needed by the Northern Colorado communities that it is purportedly designed to serve; and,

- A variety of economically, environmentally, and technologically reasonable alternatives are available to provide these communities with the water that they may need in the future.

In short, the justification for NISP is fatally flawed and much of the water it proposes to supply is simply not needed. Further, even if the Division were to find that water that NISP proposes to supply were important for economic or social development, there are alternatives to the Proposed

Action that would result in less degradation of state waters. As the Proposed Action clearly fails to meet the simple standards of 5 CCR 1002-31.8, the Division must not provide a certification that allows for degradation of state waters.

STP herein attaches the NISP SDEIS and FEIS comment letters and attachments that address these points for the Division's review.[24] The documents highlighted below speak most directly to the Division's questions but are supported by the whole of our submission here.

LRB Demand Analysis

An expert analysis conducted by LRB Hydrology & Analytics ("LRB Demand Analysis," attached here as Attachment A of the Conservation Organizations' NISP FEIS comments, October 4, 2018), demonstrates that the water use intensity—i.e., the rate that water is used by each person within the service area—has steadily declined since 2000. *See* LRB Demand Analysis at Fig. 3. Despite this clear downward trend in water use intensity, the NISP FEIS projects future water use demands based on an average of past intensity, incorporating only currently planned conservation activities as a downward pressure on water use. *See id.* 11-13. Indeed, the NISP SDEIS's projections based on average historic water use intensity have proven to be substantially higher than the actual use for the periods for which data for comparison is available (2010 and 2015). *See id.* at Fig. 5. Further, the projections presented in the FEIS easily outstrip a simple linear extension of the recent water use record, ignoring the long-running downward trend in water use intensity. *See id.* at Fig. 5. In sum, the FEIS projections of future water demand fail to accurately reflect the changing nature of water use in the service area and Colorado in general, and substantially overstate the amount of water that the participants will need to meet their needs over the planning period.

Healthy Rivers Alternative

A large coalition of citizen and nonprofit groups prepared and submitted to the US Army Corps of Engineers the Healthy Rivers Alternative ("HRA," attached hereto and Exhibit 9, Appendix B07 of the Save the Poudre's NISP SDEIS comments, September 2015). The HRA is an economically, environmentally, and technologically reasonable portfolio of actions relying on conservation and more efficient use of existing water supplies that would provide water supply security to the NISP communities with less degradation of state waters, less expense to the communities, and less impact on ranches and farms in the region. After the Corps failed to adopt HRA as their preferred alternative, STP and others provided further support of its effectiveness in their comments on the NISP FEIS (Exhibit 2, comments on NISP FEIS at 15 – 16).

A Better Future for the Poudre River

Western Resource Advocates prepared a similar document outlining a portfolio of alternative actions to providing for the water supply security of the NISP communities, "A Better Future for the Poudre River" ("Better Future," attached here as Exhibit 10, Appendix E51 of the STP's NISP SDEIS comments, September 2015). Like HRA, Better Future provides a reasonable option to NISP that would result in less expense, less degradation of state waters, and less impact on agricultural communities. The Corps' failure to adequately consider HRA and Better Future is one of the most

[24] See footnote 2 above.

significant flaws of the NISP NEPA analysis process, as outlined in the STP and Conservation Organization comments on the NISP SDEIS and FEIS.

No Action Alternative

The Corps' NEPA analysis has contemplated a No Action Alternative that would lead to less degradation than the Proposed Action. Although STP asserts that the FEIS version of this alternative is not an appropriate "no action alternative" under NEPA, *see* Exhibit 2, at pp. 8 – 11, the consideration of the outlined alternative does demonstrate that there is a viable option that would not require NISP and its associated degradation of state waters. Throughout the review process, Northern and the Corps' have alleged that the No Action Alternative is less preferable than the Proposed Action due to its impacts on the local agricultural community; the recent purchase of agricultural land to supply water for NISP demonstrates that the Proposed Action itself will have similar if not worse impacts on ranchers and farmers.

Northern has urged the Division to ignore the significant degradation of state waters that will result from construction and operation of NISP because, it alleges, the Proposed Action "is necessary to accommodate important economic or social development in the area in which the waters are located." In reality, NISP is not needed, either for the present or future development of the Northern Colorado communities that it proposes to serve. Throughout its long permitting history, inflated claims have been made about the future water demand of the region and, although the more recent analyses have lowered the demand, it still overstates the true need. The water supply security of the NISP communities can be safely met through a combination of conservation, transfer, and other techniques that will result in no degradation of state waters. The Division must not grant a 401 certification for this significantly impactful project under the guise of "necessity" when no such need exists.

IV. CONCLUSION

In conclusion, pursuant to Regulation 82.5(C)(4), Save the Poudre respectfully requests that the Division extend the public comment period, hold the public record open, and delay issuing its certification decision pending the Corps' FEIS supplementation, issuance of the Record of Decision, public hearing, and closure of the administrative record on the CWA § 404 permit. If a conditional certification is granted, then the Save the Poudre requests that the Division provide for a public hearing on the proposed mitigation plan. Finally, Save the Poudre respectfully requests that the Division deny the CWA § 401 certification for the proposed Project because NISP will not comply with Colorado's Antidegradation Rule, will not comply with Colorado's Water Quality Standards, 5 COLO. CODE REGS. § 1002-31, and would cause or contribute to violations of Water Quality Standards at 5 COLO. CODE REGS. § 1002-32.

Pursuant to Regulation 82.5(C)(1), Save the Poudre requests that the Division provide to its written analysis of its basis for certification, including identification of the stream segments affected, the potential water quality impacts identified as a result of the Project, and the results of any actions under subsection 82.5(A)(6) to prevent, reduce or mitigate water quality impacts associated with the exercise of water rights.

Thank you for your consideration of Save the Poudre's comments. Please contact me if you have any questions regarding these comments or if we may be of assistance.

To: Catherine Blackwell, U.S. Army Corps of Engineers
From: Save the Poudre: Poudre Waterkeeper
Regarding: Greenhouse Gas Impact Analysis of the Northern Integrated Supply Project

Dear Ms. Blackwell, 16 May 2014

The Climate Crisis presents a critical challenge to Colorado and our planet. Save the Poudre: Poudre Waterkeeper is deeply concerned about the coming effects of climate change, and is committed to finding solutions to environmental problems that do not create new environmental problems or worsen existing problems.

The National Environmental Policy Act requires that the U.S. Army Corps of Engineers analyze all environmental impacts associated with the proposed Northern Integrated Supply Project. Further, because the project has triggered the Clean Water Act, the SDEIS must address the EPA's 404(b)(1) guidelines (see 40 C.F.R. § 230), and the Corp's "public interest" factors (see 33 C.F.R. §§ 320 et seq.) including:

- Rejecting a permit if there is a practical alternative that would cause less adverse impact
- Ensuring that the permitting project not cause significant degradation to waters of the U.S., including "jurisdictional wetlands"
- Mitigating any impacts

We evaluated the potential greenhouse gas emissions that would be produced by NISP to consider whether the NISP project, as proposed, would contribute to climate change. Climate change emissions from NISP would come from four sources: 1) the construction of the project, 2) the pumping of water out of the Poudre River and other ditches, and up into Glade and Galeton Reservoirs, 3) the draining of 1,700 acres of wetlands due to depleted flows in the Poudre, and 4) the methane emissions from the fluctuating water levels and operations of Glade and Galeton Reservoirs.

In terms of (1) above, we have calculated that the total climate change emissions produced during the construction of the project – also called "embodied" emissions – would be at least 218,000 metric tons CO_2-equivalents. These emissions from construction alone would be equivalent to the emissions from almost 46,000 automobiles on the road for one year.

In terms of (2) and (3) above, we have calculated that the total yearly climate change emissions for NISP as proposed in the Draft Environmental Impact Statement would range from at least 43,751 to 84,236 metric tons CO_2-equivalent per year, depending on the action alternative chosen. These emissions would be equivalent to the emissions from almost 13,500 automobiles on the road every year.

In terms of (4) above, the scientific literature has not yet reached consensus on methane and carbon dioxide emissions from reservoirs in Western semi-arid environments, however emissions in this category are likely to be at least several thousand metric tons of CO_2-equivalent each year. As this science progresses over the coming months, we will offer input to the SDEIS as available.

These estimated results are major greenhouse gas emissions at a time when we should be doing absolutely everything we can to reduce greenhouse gas emissions in every aspect of our lives.

Our calculations are based on the following methodology:

1. Embodied emissions from construction of the project – including fuel burned on site, concrete manufacturing and use, rock fill, and excavation in the construction of the project – would total at least 218,000 metric tons CO_2-equivalent[1] [2], which is more than 5 metric tons CO_2-equivalent per acre-foot of water proposed to be yielded from the project. We calculated these emissions by matching the projected materials and excavation amounts in the financial cost estimates for the project with the embodied emissions calculated in the Inventory of Carbon and Energy (ICE) database.

2. Direct emissions from pumping water for the project's proposed actions would range from at least 19,822 to 45,125 metric tons CO_2-equivalent per year, depending on the action selected and the operation of the project [3] [4] [5]. These emissions were calculated be multiplying the projected electrical energy use by the current Xcel Energy portfolio emissions. Indirect emissions from pumping water would range from at least 11,893 to 27,075 metric tons CO_2-equivalent per year.[6] These emissions were calculated based on the measured leakage rates for natural gas, oil and coal production and delivery, and applying those rates to the current Xcel energy portfolio.

3. The project's proposed action and action alternatives would affect 1,700 acres of riparian-associated wetlands in the Cache la Poudre Basin.[7] [8] Carbon in soils and wetland vegetation are a major sink for ecosystem carbon, and the loss of those wetlands would result in a major source of emissions to the atmosphere of at least 7,036 metric tons CO_2-equivalent per year. We evaluated the Natural Resource Conservation Service (NRCS) SSURGO soils database for wetlands soils in the affected region[9], and then modeled the soils under

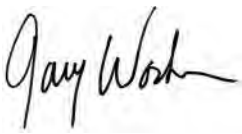
drained and undrained conditions using the CENTURY model[10] [11]. This analysis conservatively predicts emissions of at least 3.7 metric tons per year of CO_2-equivalents per acre of affected wetlands per year over 30 years. Additionally, emissions from decomposing wetland vegetation from dead and dying trees and shrubs are expected to equal at least 1.5 metric tons CO_2-equivalents per acre per year over 30 years.

4. Reservoirs in the American West are significant sources of greenhouse gases, and the combination of reservoirs constructed for the project, if built, are likely to emit thousands of metric tons CO_2-equivalent per year[12] [13]. No current model exists that we are aware of to predict the greenhouse gas emissions from temperate reservoirs, however the research we are aware of indicates that no reservoirs have been found to be a net year-round sink for carbon. Nearly all reservoirs studied to date appear to be net sources of greenhouse gas emissions, and there is no reason to indicate the reservoirs proposed under NISP would be any different. Recent measurements indicate emissions are particularly high from reservoirs that fluctuate significantly over the course of the year, as do most reservoirs in Colorado.

The results predicted above must be used and analyzed as a part of the Supplemental Draft Environmental Impact Statement (SDEIS) for NISP when that SDEIS is released – without this analysis, the SDEIS would not satisfy the requirements of the National Environmental Policy Act. If the Corps has not already done so, we recommend that the Corps do the same analysis for this project, as the analysis has direct bearing on how the Corps would select the Least Environmentally Damaging Practicable Alternative in examining the project alternatives.

Thank you for the opportunity to provide input and make requests of your offices regarding the environmental impacts of NISP. Your organization and ours mandate objective, scientifically valid information to thoroughly comply with the letter and spirit of existing national and state laws. Please acknowledge receipt of this letter.

Respectfully,



Gary Wockner

Water Supply Security that Preserves Our Rivers

In this document, the Save The Poudre Coalition, a grassroots effort built from a wide range of Local, Regional, State, and National organizations provides a ***Healthy Rivers Alternative*** to the proposed Northern Integrated Supply Project (NISP). NISP includes the proposed Glade and Galeton Reservoirs and would take water from both the Cache la Poudre and South Platte Rivers to support growth in service areas stretching from Larimer County south to the Denver metro area. Our alternative, in comparison to a proposal pursued by the NISP proponents, achieves both water supply security and river conservation for the citizens of northern Colorado, and it does so at a much reduced cost that supports agriculture and protects the environment.

In addition to the ***Healthy Rivers Alternative***, we outline long-term proposals for instream flows and river restoration and policy and legislative solutions that will provide for a sustainable future for the Cache la Poudre River and the residents of northern Colorado. Together, these short- and long-term steps set a course of action that will allow the citizens to control the fate of their rivers and communities. The steps are based on the following principles:

To provide for healthy rivers and communities in the short-term, we need the following right now:

1. **A realistic assessment of future water needs of the NISP participants.** An analysis of population growth and water demand that realistically portrays the future need for water in NISP participant communities is needed before any decisions on future investments can be made. The NISP Draft Environmental Impact Statement (DEIS) is inadequate in analyzing the growth, water need, and conservation potential for NISP participant cities. As a consequence, its justification for the project dramatically overstates the future need for water to be provided by the project. A revised Purpose and Need analysis for the NISP project provides the foundation for a proposal that will meet the participants' needs without unnecessarily draining the river.

2. **A full range of alternative water supply options for NISP participants.** A number of viable options exist (in addition to those discussed in the DEIS) that would allow the NISP participants to meet their needs without draining the Cache la Poudre River of its last flows. Although these options individually provide only a portion of the water needed, when combined they go well beyond the NISP participants needs.

3. **A full range of alternative water storage options for NISP participants.** As with supply, there are a number of storage options that, taken together, would make needed water available. A system of these options would eliminate need for construction of the unnecessary and tremendously expensive Glade and Galeton Reservoirs.

4. **An accurate and current revised cost estimate for all of the options that might be used to meet the needs of NISP participants.** Significant increases in infrastructure costs over the last few years have rendered the cost estimates prepared for the NISP DEIS inaccurate and obsolete. A revised look at both the proposed project and the options described in this document allows residents of northern Colorado and decision makers to thoughtfully approach major investments.

A Healthy Rivers Alternative to NISP/Glade

Responsible Demand Management and Small-Scale Supply Options Eliminate the need for NISP

The Save The Poudre Coalition has devoted more than a thousand hours to the analysis of the NISP DEIS. This work has been performed by research scientists, analysts, attorneys, qualified professionals, and community members with expertise in issues related to this issue. In the course of our work, we have discovered numerous problems with the NISP proposal, starting with the underlying justification for the project and continuing through the analysis and proposed mitigation

Our review made it clear that it was essential for us to carefully analyze the proposed NISP project and prepare a positive alternative that would meet the needs of the NISP participants while reducing water withdrawal-associated impacts on the Cache la Poudre River. This alternative, the ***Healthy River Alternative***, is explained in detail here.

While alternatives are typically composed solely of action steps, the fundamental flaws with the project's justification as presented in the NISP DEIS required us to take a step back and in essence start from square one. It is also necessary to critique a number of elements of the DEIS to fully explain the alternative and its rationale. Consequently, we present our discussion of the alternative in five parts:

- A critique of the Purpose and Need section of the proposed NISP project as presented in the DEIS, explaining why this project justification is fundamentally flawed and incapable of serving as the foundation for further analysis;

- A revised projection of future water demands that honestly and accurately states the needs of the NISP participants while incorporating realistic population growth scenarios, alternative water supply options, alternative storage, and industry standards for best management practices;

- An overview of alternative water supply options that can meet the actual needs of the NISP participants;

- Cost estimates for the NISP project and the Healthy Rivers Alternative scenarios;

- A comparison of the environmental impacts of the proposed NISP with the impacts of the Healthy Rivers Alternative.

The Justification for NISP Presented in the DEIS is Fundamentally Flawed

In reviewing the NISP DEIS we determined that the population growth and water demand estimates provided by the project's participants were poorly done. A large number of major inconsistencies point to a speculative and severely flawed analysis of current water use and projected demand. Key failures of the DEIS include:

- The DEIS does not evaluate the role of water conservation or efficiency either as a way to reduce demand. This is counter to the regional trend toward lowered water consumption rates.

- The DEIS arbitrarily removed major industrial users from the analysis, which artificially lowered estimates of gallons per capita daily (gpcd) water use for the participants. It then compared these estimates, which represent just a portion of the residential use, with the total industrial, residential, and municipal gpcd figures from other communities.

- Water use levels reported for several of the participants were inconsistent with other published reports on water use.

- Parts of the analysis combined water use data from one year with population data from another. Periods of high water use by the participants were arbitrarily removed from the analysis.

- Future projected population growth was inconsistent with current population trends.

These inconsistencies point to a severely flawed analysis. The results are water use estimates that are speculative and faulty, undermining the water demand analysis that the remainder of the document rests on.

An honest and accurate analysis of a community's projected water needs depends on an understanding of how the community uses water. An analysis of the distribution of water use sectors (residential, industrial, commercial and municipal/public safety) in future community growth, rational target water use goals for those water use sectors, and a clear understanding of existing water use are essential to demand projection.[1] To understand baseline needs and project water demand into the future, water providers must analyze water use over a period long enough to include droughts and other factors that influence water use.[2] It is not clear that the DEIS authors had access to such information, or if indeed the participants themselves had collected such information and done an analysis to project past and present water use by sector.

We do not believe that the decision makers tasked with reviewing and approving this project can make an informed decision into the actual purpose and need for the project unless these issues are addressed. The result is a severely flawed water use analysis that does not meet basic NEPA requirements under 40 CFR § Title 1502 et seq. The NISP DEIS does not divulge accurate information from which decision makers can accurately assess the purpose and need for the project, nor can the public adequately asses the efficacy of the analysis. We offer our revised water demand analysis below.

Reassessing Demand by Overhauling NISP Population Forecasts and Incorporating Cost-Effective Demand Management

Population Growth Projections in the NISP DEIS are Incorrectly Calculated

The annual percentage growth rates used in the NISP DEIS do not always correspond to the actual population estimates for the projected periods. Furthermore, the ranges provided for annual growth rates are far too broad. It would be more appropriate to calculate the population growth estimates based on the middle of the range growth rates for each participant. We believe that this is not only more accurate but even conservative (i.e., very unlikely to understate growth) given rising energy costs that are likely to slow growth rates in NISP project area and instead redirect growth to urban centers and transportation hubs.

Population Growth Projections in the NISP DEIS are Unachievably High

There is reason to question whether the growth rates projected in the NISP DEIS will be achieved by the NISP participants. A recent study of American housing trends analyzed the roots of the housing bubble and the mortgage foreclosure crisis, finding that high fuel costs were the largest contributing factor to the foreclosure

[1] One example that analyzes water use by industrial sector is the City of Aurora, Colorado *Water Conservation Plan* dated August 8, 2007. http://www.auroragov.org/stellent/groups/public/documents/article-publication/035857.pdf

[2] The city of Santa Fe has evaluated water demand going back to 1995 and has reduced water use by 4.2% per year through 2007. City of Santa Fe Water Conservation Office. http://www.santafenm.gov/DocumentView.asp?DID=2178

rate in suburban communities.[3] The work describes how the price of fuel is driving the U.S. housing market to restructure around transit and employment centers.

To see how this trend is affecting the NISP participants, we analyzed their foreclosure rates alongside new housing permits, and found the NISP participant regions have some of the highest foreclosure rates in the country (Figure 1 and Figure 2).[4] New housing permits in 2008 so far are half those in 1998,[5] when the population was significantly smaller. Gasoline price inflation is highly correlated with the foreclosure rate and drop in permits,[6, 7] as residents find they can no longer afford to commute by automobile long distances to work or to retail centers.

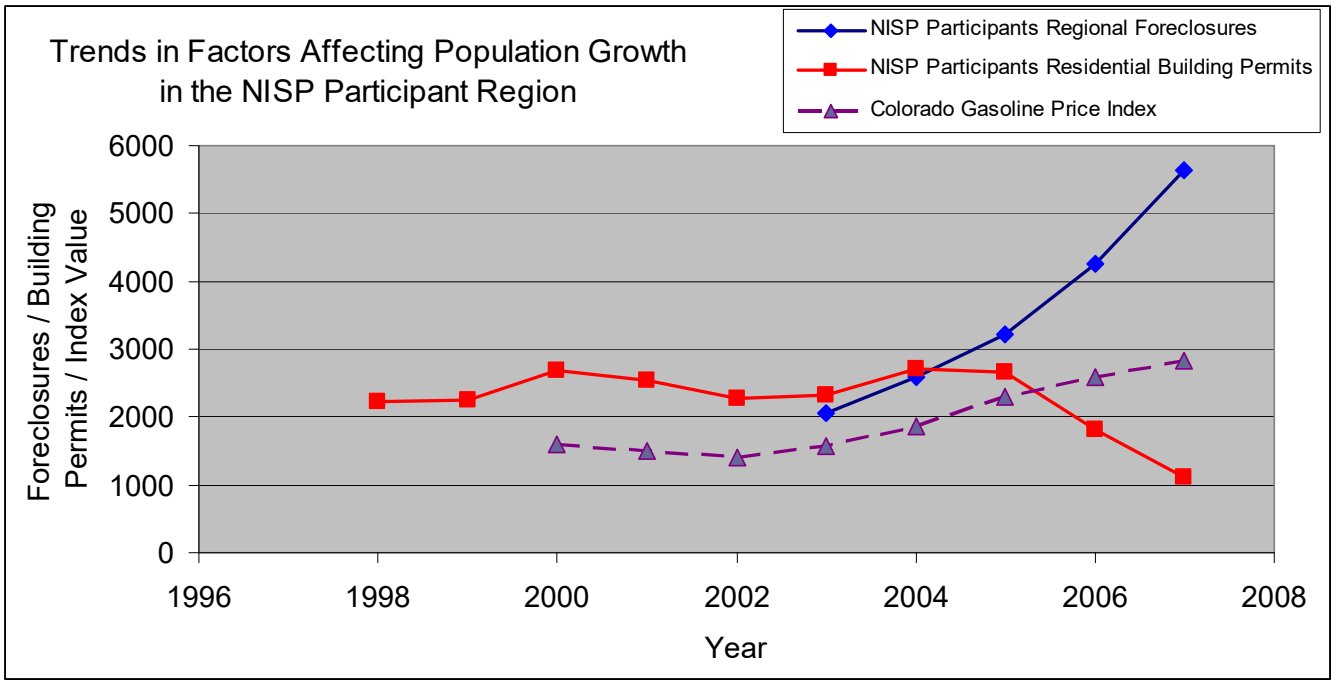

Figure 1. Indicators of significant uncertainty in population and water use growth projections for the NISP participants. As fuel price inflation soars, home mortgage foreclosures in the NISP participant region climbed well above the national average, and building permits sank to half that of recent levels. The foreclosure rate in Weld County is 1 out of very 29 homes.

[3] Joe Cortright. 2008. Driven to the Brink: How the Gas Price Spike Popped the Housing Bubble and Devalued the Suburbs. CEOs for Cities. http://www.ceosforcities.org/newsroom/pr/files/Driven%20to%20the%20Brink%20FINAL.pdf, viewed on 7/7/2008.
[4] Mortgage foreclosure data provided by RealtyTrac. http://www.realtytrac.com/ContentManagement/pressrelease.aspx?ChannelID=9&ItemID=3988&accnt=64847, viewed on 8/31/2008.
[5] Building permit data were provided by Boulder, Larimer, Morgan, and Weld Counties, and the NISP participants.
[6] U.S. Department of Energy. http://tonto.eia.doe.gov/oog/ftparea/wogirs/xls/pswrgvwsco.xls, viewed on 8/31/2008. Data are scaled for comparison purposes.
[7] Average yearly fuel costs in Colorado are 95% correlated with mortgage foreclosures, and 70% correlated with the drop in building permits.

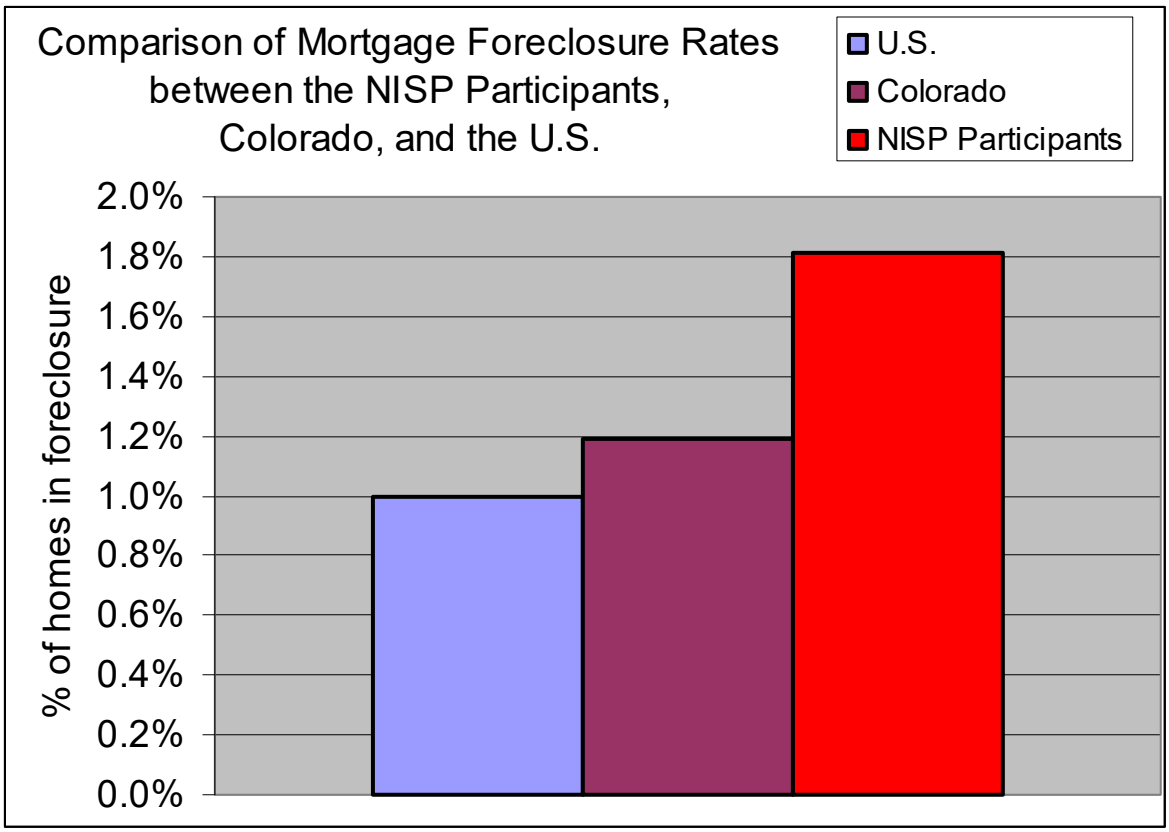

Figure 2. Population weighted mean percent in 2007 of all homes in Mortgage Foreclosure in the NISP participants region (Boulder, Larimer, Morgan, and Weld Counties) compared with the Colorado and U.S. statistics for home foreclosure.

For these reasons, we believe that the NISP participants are very unlikely to achieve the population growth scenario described in the NISP DEIS.

Revised Base Water Use Projections

In order to calculate a more reasonable and accurate water demand required by the NISP participants, we constructed revised scenarios of projected water demand over time. Population estimates were based on information in the NISP DEIS, using the mean average annual growth rate when a range was provided (Figure 3).[8] Build out figures from the DEIS were also observed. After population projections were re-calculated using the midline growth rates and respecting the listed build-out figures, total population in 2035 for the NISP participants is 375,613; 11% less than listed in the DEIS. In 2050 the population is projected to reach 440,920; 27% less than the DEIS projects.

[8] NISP DEIS, Table 1-4.

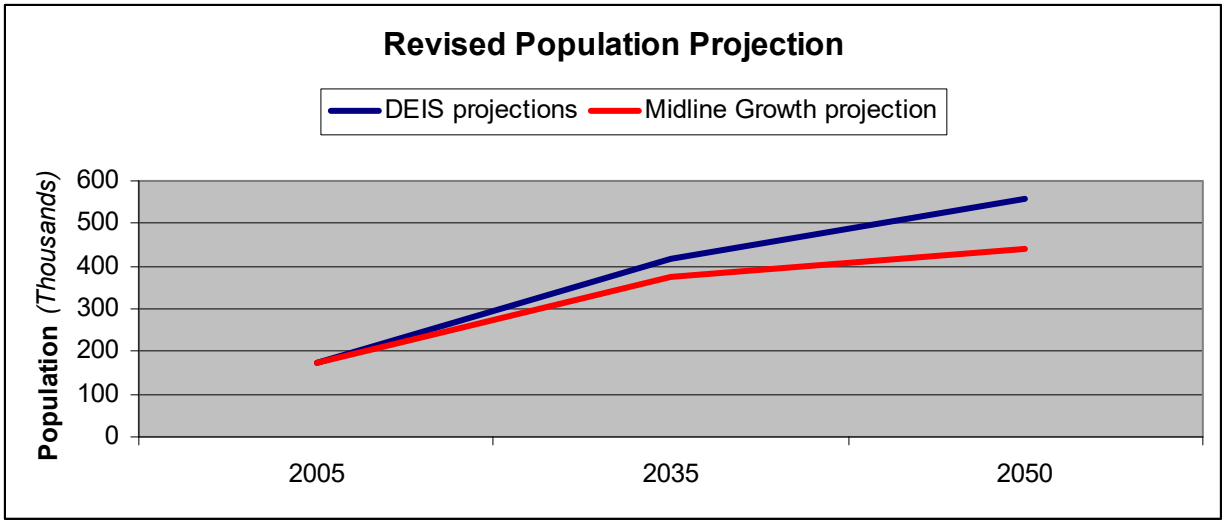

Figure 3. Projected midrange population trends in the NISP participants region.

Using these revised population projections we calculated the total required demand. Even with no decrease in levels of use, the lower population projection leads to decreased demand. We analyzed two modest conservation scenarios based on the following assumptions:

- We used current system-wide per capita figures as a basis for calculating future demand. Current per capita figures were calculated using data provided in the DEIS, Table1-3. These figures include all system-wide potable use and loss and thus is more reflective of where community use levels are than the GPCD figures provided in the DEIS that exclude large water users (Table 1).
- Final demand figures include a 10% system loss on top of the calculated potable demand. Ten percent is the level of system-wide loss that is deemed appropriate by the American Water Works Association.[9] Many NISP participants have loss levels much larger than 10%; reducing these losses will save a great deal of water and reduce overall demand.

Table 1. Recalculated 2003 Gallons Per Capita Per Day (GPCD) Figures for the NISP participants. Total population-weighted mean is 183 gpcd.

	Potable Deliveries	Total Potable Deliveries with Loss	2003 Population	System Wide GPCD

[9] AWWA Leak Detection and Water Accountability Committee, "Committee Report: Water Accountability," Journal AWWA (July 1996): 108-111.

Water conservation, also known as demand management, in Colorado has changed dramatically over the past five years. After responding to the record drought of 2002, some water utilities have implemented widespread conservation programs, not just as a drought-management tool, but also as a means to secure permanent water conservation savings. These savings can increase system reliability, serve new growth, and decrease the need for new water development that can have detrimental impacts on Colorado's river environment, water recreation, and rural communities.

Demand Management Scenarios

Based on existing trends and examples from other Front Range water utilities, we next developed two straightforward, achievable demand reduction scenarios that utilize very modest conservation and efficiency measures to reduce the base water use projections described above.[10]

Conservation and efficiency represent a solid "no regrets" strategy – one that does not tie the utilities to expensive infrastructure or rising electricity costs, with no detrimental impacts on river systems or rural communities. While conservation programs come with a price tag, they are much smaller than the one for the proposed NISP components.[11]

Previous research has determined that many Front Range communities are planning to reduce use by 1% per year in the coming decade (Figure 4).[12] Savings will be largely realized through incentives to install more advanced and efficient fixtures, indoors and out; stronger water pricing; regulation; and behavioral changes. Based on observed conservation savings over the last decade 1% per year savings is not only achievable, but likely a conservative estimate. Moreover, many of these communities have significantly stronger and more established conservation programs in place than the NISP participants. They are also comparable to NISP participants in location, climate and quality of life. Consequently, a 1% per year reduction in water use is reasonable and in agreement with regional standards and has therefore been used to project more sensible demand requirement for NISP participants in each of the two scenarios below.

[10] Two recent studies contain examples of widely used demand reduction measures from Colorado and the Western U.S.: The Colorado Water Conservation Board's *Statewide Water Supply Initiative (SWSI) Phase 2 Report* (http://cwcb.state.co.us/IWMD/SWSITechnicalResources/SWSIPhaseIIReport/, viewed on 8/31/2008) and Western Resource Advocates (2008) *Smart Water: A Comparative Study of Urban Water Use Efficiency Across the Southwest* (http://www.westernresourceadvocates.org/media/pdf/SmartWaterBrochure.pdf, viewed on 8/31/2008).

[11] Conservation and efficiency measures per yielded acre foot range from $55 to about $10,000, averaging about a tenth of the cost per acre foot of firm yield from NISP. Demand reduction can be achieved through incremental payments built into utility fee structures without having to finance the large capital costs of major projects like NISP.

[12] Western Resource Advocates. 2007. *Front Range Water Meter: Water Conservation Ratings and Recommendations for 13 Colorado Communities.* 2260 Baseline Road Suite 200, Boulder, CO 80302. http://www.westernresourceadvocates.org/watermeter/WaterMeterReport.pdf, viewed on 8/31/2008.

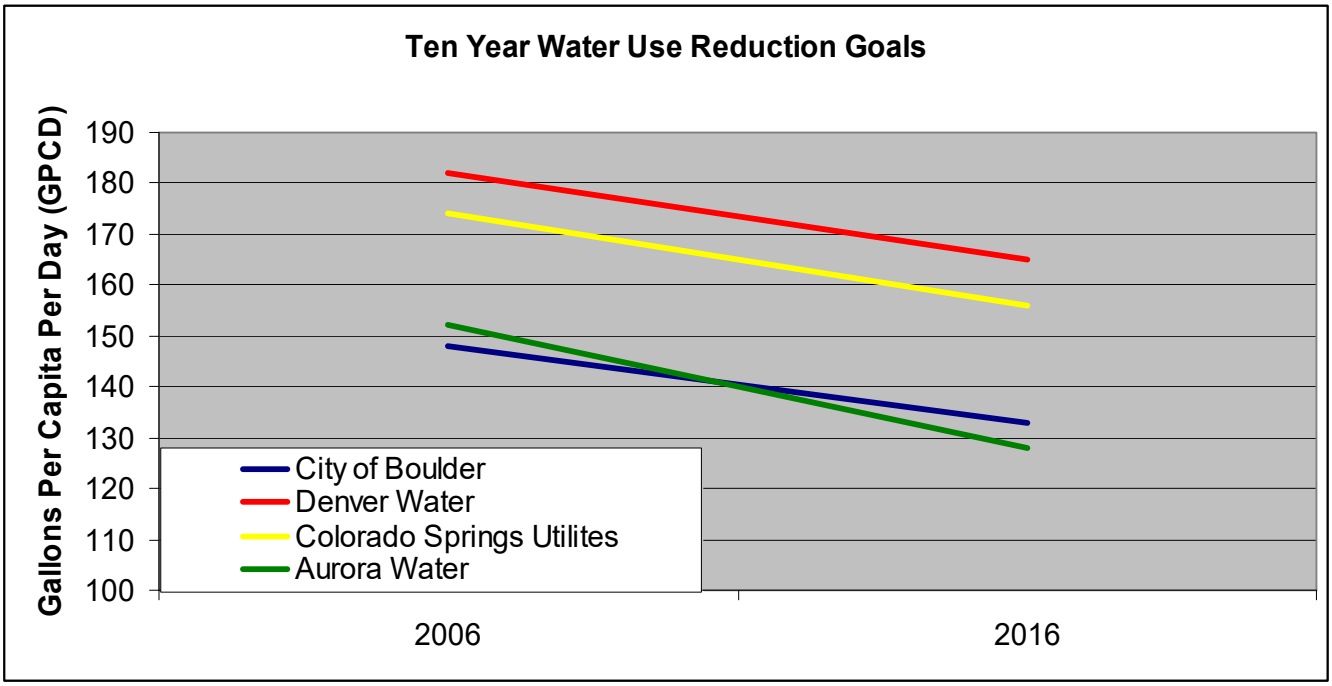

Figure 4. Ten year goals for reduction in system wide water use by various Front Range Water providers.

Our scenarios follow:

Scenario 1: In addition to the modified population projections above, scenario 1 assumes that integration of conservation and efficiency measures would lead to a 1% per year reduction in use, up to a total of 10%. For example, Fort Morgan, which in 2003 had a per capita demand of 233, would set a goal of reaching 210 GPCD system-wide. This demand-reduction figure would then be used to determine long term demand using the following formula.

$$\frac{\text{GPCD X POPULATION X 365days/year}}{\text{325,851Gallons/AF}} = \text{AF of Demand per year}$$

A 10% system-wide loss is added on top of the demand figure to yield TOTAL DEMAND.

Scenario 2: Using the 2003 use figures as a baseline, a higher level of conservation and efficiency is applied. This scenario assumes a 1% per year reduction, up to 20%. Fort Morgan, for example, which had a 2003 per capita demand of 233, would have a goal of reaching 184 GPCD, system-wide. This new GPCD figure would then be used to determine long term demand using the above formula. Again, a 10% system-wide loss is added on top of the calculated demand figure.

The result is a more refined and noticeably lower demand requirement to meet the needs of the NISP participants without sacrificing quality of life.

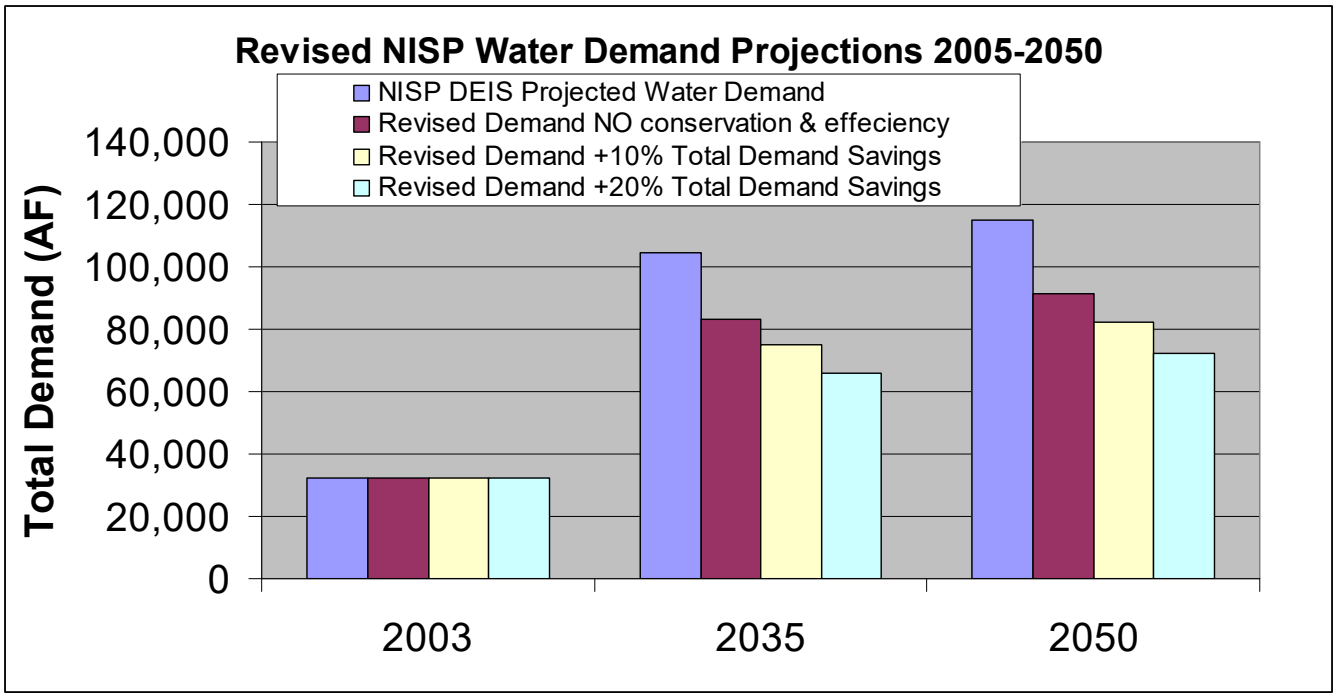

Figure 5. Revised NISP participants firm supply projections based on straightforward, achievable conservation and efficiency measures implemented over time to reduce demand.

According to the DEIS, Table1-2, current firm yield of NISP participants is 50KAF, projected to increase to more than 115,000 AF in 2050, which is 25,000 AF greater than the NISP proposed firm yield. Future demand, under the more conservative scenario 1 is projected to increase to nearly 85,000 AF annually, leaving 35,000 AF in additional water requirements above existing supply (Figure 5).

In summary, through conservative, realizable demand management scenarios the NISP participants will save themselves the cost to acquire, treat, deliver, and manage 30,000 AF of water. In the section that follows we show two recommendations for how to meet their projected water needs that won't require draining the Cache la Poudre River of any further water.

Alternative Water Supply Options

We evaluated three alternative water supply sources for the NISP participants. These supplies are "alternative" only in the sense that they do not require new water diversions from the Poudre River, building major debt-financed facilities, or relocating existing water diversions to new locations upstream. These alternative water sources utilize existing means practiced by water utilities around Colorado and the West.

After presenting potential sources for new water, we critique the NISP DEIS no-action alternative and present two possible scenarios for water supplies that meet the NISP participants' needs.

Development-Displaced Water

The NISP participants have developed major plans to expand their boundaries and dry up irrigated lands within their new growth boundaries. According to the 2002 U.S. Census of Agriculture conducted by the Department of Agriculture, and the Natural Resource Conservation Service (NRCS) National Resources Inventory (NRI), irrigated lands in the NISP participants region comprise 63-67% of the land onto which the participants intend to expand (Figure 6).

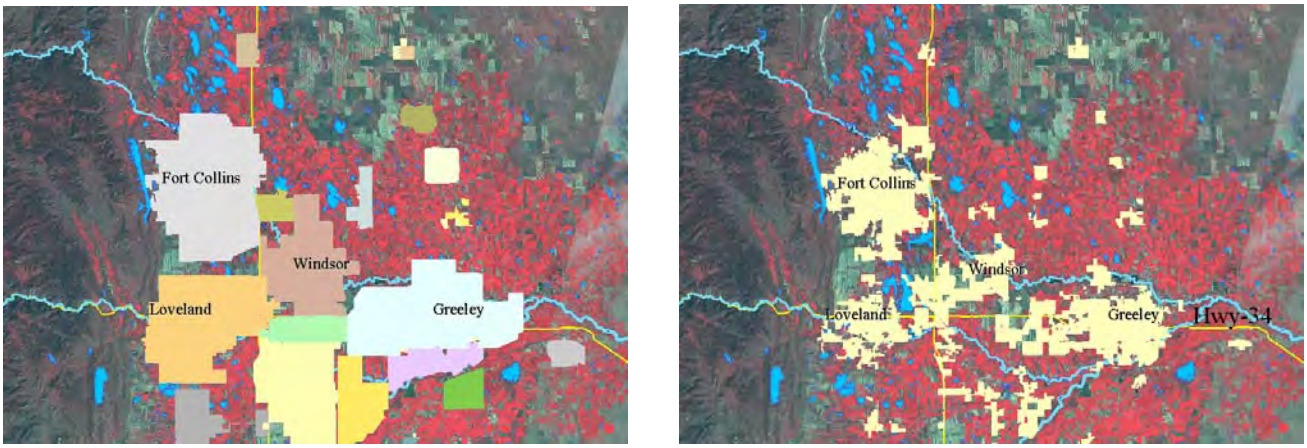

Figure 6. Projected development buildout in the Northern part of the NISP participant region by 2035 (left) compared with development in 2007 (right). The bright red circles and rectangles in the images are irrigated agricultural lands. Source: Northern Colorado Water Conservancy District.

Careful water use would allow them to use the water from these formerly irrigated lands to supply their needs. But the NISP DEIS does not address this critical source of supply. Why not?

If there is to be an open and honest discussion about helping agriculture and providing sources of water supply for the exurban expansion of the NISP participants, water supply projections must include irrigation water tied to lands developed within the NISP participants' annexations. This discussion must also include the measures that the participants are taking and, in most cases, not taking, to reduce their water supply requirements and therefore reduce the need to dry up irrigated land for municipal and industrial (M&I) development.

Based on the NISP DEIS population projections, we estimate the participant towns and water districts would occupy a developed land "footprint" or about 126,000 acres, which would be about 76,000 acres more land than they occupied in 2005 under the revised population growth scenario above. Irrigated agriculture occupies about 48,000 acres of that new land that would be developed,[13] on which about 33,300 AF of water is used for irrigation and should be available for M&I uses.[14, 15, 16]

It appears that nearly all of the water that would be provided by the NISP project would be available from the displacement of irrigation water off of newly developed lands.

Rotational Fallowing Agreements

Rotating Fallow Agreements are contracts between municipal and agricultural water uses whereby municipalities pay irrigators to regularly fallow some of their fields in return for contract payments equal to or exceeding the value the water would yield if used to irrigate crops. It has been successfully applied at large scales in California and other parts of the West.

Some advantages of rotating fallow agreements include but are not limited to:

- Provide financial stability to irrigators who are routinely affected by fluctuating crop prices.
- Irrigators remain in operation while M&I uses a portion of agricultural water supplies.

[13] 76,000 acres x 63% (average proportion of ag land in irrigated agriculture) = about 48,000 acres of irrigated land.
[14] U.S. Department of Agriculture Census of Agriculture. http://www.agcensus.usda.gov/
[15] U.S. Department of Agriculture National Agricultural Statistics Service. http://www.nass.usda.gov/
[16] Broner, I. and J. Schneekloth. 2003. *Seasonal Water Needs and Opportunities for Limited Irrigation for Colorado Crops.* Extension Bulletin 4.718, Colorado State University Extension Service, Fort Collins, Colorado.

- Irrigators use cropland fallow intervals to rest cropland, benefitting soils and improving crop yields, while allowing for irrigation infrastructure improvements and critical maintenance operations that improve system efficiency.
- M&I users and irrigators establish long-term economic linkages that benefit the community and the region.
- Irrigators may choose to retire lands that are difficult to irrigate or suffer from soil salinity, compaction, erosion, declining crop yields, or other issues.

The NISP DEIS alternatives analysis features a rotating fallow agreement scenario that we believe artificially inflated implementation costs while creating a contracting scenario of unrealistic complexity.[20] The scenario required purchasing 103,000 AF of water and then leasing back 91,000 AF to irrigators, yielding 12,000 AF, only 10% of the purchased volume.

A recent survey of South Platte basin irrigators found that that 63% of interviewed farmers would be willing to participate in a rotational land fallowing program, if compensated adequately with a mode for compensation estimates of $400/ acre-foot.[17]

The four largest ditch operators in the Poudre River system are the North Poudre Canal, Larimer County Canal, Larimer & Weld Irrigation Canal, and the New Cache la Poudre Co. Ditch (aka Greeley No. 2). About 55% of the native and imported water in the river,[18] or 226,092 AF, is diverted by these ditches.[19] Rotating fallow agreements with just these four companies have the potential to yield at least 22,600 AF of water, assuming 50% consumptive use and fallowing intervals of once every five years. This represents just a small portion of the opportunities for rotating fallow agreements in the Poudre River, Big Thompson, Little Thompson, St. Vrain, and South Platte watersheds, when combined.

Alternative Water Supply Scenarios

The NISP DEIS conducted an alternatives analysis that sought to identify possible sources of water supply for the project.[20] The alternatives analysis set an arbitrary 30% threshold figure for the firm yield supply, whereby an alternative would be required to provide a minimum of 30% of the proposed 40,000 AF firm yield in order to be included in the project. The alternatives analysis provided no substantive basis for using a firm yield cutoff threshold value. We eliminate the threshold in this analysis in order to provide greater flexibility for lower cost supply options, in conjunction with the revised demand value, having corrected for errors in the population forecasts and per capita water use figures adjusted for cost-effective conservation measures. Based on the analysis presented in the above section on population growth and demand management, we assume that demand can be reduced by 5,000 AF from 40,000 AF to 35,000 AF, well within the range of reasonable reductions.

In our analysis, we first look at the NISP DEIS No Action Alternative (NAA), assuming that the NISP participants would purchase and transfer existing agricultural water rights and C-BT shares if NISP was not built. The primary changes to what is found in the DEIS will be to reduce the demand forecast from 40,000 AF to 35,000 AF in accordance with our revised estimates to assume that phase the purchase and development of agricultural rights and C-BT shares in accordance with their needs or that they will lease water back to irrigators

[17] James Pritchett, Jennifer Thorvaldson, Neil Hansen, Ajay Jha. 2008. Water Leasing: Opportunities and Challenges for Colorado's South Platte Basin. Presented at WAEA Annual Meeting, June 26th, 2008, Big Sky, Montana. http://www.kysq.org/Lease.pdf, viewed on 8/31/2008.

[18] We use the word *native* to identify water that originates in the Cache la Poudre River Watershed. More than a hundred thousand acre feet of water is *imported* into the watershed from the Laramie River (via the Laramie River Tunnel), The Michigan River (Via the Michigan Ditch), and the Colorado River (via the Grand Ditch). Most of the *imported* water is diverted from the river for irrigation and M&I uses near the mouth of the Poudre River Canyon.

[19] NISP DEIS p. 3-11.

[20] HDR Engineering 2007. NISP Alternatives Analysis.

until needed, either of which will reduce the cost to the participants.[21] We then reexamine the assumptions of the NAA to incorporate modified estimates of what storage will actually be required by agricultural transfers and by what C-BT shares might yield and, finally, we incorporate rotational fallowing along with agricultural transfers and C-BT purchases.

These scenarios assume no changes in existing points of diversion, or that points of diversion are moved to the furthest possible point downstream to improve flows.

Re-evaluating the Cost of the NISP DEIS No Action Alternative

The basis for costing the NAA is Table 2.5 (DEIS, page 2-44). The NAA assumes: 1) individual participant acquisition of water *as needed over time* in response to growing demand for urban water; 2) that such supplies will be broadly available and are not dependent on a small number of select canals; and 3) that, with the exceptions of the Eastern Group and Ft. Lupton, every acre foot (AF) of purchased agricultural water will require an acre-foot of storage (an assumption we will examine below).[22] The table proposes (or implies) that the needed water would be provided by acquisition of 58,400 AF of agricultural water rights (to provide 29,200 AF of firm yield, i.e., a consumptive use estimate of 50 percent) and 21,600 units of C-BT (each share providing 0.5 AF of yield).[23]

According to Table 2.5, the DEIS assumes that the cost of acquiring the agricultural water will be $6,000 per acre-foot (of which 50 percent will be available for transfer) and that an acre-foot of storage will cost $4,000,[24] and that C-BT shares will be $11,000.

For purposes of assessing the effect of phasing on costs we will use the same assumptions that Charles Howe employed in his DEIS comments.[21] We assume that: 1) the water will be acquired in four equal increments of 8,750 AF; 2) the shares will be purchased at 10 year intervals, starting now; and 3) the ratio of agricultural shares to C-BT shares will be that of Table 2.5. Based on these assumptions, each increment, undiscounted, will cost $173.9 million. With all of these assumptions in place we estimate the present value of costs assuming inflation free discount rates of 4%, 5%, and 6%. The results appear in Table 2 below.

Table 2. Present Value (PV) of the NISP No Action Alternative, assuming need of 35,000 AF by 2050 and staging of development.

	Discount Rate, 4%	Discount Rate, 5%	Discount Rate, 6%
PV, 1st Increment	$173.9 million	$173.9 million	$173.9 million
PV, 2nd Increment	$117.5million	$106.7 million	$97.1 million
PV, 3rd Increment	$79.3 million	$65.6 million	$54.2 million
PV, 4th Increment	$53.6 million	$40.1 million	$30.3 million
TOTAL	$424.3 million	$386.3 million	$355.5 million

[21] For a fuller discussion of phasing and its impact on costs see Charles W. Howe letter to Chandler Peter, June 11, 2008.

[22] According to Table 2-5, the Eastern Group will only need 6,200 AF of storage of 9,800 AF of purchased agricultural rights and Ft. Lupton will need 3,000 AF of storage for 6,000 AF of purchased agricultural water rights.

[23] The 0.5 acre-foot figure seems very conservative since a quota of 0.5 is the lowest ever imposed by NCWCD and is typically imposed in wet years when outdoor water demands will be low.

[24] The NISP DEIS grossly underestimates the availability of alternative storage on the Poudre River and South Platte basins. Storage capacity is widely available in existing reservoirs and gravel pits, to the extent that there is a widely known and well-established cost for existing storage of $4,000/AF (Source – *Aggregates Manager* Magazine, June 2006). For a recent analysis of available storage, see Don W. Deere, P.E., Colby J. Hayden, P.E., and Glen G. Church, P.E. 2007. *Gravel Pit Reservoirs: Colorado's Water Storage Solution.* pp. 158-173 in Wiltshire, R.L., Parekh, M.L., and Gross, C.M. (editors), GEO-Volution: The Evolution of Colorado's Geological and Geotechnical Engineering Practice (Proceedings of the 2006 Biennial Geotechnical Seminar, Nov. 10, 2006, Denver, CO; Sponsored by The Geotechnical Group of the Colorado Section of ASCE, Rocky Mountain Section of the Association of Environmental and Engineering Geologists; and Colorado Association of Geotechnical Engineers). Reston, VA: ASCE / Geo Institute, 978-0-7844-0890-2, 2007, 215 pp., Geotechnical Practice Publication No. 4 (Barcode: RMI MK31592).

These costs are well below the costs of over $800 million for the NAA offered in the DEIS.

We believe these costs provide a good starting point for examining alternatives that will meet NISP participant needs and, at the same time, not further degrade the already stressed Cache la Poudre River.

Option 1: an Alternative with Modified Assumptions about Storage Needed for Agricultural Transfers and the Value of C-BT Shares

The DEIS assumes that agricultural water transfers generally provide 0.5 AF of transferrable water for every acre-foot purchased, but that the storage requirement is, as described above, equivalent to the AF purchased. It is true that agricultural water rights are usually limited to the months from May through October,[25] so that providing water for year-round urban need does require storage, but we challenge the need as assumed in the DEIS, i.e., one unit of storage for every unit of purchased water. We believe that the storage requirement should be adjusted both for the consumptive use component of the water that can be transferred and for the pattern of use. Urban demand follows a seasonal variation in which between 70% and 75% is used in the months from May through October and 25% to 30% from November through April.[26, 27] Between the consumptive use correction and the need to store water for winter use we assume that the storage requirement can be reduced by 60% of that which appears in Table 2-5 of the DEIS (i.e., from 51,800 AF to 21,000 AF) and by an additional 2,880 AF to account for the reduced future demand from 40,000 AF to 35,000 AF, leading to a storage requirement estimate of 18,120 AF.

The need for C-BT shares in the NAA is based on an assumed "quota" of 0.5 AF/unit/year to establish a "firm" yield. The latter figure seems unduly conservative to us since a quota of 0.5 is the lowest ever imposed by the NCWCD and is imposed in wet years when outdoor water demands are low. The long-term average share value is 0.7 and we think it is the more proper figure to use. The C-BT system has substantial storage and with this in mind we believe that "conservative assumption" about share value ignores this as well as the decision process used by the NCWCD to set a share value. We use 0.7 in this second alternative and based on this assumption approximately 13,500 shares would be needed to provide 9,450 AF of yield.

The first ten year increment of costs for this alternative would now be $138.8 million and the subsequent incremental costs would be discounted as they were above. The results, again assuming discount rates of 4%, 5%, and 6%, are shown in Table 3.

Table 3. Option 1: Present Value (PV) of Costs Assuming Need of 35,000 AF, Staging of Development, Reduced Storage Needs, and Higher C-BT Share Value. Dollar figures are in millions.

	No Discount	Discount Rate, 4%	Discount Rate, 5%	Discount Rate, 6%
PV, 1st Increment	$ 131.9	$ 131.9	$ 131.9	$ 131.9
PV, 2nd Increment	$ 131.9	$ 89.1	$ 80.9	$ 73.7
PV, 3rd Increment	$ 131.9	$ 60.2	$ 49.7	$ 41.1
PV, 4th Increment	$ 131.9	$ 40.7	$ 30.5	$ 23.0
TOTAL	$ 527.6	$ 321.9	$ 293.0	$ 269.7

These cost estimates represent a substantial reduction from the cost of the NISP DEIS proposed action alternative.

Option 2: An Alternative that Incorporates Rotational Fallowing with Agricultural Transfers and C-BT Shares

For purposes of this alternative we assume that rotational fallowing can supply slightly more than a third of our estimate of demand or 12,000 AF/year and that two thirds (or 8,000 AF) of this will supplant the agricultural transfers component of our above alternatives and one-third the C-BT component. In other words, to meet a demand of 35,000 AF of demand, 12,000 AF will come from rotational fallowing, 15,800 AF from agricultural transfers, and 7,200 AF from C-BT shares (not unreasonable for C-BT, given the flexibility of share purchases).

Assuming that the fallowing will come with a storage requirement comparable to agricultural transfers, the storage will be increased from 18,120 AF to approximately 21,600 AF. Regarding costs of rotational water, we assume that the basic cost (i.e., compensation to irrigators) is $400/ acre-foot, that additional administrative costs will be 25% or $100/AF and that the present value of the time stream of costs ($500/year/acre-foot) is approximately (depending on the discount rate) $5,000/acre-foot. With these assumptions the first increment of costs is $112.3 million. With this as the incremental cost, the discounted present value for this alternative, again for three discount rates, is in Table 4.

Table 4. Option 2: Present Value (PV) of Costs Assuming Need of 35,000 AF, Staging of Development, Reduced Storage Needs, Higher C-BT Share Value, and Agricultural Fallowing.

	No Discount	Discount Rate, 4%	Discount Rate, 5%	Discount Rate, 6%
PV, 1st Increment	$ 112.3	$ 112.3	$ 112.3	$ 112.3
PV, 2nd Increment	$ 112.3	$ 75.8	$ 68.9	$ 62.7
PV, 3rd Increment	$ 112.3	$ 51.2	$ 42.3	$ 35.7
PV, 4th Increment	$ 112.3	$ 34.6	$ 26.0	$ 19.6
TOTAL	$ 449.2	$ 273.9	$ 249.5	$ 229.6

The introduction of rotational fallowing, given the cost assumptions we have made, leads to another alternative cost reduction.

Revised Cost Estimates for the NISP DEIS Action Alternatives

In their analysis of the cost projections for the NISP project,[28] Western Resource Advocates found that the NISP DEIS and technical reports did not include more than $350 million in costs associated with the project. These costs include: (a) construction costs inflation linked to the spike in energy and raw materials prices, (b) funds needed to renovate existing drinking water and wastewater treatment facilities affected by the project, and (c) finance costs not included in the project costs, discussed below.

Energy/Cement/Steel Price Inflation Impacts NISP

The construction cost estimates in the NISP DEIS and technical reports are based on reports from 2003 to 2006, before the recent spike in construction materials and energy prices. Since that time, price inflation for critical construction cost line items such as diesel fuel, cement, and steel have risen nearly 100%, leading to dramatically rising construction costs for major projects like reservoirs. Since 2006, major construction projects in Colorado have run over predicted budgets by 30 to 50%.[29, 30, 31] In their analysis of the NISP project costs,[28] Western Resource Advocates applied inflation indices used by the Corps of Engineers to previous costs

[28] Western Resource Advocates. 2008. *Revised Construction Cost Estimates for the NISP Project.* 2260 Baseline Road, Suite 200, Boulder, CO 80302.

[29] Elkhead Reservoir construction costs increased by 50% from $20 million to $30 million. Source: Colorado River Water Conservation District, Elkhead Reservoir Enlargement Project website, http://www.crwcd.org/page_28, viewed August 31, 2008.

[30] FasTracks in Denver is expected to cost $1.8 billion more, a 30% increase. Source: *Fastbacks Price Tag Jumps.* Denver Post, August 21, 2008. http://www.denverpost.com/breakingnews/ci_10259704, viewed August 31 2008.

[31] Costs for the Lake Powell Pipeline escalated 22% between 2005 and 2008.

estimates done by the project proponents, finding that construction costs are likely to be at least $77 million (18%) higher than the DEIS estimate.

Renovations to Existing Drinking Water and Sewage Treatment Facilities

The City of Fort Collins reported in their summary of comments on the NISP DEIS that the city would incur additional costs of $75-125 million to upgrade water treatment facilities in order to meet post-NISP discharge permit conditions.[32] If the proposed pipeline is built between the existing Horsetooth Reservoir and the proposed Glade Reservoir, $50-90 million in additional costs to upgrade potable water treatment facilities would be required. Additional yearly operating costs of at least $3 million would be incurred. This represents a total cost burden (in 2008 dollars) to the City of Fort Collins of $125 - $215 million.

Several other utilities would be affected by the NISP project, but have not published estimates of the financial impacts of the NISP project would have on their facilities or operating costs. These include the Eastern Larimer County Water District and the Fort Collins-Loveland Water Districts, which use water from Horsetooth Reservoir, and the Boxelder Sanitation District and sewage treatment facilities for Timnath, Severance, Windsor, and Greeley, all of whom discharge treated sewage into the Poudre River and draw from the Poudre River for drinking water supplies.

Project Financing Costs

The NISP Master Financing Plan recommends that the Participants finance the NISP project using a combination of cash payments, revenue bonds, and a guaranteed loan from the Colorado Water Conservation Board's revolving loan fund.[33] Using the scenarios recommended in the plan, we project the financing costs to be $140 – $260 million (in present value).

Total Revised Cost for NISP

Tables 5 and 6 show the revised cost estimate for the NISP project based on the above analyses:

Table 5. Comparison of total costs (not discounted) of NISP, including financing costs, under the Draft EIS estimate and two revised estimates. Dollar figures are in millions. Financing assumes a down payment of $85,200,000 (20% of the Draft EIS cost projection), a 30 year term, and 4.45% bond rate. The third row includes cost of upgrades to the Fort Collins water and sewage treatment facilities, which range from $125,000,000 to $215,000,000.

Cost Category	Construction Costs	Financing Costs	Total Cost
Draft EIS Estimate	$ 426	$ 220	$ 646
Revised Construction Costs Estimate	$ 503	$ 269	$ 772
Revised Construction Costs + Upgraded Treatment Plants	$ 628-718	$ 350-408	$ 978-1,126

[32] City of Fort Collins. Agenda item #24 summary for September 2, 2008 City Council Meeting. http://citydocs.fcgov.com/?cmd=convert&vid=72&docid=1303915, viewed on 8/29/2008.
[33] Red Oak Consulting. November, 2006. NISP Master Financing Plan Final Report, prepared for the Northern Colorado Water Conservancy District.

Table 6. Comparison of total costs (discounted into 2008 dollars) of NISP, including financing costs, under the Draft EIS estimate and two revised estimates. All costs are in millions of dollars. Financing assumes a down payment of $85,200,000 (20% of the Draft EIS cost projection), a 30 year term, and 4.45% bond rate. The financing costs are discounted into present value (2008 dollars) based on a 5% discount rate. With a higher bond rate, financing costs will be more substantial.

Discount Rate	4%	5%	6%	Financing Costs	Total Cost assuming 5% discount rate
NPV - DEIS Estimate	$ 331	$ 311	$ 293	$ 140	$ 451
NPV - Revised Construction Costs, No Treatment Plant Upgrades	$ 390	$ 367	$ 346	$ 172	$ 539
Revised Construction Costs + Upgraded Treatment Plants	$ 493-567	$ 465-536	$ 440-507	$ 223-260	$ 688-796

Based on a total non-discounted project cost of $978 - $1,126 million, the cost per acre foot would be $24,450–28,150, at the upper end nearly three times that described in the NISP DEIS. The total discounted cost at 5% would be $688 – $796 million, or $17,200 – $19,900 per acre foot.

We wish to emphasize that these revised estimates are conservative. They are based on the low end of the range of bond interest and inflation rate figures that will likely apply to NISP if it is built. For example, cost overruns like those seen in other recent projects, which were 2.5 to 4 times higher than the Corps of Engineers inflation indices, would drive construction costs far higher than even these revised estimates. Higher revenue bond interest rates (possibly up to 5.5%) would drive financing costs higher. Either of these contingencies, either separately or combined, would drive the total project cost well over $1 billion.

Cost for the Healthy Rivers Alternative

We estimate the demand reduction measures will cost the NISP participants $28-92 million, based on the range of conservation and efficiency costs from the Colorado Statewide Water Supply Initiative (SWSI), Phase II report.[34] The actual costs would depend on the measures best suited for each NISP participant. Based on the preceding analysis, we estimate the non-discounted cost for the Healthy Rivers Alternative to be $449 - $528 million, or $11,225 - $13,200 per acre foot. Discounted costs would be $250 - $393 million, or $6,250 - $9,825 per acre foot.

Comparing NISP with the Healthy Rivers Alternative

The NISP DEIS projected devastating consequences for agriculture if the document's action alternatives were not enacted. Our own analysis and that of other expert reviewers indicates that the DEIS analysis was faulty, transparently flawed and subject to major revision.[35] Here is a summary of the problems in the analysis:

- Total agricultural lands impacted by the no-action alternative were artificially inflated upwards by the use of faulty calculations and incorrect equation factors. As a result the document proposed agricultural impacts from the no-action alternative that were more than twice what is likely.

[34] http://cwcb.state.co.us/NR/rdonlyres/C65D6406-3EE0-4E44-9C5E-E1655D814CB8/0/S2_ConservationEfficiency.pdf, viewed on 8/31/2008.
[35] Save The Poudre Coalition. 2008. *A Review of the Likely Agricultural Impacts from the Northern Integrated Supply Project.* http://www.SaveThePoudre.org.

- The action alternatives received a cursory analysis that did not include issues that affect tens of thousands of farmland. For example, diverting and storing the Grey Mountain Right (which is the last remaining peak flows left in the river) would harm hundreds of irrigators in the Lower Poudre and South Platte watersheds who depend on the Grey Mountain Right for well augmentation. The Grey Mountain Right is likely diverted for irrigation from the South Platte in Colorado and Nebraska, drying up at least 13,000 irrigated acres if NISP went forward.

- Thousands of acres of cropland served by the South Platte Water Conservation Project would likely become saline, and existing crops could require up to 60% more irrigation water just to maintain current yields because of the salinity of South Platte River water.

- The DEIS used a blatantly faulty method to estimate the farmland irrigation-associated wetlands affected by the no-action alternative, providing an estimate of wetlands affected (1,384 acres) that is probably at least ten times too large. It downplayed the poor habitat value of most irrigation-associated wetlands, while virtually ignoring most riparian-associated wetlands along the Poudre River.

- The DEIS failed to document the agricultural lands displaced by the expansion of the NISP participants, estimate at about 76,000 acres between now and 2050.

Our analysis of the NISP project impacts on irrigated agriculture suggest that the NISP no action alternatives would impact about the same amount of irrigated land as would the action alternatives. Table 7 indicates that all of the NISP project alternatives would affect roughly the same amount of irrigated land. The complexity of water use and water law in Colorado, and the high degree of demand in all sectors means that the Grey Mountain Right and virtually all other water that originates in the Poudre River basin is currently diverted and used either in the Poudre River or downstream on the South Platte.

The proponents of the NISP project are simply squeezing the water supply balloon — they claim NISP reduces pressure on Ag water supplies in the Poudre River basin, but in reality it increases pressure on irrigators drawing water from the South Platte River. And it places even greater pressure on South Platte Basin irrigators drawing from wells, who rely increasingly on the Grey Mountain right and existing flows in the Poudre for their well augmentation. We did not estimate those impacts, but including them would drive the NISP impacts on agriculture even higher.

We would also like to point out that the exurban expansion plans of the NISP participants may be the least agriculture-friendly aspect of this project. Whether they seek water supplies from NISP, the Healthy Rivers Alternative, or some other means, their expansion plans will lead to developing about 76,000 acres of agricultural land, of which about 48,000 is currently irrigated. This would free up about 60,000 AF of water supply for the participants.

The Healthy Rivers Option 2 offers the greatest potential to reduce the impact on agriculture. Adopting comprehensive conservation and efficiency measures and implementing rotating fallow agreements with farmers reduces demand for agricultural water transfers, while providing a reliable income stream to irrigators. Adopting very modest conservation measures to reduce water demand by 20% in 2050 would require 8,500 AF less water for the NISP participants in addition to the savings already in the Healthy Rivers Alternative. Doubling the proportion of their supply from rotating fallow agreements would require 12,000 AF less from agricultural water transfers.

Table 7. Summary of NISP DEIS irrigated cropland loss estimates compared with the Healthy Rivers Alternative.

Irrigated Agriculture	Irrigated Acreage Lost	Dryland Acreage Lost	Total Ag Acres Impacted
NISP DEIS No Action Alternative			
Ag Water Transfers	20.938	-	20.938
C-BT Transfers	6,563	-	6,563
total	**27,501**	-	**27,501**
Alternative 2-4 (Action Alternatives)			
Grey Mountain Right Diversion	13,889	-	13,889
Soil Salinity Impacts	1,600	-	1,600
Saline Irrigation Water Impacts	2,400	-	2,400
Reservoir Development	200	3,121 - 6,037	3,321 – 6,237
total	**18,089**	**3,121 - 6,037**	**21,210 – 24,126**
Healthy Rivers Alternative, Option 2[36]			
Ag Water Transfers	10,972	-	10,972
C-BT Transfers	5,000	-	5,000
Rotating Fallow Agreements	-	-	-
total	**15,972**	-	**15,972**

Based on expert reviewer analysis of the NISP DEIS, we offer the following comparison between the Healthy Rivers Alternative Option 2 with the NISP DEIS action alternatives (Table 8).

[36] From Save The Poudre Coalition's analysis of the impacts of NISP on Agriculture, at 1.44 AF/acre, 15,800 AF of water would irrigate about 10,972 acres of land in the Poudre River basin.

Table 8. Summary of impacts of the NISP DEIS action alternatives compared with the Healthy Rivers Option 2.

Impact Category	NISP Action Alternatives	Healthy Rivers Option 2
Water Quality	↓ Regulatory action by the State of Colorado and the Federal Environmental Protection Agency would be likely in order to protect public health and safety.	↔ Maintains the remaining peak flows in the Poudre river, supports restoration of base flows and addition to peak flows, greatly improving water quality and eliminating the need for regulatory actions.
Maintain and Support Agriculture	↓ Lead to the dry up at least 60,000 acres of irrigated land, and lead to increased salinity of irrigated soils in the farmland served by the proposed Galeton Reservoir. Crop yields would drop significantly and at least 6,000 acres of land likely would need to be retired because of salt buildup.	↑ Implementing conservation and efficiency measures though demand-side management while securing water supplies through rotating fallow agreements and development-displaced water reduces pressure for agriculture water transfers and provides a new secure income stream to farmers and ranchers, particular during drought years.
Riparian-associated wetlands	↓↓ Lost river flows would drop the water table, impacting existing cottonwoods and willows. Loss of peak flows would end the process that builds new seedbeds for cottonwoods and willows, leading to long-term decline of the riparian forest.	↔ Retaining peak flows makes river restoration efforts possible and much more likely to succeed.
Irrigation-associated wetlands	↓↓ NISP would dry-up more than 60,000 acres of irrigated farmland, leading to the loss of wetlands associated with the irrigation of those lands. The salinity of South Platte River water used to replace much cleaner Poudre River water would degrade existing irrigation-associated wetlands. Loss of irrigated lands through reduced flows on the South Platte would degrade existing irrigation-associated wetlands.	↔ Implementing water conservation and efficiency measures, and securing water through rotating fallow agreements with farmers will minimize the impacts of irrigated land dry-up. Pursuing aggressive conservation and efficiency measures and rotational fallowing agreements could mean relatively little irrigated land dry-up. Depending on the mix of water supply options the NISP participants choose, agricultural water transfers and purchasing C-BT units from agriculture would impact irrigation-associated wetlands.
Aquatic ecosystem	↓↓ Peak flows are critically important to the Poudre River aquatic ecosystem. Loss of peak flows would lead to a cascade of impacts leading to a likely collapse of the current aquatic ecosystem. River Restoration efforts that would improve the aquatic ecosystem would be much less likely to succeed.	↔ Retaining peak flows maintains the existing aquatic ecosystem and water quality levels, while making river restoration efforts possible and much more likely to succeed.
Riparian ecosystem	↓↓ Peak flows are critically important to the Poudre River riparian ecosystem. Loss of peak flows would lead to a cascade of impacts leading to the long-term, highly visible decline of the riparian ecosystem. River Restoration efforts that would improve the riparian ecosystem would be much less likely to succeed.	↔ Retaining peak flows maintains the existing riparian ecosystem on the river, while making river restoration efforts possible and much more likely to succeed.
Recreation	↓ Loss of peak flows likely to lead to the collapse of the existing aquatic ecosystem due to silt buildup, higher water temperatures, buildup of algae, loss of native plants, and channel constriction. Existing quality trout fishery between the Poudre River Canyon mouth and I-25 would be highly degraded. Whitewater sports downstream of the Poudre River Canyon	↔ Retaining peak flows sustains the existing trout fishery, supports water-based recreation such as kayaking, canoeing, tubing, and supports whitewater parks. Preserving the riparian and aquatic ecosystem will maintain current recreation and support current investments in open space, natural areas, and recreation infrastructure along the river. Successful

	mouth would be limited to a few weeks a year only in wet years. Whitewater parks in Bellvue, LaPorte, Fort Collins, Windsor, Greeley, or other locations downstream of NISP diversion dams would not be possible.	restoration efforts are highly likely to improve recreation substantially.
Total Cost	↑↑ Revised costs for NISP proposed action conservatively estimated at $ 688 - $ 796 million, or $17,200–19,900 per AF (discounted into present value). Estimate likely to rise as other utility districts evaluate NISP impacts on water supply and sewage treatment plant permit requirements. Additional construction cost inflation and revenue bond interest rate increases would raise costs much higher.	↓ Costs conservatively estimated at $265 - $301 million, or $6,626 - $7,516 per AF. Construction cost inflation could raise costs of alternative storage options.
Protect threatened and endangered species	↓ The long-term survivial of the Preble's meadow jumping mouse would be placed in jeopardy. Construction of the proposed Glade reservoir jeopardizes Bell's twinpod, a globally-imperiled plant species found only on the hogback at the Glade site and a very few other sites in Colorado.	↔ Helps to maintain existing populations of Preble's meadow jumping mouse. Prevents degradation of habitat for Bell's twinpod. Successful restoration efforts likely to improve existing habitat and may create new habitat for Preble's meadow jumping mouse as well as two threatened plant species found in Colorado (Ute ladies' tresses orchid and Colorado butterfly plant).
Groundwater quality	↓ Removing peak flows will degrade the Poudre River alluvial aquifer, likely lead to reduced water quality, and hamper the efforts of downstream irrigators to continue irrigating from groundwater sources.	↔ Maintaining existing flows sustains existing alluvial aquifer levels and supports downstream irrigators' efforts to continue irrigating using groundwater sources. Successful restoration efforts are highly likely to improve aquifer levels and support well augmentation efforts by downstream irrigators.
Cleanup of superfund site under proposed Glade Reservoir	↓ The trichloroethylene (TCE) plume under the site for the proposed Glade Reservoir forebay would be much more difficult to clean up due to increased groundwater flow pressures from Glade, and water quality in the reservoir would be threatened by TCE contamination via the forebay.	↑ Existing proposed cleanup efforts are much more likely to succeed without groundwater flow pressure from Glade.

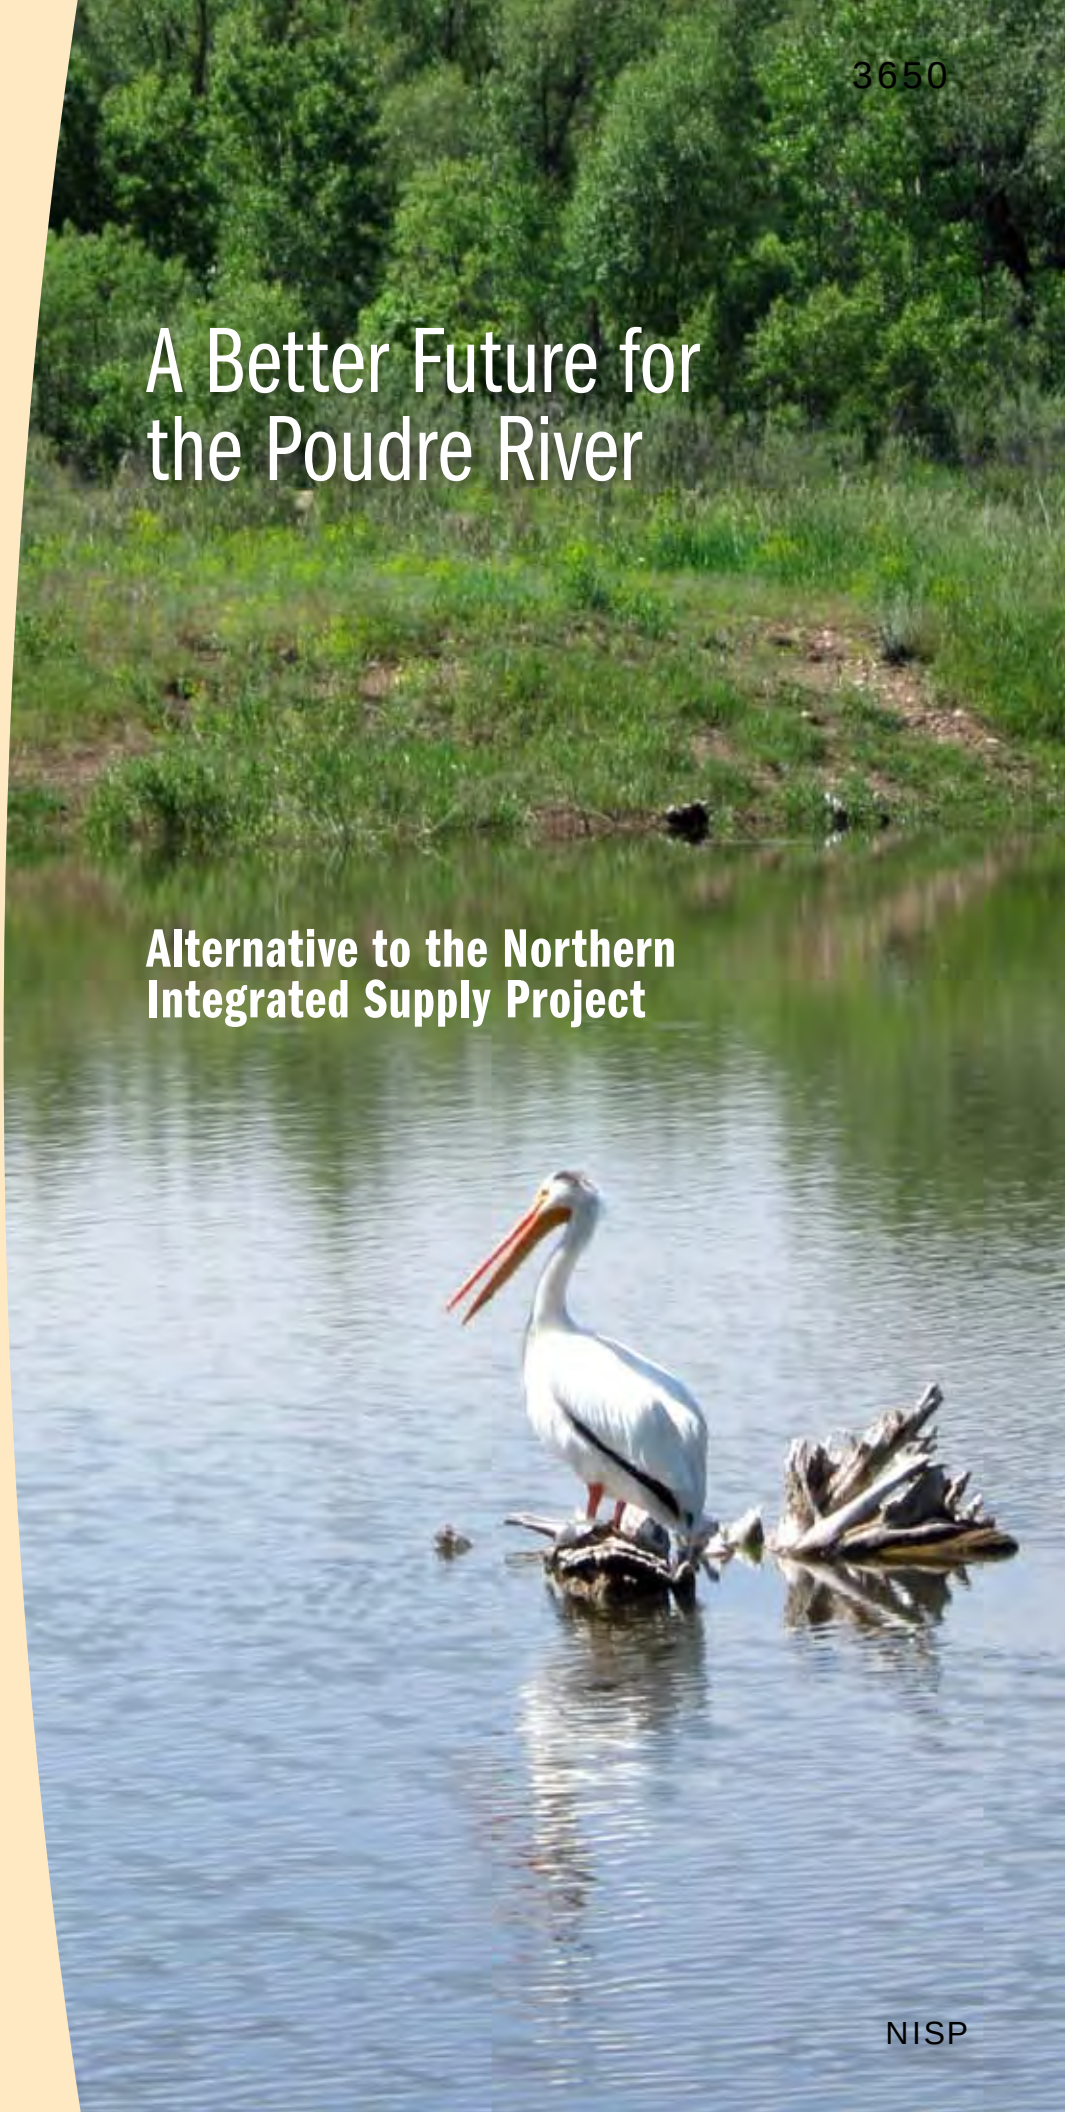
A Better Future for the Poudre River

Alternative to the Northern Integrated Supply Project



WESTERN RESOURCE ADVOCATES

BCC 08/17/20

NISP

This report was prepared by Laura Belanger, with valuable contributions from Stacy Tellinghuisen and Amelia Nuding. We are grateful to Drew Beckwith, John Gerstle, Charles ("Chuck") Howe, Becky Long, Dan Luecke, and Bart Miller for their review and feedback. Their experience in Colorado water issues and thoughtful suggestions enhanced the content of this report. We also thank Lee Rozaklis for his input on initial report concepts, municipal and irrigation water uses, and water rights considerations. Thanks for editing and report production assistance to Jason Bane, Anita Schwartz, and Nicole Theerasantiankul.

This report was funded by grants from the William and Flora Hewlett Foundation and the Compton Foundation, and by our generous supporters.

Contents

Definitions

acre-foot (AF)

Volume of water equal to 325,851 gallons. It is approximately the volume used by two to four families in a year. An acre-foot is enough water to cover an acre, one foot deep.

active conservation

Water demand reductions that result from conservation programs and measures implemented by water utilities and their customers. Active conservation can be voluntary or mandatory through regulations. Examples of active conservation include leak detection programs, tiered water rate structures that increase with higher use, improved irrigation management, switching to more water efficient landscaping, and toilet rebates.

Colorado-Big Thompson (CBT) Project

A U.S. Bureau of Reclamation project that diverts approximately 260,000 acre-feet of water each year from West Slope Colorado River headwaters to the South Platte Basin on the east slope. Northern Water apportions the water amongst irrigators and communities that receive municipal and industrial water from the project.

Colorado Water Conservation Board (CWCB)

A Colorado state agency whose responsibilities range from protecting Colorado's streams and lakes, to water conservation, flood mitigation, watershed protection, stream restoration, drought planning, water supply planning, and water project financing.

consumptive use

The portion of water that is used in a process that does not return to the adjacent hydrologic system. For example, water that evaporates or is transpired by plants during agricultural use, or water that is used up or evaporates in an industrial process.

Environmental Impact Statement (EIS) and Draft, Supplemental Draft, and Final EIS (DEIS, SDEIS, FEIS)

The National Environmental Policy Act (NEPA) requires federal agencies to consider the environmental impacts of proposed actions (projects) and reasonable alternatives to those actions. The detailed analyses contained in an EIS meets NEPA requirements.

firm yield

A measure of dependable water supply that can be expected in most (including dry) years, typically used in water supply planning. Average and wet year yields can be significantly higher than firm yield.

gallons per capita per day (gpcd)

A metric for measuring average water use. May include only residential use or be used to represent average system-wide use (residential and other uses, such as commercial, industrial, and institutional) in a community. In this report, gpcd refers to total per capita system-wide use.

Northern Colorado Water Conservancy District (Northern Water)

A public agency created in 1937, the Northern Colorado Water Conservancy District and its municipal subdistrict (both identified in this report as "Northern Water") serve a large portion of northeastern Colorado, providing water to irrigators, cities, towns, rural-domestic water districts, and industries from the CBT and Windy Gap projects.

present value of costs

A figure reflecting the time value of money, calculated by applying a discount rate to a series of expenditures and revenues over time. Using present value allows for an apples-to-apples comparison of costs and revenues that may occur over a wide variety of time frames.

water (or water resources) charge

Several NISP participants receive water treated by other utilities. These utilities apply a water resources charge, or fee, in the form of water supplies provided by the NISP participant to the treating utility. In the Harvey Report and the Better Future Alternative, the water charges are calculated as a percentage of "water deliveries."

water deliveries

The volume of water that is used by NISP participants' customers at the tap. It is what is needed to meet customer demands and is usually metered at a property (home, businesses, irrigation tap, etc.). This volume does not include system losses and water charges.

water losses (or system losses)

Water loss that occurs in treating and delivering water to end use taps.

passive conservation

Water demand reductions that are associated with the impacts of improved technology and state and federal policy measures that result in lower flow standards for fixtures and appliances. Passive conservation savings are realized as more efficient new homes are built or fixtures and appliances are replaced over time in older homes.

Record of Decision (ROD)

The ROD is the final step in the process of creating an Environmental Impact Statement. It includes a decision on the alternative that has been selected.

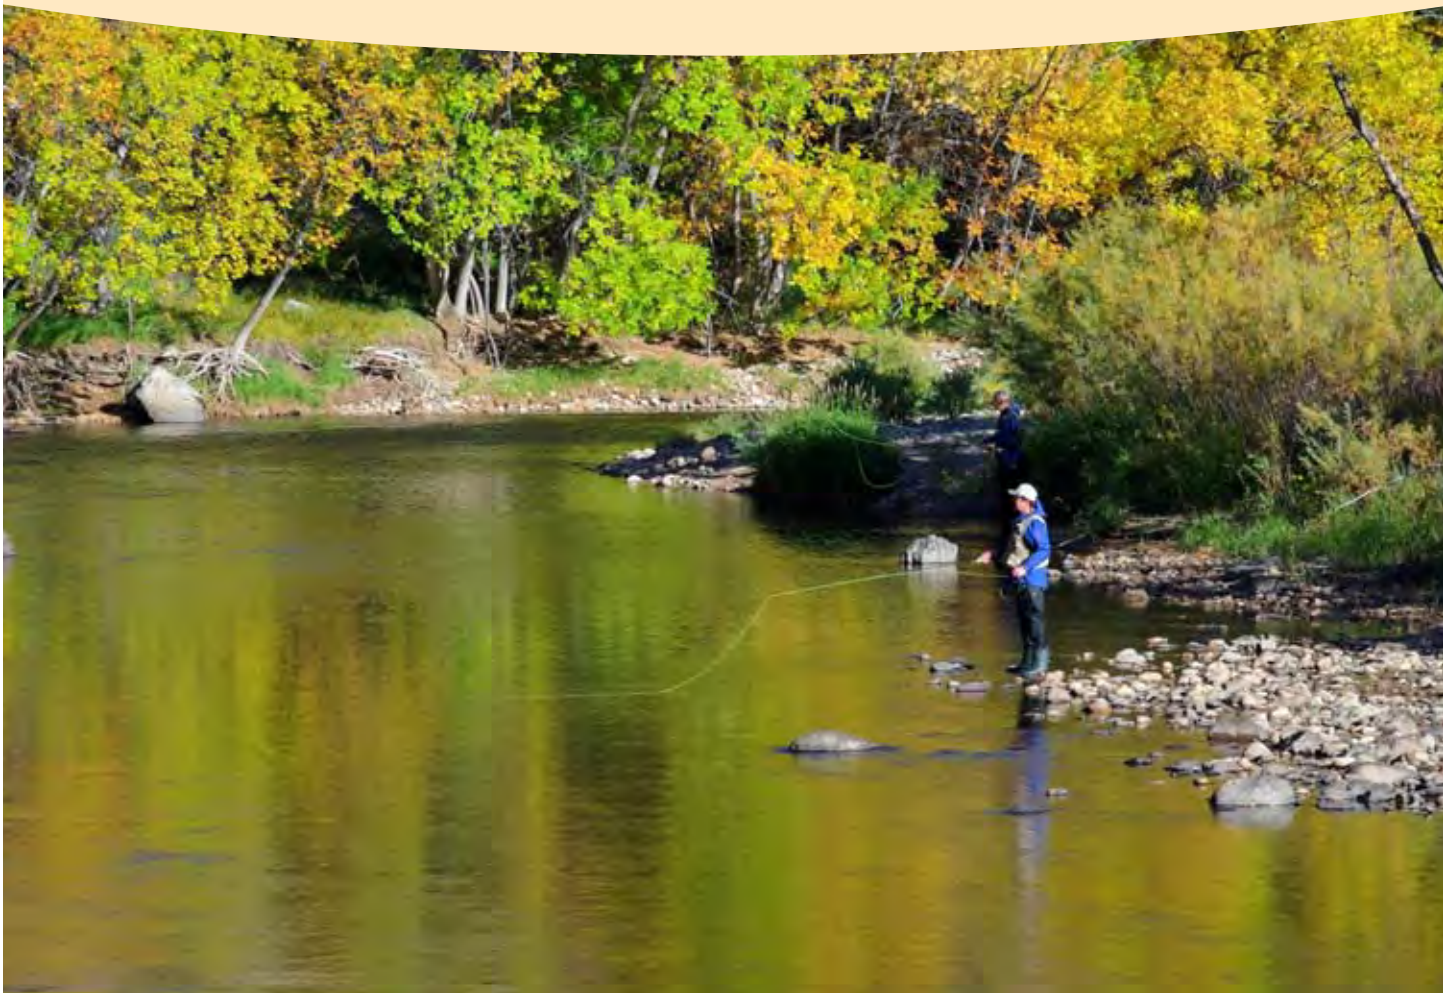
Statewide Water Supply Initiative 2010 (SWSI or SWSI 2010)

Report that provides a comprehensive picture of Colorado's current and future projected water needs and existing and potential supplies. It is updated by the state every few years.

total water requirements

In order to get "water deliveries" to NISP customers' taps, additional water is needed both to cover system losses (e.g., losses during treatment and transit) and to cover "water charges" applied to treat and deliver water to NISP participants. "Total water requirements" is the total volume of "water deliveries" plus "water losses" plus "water charges."

> "I applaud the advanced thinking that has gone into the Better Future Alternative. This report identifies innovative, workable, and viable water policy solutions that Colorado legislators and policy makers are well-advised to consider today as we work to plan our water future."
>
> — Randy Fischer, State Representative, Colorado House District 53



Executive Summary

The Better Future for the Poudre River Alternative ("Better Future Alternative" or "Better Future") is an alternative to the Northern Integrated Supply Project (NISP). NISP is a water supply project proposed by the Northern Colorado Water Conservancy District* (Northern Water) to provide 40,000 acre-feet† (AF) of water annually to help meet the future water needs of 15 towns and water districts in northern Colorado.‡ The Save the Poudre Coalition and Western Resource Advocates (WRA) first developed an alternative to NISP, the "Healthy Rivers" alternative, in 2008. The Better Future Alternative was developed by WRA to incorporate more current Colorado State Demography Office population projections, revised NISP participant demands and supplies from a 2011 report by Harvey Economics, data from the Colorado 2010 Statewide Water Supply Initiative, and other recent reports.

A Better Future provides water supplies sufficient to meet and exceed NISP participants' water demands while maintaining flows critical to aquatic and riparian environments and recreational opportunities in the Cache la Poudre River (Poudre River). In contrast, NISP would divert between 43% and 48% of the remaining flows from the Poudre River each year.

The Better Future Alternative relies on water from growth onto agricultural lands, conservation, reuse, and cooperative agreements with agriculture. It offers several benefits not provided by NISP:

* The Northern Colorado Water Conservancy District and its municipal subdistrict (both identified here as "Northern Water") serve a large portion of northeastern Colorado, providing water to irrigators, cities, towns, rural-domestic water districts, and industries.

† An acre-foot of water is equal to 325,851 gallons. It is approximately the volume used by two to four families in a year. An acre-foot is enough water to cover an acre (about a football field without the end zones) one foot deep in water.

‡ The NISP participants are Central Weld County Water District, Dacono, Eaton, Erie, Evans, Firestone, Fort Collins–Loveland Water District, Fort Lupton, Fort Morgan, Frederick, Lafayette, Left Hand Water District, Morgan County Quality Water District, Severance, and Windsor.

- The Better Future Alternative meets the needs of NISP participants through 2060. In contrast, NISP is designed to meet projected demands only through 2030.

- Rather than depending on large new reservoirs and diversions, a Better Future includes a diverse supply portfolio.

- By relying on a phased approach (i.e., increasing water supplies incrementally and avoiding large, up-front investment by participants), the Better Future Alternative provides water supply flexibility and financial risk management to communities. If population growth is not as rapid as predicted, communities can delay investment and avoid burdening existing residents with debt.

- Cooperative agreements with the agricultural community provide towns with long-term secure supplies while maintaining agricultural ownership of water. Less than 1% of agricultural consumptive-use water from the South Platte Basin will be necessary for the Better Future Alternative each year.

- The cost of NISP — in present value* — is approximately $364 million. Though not directly comparable to NISP, the Better Future Alternative's present value to provide 40,000 AF† of water (NISP's yield) — excluding some infrastructure costs — is $109 million.

- The Better Future Alternative protects the Poudre River, wetlands, and other important environmental and recreational resources as well as the communities and businesses that depend on them.

Better Future Alternative Water Supply Portfolio

Based on Colorado State Demography Office population estimates, recent NISP participant per capita water use, and applying passive conservation savings, the Better Future Alternative calculates that water requirements for NISP participants will total 72,100 AF in 2030 and 109,100 AF in 2060. This is 27,000 AF and 34,300 AF less than current NISP projections for 2030 and 2060, respectively.

The Better Future Alternative water supply portfolio (Figure 1), excluding Windy Gap Firming Project (WGFP) supplies, includes total firm yield

* The present value of costs reflects the time value of money by applying a discount rate to a series of expenditures and revenues over time. Using present value allows for costs and revenues that may occur over a wide variety of time frames to be similarly examined.

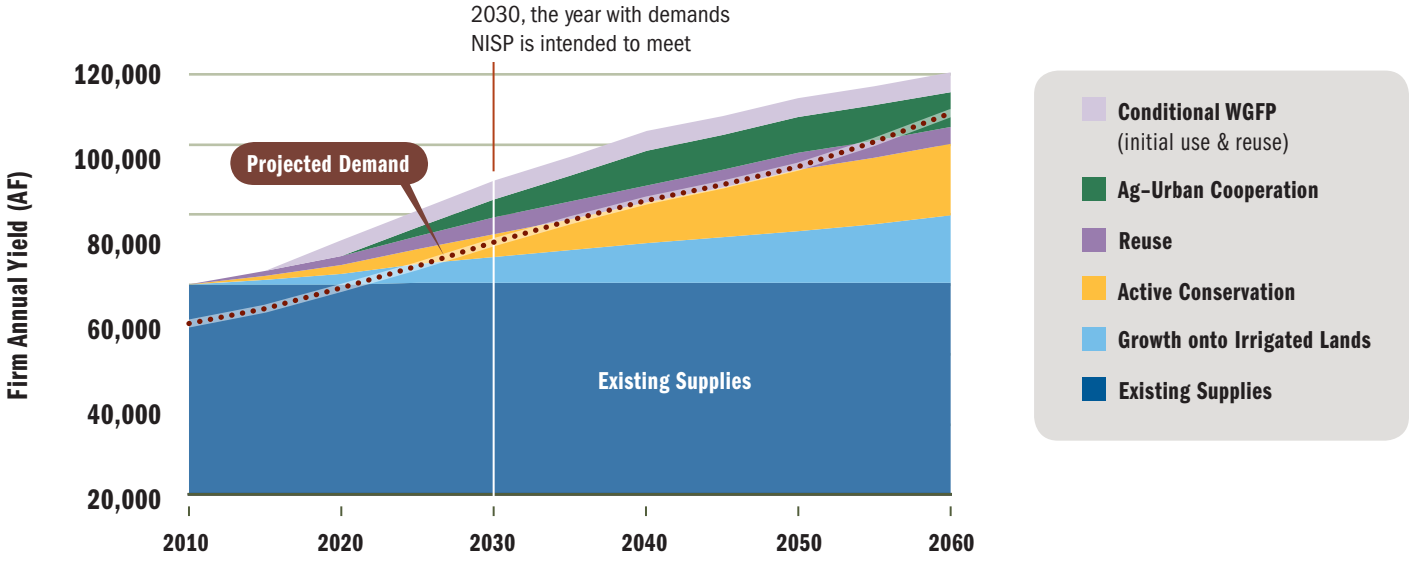
† The Better Future Alternative provides a total of more than 60,000 AF of new firm yield supplies by 2060, in addition to existing NISP participant supplies. The Better Future Alternative is projected to yield 40,000 AF of new firm yield supplies, equivalent to the NISP yield, between 2035 and 2040.

supplies of 84,200 AF in 2030 and 115,100 AF in 2060. This portfolio exceeds NISP's projected total water requirements by 12,100 AF in 2030 and by 6,000 AF in 2060. The components of the portfolio are:

- Current firm yield supplies = 60,550 AF
- Annual firm yield from traditional agricultural transfers from urban growth onto previously irrigated lands = 7,360 AF by 2030 and 19,150 AF by 2060
- Active conservation savings = 6,401 AF by 2030 and 20,482 AF by 2060
- Reuse of existing supplies = total of 4,900 AF by 2030
- Agricultural-Urban (Ag-Urban) cooperation = 5,000 AF by 2030 and 10,000 AF by 2060

Several NISP participants have also requested Windy Gap Firming Project supplies. Because this project has not yet been approved, and because of potential impacts to West Slope streams and rivers, a Better Future only conditionally includes WGFP supplies (first-time use and reuse) of 5,500 AF. When WGFP water is included, Better Future Alternative supplies exceed demands by 17,700 AF in 2030 and 11,500 AF in 2060. NISP participant projected demands are met with or without the WGFP.

FIGURE Nº 1 BETTER FUTURE ALTERNATIVE SUPPLIES MEET AND EXCEED NISP PARTICIPANTS' PROJECTED 2060 DEMANDS.



Recommendations

Planning for and meeting the water needs of NISP participant communities is critical, as is ensuring the health of the Poudre River and the recreational, economic, and other benefits it provides. We believe that Northern Water and NISP participants can chart an innovative path forward, one that differs from the traditional approach of building very large reservoirs. The Better Future portfolio instead relies on a combination of supplies from conservation, reuse, water transferred as a result of growth onto irrigated agricultural lands, and voluntary agreements with agriculture.

We encourage the U.S. Army Corps of Engineers to incorporate elements of the Better Future Alternative into its No Action Alternative when completing the NISP Supplemental DEIS.

Western Resource Advocates offers the following key recommendations for Northern Water, NISP participants, and the U.S. Army Corps of Engineers to consider carefully in planning for the region's future water needs:

- ✓ Meet projected demands with balanced strategies that are the least environmentally damaging, in contrast to large traditional reservoir and pipeline projects.
- ✓ Protect Colorado's rivers and streams as an integral part of any future water development strategy. Nonconsumptive uses of water—for fishing, boating, and other uses—are extremely valuable to the local economy and are critical to our quality of life.
- ✓ Use reliable and up-to-date population data and projections from the State Demography Office.
- ✓ Implement more aggressive water conservation strategies. Conservation is often the cheapest, fastest, and smartest way to meet new demands, and NISP participants have significant opportunities to boost their existing water conservation efforts.
- ✓ Conservation savings—passive and active—must be integrated into water supply planning.
- ✓ Include all existing supplies, supplies from growth onto irrigated lands, and NISP participants' water dedication requirements in future supply projections
- ✓ Maximize the role of water reuse in meeting future needs. Include NISP participants' existing and planned reuse—as well as additional Better Future reuse supplies—in any analysis.
- ✓ Include increased cooperation between agriculture and local communities in the form of voluntary water sharing agreements that benefit both NISP participants and the agricultural community without permanently drying up irrigated acres. Alternatives to "buy and dry" transfers present excellent opportunities for meeting future municipal demands.

By following these recommendations, NISP communities can more than meet their future water needs while minimizing impacts to rivers and streams.

Background

The Northern Integrated Supply Project

Northern Water has proposed the Northern Integrated Supply Project (NISP) to provide 40,000 acre-feet (AF) of annual yield to help meet projected 2030 demands for 15 towns and water districts in northern Colorado (Figure 2). If approved, NISP would create two new off-stream reservoirs: Glade Reservoir,* which would inundate a valley north of the mouth of the Poudre Canyon, and Galeton Reservoir, northeast of Greeley (Figure 3). The NISP reservoirs would be supplied by increased diversions from the Poudre River, eliminating remaining peak flows that are critical to stream and riparian health, habitat maintenance, river recreation, and the businesses that rely on it. In addition to Poudre River diversions, water diverted from Colorado's West Slope may be used during Glade Reservoir's initial fill as well as during droughts. Diversions from the South Platte River would also be used to supply Galeton Reservoir.

In 2006, Harvey Economics (hired by Northern Water) developed a survey of NISP participants' supplies and projected future water demands. The report by Harvey Economics provided the basis for the preferred alternative in the Draft Environmental Impact Statement (DEIS) released by the U.S. Army Corps of Engineers in 2008.† Many concerns about the DEIS were raised and, as a result, the Army Corps of Engineers is now in the process of completing a Supplemental DEIS. Because of the amount of time that had elapsed since the demand projections were first developed in 2006, an updated report was prepared by Harvey Economics in January 2011 (referred to herein as the "Harvey Report").‡ The Harvey Report projects demands through 2060, though NISP is planned only to meet 2030 projected demands. Additional supplies will be needed to meet demands beyond 2030 levels.

* NISP's proposed Glade Reservoir would have a very large capacity of 170,000 AF. For comparison, a) Aurora Reservoir's normal storage capacity is 32,400 AF; b) Standley Lake in Westminster holds 42,000 AF when full; and c) Denver's Lake Dillon holds 257,304 AF. Importance of Maintaining Poudre River Flows

The Poudre River is highly valued as a recreational and scenic mecca for Colorado residents. NISP would divert between 43% and 48% of remaining flows from the Poudre River near the canyon mouth each year, on average, with greatest impacts during peak flows months. During these months, up to 71% of monthly flows would be diverted.* The impact on aquatic and riparian habitats, the species that depend on them, and the river recreation corridor could be dramatic. The Poudre River from the canyon mouth to the confluence with South Platte River is habitat for many fish, including species that are listed by the state as being "endangered, threatened, and species of concern." Sections of this reach also provide "significant riparian and wetland habitat."†

* Northern Colorado Water Conservancy District. 2010. Map of NISP participant boundaries. http://www.northernwater.org/docs/NISP/MapsDocuments/MapsPDFs/4_nisp_participants.pdf.

The NISP DEIS says, "On average, about 430,000 AF of the annual flow of the Poudre River is diverted for [agricultural, municipal, and industrial] use."‡ This current flow regime ("Without NISP" in Figure 4) has already led to degradation of the Poudre River in many places. To address current impacts to the river, the Save the Poudre organization and others have developed proposals to protect river flows and restore the river.§,¶ NISP diversions would exacerbate flow issues through large additional withdrawals during the spring peak flow ("With NISP" in Figure 4). While the biggest impact would be felt on the Poudre River, NISP diversions would also decrease South Platte River flows below the confluence.

Peak flows serve many important functions. They maintain the stream channel by mobilizing sediment, forming pool and riffle zones, enhancing

> "NISP would destroy the Cache la Poudre River. As a lifetime resident and fly fisher of the Poudre, it is clear that turning a river into an irrigation channel would destroy its fundamental role in the hydrological cycle."
>
> —Rico Moore, Fly Fisherman

wetlands, removing encroaching vegetation, and flushing away debris and pollutants. High flows are also important in the life cycles of aquatic and riparian species. Decreased flows result in sediment buildup, increased algae, loss of native plants, and channel constriction. Lower flows also degrade water temperature and quality and lead to lowered alluvial groundwater tables, impacting riparian cottonwoods, willows, and other vegetation.

The Better Future Alternative demonstrates that NISP—and the detrimental impacts it would have on the Poudre River—are unnecessary. NISP communities should pursue reasonable, lower-impact supply alternatives prior to making large new diversions that would irreparably change the Poudre River.

The Better Future Alternative

The Better Future Alternative meets and exceeds NISP participant demands through 2060 while maintaining peak flows in the Poudre River, which are critical to recreation and the aquatic environment. It relies on a combination of supplies from conservation, reuse, water transferred as a result of growth onto agricultural lands, and voluntary agreements with agriculture. It is a regional alternative that evaluates NISP participant supplies and demands together rather than evaluating each participant individually. Such regional planning is appropriate and is similar to many other initiatives, including Colorado's Statewide Water Supply Initiative (SWSI), the Colorado River Water Availability Study, the Colorado River Basin Study, and WRA's *Filling the Gap* reports.

In the Better Future Alternative, WRA calculates baseline demands using current State Demography Office population projections, NISP participants' historical water use, and estimated future passive conservation savings.* The following diverse supply portfolio is then relied upon to meet demands:

1. **Existing supplies** — Firm yield from existing water supplies as specified in the Harvey Report, including an additional small volume that was documented but not included in the report's current supply total

2. **Growth onto irrigated lands** — Water that will be transferred to towns as they grow onto previously irrigated lands (such transfers or alternative supplies are required by many town ordinances)

3. **Active conservation** — 60% of savings from active conservation measures applied towards future demands (40% of savings held for drought response and to improve system reliability)

4. **Reuse** — Current, planned, and additional reuse of existing supplies

5. **Ag-Urban cooperation** — Voluntary and compensated leasing of water from agriculture to provide municipal water supply security while maintaining agriculture and agricultural communities.†

* Passive conservation savings occur without active efforts by towns, water providers, or residents. They are water demand reductions resulting from technological advances and state and federal policies that set lower flow standards for fixtures and appliances.

† Agricultural-Urban (Ag-Urban) cooperation would maintain irrigator control of water rights while providing the long-term security needed by municipalities. The participation of a group of irrigators in an Ag-Urban cooperation program (discussed in detail below in the "Ag-Urban Cooperation" section) would provide a permanent and reliable water supply for municipalities.

We also *conditionally* include initial use and reuse from the Windy Gap Firming Project (WGFP), which would provide supplies for five NISP participants. A Final EIS for this project was released in November 2011, but a Record of Decision (ROD) has not yet been released. This project would divert additional water to the Front Range, further impacting Colorado River headwaters. Because the WGFP has not yet been approved—and because of concerns about potential impacts—a Better Future discusses water supplies both with, and without, the WGFP. The inclusion of the WGFP in a Better Future should not be construed as support of the project. It is included, however, because it is in the final stages of approval and may be considered a reasonably foreseeable project.

The Better Future Alternative water supply portfolio exceeds expected 2060 demands (water needs) by nearly 6,000 AF. When the WGFP is included, water supplies exceed 2060 demands by nearly 11,500 AF (Figure 1). As documented in Appendix A, Better Future analyses are conservative and likely result in an underestimation of future water supplies. For municipal planning, this is appropriate to ensure that adequate water supplies are available to meet future needs. See Appendices B, C, D, and E for more detailed calculations and documentation of Better Future Alternative supply assumptions.

NISP Participant Water Demands

Key Definitions

This study utilizes data provided in the Harvey Report and compares NISP participant demands from that report to Better Future demands. In reviewing this study, it is important to understand that the Harvey Report and the Better Future Alternative discuss "water deliveries" as well as "total water requirements."

- **Water deliveries:** The volume of water that is used by NISP participant customers at the tap. It is what is needed to meet customer demands and is usually metered at the property (home, businesses, irrigation tap, etc.). This volume does not include system losses and water charges required to deliver water to the tap.

- **Water (or water resources) charges:** Several NISP participants receive water treated by other utilities. These utilities apply a water resources charge, or fee, in the form of water supplies provided by the NISP participant to the treating utility. In the Harvey Report and the Better Future Alternative, the water charges are calculated as a percentage of "water deliveries."

- **Total water requirements:** In order to get "water deliveries" to customers' taps, additional water is needed to cover both system losses (e.g., losses during treatment and transit) and "water charges" applied to treat and deliver water to NISP participants. "Total water requirements" is the total volume of "water deliveries" plus system losses plus "water charges."

A Better Future is designed to satisfy both water deliveries and total water requirements.

Projected Populations

The Harvey Report states that NISP participants utilized a host of different methodologies to develop demand projections that, in some cases, were then modified by Harvey Economics. Because population projections are the major driver for increasing future water demands, it is critical to have accurate and up-to-date projections for planning efforts.

Population projections are also heavily dependent on the near-term rates of population growth, and any deviations from projections in the first few years are compounded over time. The Harvey Report population projections include an unrealistic (now known to be incorrect) initial jump between the last year of historical data (2009) and first year of projected data (2010)—a 3.5% increase in population, the highest growth rate in the entire 50-year planning period. U.S. Census data from 2010 was not available when the Harvey Report was being developed, so the report had to estimate 2010 NISP participant populations. Comparing the Harvey Report's 2010 estimates for NISP participant towns to now-available 2010 U.S. Census data* shows that the report's estimates are 5.5% higher than actual populations. This comparison includes only NISP participant towns and does not include water districts that cover larger geographic areas (Central Weld County Water District, Fort Collins–Loveland Water District, Left Hand Water District, and Morgan County Quality Water District—see Figure 2) because discrete Census Bureau data are not available for these districts.

Better Future population estimates improve upon the older, pre-economic slowdown data used in the Harvey Report, much of which is based on inconsistent assumptions. The Colorado State Demography Office (SDO) is the official governmental agency responsible for population projections. Consequently, SDO projections should be used unless there are specific reasons to do otherwise.† A Better Future relies on 2011 SDO-projected county growth rates‡ through 2040 (the last year for which state projections are available) and the Harvey Report's projected growth rates for 2045 through 2060.

The Better Future 2060 projected population is 507,033, which is 12% lower (68,606 people fewer—about the current size of the towns of Eaton, Erie, Evans, Firestone, Fort Lupton, and Frederick, combined) than the Harvey Report estimate of 575,639 people (Figure 5). See Appendix B for more detailed calculations.

* Colorado Department of Local Affairs, State Demography Office. 2010. Excel file Census PopulationByAge2010_IncorporatedPlace.xls. Accessed May 25, 2012. Available at "2010 Census Data for Colorado" under Population by Age by City/Town http://dola.colorado.gov/dlg/demog/2010censusdata.html.

† In *Pagosa Area Water and Sanitation District and San Juan Water Conservancy District v. Trout Unlimited,* the Colorado Supreme Court found that the districts should use population projections corresponding to State Demography Office projections unless there was valid reason to do otherwise.

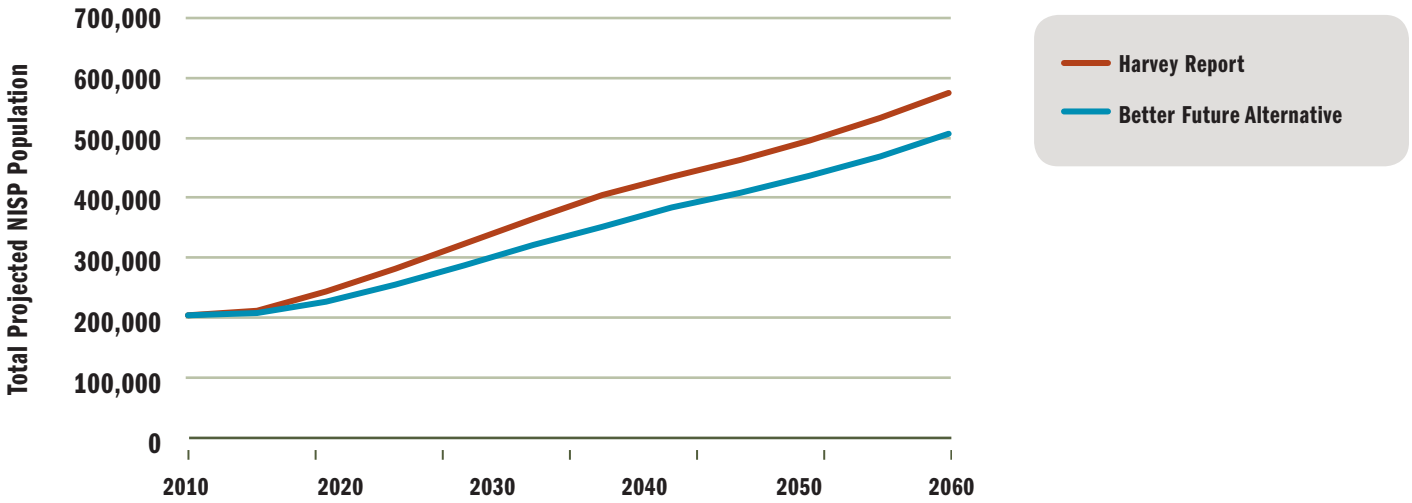
FIGURE Nº 5 BETTER FUTURE ALTERNATIVE POPULATION PROJECTIONS (DEVELOPED USING STATE DEMOGRAPHY OFFICE DATA) ARE LOWER THAN HARVEY REPORT PROJECTIONS.



As populations grow, some development will occur on agricultural lands.

Baseline Demands

Better Future NISP participant demands were developed to reflect baseline water use rates applied to our population estimates. **Total Better Future Alternative water requirements are 72,100 AF in 2030 and 109,100 AF in 2060.** This is 27,000 AF and 34,300 AF less than Harvey Report projections in 2030 and 2060, respectively.

A review of data provided in the appendices of the Harvey Report shows that for the period from 2004 to 2009, NISP participants used an average of 185 gallons per capita per day (gpcd), based on water deliveries. A Better Future uses this recent historical average to project water demands.* Passive conservation savings of 10.2%, a SWSI estimate,† were then assumed to occur gradually through 2050, after which per capita use was held constant.‡ Passive savings accrue without active—or purposeful—conservation efforts on the part of towns, water providers, residents, or industry. Passive savings result from technological improvements and state and federal policies, such as new fixture and appliance flow-rate regulations. Passive savings are evident in new homes that use less water than existing homes and are realized in older homes when fixtures and appliances are replaced with new equipment that uses less water.

The Better Future Alternative projects that NISP participant populations will increase by nearly 150% from 2009 to 2060 (Figure 5). As a result, the majority of homes and businesses will be new and will use less water due to passive conservation effects. To reflect this trend, Better Future per capita use rate decreases from 185 gpcd in 2009 to 166 gpcd in 2050 (and remains constant at this rate through 2060) (Figure 6). Applying Better Future baseline demands to our population projections results in total Better Future water requirements of 72,100 AF in 2030 and 109,100 AF in 2060. See Appendix B for more detailed calculations.

The Harvey Report bases future demands on average per capita usage rates that increase from a projected 193 gpcd in 2010 to a high of 212 gpcd in 2030 (an increase of 10%), before falling back to 193 gpcd in 2060 (Figure

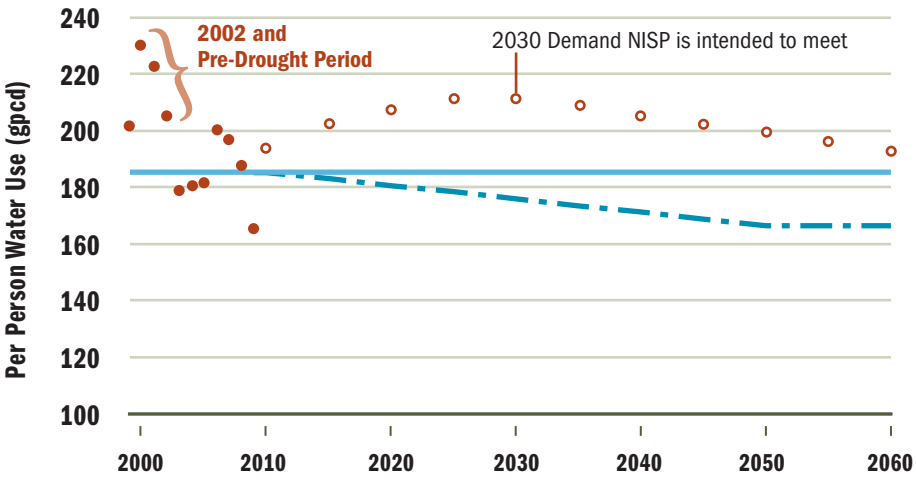
* The Better Future Alternative average, which is based upon Harvey Report data, is higher than the 177 gpcd that Northern Water frequently refers to for NISP participants and is higher than the rates provided in Table III-1 of the Harvey Report.

† Colorado Department of Natural Resources, Colorado Water Conservation Board. 2011. "Appendix L: SWSI 2010 Municipal and Industrial Water Conservation Strategies," prepared by Aquacraft, Inc. and Headwaters Corporation, January 2011. In *Colorado's Water Supply Future, Statewide Water Supply Initiative 2010, Final Report*. January.

‡ Savings were implemented through 2050, which is the end of the SWSI planning period. 2050 use rates were then held constant for the Better Future Alternative through 2060.

FIGURE Nº 6 PER CAPITA DATA* BASED ON SYSTEM-WIDE WATER DELIVERIES.

Better Future baseline usage is based on recent historical data with SWSI passive conservation savings applied. Harvey Report estimates include no conservation savings and increase (without explanation) to a peak in 2030 before decreasing.



- **Harvey Report Historical**
- **Harvey Report Projected**
- **Recent Historical Average** (2004–2009)
- **Better Future Baseline** (includes passive conservation)

* Harvey Report Historical, Harvey Report Projected, and Recent Historical Average per person water use rates were calculated by WRA utilizing the population and demand data provided in the Harvey Report appendices. Rates for the Better Future Baseline were developed by WRA, as described above.

6).§ Interestingly, the peak per capita year, 2030, is the year with demands that NISP is intended to meet. No explanation for increased per capita use is provided and, in fact, the projection is contrary to a wide body of data that show use rates decline over time as a result of passive and active conservation.¶,**,††,‡‡ The impact of overestimated demands is then compounded in the Harvey Report when losses and water charges are applied as a percentage of water deliveries (see the "Key Definitions" section). To develop baseline demands, it is more reasonable to use recent per capita use rates and project modest decreases over time.

§ WRA calculated historical and projected average per capita usage for NISP participants utilizing the population and demand data provided in the Harvey Report appendices.

Better Future Supplies

Existing Supplies

The Better Future Alternative includes 60,550 AF of current firm yield supplies. Existing supplies include the 59,400 AF of yield assumed in the Harvey Report as well as 1,150 AF of additional water that was documented in Appendix P of the Harvey Report but not applied to future demands in that report.

These additional supplies include:

- 270 AF of firm yield from Fort Lupton's Fulton Ditch shares was not included in the town's existing supplies.* Per Fort Lupton's water conservation plan,† this water is currently used by the City to irrigate the golf course and cemetery and for augmentation of the City's wells.

- 680 AF of firm yield from the consumptive use portion of North Poudre Irrigation Company shares,‡ owned by Eaton (205 AF), Severance (54 AF), and Windsor (421 AF), which have not yet been changed to municipal use. A Better Future acknowledges that issues may arise while transferring agricultural water to municipal use. Also, once a right is changed, there can be additional issues accessing the water at the time and location it is needed. However, these shares are owned by the specified NISP participants, and it is reasonable to assume this water will become available to meet municipal needs. To provide for time to transfer the rights, the Better Future Alternative assumes yield from these shares is available beginning in 2025.

- A math error in Appendix P of the Harvey Report appears to have underestimated Fort Morgan's existing firm yield supplies by 200 AF. The Better Future Alternative assumes this water is currently available.

* The Harvey Report lists total firm yield from these shares as 700 AF. Per Fort Lupton's water conservation plan, 270 AF is the consumptive use portion of these shares, though some of this water continues to be used for irrigation so may have a higher yield.

† Clear Water Solutions, Inc. 2007. *City of Fort Lupton Water Conservation Plan*. August. http://www.fortlupton.org/DEPARTMENTS/FINANCE/water_conservation_plan/Water.pdf.

‡ North Poudre Irrigation Company has both Colorado-Big Thompson Project (see sidebar on page 43) and native (Poudre River Basin) shares. This 680 AF is native portion shares.

Growth onto Irrigated Lands

The Better Future Alternative estimates the annual firm yield from traditional agricultural transfers from urban growth onto previously irrigated lands will be 7,360 AF by 2030 and 19,150 AF by 2060.

As NISP participant populations increase, a portion of new growth will occur on previously irrigated agricultural lands that are adjacent to NISP towns. These are lands that are sold willingly by farmers for a variety of reasons, which may include retirement, the decision to downsize, a preference to relocate, or changes in commodity markets, among others.

To ensure that adequate supplies are available to meet the needs of new development, most towns and cities require that the water previously used for irrigation on annexed lands (also sold voluntarily by farmers) be transferred to the respective water supply utility, and that additional water supplies (frequently including storage), or at times "cash in lieu" (cash instead of water), be provided (see sidebar). Normally, only the historical consumptive use portion of irrigation water can be transferred, and the process of changing a water right can be complicated and takes time. When new supplies are acquired, additional collection infrastructure, storage, and water treatment may be required in order for municipalities to utilize the water.

A Better Future includes only the consumptive use portion of supplies that are anticipated to be transferred directly from previously irrigated lands upon which growth occurs.* It does not estimate other water dedications required by towns. Data from the state's South Platte Decision Support System, the U.S. Census Bureau, and the NISP No Action Alternative† were used to estimate a minimum volume of agricultural water that will be transferred to NISP participants. To be conservative, for this analysis the Better Future Alternative assumes a relatively high density of 5 people per acre. This is much higher than current NISP community densities (Table 1) and so minimizes the assumed acreage from which water will be transferred. The Better Future Alternative encourages higher density development for a variety of reasons, including its potential to reduce water use (through less outdoor irrigation), infrastructure costs, and water loss when compared to typical suburban, low-density developments.‡

TABLE Nº 1

2010 POPULATION DENSITIES FOR NISP PARTICIPANTS AND OTHER FRONT RANGE COMMUNITIES.*

NISP Participant	People/Acre
Erie	1.65
Evans	2.84
Fort Lupton	1.60
Fort Morgan	4.66
Lafayette	4.04
Windsor	1.05
Firestone	1.53
Frederick	1.01
Better Future Assumed NISP Participant Density	**5.0**

Large Front Range Communities	People/Acre
Denver	6.13
Boulder	6.17
Fort Collins	4.15
Longmont	5.15

* U.S. Census Bureau. 2010. "State and County Quick Facts." Revised September 18, 2012. Available at http://quickfacts.census.gov/qfd/states/08000.html. Data were not available for NISP communities not listed here.

* In Colorado, only the historically consumed portion of an agricultural water right can be transferred to ensure that other water users aren't negatively impacted by such a transfer. Better Future estimates of water transferred from growth onto agricultural lands include only the consumptive use portion of historical water use.

† An EIS requires the analysis of a No Action Alternative (or status quo) option. In this case of NISP, the No Action Alternative evaluated other options for meeting participant demands without the project.

‡ Western Resource Advocates. 2009. *New House, New Paradigm: A Model of How to Plan, Build, and Live Water-smart*.

NISP Participants' New Development Water Requirements

One of the largest costs for developers is water service. Water dedication policies vary by town and water district. Potential supplies are also evaluated for desirability based on their specifics (e.g., location, quality, seniority, storage). Some towns and water districts may require that they be given first option on any water supplies associated with a parcel. Others may not want a specific water right if it is difficult to transfer the diversion location to their water supply intake. Others may require supplies from specific sources or accept cash in lieu (cash instead of water) rather than requiring the transfer of historical water rights. Furthermore, some supplies may not be suitable for potable use, but may be useful for outdoor irrigation of parks, open space, and other common areas. In some cases, water has already been sold off from land, so either other supplies or cash in lieu are required. The following are examples of the water dedication policies for several NISP participants.

City of Evans (Municipal Code Chapter 13.08)
...It is the intent and purpose of this chapter to require the dedication or transfer of water or water rights to the city sufficient to satisfy any new or additional demand for city water service...

...any person who seeks approval of any of the following: 1. An extension of water service; 2. Annexation of land to the city; 3. Any change in land use, within or outside the limits of the city, if such change in land use will increase the demand for city water service, shall dedicate or transfer to the city a water allotment contract with the Northern Colorado Water Conservancy District (C-BT contract) for sixty-five hundredths (0.65) of an acre-foot (which will yield an average of approximately forty-six hundredths (0.46) of an acre-foot) for each EQR [equivalent residential] unit calculated

...Prior to any extension of service, any person required to comply with the provisions of this chapter shall also grant to the city the option for one year to purchase any and all water rights which are appurtenant to the land to be annexed, or on which the land use is proposed to be changed, but which are in excess of the dedication or transfer requirement of this chapter...

Fort Lupton (Municipal Code Sec. 13-122)
...Any person annexing land to or developing within the City...shall make a cash-in-lieu-of-water payment in an amount as determined by the City or...convey water rights or shares of sufficient quantity and water quality as determined by the City...

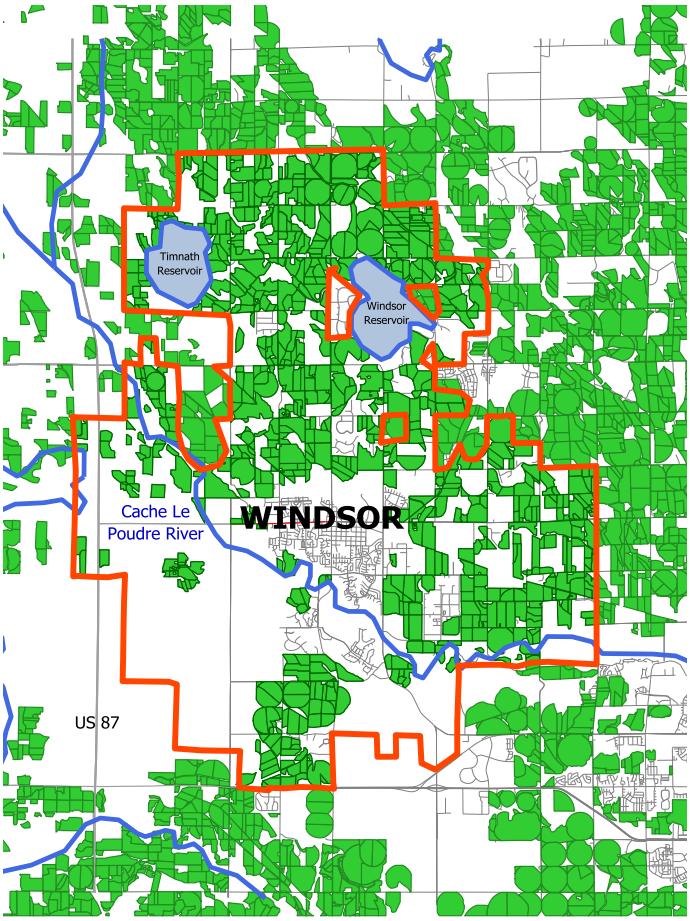
Fort Morgan (Municipal Code Sec. 18-2-210)
... At the time of annexation, property owners shall transfer all other water rights associated with the property to be annexed...The property owner shall also purchase water from a source that can be integrated into the City's potable water system sufficient to meet the needs of the property development or the current use of the property...

City of Lafayette (Municipal Code Sec. 120-91)
...The dedication and conveyance of CBT [Colorado-Big Thompson] water, direct flow and/or storage water rights to the city shall be required as a condition precedent to the approval of the subdivision or replatting of any land zoned and/or used as residential property. The dedication and conveyance of CBT water, direct flow and/or storage water rights to the city for all property other than residential shall be required as a condition precedent to the approval of a water service application...

Windsor (Municipal Code Sec. 13-2-80)
All premises requesting original water service...shall furnish...without cost to the Town, water rights in the amount of three (3) acre-feet of water for each acre of land zoned Single-Family Residential SF-1 District, Single-Family Attached Residential SF-2 District and Planned Mobile Home Park PD-MHP Development, and annexed to the Town...The Town may accept cash in lieu of water...

FIGURE Nº 7

EXAMPLE OF NISP PARTICIPANT WINDSOR'S GROWTH MANAGEMENT AREA* AND SURFACE-WATER-IRRIGATED LANDS†.



Red outline = Windsor's Planned Growth Area
Green parcels = Surface-Water-Irrigated Lands

Surface-water-irrigated parcels in Windsor's Growth Management Area. The Better Future Alternative assumes a growth footprint less than half the size of this area.

* Town of Windsor, Colorado. 2007. *2006 Update of 2002 Windsor Comprehensive Master Plan*. January 4. http://windsorgov.com/DocumentCenter/Home/View/1665.

† South Platte Decision Support System geographical information system and modeling data available at http://cdss.state.co.us/basins/Pages/SouthPlatte.aspx.

At 5 people per acre, the Better Future Alternative's projection of 302,748 new people by 2060 results in 60,550 acres being developed. Mapping by WRA was used to estimate growth footprints around each NISP participant community (see the example of Windsor provided in Figure 7).* Evaluating South Platte Decision Support System data for growth areas found that, on average, 42% of NISP growth will occur on lands that are currently irrigated by surface water.† Based on SWSI‡ and NISP No Action Alternative§ consumptive use data, a Better Future assumes that the water-supply-limited transferable yield¶ averages 1.0 AF/acre for parcels irrigated with surface water. To account for uncertainty and the complexities associated with changing irrigation water to municipal use, the Better Future Alternative further limits yields by assuming that only 75% of transferrable water is acquired and utilized by NISP participants. This results in an annual yield from growth onto previously irrigated lands of 7,360 AF in 2030 and 19,150 AF in 2060.** See Appendix C for more detailed calculations.

The above calculations differ from the Harvey Report, which did not include any water supplies associated with new development growing onto agricultural lands, nor required dedications from developers.

* Water districts covering large geographic areas (Central Weld County Water District, Fort Collins–Loveland Water District, Left Hand Water District, and Morgan County Quality Water District), in which other water providers may operate, were not included in the analysis of percentage of surface-water-irrigated lands in the growth footprint.

† Due to potential complexities, the Better Future Alternative does not consider groundwater supplies and does not include parcels that are irrigated with a combination of surface water and groundwater.

‡ Colorado Department of Natural Resources, Colorado Water Conservation Board. 2011. *Colorado's Water Supply Future: Statewide Water Supply Initiative 2010, Final Report*. January.

§ MWH. 2010. *Northern Integrated Supply Project No Action Alternative*. Prepared for Northern Colorado Water Conservancy District. April.

¶ Many farmers in northern Colorado irrigate, at least in part, with Colorado-Big Thompson (CBT) water. Because CBT water can easily be moved around, a Better Future assumes CBT supplies may not be available for direct transfer for lands, so uses a consumptive use value (1.0 AF/acre) that is lower than water-supply-limited consumptive use in the No Action Alternative. For additional information on the CBT project, see sidebar on page 43.

** Better Future yields from agriculture as a result of NISP participants' growth footprints are different than those in Save the Poudre's "The Farm Facts about NISP" (accessible at http://www.savethepoudre.org/docs/farm-facts-april2011.pdf). This does not undermine Save the Poudre's analysis, but is the result of the different methodology used in the Better Future Alternative.

Active Conservation

Water conservation has grown significantly in the past decade and will be a key part of meeting future water demands in northern Colorado communities. **The Better Future Alternative applies active conservation savings of 6,401 AF by 2030 and 20,482 AF by 2060 towards NISP participant demands.**

All NISP participants, with the exception of Central Weld County Water District and Morgan County Quality Water District, have conservation plans that detail active conservation measures they plan to implement in the coming years (Table 2). These measures will produce water demand savings in excess of passive conservation, which occurs as a result of new development and as older, more inefficient fixtures and appliances are replaced.

The Better Future Alternative uses the SWSI high conservation strategy goal of decreasing South Platte Basin†† per capita use by 38.3% by 2050.‡‡ Of this, 10.2% is from passive conservation already accounted for above in the Better Future baseline demands. Here we evaluate only those savings (28.1%) associated with active conservation. SWSI conservation goals include system losses of 7%, which is consistent with average NISP participant loss projections.§§ When planning for future demands, water providers are frequently cautious about relying on recent or expected changes in water use resulting from conservation. To address these concerns, the Better Future Alternative assumes that only 60% of active conservation savings are applied to meet future demands and that 40% is reserved to improve system reliability or for drought reserves and is not included in our portfolio.¶¶ See more detailed calculations in Appendix D.

The conservation measures required to achieve the high conservation strategy utilized in the Better Future Alternative are best management practices (standard practices that have been found to achieve results) and should be implemented prior to making additional diversions from the Poudre and

†† South Platte Basin planning area does not include the Denver metro area, which is evaluated separately in the SWSI report.

‡‡ Colorado Department of Natural Resources, Colorado Water Conservation Board. 2011. "Appendix L: SWSI 2010 Municipal and Industrial Water Conservation Strategies," prepared by Aquacraft, Inc. and Headwaters Corporation, January 2011. In *Colorado's Water Supply Future, Statewide Water Supply Initiative 2010, Final Report*. January.

§§ Harvey Economics. 2011. Table II-3. In *Water Supplies and Demands for Participants in the Northern Integrated Supply Project Final Report*. Report prepared for the Northern Colorado Water Conservancy District and the Northern Integrated Supply Participants. January 21.

¶¶ This methodology of assuming SWSI high conservation strategy savings, applying 60% of the savings, and retaining 40% for system reliability or drought reserve is consistent with previous WRA reports. This methodology is also consistent with portfolios developed by the Colorado River and Yampa-White Basin Roundtables – see CDM Smith. 2012. *Technical Memorandum: Basin Roundtable Portfolio and Trade-off Analysis.* February 23. http://cwcb.state.co.us/about-us/about-the-ibcc-brts/Documents/RoundtableSummit2012/TM-Basin%20Roundtable%20Summit.pdf.

TABLE Nº 2 NISP PARTICIPANTS' WATER CONSERVATION PLAN NEAR-TERM GOALS ARE SUBSTANTIAL.

NISP Participant	Water Conservation Plan Goal[a] (% Reduction in Use)	Achieve Goal by (Year)
Central Weld County Water District (CWCWD)[1]	No quantifiable goals	Not available
Dacono[2]	10%	2021
Eaton[3]	8%	2021
Erie[4]	17% (achieve 190 gpcd)[b]	2014
Evans[5]	13%	2018
Firestone[6]	4.7% residential, 13.4% commercial, 12.1% parks, 19% open space	2017
Fort Collins–Loveland Water District (FCLWD)[7]	13%	2017
Fort Lupton[8]	5% by 2016, 7% by 2030	2016
Fort Morgan[9]	No quantifiable goals	NA
Frederick[10]	18.40%	2021
Lafayette[11]	12.7% + loss decreased by 3%	2016
Left Hand Water District (LHWD)[12]	11.3%	2017
Morgan County Quality Water District (MCQWD)	No plan	Not available
Severance[13, c]	7.9%	2019
Windsor[14]	12%	2017

a Reductions in system loss are included in several providers' goals.

b Erie has a goal of 190 gpcd, which it already achieves at times. This goal is equivalent to a 17% reduction as compared to use without conservation. In comparison, the Harvey Report projects Erie's per capita use rate to increase as high as 310 gpcd in 2030 (gpcd calculated by WRA based on data provided in Harvey Report, Appendix D).

c Severance doesn't have a water conservation plan, but portions of the town are served by the North Weld County Water District, whose plan has a goal of reducing use by 7.9% by 2019.

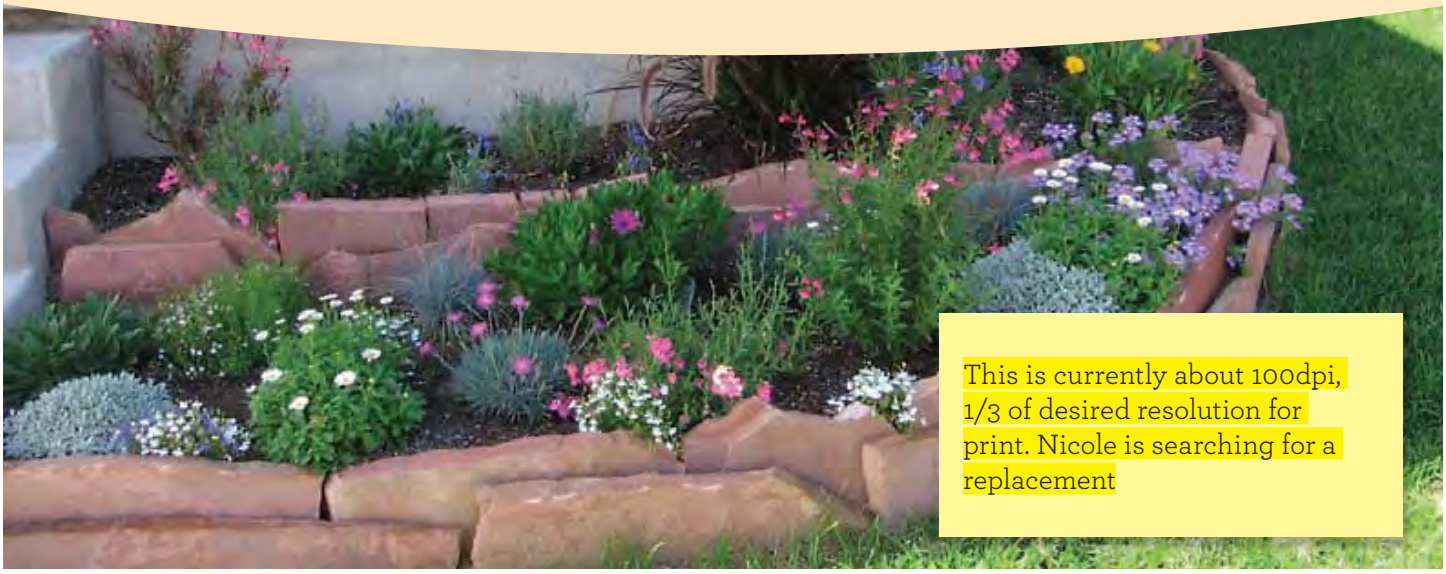
SWSI Municipal and Industrial Low, Medium, and High Water Savings Strategy Measures*

This table from the 2010 SWSI Report illustrates the type of conservation measures assumed to be applied to realize low, medium, and high conservation savings. Measures may be included under all strategy levels (i.e., marked in multiple columns), but levels of implementation or penetration can vary. Additional details regarding implementation assumptions can be found in Table D-2 in Appendix D.

Conservation Measures	Water Saving Strategy		
	Low	Medium	High
Passive water conservation savings from natural replacement of fixtures and appliances	X	X	X
Public information and education	X	X	X
Reduction in customer side leakage	X	X	X
Conservation-oriented plumbing and building codes	X	X	X
Landscape water use reductions	X	X	X
Improved utility water loss control measures	X	X	X
Conservation-oriented and water budget-based water rates		X	X
Smart metering with leak detection		X	X
Submetering of new multi-family housing		X	X
Targeted utility audits for high demand non-residential landscape customers		X	X
Irrigation efficiency improvements		X	X
Informational landscape water budgets and customer feedback		X	X
Landscape water budgets tied to the rate structure and customer feedback	X	X	X
Landscape transformation from high water requirement turf to low water requirement		X	X

"Appendix L: SWSI 2010 Municipal and Industrial Water Conservation Strategies," prepared by Aquacraft, Inc. and Headwaters Corporation, January 2011. In *Colorado's Water Supply Future, Statewide Water Supply Initiative 2010, Final Report*. January.



This is currently about 100dpi, 1/3 of desired resolution for print. Nicole is searching for a replacement

South Platte rivers (see page 29). Notably, the vast majority of measures will not require significant behavioral changes on the part of customers.

Lower per capita usage resulting from conservation provides system security, which is of utmost importance to water providers. If more people's needs are met with less water, this decreases the impacts of drought. Additionally, lower demands under the Better Future conservation strategy reduce the need for additional water storage. Water conservation also decreases water treatment costs, as water demands increase more slowly, providing utilities with more time to upgrade or develop new facilities. Decreasing demands through conservation also leads to lower losses and system delivery charges.

It is in the best interest of Northern Water and NISP participants to support and encourage water conservation. A 2012 survey of Northern Water municipal customers about water conservation found that municipal suppliers support conservation for the following key reasons: it's the right thing to do, for drought preparedness, to reduce peak expansion cost, and to offset increased demand of future growth.* This is supported by the fact that nearly all NISP participants have water conservation plans (Table 2) with quantifiable goals, many of which are comparable to — or exceed — SWSI high conservation strategy reductions of around 1% per year. Most water conservation plans have planning periods of 7 to 10 years (Table 2). As a result, additional savings beyond current goals are very likely by 2060.

The Harvey Report's analysis did not include any new water conservation savings, passive or active, from 2009 forward. This is inconsistent with a recent brochure published by Northern Water titled "NISP Communities' Water Conservation Efforts: A Key Component to Meeting Future Water Needs"† and at odds with the water conservation goals established by NISP participant communities. It is also confusing because the Harvey Report includes an entire section on water conservation but does not apply any savings towards future demands. As discussed above, rather than including conservation savings, the Harvey Report's demand projections assume the opposite, that per capita use increases from current levels (Figure 6). This is contrary to a wide body of research and data, and NISP participants' own experiences, about the effects of water conservation.

* Northern Water. 2012. *NISP Communities' Water Conservation Efforts: A Key Component to Meeting Future Water Needs.* http://www.northernwater.org/docs/Brochures/conserve_brochure_NISP_Feb2012.pdf

† 2,000 AF or more was assumed to be the threshold of reusable supplies for which the benefit of developing direct and/or indirect reuse would be sufficient for a community to pursue, though this can also be feasible for communities with fewer reusable supplies. Left Hand Water District has 1,700 AF of reusable supplies, which is close to the 2,000 AF threshold selected for the Better Future Alternative, but due to its large and distributed service area, the Better Future Alternative does not include reuse for the district. All other NISP participants have less than 1,000 AF of existing potentially reusable supplies.

TABLE Nº 3 BETTER FUTURE ALTERNATIVE NISP PARTICIPANT REUSE.

NISP Participant	Potentially Reusable Supplies (AFY)		Reuse (AFY)	
	Irrigation Company Shares	Conditional WGFP	Irrigation Company Shares	Conditional WGFP
Erie	124	2,000	76	1,224
Lafayette	4,235	800	1,906	360
Evans	6,496	500	2,923	225
TOTAL	**10,856**	**3,300**	**4,905**	**1,809**

Planned and Additional Reuse

As new water supplies become more difficult and expensive to acquire, many utilities are integrating reuse of existing supplies into their water supply portfolios. **The Better Future Alternative assumes reuse supplies of 4,905 AF**, all of which are available from current supplies. The Better Future Alternative evaluated *existing* reusable supplies (see sidebar) for each NISP participant utilizing the supply data provided in Harvey Report Appendix P and requested Windy Gap Firming Project yield. Note that while reuse of WGFP supplies is discussed in this section for ease of explanation, no WGFP reuse is included in the assumed "Reuse" yield of 4,905 AF. WGFP reuse yield is instead captured in the "Conditional Inclusion: Windy Gap Firming Project" section below.

Only three towns have 2,000 AF or more of existing reusable supplies‡ — Lafayette, Erie, and Evans (Table 3) — two of which already have reuse plans in place. *Note that agricultural water transferred as a result of growth onto irrigated land and through Ag-Urban cooperation will provide significant additional reuse opportunities not accounted for in the Better Future Alternative.* Also, Better Future calculations consider only first-time reuse, though return flows from these supplies can be reused to extinction, which increases the potential yield. An additional 1,809 AF of WGFP reuse is accounted for below in the "Conditional Inclusion: Windy Gap Firming Project" section of this report.

Erie — The Town of Erie's water conservation plan§ says that Erie plans to reuse 690 AF each year by 2014. Because some of this is Windy Gap water (see Table 3), and a WGFP Record of Decision has not yet been issued, a Better Future assumes Erie's reuse of 690 AF starts in

‡ 2,000 AF or more was assumed to be the threshold of reusable supplies for which the benefit of developing direct and/or indirect reuse would be sufficient for a community to pursue, though this can also be feasible for communities with fewer reusable supplies. Left Hand Water District has 1,700 AF of reusable supplies, which is close to the 2,000 AF threshold selected for the Better Future Alternative, but due to its large and distributed service area, the Better Future Alternative does not include reuse for the district. All other NISP participants have less than 1,000 AF of existing potentially reusable supplies.

§ CDM. 2008. *Town of Erie Water Conservation Plan*. January.

2020. Erie's 2007 *Non-Potable Municipal Water System Master Plan*[*] includes a plan to develop approximately 1,300 AF of dry year direct reuse by build-out. However, the SWSI Portfolio Tool[†] includes Erie reuse ranging from 3,700 to 4,300 AF as an Identified Project and Process (IPP).[‡] Relying on the lower Erie planning document estimates, a Better Future assumes that reuse will increase from 690 AF in 2020 to 1,300 AF in 2050, of which only **76 AF (non-WGFP reuse) is included in the reuse total** (the remaining 1,224 AF is included below in the conditional WGFP yield).

Lafayette — The City of Lafayette's water conservation plan[§] says the city currently reuses 60% of its return flows through exchange, and that the City has a conceptual design for a pipeline between its water reclamation plant and a reservoir complex that would maximize the full use of return flows from this plant. Lafayette's water conservation plan documents 1,479 AF of existing reuse. Based on the supplies identified in the Harvey Report, Appendix P, and assuming that 50% of reusable supplies are used indoors and 90% of indoor water returns and can be reused, we estimate that first-time reuse of existing supplies by Lafayette can increase to 2,266 AF. The Better Future Alternative assumes current reuse for Lafayette is 1,479 AF and that reuse increases to the full 2,266 AF by 2030. **1,906 AF of reuse** is assumed to be from existing supplies (the remaining 360 AF is included below in the conditional WGFP yield).

Evans — Evans' potentially reusable supplies are approximately 7,000 AF. Evans' water conservation plan[¶] refers to a small amount of reuse at its wastewater treatment plant. A Better Future includes 3,148 AF of reuse for the Town of Evans, assumed to be in place by 2030, calculated using the same indoor and outdoor distribution and return flow assumptions used for Lafayette. **2,923 AF of reuse** is assumed to be from existing supplies (the remaining 225 AF is included below in the conditional WGFP yield).

This analysis is consistent with the Metro Roundtable assumption of a 50% reuse factor.[**] The 50% reuse factor means that for 1.0 AF of reusable supply, with reuse that supply increases to 1.5 AF. The Better Future Alternative's implied reuse factor is slightly lower, at 47%.

What water can be reused?

Colorado water law is very specific in the types of water that can be reused. These are limited to:

- Non-native water that has been imported into a basin (i.e., transbasin diversions, such as WGFP water).
- The consumptive use portion (CU) of agricultural water that has been transferred to another use (such as the consumptive use portion of irrigation company shares).*
- Nontributary groundwater.
- Water diverted under a water right with a decreed reuse right.

How can you reuse water?

Reuse can be accomplished in two ways:

- **Direct Reuse**—Return flows from reusable supplies can be physically reclaimed for potable and nonpotable purposes. For example, a water utility captures reusable water leaving its wastewater treatment plant and uses this water again for urban, agricultural, recreational, environmental, or industrial purposes.
- **Indirect Reuse**—Return flows can be reused under substitution or exchange arrangements.† An example of indirect reuse is when a water utility lets reusable water leaving its wastewater treatment plant flow downstream for diversion by an irrigator, and the utility diverts an equivalent amount of water into its system upstream.

What are the impacts of reuse on downstream users?

Reuse can only occur within Colorado's priority system. That means that water cannot be reused if it will injure a senior water right holder. However, streams and downstream users may have historically benefitted when potentially reusable supplies were not used and flowed downstream. If water is then reused, either directly or indirectly, this will typically decrease streamflows and downstream supplies that had previously been available to others. This is within the rights of the owner of the reusable supplies. When water is transferred from irrigation to other uses, only the consumptive use portion can be converted. Historical return flows (which are not included in the yield from the transferred consumptive use portion of Better Future supplies) must be maintained so as to not injure other water users. Additionally, when historical wastewater return flows are reused, some very important environmental benefits can be diminished, e.g., streamflows and wetlands, impacting fish and wildlife. The environmental impacts of reuse, as compared to impacts associated with alternative water supply options, should be considered when evaluating reusable supplies.

The environmental impacts of reuse should be considered when evaluating reusable supplies.

* The consumptive use portion of water used for other purposes, such as industrial uses, may also be transferred. However, typically transfers from agriculture are discussed in this context.

† An exchange is generally an arrangement in which a junior water user makes water available to a senior water user (e.g., reusable treated effluent) in exchange for permission to use or divert an equivalent amount of water to which the senior would otherwise be entitled. A substitution or augmentation arrangement provides water supplies to replace out-of-priority diversions.

Though both Erie and Lafayette have existing and/or planned reuse and Evans has significant reusable supplies, the Harvey Report did not include any existing or planned reuse.

FIGURE Nº 8

ANNUAL SOUTH PLATTE BASIN AGRICULTURAL CONSUMPTIVE USE (CU) COMPARED TO ASSUMED BETTER FUTURE YIELD FROM AG-URBAN COOPERATION.

Ag-Urban Cooperation proposed under the Better Future Alternative would share less than 1% of agricultural consumptive use with municipalities.

South Platte Basin Current (2008) Annual Agricultural CU = 1,117,000 AF

Better Future Ag-Urban Cooperation Yield = 10,000 AF (< 1% of total CU)

Ag-Urban Cooperation

The Better Future Alternative assumes Ag-Urban cooperation supplies 10,000 AF. A Better Future relies on Ag-Urban cooperation, or alternative agricultural transfers, to provide water supplies to NISP participants. Nearly 90% of water used in NISP counties (Boulder, Larimer, Morgan, and Weld) is currently used for crop irrigation.* SWSI estimates that in 2008 there were 831,000 irrigated acres in the South Platte Basin, with an annual consumptive use of 1,117,000 AF.† A Better Future assumes that water from only a very small portion of this (less than 1%) will be necessary each year to provide a yield of 10,000 AF from Ag-Urban cooperation (Figure 8).

Given the large presence of agriculture and seniority of many rights, alternative agricultural transfers are feasible as a potential future supply for NISP participants. These agreements are between willing farmers and cities and provide farmers with reliable income and cities with reliable water supplies. Though hurdles remain to implementation, interest in such agreements has gained traction in recent years, and they are seen by many—especially irrigators and their communities—as preferable to "buy and dry" agricultural water transfers where the water is permanently severed from farmland.

* Ivahnenko T. and J. L. Flynn. 2005. *Estimated Withdrawals and Use of Water in Colorado*, 2005. Prepared in cooperation with the Colorado Water Conservation Board. Washington, D.C.: U.S. Geological Survey. Scientific Investigations Report 2010–5002.

† Colorado Department of Natural Resources, Colorado Water Conservation Board. 2011. *Colorado's Water Supply Future: Statewide Water Supply Initiative 2010, Final Report*. January.

Alternative agricultural transfers may include:

- Interruptible supply agreements
- Long-term rotational fallowing
- Water banks
- Deficit/partial irrigation practices
- Alternate cropping types‡

Ag-Urban cooperation is similar to a concept already integrated into NISP, which states that "…NISP will have the option of entering into contracts with agricultural water users to lease water that can be subsequently diverted and stored in NISP facilities"§ when Glade inflows fall below a certain volume.

When discussing Ag-Urban cooperation, water providers frequently state that they are unwilling to depend on supplies from agreements where agriculture retains ownership of the water rights. However, two new pilot projects are working to address both agricultural and municipal concerns, the Arkansas Valley Super Ditch and the Lower South Platte Water Cooperative (LSP Co-op). These two projects are advancing the concept of umbrella organizations that facilitate the involvement of many irrigators, and which could guarantee supply volumes to municipalities and others while maintaining irrigator ownership of water rights. The LSP Co-op's mission statement, for example, is to "Create a member-based organization controlled by local water users to facilitate more efficient uses of water to better meet current and future water supply needs in both local and regional areas."¶ The LSP Co-op is evaluating means to deliver firm yield and water needed on a periodic basis while maintaining member control of water supplies.

In the Arkansas Basin, farmers' interest in the Super Ditch is exceeding expectations. In a 2011 *Pueblo Chieftain* article, Peter Nichols, attorney for the Lower Arkansas Valley Water Conservancy District, is quoted as saying, "Water rights holders representing 67 percent of the land and 70-75 percent of the water under seven ditches proposed for inclusion in Super Ditch … [indicated] they might be interested in selling water through a lease program."** Similarly, a survey of South Platte Basin irrigators found that 63% of interviewed farmers would be willing to participate in a rotational land

** Woodka, C. 2011. "Most Farmers Interested in Super Ditch." *Pueblo Chieftain*. January 20. http://www.chieftain.com/news/local/most-farmers-interested-in-super-ditch/article_97faaeaa-2463-11e0-a4d2-001cc4c03286.html.

fallowing program, if compensated adequately (the most common estimate of compensation was $400 per AF).*

Additional storage may be needed to re-time a portion of deliveries from historical irrigation months to meet year-round municipal demands. Existing and improved storage, smaller off-channel reservoirs, local gravel pits, and other storage could be pursued for this purpose. Examples of potential storage locations from the DEIS† include the following:

- Erie, Lafayette, Left Hand Water District — gravel pits along Boulder Creek downstream of Longmont
- Eaton, Severance, Windsor — gravel pits along the Poudre River downstream of Fort Collins
- Fort Morgan, Morgan County Quality Water District — gravel pits along the South Platte River upstream of Fort Morgan
- Central Weld County Water District — gravel pits along the South Platte River to the east of Frederick, Firestone, and Dacono
- Evans — gravel pits on the South Platte River in the vicinity of Evans
- Fort Collins–Loveland Water District — gravel pits on the Poudre River and enlargement of a North Poudre Irrigation Company Reservoir
- Fort Lupton — gravel pit along the South Platte River in the vicinity of Fort Lupton

The Colorado-Big Thompson (CBT)‡ system also provides for unique opportunities for Ag-Urban cooperation as all NISP participants receive CBT water. Water can — and is — moved around with relative ease among CBT participants.

Many details of Ag-Urban cooperation will need to be worked out, including overcoming technical issues, legal challenges, and existing reluctance on the part of municipalities and irrigators.§ At the same time, a great deal of interest and political will exists to advance the concept, and significant resources are being invested by the state to this end. Because such supplies will not be needed by NISP participants for at least a decade,¶ this provides time for

* Pritchett, J., J. Thorvaldson, N. Hansen, and A. Jha. 2008. "Water Leasing: Opportunities and Challenges for Colorado's South Platte Basin." Paper presented at Western Agricultural Economics Association annual meeting, Big Sky, Montana, June 26.

† U.S. Army Corps of Engineers, Omaha District. 2008. *Northern Integrated Supply Project Draft Environmental Impact Statement*. Applicant: Northern Colorado Water Conservancy District. April.

‡ The CBT Project is a U.S. Bureau of Reclamation project that diverts approximately 260,000 AF of water each year from West Slope Colorado River headwaters to the South Platte Basin on the east slope. Northern Water apportions the water amongst irrigators and communities that receive municipal and industrial water from the project.

§ *A Better Future* does not evaluate specific ditches and supplies because temporarily transferring agricultural water rights for municipal use can be extremely complex, requiring analysis for each specific situation, including NISP participant needs, potential supplies, timing, storage, delivery infrastructure, costs, water quality, and treatment, among other factors.

¶ *A Better Future* includes Ag-Urban supplies beginning in 2025, but these are supplies in excess of demands so they could be developed later.

specifics to be worked out and for the necessary administrative and market frameworks to develop.

As the framework for Ag-Urban cooperation is being developed in Colorado, two successful examples can be found in California. In 2005, a 35-year-long transfer program began in which land is fallowed in the Palo Verde Irrigation District to provide water to the Metropolitan Water District of Southern California (Metropolitan). Discussing the benefits of this agreement, Bart Fisher, a farmer and Palo Verde Irrigation District board member, said, "Being compensated by Metropolitan for fallowing serves both ends: It doesn't diminish the bottom line and it allows farmers to make the land more productive." Fisher added, "The community also is already seeing the benefits of the additional revenues that are flowing in."** Another example is the Imperial Irrigation District, which is transferring water to the San Diego County Water Authority and Coachella Valley Water District under a 45-year agreement finalized in 2003.

The Harvey Report does not include any supplies resulting from Ag-Urban cooperation. The NISP No Action Alternative (NAA) evaluation conducted by MWH dismissed rotational fallowing and dry year leases from among viable NISP alternatives. This conclusion was based on assumptions that more than 40,000 AF of annual supply would be needed via this source alone and that land would be fallowed in 1 out of 10 years, necessitating the involvement of a large number of acres.††

The Better Future Alternative assumes Ag-Urban cooperation is one among several supplies contributing to meeting local water demands. Additionally, fields could be fallowed more frequently than 1 out of 10 years, thus requiring the participation of fewer acres. For example, a 1:4 ratio (land fallowed 1 out of every 4 years) is consistent with both the Super Ditch and Palo Verde Irrigation District/Metropolitan agreements. The NAA also dismissed dry year leases because the alternative assumed the water would be needed in all years. Because all Better Future supplies are firm yield supplies (water expected to be available in dry years), more water is available in average and wet years. As a result, NISP participants could choose to rely on Ag-Urban cooperation—such as interruptible supply agreements—in dry years only.

Conditional Inclusion: Windy Gap Firming Project

The Windy Gap Firming Project is designed to improve the reliability of the existing Windy Gap Project, which has not delivered anticipated yields. A new reservoir, Chimney Hollow, would store water for the future needs of 13 WGFP participants, five of whom are also NISP participants (Central Weld County Water District, Erie, Evans, Fort Lupton, and Lafayette).

In November 2011, the U.S. Bureau of Reclamation released a Final Environmental Impact Statement for the project. A Record of Decision has not yet been released. This project would divert additional West Slope water to the Front Range, further impacting Colorado River headwaters. Because the WGFP has not yet been approved—and because of concerns about potential detrimental impacts to West Slope streams and rivers—the Better Future Alternative discusses WGFP water supplies both with and without the project. The inclusion of the WGFP in a Better Future should not be construed as support of the project. It is included, however, because it is in the final stages of approval and, as such, may be considered a reasonably foreseeable project.

A Better Future conditionally assumes 3,700 AF of WGFP firm yield for NISP participants beginning in 2020, as documented in the WGFP Final EIS.* WGFP reuse of 1,809 AF is also assumed, as discussed above in the "Planned and Additional Reuse" section. **Total conditional yield for NISP participants, both first-time use and reuse, from the WGFP is assumed to be 5,509 AF. Note that the Better Future Alternative meets NISP participant water demands with or without this project.**

The Harvey Report analysis does not include WGFP supplies.

* U.S. Department of the Interior, Bureau of Reclamation, Great Plains Region, Eastern Colorado Area Office. 2011. *Windy Gap Firming Project Final Environmental Impact Statement*. Volume 1 FEIS 11-29. November.

Water Supply and Drought

Water supplies can vary greatly from year to year depending on hydrologic conditions, a community's specific water rights portfolio, and the amount of water remaining in storage from previous years. For this reason, "firm yield" supplies—water that is expected to be available even in dry years—typically are used in water supply planning, as opposed to planning around average or wet year supplies. This ensures that communities have sufficient water available to meet demands in most years. However, multi-year droughts can decrease the availability of supplies, albeit on a temporary basis. For example, with 100% of the state experiencing some level of drought during the summer of 2012, many communities did not implement drought measures because reservoirs were relatively full from a very wet 2011. If those supplies are drawn down and the drought continues, subsequent years will be more challenging and may require mandatory water use restrictions. Long-term drought and climate change increase the likelihood of more frequent and intense droughts in the future.

Many communities or water providers have drought response plans that can be put in place temporarily to ensure that critical water needs are met. Colorado has a statewide Drought Mitigation and Response Plan and encourages and financially supports water providers to develop drought mitigation plans specific to their service areas. Drought mitigation measures are temporary and are different from ongoing water conservation programs. Examples of temporary drought mitigation activities include imposing more stringent limits on outdoor irrigation, setting tighter water budgets, serving water only upon request at restaurants, setting water savings goals for large water users, and implementing industry-specific water restriction programs.

To account for drought, all of the supplies in the Better Future Alternative are "firm yield" supplies. Additionally, the Better Future Alternative applies only 60% of active conservation savings to future demands. The remaining 40% is not included as a supply, but rather is assumed to be set aside to provide a buffer in times of drought and other uncertainties, and to improve system reliability. All NISP participants also have Colorado-Big Thompson shares that typically provide more water in dry years because the project was designed to provide supplemental supplies when other supplies are insufficient. A Better Future (and the Harvey Report) assumes that NISP participants' existing CBT supplies yield 0.60 AF/share, yet in past dry years the yield has typically been higher. For example, in 2002 the CBT quota was 0.70 AF/share and in 2012 it was 1.0 AF/share. Lastly, the Better Future Alternative relies on a variety of supplies that provide flexibility, rather than relying heavily on one project. For these reasons, and because the Better Future Alternative portfolio exceeds demands, our alternative provides secure water supplies, even in periods of drought.

The Smart Principles

Western Resource Advocates, in collaboration with Trout Unlimited and the Colorado Environmental Coalition, has developed a set of Smart Principles to guide future water supply management and development efforts:

- Make full and efficient use of existing water supplies and reusable return flows before developing new diversion projects.
- Improve use of existing water supply infrastructure by integrating systems and sharing resources among water users to avoid unnecessary new diversions and duplication of facilities.
- Recognize the fundamental political and economic inequities and the adverse environmental consequences of new transbasin diversions.
- Expand or enhance existing storage and delivery before building new facilities in presently undeveloped sites, and expand water supplies incrementally to better utilize existing diversion and storage capacities.
- Recognizing that market forces now drive water reallocation from agricultural to municipal uses, structure voluntary transfers, where possible, to maintain agriculture and in all cases to mitigate the adverse impacts to rural communities from these transfers.
- Involve all stakeholders in decision-making processes and fully address the inevitable environmental and socioeconomic impacts of increasing water supplies.
- Design and operate water diversion projects to leave adequate flows in rivers to support healthy ecosystems under all future scenarios, even if water availability diminishes in the future as a result of climate change or other factors.
- Seek to develop “multi-purpose projects” to spread project benefits as well as costs.

While NISP meets a few of the Smart Principles, it is in stark contrast to others.

While NISP meets a few of the Smart Principles, like integrating systems and sharing resources, it is in stark contrast to others, such as leaving adequate flows in rivers to support healthy ecosystems. The Smart Principles are meant to be taken as a whole, and NISP does not meet that requirement. NISP’s major impacts on streamflow, combined with exaggerated populations and demands, and the lack of inclusion of water conservation (efficient use) and other reasonable supplies (reuse, water transferred as a result of growth onto irrigated lands, voluntary cooperation with agriculture) mean that NISP does not meet the Smart Principles.

Cost Analysis

The Better Future Alternative allows participants to be more flexible with growth and investments in water supplies. In addition, it may cost significantly less than NISP. Below, we summarize our cost analysis and assumptions for the key components of the Better Future Alternative (growth-displaced agricultural water supplies, active conservation, additional reuse, and Ag-Urban cooperation).*

A Better Future increases water supplies and costs incrementally as cities grow, allowing participants to defer the capital construction costs to future years, and does not force cities to grow in order to repay project debts. To reflect the value of deferring such investments, we evaluate the Better Future Alternative in terms of a present value. The present value of the cost of providing 40,000 AF of water† through a Better Future, assuming a 5% discount rate, is approximately $109 million. The present value cost of a Better Future through 2060 is moderately higher, at $150 million. In addition to water supplies, the Better Future Alternative will undoubtedly require facilities to store and convey water to participants. The character of these facilities depends on a range of factors, such as individual cities' growth patterns (which determines what agricultural land and water is transferred to cities), capacity in cities' existing water conveyance systems, the seniority of agricultural water rights leased or transferred with land (which determines the size of storage facilities needed), and the location of reuse customers. In some cases, cities may be able to rely on existing infrastructure and avoid large additional costs. Estimating the cost of potentially needed facilities is beyond the scope of this analysis, but would be in addition to the $109 million cost for 40,000 AF of water supplies.

WRA's cost analysis includes water supplies that are in excess of what utilities are already planning or have underway. For example, the City of Erie is already planning to develop 690 AF of reuse water by 2014 and a total of approximately 1,300 AF of reuse by build-out;‡,§ the cost of that water, therefore, is not included in this analysis. Assumptions are outlined below in each individual section.

* The cost analysis does not include the cost of Windy Gap Firming Project supplies because those are being developed independent of the purpose and need for NISP.

† 40,000 AF is the amount of water equivalent to the volume provided by NISP.

‡ CDM. 2008. *Town of Erie Water Conservation Plan*. January.

§ CDM. 2007. *Town of Erie Non-Potable Municipal Water System Master Plan*. September.

The Better Future Alternative is a strategy for meeting NISP participants' water needs *through the year 2060*, providing about 55,000 AF of new water (60,000 AF with the WGFP). In contrast, NISP proposes to meet participants' water needs through 2030, providing 40,000 AF of water. Under NISP, participants' total demands are projected to continue rising beyond 2030. WRA presents two cost comparisons:

1. The cost of a Better Future at the point when it provides 40,000 AF of new water (estimated to be around the year 2037)

2. The cost of a Better Future through the year 2060

Table 4 summarizes the data used to estimate the total cost of the Better Future Alternative; each element is described in greater detail below.

TABLE Nº 4 SUMMARY OF UNIT COSTS OF KEY COMPONENTS OF THE BETTER FUTURE ALTERNATIVE.

Better Future Component[a]	Cost
Growth onto irrigated agricultural land	$11,184/AF (one-time)
Active conservation	$8,183/AF (one-time)
Reuse	$13,500/AF (one-time)
Ag-Urban cooperation (leasing)	$410/AF (annual)

a Ag-Urban cooperation (leasing) would be a cost incurred during each year of the leasing period (regardless of whether or not the water is required each year); all other costs are a one-time, up-front cost.

Growth onto Irrigated Lands

As cities grow, their footprint also grows, often displacing agricultural land and altering associated water use. In this analysis, we include all costs of growth-displaced agricultural water, regardless of whether the city or developer pays for it.

To estimate the cost of purchasing water supplies, we rely on the recent cost of Colorado-Big Thompson water. CBT share prices fluctuate from year to year, depending on demands. The City of Longmont increased its fee for cash in lieu of water rights transfers from $9,868/AF to $11,184/AF in May 2012.* For this analysis, we assume water rights cost $11,184/AF.

The question of "who pays" for water supplies does not affect the overall cost analysis of NISP as compared to the Better Future Alternative. Some cities require developers to provide water supplies to a city, others allow developers to pay a fee to cover the city's cost for developing new water supplies, and others allow for a combination of the two. While these arrangements are important for a city's financial planning, they do not affect the overall cost of a water supply. For example, presumably a city will ultimately pass the costs of NISP on to developers, even though the city will pay the up-front cost of developing the project. Likewise, a city could pay for the cost of CBT water, reuse water, or conservation, and then pass those costs on to developers. In

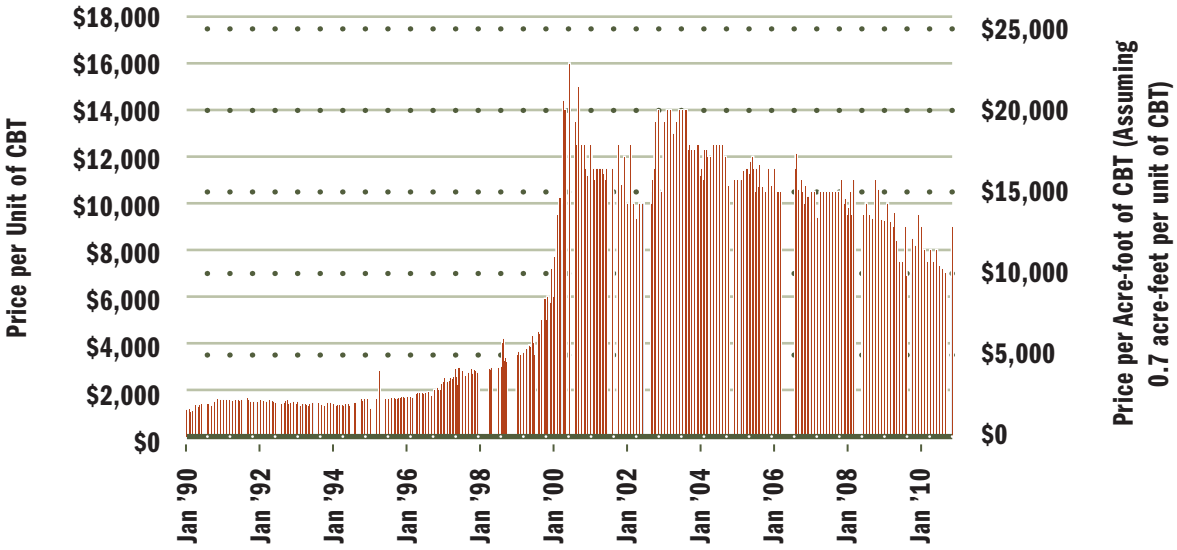
* City of Longmont, Colorado. 2012. "City Council Communication: Resolution Setting the Fee for Cash In Lieu of Water Rights Transfers at $11,184.00 per Acre-Foot." May 8. http://www.ci.longmont.co.us/city_council/agendas/2012/documents/050812_9E.pdf.

Colorado-Big Thompson (CBT) Water Market

An element of the Colorado-Big Thompson project is an active water market. CBT water, which is imported from Colorado's West Slope, is unique in that it can be leased or sold throughout Northern Water's geographic service area with relative ease compared to other water rights. Units are purchased and sold by irrigators and municipalities on a regular basis. As a result, CBT prices impact other water right transaction prices in the area.

Northern Water changes the quota (the volume of water provided per CBT share) regularly to respond to conditions and the needs of CBT users. The delivery in any year is a Northern Water board decision that depends, among other things, on the amount of water that can be put to use. CBT water cannot be imported and then wasted in wet years when demand for supplemental water is low. The chart below shows the historical price per CBT unit or share (left axis) and the price per AF assuming a 0.70 AF/unit quota (right axis). Note that these are prices to purchase CBT units, not lease them.

HISTORICAL PRICE OF COLORADO BIG THOMPSON (CBT) UNITS*



* Leonard Rice Engineers. 2011. "Colorado Big Thompson Water Rights Price Trends." Accessed July 2, 2012. http://lrewater.com/sites/default/files/files/CBT_Water_Rights_Price_Trends.pdf.

order to provide an appropriate comparison, this cost analysis includes all of the new water supplies, regardless of whether the cost is directly borne by developers or the city.

Active Conservation

We include the cost of active conservation savings in excess of those that would result from the low conservation strategy (which we assume will occur whether or not the Better Future Alternative is adopted by NISP participant communities). We estimate the costs of saving 16,800 AF of water* through active, high conservation measures. The SWSI 2010 report estimates that water saved through measures employed under the high conservation strategy typically cost $8,183/AF. While only 60% of the active conservation savings are applied toward meeting demands (40% is held for drought response and to improve system reliability), our analysis reflects the cost of saving the full volume of water (100%). Finally, we assume conservation savings are permanent.

Reuse

As noted above, several NISP participants have plans to develop or expand reuse supplies. Erie, for example, plans to develop 690 AF of reuse water by 2014 and 1,300 AF of reuse water by build-out. Similarly, Lafayette currently reuses almost 1,500 AF of water. We do not, therefore, include these volumes in our cost estimate. The remaining volume of reuse water developed by NISP participants under WRA projections amounts to 3,935 AF in 2060.†

The cost of developing reuse water depends on a host of factors, such as the quality of the wastewater (high dissolved solids, for example, may require reverse osmosis or other treatment), new or expanded transmission and conveyance facilities, the designated use (i.e., potable or nonpotable), and—if direct reuse—the proximity of the wastewater treatment plant to reuse customers.

The Colorado Water Conservation Board estimates the cost of reuse in its *Reconnaissance Level Cost Estimates Report*.‡ According to the report,

* Total Better Future 2060 active conservation savings, less savings attributed to decreased losses and water charges (which should not have conservation costs applied to them), are 29,578 AF. Of this, 14,749 AF can be attributed to savings resulting from the SWSI low conservation strategy, which we assume will occur regardless of NISP or the Better Future Alternative, so low strategy costs are not included. The cost to implement the remaining 16,800 AF of savings from high conservation measures (29,578 – 14,749 = 16,798 AF) is included as a Better Future cost.

† Some of this reuse volume may result from water provided through the Windy Gap Firming Project. While this project may not be built, for simplicity, our cost estimate includes WGFP reusable supplies.

‡ CDM. 2010. *Reconnaissance Level Cost Estimates for Agricultural and New Supply Strategy Concepts*. Prepared for Colorado Water Conservation Board. June 4. http://cwcb.state.co.us/water-management/water-supply-

developing direct, nonpotable reuse has a capital cost of $7,000/AF, whereas indirect potable reuse costs $13,500/AF. The higher cost estimate is based on a hypothetical system similar to the proposed Water, Infrastructure, and Supply Efficiency (WISE) project, in which treated wastewater is discharged into a natural stream, withdrawn, and pumped to South Metro Water Supply Authority cities, where it is treated at a regional treatment facility (using advanced treatment, such as reverse osmosis or ultraviolet radiation). Of note, this treatment process would provide fully potable water. NISP provides high-quality raw water that would still require treatment at cities' treatment plants (or a regional treatment plant). Treatment to potable standards is not included in NISP or in the cost estimates of other elements of the Better Future Alternative. While this is likely more complex and expensive than the probable reuse system that would be developed in NISP participant cities, we use the higher cost estimate ($13,500/AF), which likely represents an upper bound of actual costs.

Ag-Urban Cooperation

Flexible, voluntary transfers of water between agricultural and municipal users represent another component of the Better Future Alternative. These transfers could take many forms; however, in this analysis, we evaluate only the cost of rotational fallowing, using price estimates developed by economists at Colorado State University. Supplies could be relied on in all years or just in times of drought, depending on the structure of agreements. In either case, long-term agreements likely would need to be in place to provide security to both irrigators and municipal water users.

Surveys by researchers at Colorado State University show that a majority of farmers surveyed (75%) indicated a willingness to accept between $225 and $575 per acre fallowed.§ Given the typical consumptive use of water in the region, the median price of leased water would amount to approximately $410/AF. Recent short-term leases on the Front Range exhibit similar prices: Aurora paid farmers in the Rocky Ford-Highline Canal $300/AF for a short-term lease; with revegetation and administrative costs, the total cost was $500/AF.¶ Of note, any fallowing program would have to incorporate the cost of managing the fallowed cropland, which would include revegetation, weed control, and other maintenance costs.

Better Future Present Value of Costs

Cities and water utilities finance the development of new water supplies in varying ways. Most fund projects through municipal bonds, which are then repaid through tap fees, water rates, and other mechanisms. On rare occasions, cities or utilities fund projects with cash or money that has already been collected through rates or other fees. It is critical that costs are evaluated in terms of the present value — that is, future costs are discounted into present terms. There is a "time value of money" — any money not spent on capital investments, for example, could be gaining interest or used for other needed capital improvements (e.g., highways, libraries, etc.).

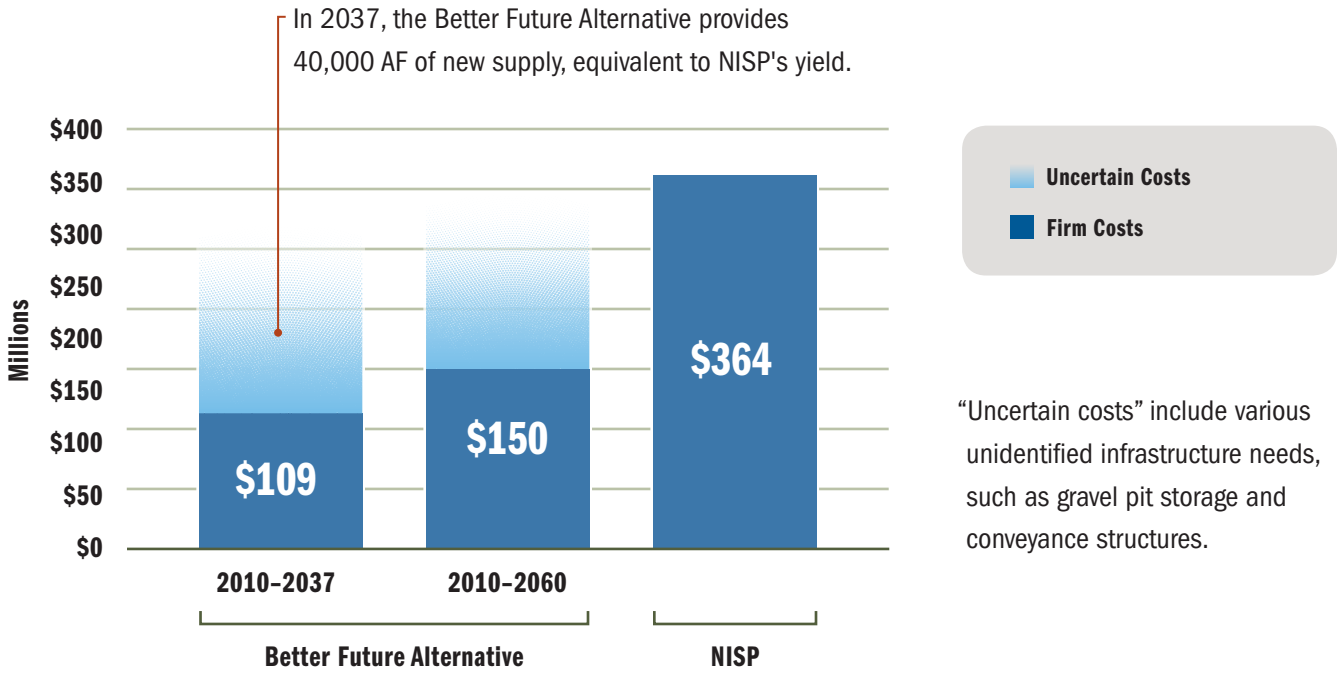
Both public agencies and private businesses evaluate investments in terms of the present value. The discount rate chosen has a substantial effect on the present value of the costs. For this analysis, we calculate the cost (Figure 9) assuming a discount rate of 5% (approximately equal to the current municipal bond rate), which represents the most likely discount rate under present conditions.

A phased approach to developing new supplies allows cities to postpone major investments and also helps cities hedge against the risk of overbuilding supplies and locking existing customers into paying off the debts. This is a particular risk if cities or utilities are counting on new growth (and tap fees) to pay municipal bonds. In Colorado Springs, for example, payments to construct the Southern Delivery System are being funded primarily by existing ratepayers, who have seen double-digit rate increases partially due to slower growth (and thus fewer tap fee sales).*

The present value of costs for Better Future water supplies (Figure 9) are evaluated over the time periods of 2010–2037 (2037 is the year in which the Better Future Alternative provides 40,000 AF of new supply, which is equivalent to the NISP yield) and 2010–2060. We also illustrate conceptually the timing of investments in the Better Future Alternative, broken down by water supply source, for the entire planning period of 2010–2060 (see Figure 10, which assumes that supplies are added incrementally every five years, with the exception of Ag-Urban cooperation, which has annual costs). Not shown in these figures is the cost of storage, pipelines, or other infrastructure that may be required to deliver water to participating cities. Because of these undefined costs, the costs of the Better Future Alternative cannot be directly compared to those of NISP. However, it is important to note that the majority

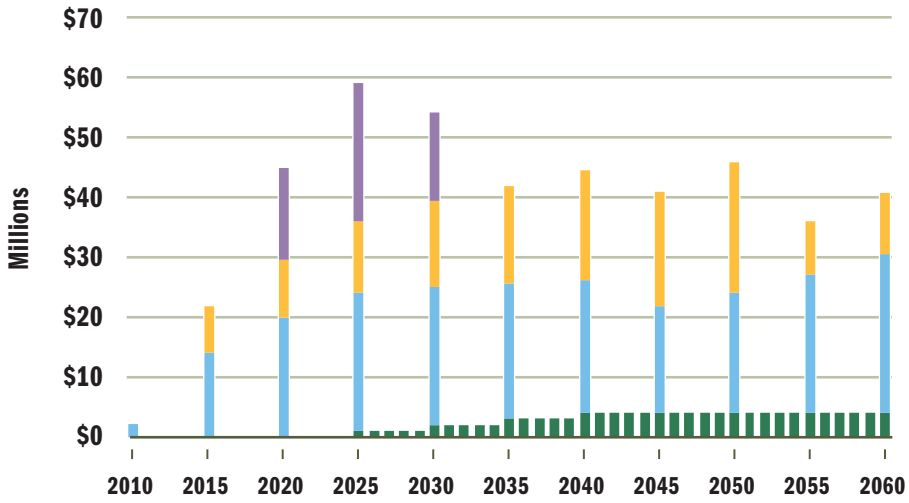
* Colorado Springs Utilities increased water rates by 41% in 2009, 6% in 2010, and was expected to increase rates by 12% per year for the next 6 years. Source: Zubeck, P. 2010. "Paying Through the Hose." *Colorado Springs Independent*, July 8.

FIGURE Nº 9 ESTIMATED NET PRESENT VALUE OF COSTS FOR NISP AND THE BETTER FUTURE ALTERNATIVE.



"Uncertain costs" include various unidentified infrastructure needs, such as gravel pit storage and conveyance structures.

FIGURE Nº 10 ESTIMATED ANNUAL COSTS FOR THE BETTER FUTURE ALTERNATIVE*.



* Five-year intervals are used for planning purposes in both the Harvey Report and the Better Future Alternative. As a result, the Better Future Alternative assumes costs to develop and/or expand reuse programs, active conservation, and growth onto irrigated lands are incurred at five-year intervals. Ag-Urban cooperation would require that irrigators are paid an annual fee whether or not water is being transferred that year, to incentivize them to participate, so Ag-Urban cooperation costs are assumed to be incurred every year.

of NISP capital costs, estimated at approximately $479 million* total, or a present value of $364 million (assuming a 5% discount rate), occur over the next 10 years.†,‡,§ NISP participants also will have additional demands beyond 2030 that are not met by NISP, which will require investment on the part of participants, resulting in costs also not shown.

In this analysis, we address only the capital costs of NISP and the key nonstructural elements of the Better Future Alternative. Both NISP and a Better Future would have annual operations and maintenance (O&M) costs. For NISP, those costs would include operating pumping stations and reservoirs; for a Better Future, those costs could include operating pumping stations and gravel pits. Because we do not include an assessment of infrastructure needs in the Better Future Alternative, it is not possible to estimate annual O&M costs, and not accurate to compare them to NISP's O&M costs.

Finally, the NISP costs do not include uncertain or unforeseen costs. For example, in its comments on the NISP Draft EIS, Fort Collins indicated it may have to upgrade its wastewater treatment facilities in order to meet discharge standards due to the Poudre River's decreased ability to dilute wastewater outflows. This cost may be high but it is uncertain, and, therefore, not included in our cost analysis.

* This amount is slightly lower than costs reported in the news media and on Northern Water's website ($490 million) or through personal communication with Brian Werner, Northern Water ($486.7 million), August 23, 2012. However, it reflects the most detailed cost breakdown WRA had available that sufficiently allowed us to identify the timing of investments in order to estimate a present value cost.

Recommendations

Planning for and meeting the water needs of NISP participant communities is critical, as is ensuring the health of the Poudre River and the recreational, economic, and other benefits it provides. We believe that Northern Water and NISP participants can chart an innovative path forward, one that differs from the traditional approach of building very large reservoirs. The Better Future portfolio instead relies on a combination of supplies from conservation, reuse, water transferred as a result of growth onto irrigated agricultural lands, and voluntary agreements with agriculture.

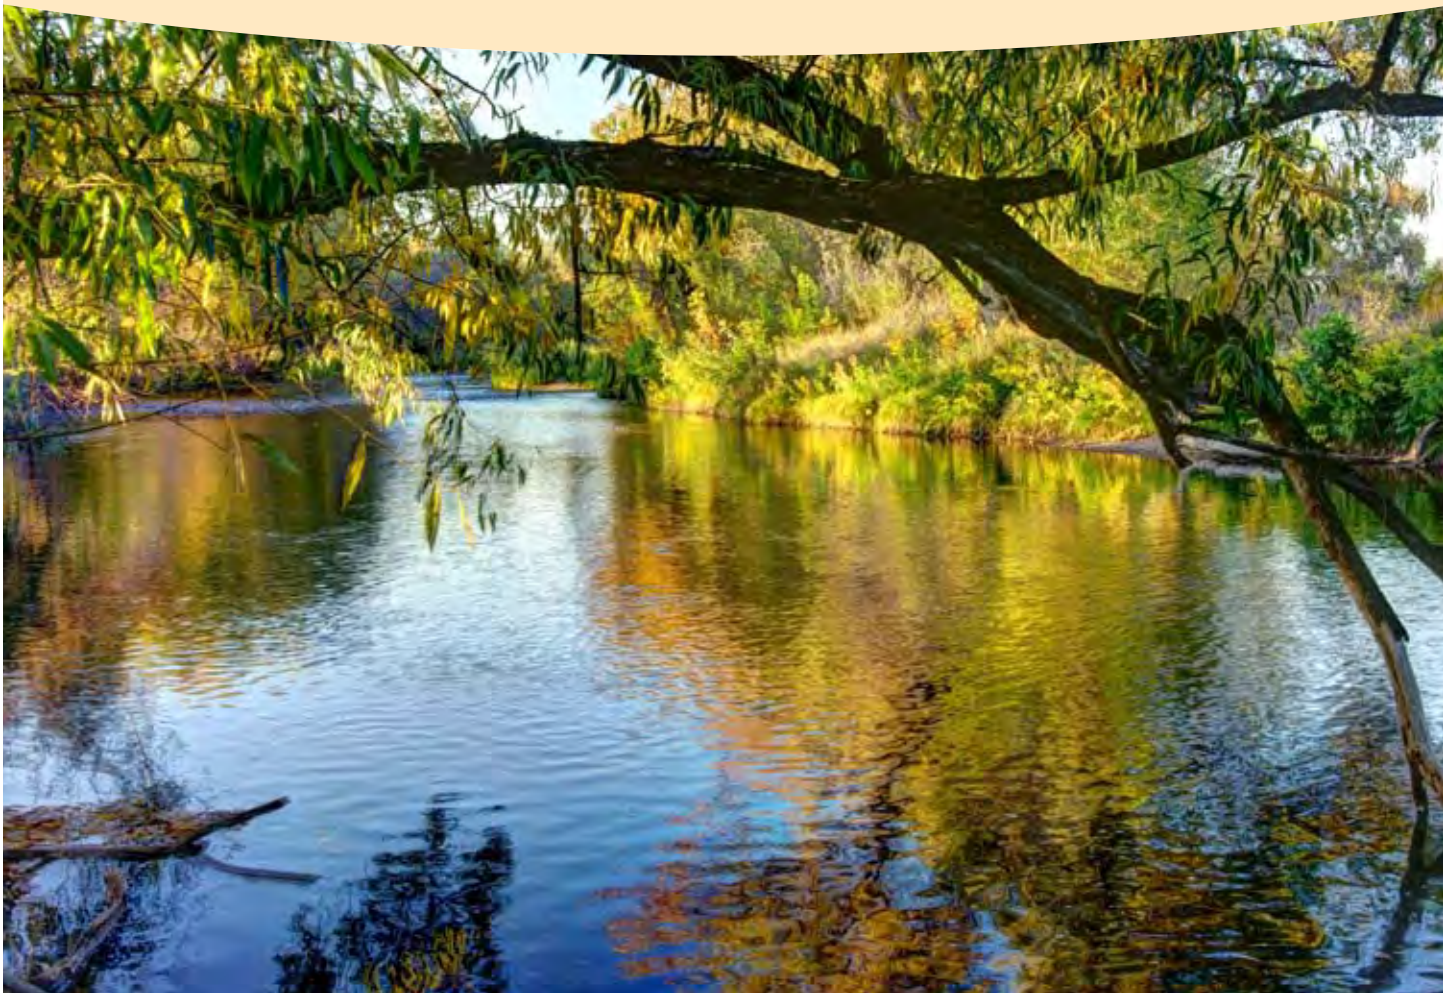
We encourage the U.S. Army Corps of Engineers to incorporate elements of the Better Future Alternative into its No Action Alternative when completing the NISP Supplemental DEIS.

Western Resource Advocates offers the following key recommendations for Northern Water, NISP participants, and the U.S. Army Corps of Engineers to consider carefully in planning for the region's future water needs:

- ✓ Meet projected demands with balanced strategies that are the least environmentally damaging, in contrast to large traditional reservoir and pipeline projects.
- ✓ Protect Colorado's rivers and streams as an integral part of any future water development strategy. Nonconsumptive uses of water—for fishing, boating, and other uses—are extremely valuable to the local economy and are critical to our quality of life.
- ✓ Use reliable and up-to-date population data and projections from the State Demography Office.
- ✓ Implement more aggressive water conservation strategies. Conservation is often the cheapest, fastest, and smartest way to meet new demands, and NISP participants have significant opportunities to boost their existing water conservation efforts.
- ✓ Conservation savings—passive and active—must be integrated into water supply planning.
- ✓ Include all existing supplies, supplies from growth onto irrigated lands, and NISP participants' water dedication requirements in future supply projections
- ✓ Maximize the role of water reuse in meeting future needs. Include NISP participants' existing and planned reuse—as well as additional Better Future reuse supplies—in any analysis.
- ✓ Include increased cooperation between agriculture and local communities in the form of voluntary water sharing agreements that benefit both NISP participants and the agricultural community without permanently drying up irrigated acres. Alternatives to "buy and dry" transfers present excellent opportunities for meeting future municipal demands.

By following these recommendations, NISP communities can more than meet their future water needs while minimizing impacts to rivers and streams.

> At New Belgium, the excellence of our beer and the livelihoods of over 450 people depend on reliable, high-quality water. So both our hearts and our minds demand that we protect the Poudre River. We cannot support a solution that further jeopardizes our environment when there is a portfolio of better options.
>
> —Jenn Vervier, Sustainability Coordinator, New Belgium Brewery



Conclusions

The Better Future Alternative includes a diverse portfolio of water supplies to meet, and exceed, NISP participant demands through 2060. Relying on water from growth onto agricultural lands, conservation, reuse, and cooperative agreements with agriculture, a Better Future provides an alternative to NISP that meets water demands far into the future while maintaining Poudre River flows that are critical to the aquatic environment, recreation, and local economies. The Better Future Alternative includes:

- Total water requirements of 72,100 AF by 2030 and 109,100 AF by 2060 (which is 27,000 AF and 34,300 AF less than Harvey Report projections in 2030 and 2060, respectively)
- 60,550 AF of current firm yield supplies
- Annual firm yield from traditional agricultural transfers from urban growth onto previously irrigated lands of 7,360 AF by 2030 and 19,150 AF by 2060
- Active conservation savings of 6,401 AF by 2030 and 20,482 AF by 2060 applied toward NISP participant demands
- Reuse supplies of 4,900 AF by 2030
- Ag-Urban cooperation supplies of 5,000 AF by 2030 and 10,000 AF by 2060
- Conditional (NISP participant demands are met with or without this project) Windy Gap Firming Project yield (first-time use and reuse) of 5,500 AF by 2030
- Firm yield that exceeds projected demands by 12,100 AF by 2030 and 6,000 AF by 2060 without the WGFP; when the WGFP is included, Better Future supplies exceed demands by 17,700 AF by 2030 and 11,500 AF by 2060

We have been conservative in our analysis of Better Future water supplies, as documented throughout this report and in "Appendix A: Better Future Alternative Safety Factors." As a result, we anticipate that the Better Future Alternative portfolio will yield supplies in excess of those described.

We anticipate that the Better Future Alternative portfolio will yield supplies in excess of those described.

NISP participants will also pursue other supply sources not included in the Better Future Alternative. For example, Erie's water conservation plan says, "Erie anticipates the need to acquire additional water rights to meet future needs. These will likely consist of Windy Gap shares, CBT shares, and ditch water rights."* A Better Future does not include an estimate of these or similar supplies being pursued by other NISP participants. Additionally, the supplies identified are firm yield (i.e., dry year) supplies. In average and wet years, additional water will be available. For example, the Harvey Report includes existing firm yield supplies of 59,400 AF and average year supplies of 82,076 AF. It may be possible to utilize small, incremental storage projects, such as improved gravel pits, to increase firm yields with additional carryover of average and wet year supplies.

The present value cost of the Better Future Alternative to yield 40,000 AF† (NISP's yield) is $109 million, though this doesn't include some infrastructure costs. By relying on a phased approach (i.e., water supplies increase incrementally and do not require a large, up-front investment by participants), a Better Future provides water supply flexibility and financial risk management for communities. If population growth is not as rapid as predicted, communities can delay investment in reuse and water transfers. In contrast, NISP requires large up-front costs, meets demands only through 2030, and diverts critical peak flows from the Poudre River.

The Better Future Alternative is a realistic and reasonable alternative to NISP. The supplies identified in the Better Future portfolio do not require the development of large new reservoirs and river diversions. However, portfolio components may impact streamflows, as historical return flows are reused and if diversion points change as a result of growth on previously irrigated lands or Ag-Urban cooperation. Additionally, water conservation can result in decreased returns flows. New supply development, including the Better Future portfolio, should be undertaken with care to avoid or mitigate significant impacts to stream and ecosystem health.

Better Future Alternative portfolio components and projected water requirements are shown in Figure 11. Additional water supply details for the 2010 to 2060 planning period are provided in Table E-1 in Appendix E.

* CDM. 2008. *Town of Erie Water Conservation Plan*. January.

† The Better Future Alternative provides a total of more than 60,000 AF of new firm yield supplies (about 55,000 AF when the WGFP is not included), in addition to existing NISP participant supplies.

> The Better Future Alternative is a common-sense path forward for NISP communities. It protects the Poudre River, safeguards Fort Collins' interests, and provides water to these small towns.

Appendices

Appendix A describes the various safety factors incorporated throughout this report in order to be conservative in our analysis of Better Future water supplies.

Appendices B-E provide additional details regarding the data, assumptions, and calculations that are the basis of the Better Future Alternative. Data sources include the 2011 Harvey Report, Colorado State Demography Office, and Colorado's 2010 Statewide Water Supply Initiative, among others.

Appendices are not provided for Better Future water supplies that are fully explained in the main report body, e.g., reuse supplies.

- Appendix A: Safety Factors
- Appendix B: Population Projections and Baseline Demands
- Appendix C: Growth onto Irrigated Lands
- Appendix D: Active Conservation
- Appendix E: Summary of Supplies and Demands

Appendix A: Better Future Alternative Safety Factors

Numerous safety factors have been included in the Better Future Alternative to ensure that the alternative provides sufficient supplies to meet future demands. If demands decrease below Better Future projections and/or if additional supplies are realized, that will provide NISP participants with additional security or enable them to scale back and be even more flexible in the supplies they choose to develop. Specific Better Future safety factors are discussed below.

General

- The Harvey Report and the NISP DEIS state that NISP participants are pursuing other supplies in addition to NISP. While there is undoubtedly some overlap with Better Future Alternative supplies, additional supplies that were not included in this analysis will further increase the reliability of NISP participants' systems. For example, Fort Lupton's water conservation plan[*] states that the town has plans to purchase additional Fulton Ditch and Windy Gap shares, but these supplies are not included in the Better Future portfolio. Similarly, Erie's water conservation plan says, "Erie anticipates the need to acquire additional water rights to meet future needs. These will likely consist of Windy Gap shares, CBT shares, and ditch water rights."[†]

Baseline Demands

- To develop baseline demands, the Better Future Alternative applied the 2004–2009 average of 185 gpcd to projected populations. This is higher than the NISP participant average of 177 gpcd that Northern Water frequently refers to[‡,§] and is higher than the current usage rates provided in Table III-1 of the Harvey Report.[¶] If NISP participants are actually using

¶ Western Resource Advocates was unable to replicate the data provided in Harvey Report, Table III-1, using the data provided in the report's appendices. Our calculations resulted in higher historical use rates.

less than 185 gpcd currently, demands will be lower than those identified in this report.

- Several high water use customers — including dairies, food and milk processing plants, and power generation facilities — elevate existing per capita use. As populations grow, such large water users will likely account for a smaller percentage of total use, leading to lower total per capita use. No adjustments were made to the Better Future baseline to account for this.

Existing Supplies

- The Harvey Report documents 37,854 AF of existing Colorado-Big Thompson firm yield supplies. This assumes that CBT shares have a firm yield of 0.6 AF. In fact, these shares typically yield more in dry years. For example, in 2012 — a very dry year — CBT shares yielded 1.0 AF. In 2002, CBT shares yielded 0.70 AF. Based on past practice, more CBT water will be available to NISP participants in dry years.

- Fort Lupton's existing supplies decreased from 3,538 AF in the NISP DEIS to 1,864 AF in the 2011 Harvey Report with no explanation (a decrease of 1,674 AF). The Better Future Alternative used the lower 1,864 AF yield number, adjusting it up only by 270 AF to account for the city's existing Fulton Ditch firm yield, which was not accounted for in Harvey Report supplies. If there were an error in the 2011 Harvey Report, Fort Lupton could have as much as 1,674 AF of additional supplies.

- In the Harvey Report, Fort Morgan supplies decreased by 500 AF from the supplies listed in the NISP DEIS with no explanation. A Better Future adjusted Fort Morgan existing supplies up by only 200 AF to account for a math error in Appendix P of the Harvey Report.

- In the Harvey Report, it is unclear if 336 AF of CBT water is accounted for in either Windsor's or Fort Collins–Loveland Water District's firm yield supplies. This existing supply should be included in one of these water provider's supplies but may not be. No adjustments from the Harvey Report data were made in the Better Future Alternative, due to the lack of clarity on this matter.

- The supplies identified in our report are firm yield (i.e., dry year) supplies. In average and wet years, additional water will be available. For example, the Harvey Report states that NISP participants' current firm yield supplies total 59,400 AF, but average year supplies total 82,076 AF. It may be possible to utilize small, incremental storage projects, such as improved gravel pits, to increase firm yields with additional carryover of average and wet year supplies.

Supplies from Growth onto Irrigated Lands

- Better Future calculations of irrigated acreage that will be developed utilize Better Future population projections that are lower than Harvey population estimates. The resulting smaller growth footprint means less water is transferred (from growth onto irrigated lands) than would occur for larger populations.

- Current NISP participant population density is much lower than the 5 people per acre assumed in Better Future calculations. Less dense development would result in a larger growth footprint and more water transferred.

- The Better Future Alternative assumes 1 AF/acre of firm yield from growth on surface-water-irrigated lands and then assumes that water is transferred from only 75% of this land (to account for uncertainty and the complexities associated with changing irrigation water to municipal use), in effect resulting in a low 0.75 AF/acre of firm yield.

- Additional opportunities exist if water used historically for irrigation continues to be used for outdoor irrigation on the same parcel. The full historic yield, rather than just the consumptive use portion, potentially could be utilized. These opportunities were not evaluated in the Better Future Alternative.

- No parcels irrigated by groundwater or a combination of groundwater and surface water were included in our geographical information system (GIS) analysis of the percentage of irrigated acreage in the growth area, though some of this water may be transferred.

- By using the water-supply-limited, non-CBT portion of consumptive use, a Better Future assumes that little or no CBT water is transferred or acquired.

- Many NISP participants have requirements that developers provide sufficient water supplies for new development, including dedication of CBT water in some cases (see sidebar on page 25). The Better Future Alternative includes only the consumptive use portion of water that would be transferred directly from parcels where growth occurs that were previously irrigated by surface water. Additional water dedications required by towns were not included in Better Future supplies.

- The consumptive use portion of transferred agricultural water would be reusable. No reuse of these supplies is included in Better Future calculations.

Conservation

- Only 60% of active high conservation strategy savings were applied to meet future demands, while 40% is retained (not included in the Better Future Alternative portfolio) for assumed use to improve system reliability and provide for drought response.

- Conservation savings were applied to current baseline per capita use rates, though these are skewed higher by several very large water users, including dairies, food processors, and power generation facilities. As residential populations grow, these customers will account for a smaller percentage of total water use, decreasing per capita use rates. A Better Future did not adjust for this and instead worked off the higher rates. (Note this safety factor was also discussed under "Baseline Demands." Here we discuss the relationship to active savings.)

- Conservation savings were based on the SWSI South Platte Basin assumed percentage reduction in per capita use (38.3%) by 2050 rather than SWSI's high conservation scenario per capita use rate of 116 gpcd for 2050, which would result in lower demands. Table D-1 in Appendix D shows that when losses are added in to be comparable to SWSI data, the Better Future Alternative results in 2050 use of 122 gpcd, which is higher than SWSI's 116 gpcd.

- Projected water charge percentages from the Harvey Report (applied to water deliveries) were maintained, though these could decrease over time as treating utilities charge a smaller percentage as volumes increase. Also, as their use increases, NISP participants, who currently pay water charges, may find that it is more cost-effective to treat their own water, which would eliminate water charges.

- The Harvey Report water loss percentage of 7% (applied to water deliveries) was maintained, though utilities will likely—and should—decrease water losses (as a percentage of deliveries) over the next 50 years.

Reuse

- The Better Future Alternative calculated reuse only for participants with 2,000 AF or more of existing reusable supplies yield. An additional 4,900 AF of existing reusable supplies (including WGFP) were not included in Better Future calculations for participants with supplies below the 2,000 AF threshold.

- Most reusable supplies can be used to extinction. A Better Future evaluated only first-time reuse.

- Though many new supplies acquired will be reusable, a Better Future does not include reuse from those supplies here. For example, agricultural water

transferred as a result of growth or via Ag-Urban cooperation will provide additional reuse opportunities not accounted for in the Better Future Alternative. Using the reuse assumptions discussed above, the 19,150 AF yield from growth onto irrigated lands has the potential for over 8,600 AF of first-time reuse.

- A Better Future includes 1,300 AF of Erie reuse per Erie's nonpotable master plan. The state's Water Supply Future Portfolio and Trade-off Tool* includes much more reuse by Erie, ranging from 3,700 to 4,300 AF. A Better Future relies on the lower estimates from Erie's planning documents rather than the higher state estimate.

Cost Analysis

- NISP participants will have additional demands beyond 2030 that are not met by NISP, which will require investment on the part of participants. These costs are not included in our analysis but are critical to consider when comparing NISP and the Better Future Alternative.

- Only the Better Future includes costs associated with water transferred from growth onto irrigated lands, though this water will most likely be transferred to NISP participants under both NISP and Better Future scenarios.

- Reuse unit cost assumptions are based on an expensive indirect use project with many miles of pipelines, pumping, and water treatment to provide for potable use. NISP participant reuse would likely be much less expensive, being more localized and possibly being used primarily to meet nonpotable demands.

- The Better Future Alternative incurs all active conservation costs between the SWSI low and high conservation strategies even though NISP participant water conservation plans may already exceed low strategy programs and measures.

Appendix B: Better Future Alternative Population Projections and Baseline Demands

Population Projections

The Better Future Alternative is based on Colorado State Demography Office (SDO) county population estimates† through 2040 (the last year for which state projections are available) and Harvey Report growth rates from 2041 through 2060.

† Population forecasts ***are not*** available for municipalities. Forecasts are available for counties and sub-state regions only.

TABLE B-1 ANNUAL GROWTH RATES FOR NISP PARTICIPANTS CALCULATED FROM FIVE-YEAR DATA.

Year	Better Future	Harvey Report		State Demography Office Annual Growth Rate for Period[a]				
	Growth Rate (annual % increase)	Population	Growth Rate (annual % increase)	Boulder County	Larimer County	Morgan County	Weld County	Weighted NISP SDO Growth Rate

TABLE B-2 NISP PARTICIPANT POPULATION PROJECTIONS.

Year	Harvey Report Population	Better Future Population	Change in Population From Harvey Report
A	B	C	D
2009	204,285	204,285	0
2010	211,404	207,363	-4,041
2015	244,445	227,255	-17,190
2020	281,746	255,379	-26,367
2025	322,743	287,958	-34,785
2030	365,661	320,576	-45,085
2035	404,864	352,483	-52,381
2040	435,559	383,648	-51,911
2045	464,078	408,768	-55,310
2050	496,296	437,147	-59,149
2055	533,285	469,727	-63,558
2060	**575,639**	**507,033**	**-68,606**

Table B-1 compares the average annual assumed growth rate for NISP participants in the Harvey Report (column D) with State Demography Office projected growth rates for NISP participant counties (columns E, F, G, and H). Harvey Report growth rates (column D) were calculated by WRA based on population data for individual NISP participants provided in Harvey Report appendices. WRA summed these data to total annual NISP population projections (column C) and calculated the annual growth rate (column D). Better Future growth rates (column B) are weighted SDO rates (column I) through 2040 and Harvey Report rates after that. Weighted NISP SDO growth rates (column I) were developed by multiplying SDO county projections (columns E through H) by the estimated percentage of 2009 NISP population in each county from the "Est. % 2009 Population" row (when a NISP participant serves more than one county, the population was assumed to be evenly distributed among those counties).

Table B-2 shows the Better Future Alternative population projections as compared to Harvey Report projections.

Baseline Demands

Table B-3 shows NISP historical populations, water deliveries, and average per capita usage calculated by WRA using data provided in the Harvey Report appendices. Harvey Report demand projections are based on unsupported rates that are higher than recent historical usage (Table B-4, column B). Recent average (2004–2009) use was 185 gpcd. This is the assumed baseline used in the Better Future Alternative. A Better Future then adjusts baseline demands to incorporate passive water conservation from 2010 through 2050 according to SWSI percentage saving (10.2% savings) estimates. The per capita usage rate (Table B-4, column F) was then held constant from 2050 to 2060 since no additional savings are estimated by SWSI for this period.

SWSI projects South Platte Basin municipal and industrial passive savings ranging from 6.0% to 10.2% in the South Platte Basin by 2050.* The Better Future Alternative applies passive conservation savings of 10.2%,† which results in a 2050 through 2060 per capita use rate of 166 gpcd (Table B-4). Better Future annual deliveries were calculated by applying baseline per capita use rates to Better Future population projections. The projected percentage water charges and losses in the Harvey Report analysis (Table B-4, column E) ranged from 13% to 15%. The Better Future Alternative assumes the same annual rates for charges and losses. Better Future total water requirements (Column I) were calculated by applying Harvey Report loss and water charge percentages to annual deliveries.

TABLE B-3 HISTORICAL WATER USE AND POPULATIONS FOR NISP PARTICIPANTS FROM HARVEY REPORT DATA.[A]

Year	Population	Water Deliveries (AF)	Average Per Person Use (gpcd)
A	B	C	D
1999	121,362	27,411	202
2000	130,332	33,612	230
2001	141,407	35,236	222
2002	150,211	34,522	205
2003	159,542	31,930	179
2004	170,558	34,458	180
2005	184,394	37,424	181
2006	192,344	43,156	200
2007	195,723	43,198	197
2008	200,213	42,108	188
2009	204,285	37,852	165
2004–2009 Average			**185**

a Annual totals and per capita data calculated by Western Resource Advocates using individual NISP participant data provided in Harvey Report, Appendices A through O.

* Colorado Department of Natural Resources, Colorado Water Conservation Board. 2011. "Appendix L: SWSI 2010 Municipal and Industrial Water Conservation Strategies," prepared by Aquacraft, Inc. and Headwaters Corporation, January 2011. In *Colorado's Water Supply Future, Statewide Water Supply Initiative 2010, Final Report*. January.

† The higher end of the SWSI passive savings range was used because the Better Future Alternative projects that NISP participant populations will increase by nearly 150% from 2009 to 2060. As a result, the majority of homes and businesses will be new and so will use less water as a result of passive conservation. Additionally, because of the long 50-year Better Future planning period, many existing home will have to replace less efficient fixtures and appliances.

TABLE B-4 BETTER FUTURE ALTERNATIVE BASELINE PER CAPITA USE, WATER DELIVERIES, AND TOTAL WATER REQUIREMENTS COMPARED TO THOSE FROM THE HARVEY REPORT.

Year	Harvey Report[a]				Better Future Alternative			
	Per Capita Use (gpcd)	Water Deliveries (AF)	Total Water Requirements (AF)	Annual Loss and Water Charges[b] (% of Water Deliveries)	Baseline Per Capita Use (gpcd)	Population	Water Deliveries[c] (AF)	Total Water Requirements[d] (AF)
A	B	C	D	E	F	G	H	I
2009	165	37,852	42,786	13%	NA	204,285	–	–
2010	193	45,820	51,900	13%	185	207,363	43,051	48,764
2015	203	55,480	63,300	14%	183	227,255	46,579	53,145
2020	208	65,490	74,800	14%	181	255,379	51,668	59,013

2060	193	124,250	143,400	15%	166	507,033	94,529	109,098
2010 to 2060 % change	0.4%				-10.2%	–	–	–

a WRA calculations based on data in Harvey Report, Appendices A through O.

b Calculated as the difference between total water requirements (column D) and water deliveries (column C) divided by water deliveries (column C).

c Water deliveries calculated by applying Better Future baseline per capita use (column F) by Better Future population projections (column G).

d Total water requirements calculated by multiplying Better Future water deliveries (column H) by Harvey Report annual loss and water charge percentage for that year (column E) and adding that to water deliveries (column H).

Appendix C: Better Future Alternative Growth onto Irrigated Lands

The Better Future Alternative includes supplies transferred from direct growth by NISP communities onto lands that were previously irrigated. This differs from the Harvey Report, which didn't include any water from this source, though such transfers frequently occur. A Better Future projects the total NISP population to increase, from 2009, by approximately 116,300 by 2030 and 302,750 people by 2060. Assuming new development will be relatively dense at 5 people per acre, which is higher than current population densities for the NISP participants (see Table 1, main report body), results in an estimated 60,550 acres being developed. This is a significantly smaller footprint than what would result if current densities were used in estimates.

The volume of water available to be transferred is site- and situation-specific. The Better Future Alternative relies, in part, on data presented in the NISP No Action Alternative* (NAA) and SWSI. The NAA documents the average supply-limited consumptive use (CU) per acre for the several South Platte River sub-basins. The average supply-limited CU for all basins was 1.12 AF/acre (NAA, Table 5). For the NAA, supply-limited consumptive use for specific ditches selected for the alternative was then further adjusted to remove CU resulting from Colorado-Big Thompson deliveries (NAA, Table 6). This was done because CBT water isn't tied to specific parcels as other water rights are so can be moved around. As a result, CBT water is very desirable and may or may not be available for transfer to NISP participants. For the Poudre Basin, the NAA assumed the average transferable CU was 0.70 AF/acre. For the South Platte Basin, the NAA assumed the average transferable CU was 1.13 AF/acre.† SWSI 2010 data shows an average South Platte Basin water supply limited CU of 1.34 AF/acre.‡ Based upon the NAA and SWSI data, a Better Future assumes an average water supply limited transferable CU of 1.0 AF/acre.

Using irrigated crop data layers (2005) from Colorado's Decision Support System, WRA estimates that, on average, 42% of land surrounding NISP communities where growth would occur is currently agricultural land that is irrigated by surface water. This results in growth by NISP communities onto

* MWH. 2010. *Northern Integrated Supply Project No Action Alternative*. Prepared for Northern Colorado Water Conservancy District. April.

† Note that the NAA Table 6 incorrectly lists the South Platte average as 0.77 AF/acre. Calculations erroneously did not include Farmers Independent Ditch. When this ditch is included, the South Platte average is 1.13 AF/acre.

‡ Calculated by WRA using data provided in SWSI 2010 (Table 4-12): 1,117,000 AF water supply limited CU divided by 831,000 acres.

25,534 surface water irrigated acres (42% of 60,550 developed acres is 25,534 acres). WRA's analysis did not include parcels irrigated by groundwater or parcels where both groundwater and surface water are applied. Additionally, the Better Future Alternative further limits water from this source by assuming that only 75% of the water historically used for agriculture is transferred, resulting in 7,356 AF in 2030 and 19,150 AF by 2060 (Table C-1).

TABLE C-1 WATER SUPPLIES FROM NISP PARTICIPANT GROWTH ONTO IRRIGATED LANDS.

Year	Better Future Cumulative Increase in Population	Cumulative Developed Land[a] (acres)	Traditional Ag Transfers from Developed Lands[b] (AF)
A	B	C	D
2009	–	–	–
2010	3,078	616	195
2015	22,970	4,594	1,453
2020	51,094	10,219	3,232
2025	83,673	16,735	5,293
2030	116,291	23,258	7,356
2035	148,198	29,640	9,374
2040	179,363	35,873	11,345
2045	204,483	40,897	12,934
2050	232,862	46,572	14,729
2055	265,442	53,088	16,790
2060	**302,748**	**60,550**	**19,150**

a Calculated by dividing cumulative change in population (column B) by the assumed density of 5 people per acre.

b Calculated by multiplying developed acreage (column C) by average surface-water-irrigated percentage of 42.2%, and then applying 1.0 AF for each acre and multiplying that by the 75% assumed transfer rate.

Appendix D: Better Future Alternative Active Conservation

Better Future passive conservation savings are accounted for in baseline demand projections. Active conservation will result in additional savings. SWSI* includes high, medium, and low conservation strategies, which include both passive and active conservation savings (Table D-2). The Better Future Alternative assumes high conservation savings will be achieved by 2050, over a 40-year period. A Better Future applies 60% of active conservation savings to future demands and reserves the remaining 40% for drought response and system reliability.

SWSI's high conservation strategy is projected to decrease water use from 188 gpcd to 116 gpcd in 2050 in the South Platte Basin, a savings of 38.3% (Table D-1). Because the 38.3% savings also includes passive savings of 10.2% (already accounted for in Better Future baseline demands), a Better Future assumes active conservation savings equalling 28.1%. Applying passive and active conservation to Better Future historical use of 185 gpcd results in 2050 per capita use of 114 gpcd. SWSI estimates include system losses of 7%, which are comparable to the 7% system loss assumed in the Harvey Report, Table II-3, and the Better Future Alternative.

To compare Better Future per capita use rates with the SWSI data, losses must be included. When 7% system loss is added to the Better Future Alternative, recent average historical use increases from 185 gpcd (based on water deliveries) to 198 gpcd (water deliveries plus system losses), and 2050 use—with passive and active conservation—increases from 114 to 122 gpcd. Resulting Better Future rates are higher than SWSI high conservation strategy use rates.

TABLE D-1 SWSI AND BETTER FUTURE ALTERNATIVE PER PERSON WATER USE ASSUMPTIONS.

	SWSI	Better Future
Historical use including system loss	188 gpcd[a]	198 gpcd
Historical use without system loss	---	185 gpcd
2050 use with conservation and system loss	116 gpcd[a]	122 gpcd
Percent conservation savings	38.3%[b]	38.3%
2050 use not including system loss	108 gpcd[b]	114 gpcd
System loss	7%[a]	7%

† Landscape water demand reductions include the anticipated impact of urban densification.

The Better Future Alternative assumes that only 60% of active conservation savings are applied to meet future demands. Active conservation, phased in over time, results in applied (60% of total) savings of 6,401 AF in 2030 and 20,482 AF in 2060 (Table D-3). These savings include decreases in water charges.

TABLE D-3 PASSIVE AND ACTIVE CONSERVATION SAVINGS AND RESULTING DECREASES IN WATER CHARGES.

Year	Better Future Population	Per Capita Use with Passive and Active Conservation[a] (gpcd)	Water Deliveries[b] (AF)	Annual Loss and Water Charges[c]	Water Requirements[d] (AF)	Baseline Water Requirements[e] (AF)	Active Savings[f] (AF)	60% Active Savings Applied[g] (AF)

Re: Request For Supplemental NEPA Review By The Corps For The Northern Integrated Supply Project In Light Of Significant New Information Bearing On The Proposed Action

On behalf of the nonprofit organization Save The Poudre, I hereby request that the U.S. Army Copy of Engineers ("Corps") conduct supplemental environmental analysis pursuant to the National Environmental Policy Act ("NEPA"), 42 U.S.C. §§ 4321-4370m, by preparing a supplemental environmental impact statement ("SEIS") or, at bare minimum, a supplemental environmental assessment ("EA") to address and evaluate new circumstances and significant information relevant to this project and its environmental impacts. As explained below, **we request a response from the Corps by no later than March 29, 2019** informing Save The Poudre whether the Corps intends to conduct any supplemental NEPA review, and, if not, explaining the reasons why the Corps has declined to take this action.

BACKGROUND

I. STATUTORY AND REGULATORY FRAMEWORK

Congress created NEPA more than four decades ago "[t]o declare a national policy which will encourage productive and enjoyable harmony between man and his environment; to promote efforts which will prevent or eliminate damage to the environment . . . ." 42 U.S.C. § 4321. In light of this mandate, the Supreme Court has reasoned that NEPA is "intended to reduce or eliminate environmental damage and to promote 'the understanding of the ecological systems and natural resources important to' the United States." *Dep't of Transp. v. Pub. Citizen*, 541 U.S. 752, 756 (2004) (quoting 42 U.S.C. § 4321).

In achieving NEPA's substantive goals, Congress created two specific mechanisms through which federal agencies must evaluate the environmental and related impacts of a

particular federal action—an EIS and an EA. *See* 42 U.S.C. § 4332(c). These procedural mechanisms are designed to inject environmental considerations "in the agency decisionmaking process itself," and to "'help public officials make decisions that are based on understanding of environmental consequences, and take actions that protect, restore, and enhance the environment.'" *Pub. Citizen*, 541 U.S. at 768-69 (emphasis added) (quoting 40 C.F.R. § 1500.1(c)). Therefore, "NEPA's core focus [is] on improving agency decisionmaking," *Pub. Citizen*, 541 U.S. at 769 n.2, and specifically on ensuring that agencies take a "hard look" at potential environmental impacts and environmentally enhancing alternatives "as part of the agency's process of deciding whether to pursue a particular federal action." *Balt. Gas & Elec. Co. v. Nat. Res. Def. Council*, 462 U.S. 87, 100 (1983). The alternatives analysis "is the heart" of an EIS or EA. 40 C.F.R. § 1502.14. NEPA's implementing regulations require that the agency "present the environmental impacts of the proposal and the alternatives in comparative form, thus sharply defining the issues and providing a clear basis for choice among options by the decisionmaker and the public." *Id.*

An EIS must be prepared by an agency for every "major Federal action significantly affecting the quality of the human environment." 42 U.S.C. § 4332(c). Under the Council on Environmental Quality's ("CEQ") regulations that implement NEPA, "significance" requires consideration of both context and intensity. Where a significant environmental impact is not expected, the agency must still prepare an EA and a Finding of No Significant Impact ("FONSI"). *Id.* §§ 1508.9, 1501.3. Where an EA or EIS has been previously prepared, NEPA's regulations require an agency to supplement its prior NEPA review when "[t]he agency makes substantial changes in the proposed action that are relevant to environmental concerns," or "[t]here are significant new circumstances or information relevant to environmental concerns and bearing on the proposed action or its impacts." 40 C.F.R. § 1502.9(c).

II. FACTUAL BACKGROUND

The Corps commenced its decisionmaking and NEPA review process for the Northern Integrated Supply Project ("NISP") in August 2004. *See* Corps, *Environmental Impact Statement – Northern Integrated Supply Project*, https://www.nwo.usace.army.mil/Missions/Regulatory-Program/Colorado/EIS-NISP/. The Corps issued its Draft EIS in April 2008, its Supplemental Draft EIS in June 2015, and its Final EIS in July 2018. *Id.* According to the Corps' project website, the agency intends to issue a Record of Decision ("ROD") authorizing this project later this year (i.e., in 2019). *Id.*

It would be a major understatement to say that this project has engendered substantial controversy. Save the Poudre, affected municipalities such as the City of Fort Collins, and many other interested parties have submitted extensive comments criticizing myriad aspects of the Corps' decisionmaking process including the agency's impermissibly narrow purpose and need statement, the artificially constrained analysis of practicable alternatives, the use of inappropriate screening criteria in examining project alternatives, and major project impacts that have not been adequately analyzed. Those comments are all part of the public decisionmaking record.

DISCUSSION

Although the Corps evidently intends to issue its ROD later this year, the Northern Colorado Water Conservancy District ("Northern Water")—i.e., the project proponent—recently made a major change in project operations that alters many of the basic assumptions underlying the NISP project and the ability of Northern Water to fill the proposed Glade Reservoir. On February 28, 2019, Northern Water revealed—*for the first time ever*—that, in order for NISP to be viable, Northern Water may have to purchase at least "25,000 acre-feet of water" from northern Colorado farmers, which Northern Water representatives estimate "would take about a decade and 100 or more farms, depending on their size." Loveland Reporter, *Northern Water Buys First Farm for NISP Water* (Feb. 28, 2019), *available at* http://www.reporterherald.com /news/larimer-county/ci_32483944/northern-water-buys-first-farm-nisp-supply. Indeed, in purchasing its first water from a northern Colorado farm in furtherance of NISP, Northern Water spent $330,000 to purchase a mere 30 acre-feet of water—i.e., $11,000 per acre-foot. Even assuming other farms will sell to Northern Water at no more than this rate (a proposition that is far from certain), purchasing all of the required water would add an additional $275 million in total project costs. *See id.* On the same day that local newspapers revealed this approach, Northern Water separately unveiled its new regime—called the WaterSecure program—and launched a website providing information about it. *See* Northern Water, *WaterSecure*, *available at* https://www.northernwater.org/sf/nisp/watersecure. For several reasons, these purchases would represent a wholesale change to the approach Northern Water will take to acquire the water for NISP, and is a fundamentally different and highly significant modification to the project that bears directly on the proposed action, its impacts, and its alternatives.

First, Northern Water's new approach of purchasing some or all of the required 25,000 acre-feet of water from northern Colorado farms—i.e., more than 60% of the 40,000 annual acre-feet of water that Northern Water alleges is a necessary project component of NISP—has *never* been analyzed as part of the Corps' Draft EIS, Supplemental Draft EIS, or Final EIS. To the contrary, the Final EIS makes clear that under Northern Water's preferred alternative—as well all other action alternatives—"$0" would be spent on "water rights acquisition." Final EIS at 2-103. In contrast, the Corps estimated that under the *no-action* alternative, Northern Water would have to spend $700 million on water rights acquisition by buying water rights from farms at approximately $15,500 per acre-foot. *See* Final EIS at 2-102. Accordingly, because Northern Water's new approach fundamentally transforms the preferred action and its underlying assumptions and operational mechanics, at minimum the Corps must prepare supplemental NEPA review disclosing to the public this new approach and soliciting public input on this substantial change.[1]

[1] The Final EIS states that Northern Water already owns the water rights necessary to implement the preferred alternative. *See* Final EIS at 2-77 ("With the exception of Upper Galeton Reservoir as a point of storage for the SPWCP water right, *Northern Water owns the water rights with the necessary points of diversion and storage for Alternative 2M*." (emphasis added)). Thus, the fact that Northern Water actually does *not* own some of these water rights—to the tune of 25,000 of annual acre-feet of water (more than half the water Northern Water claims to need from this project)—is a colossal change in the preferred alternative that alters the entire landscape of this project is a significant way.

Second, supplemental NEPA review is necessary because Northern Water's new approach completely alters the baseline against which practicable alternatives are measured, especially in light of the significantly increased project costs. Even if Northern Water is able to buy 25,000 acre-feet at approximately $11,000 per acre-foot—which is not certain given the fair market price for such water rights, *see* Final EIS at 2-102—this would add at least $275 million to overall project costs, which means that certain alternatives previously dismissed due to higher costs might now be "practicable" when compared to the much higher costs of the preferred alternative in light of Northern Water's new farm purchasing scheme. Given the new cost baseline for the project, the Corps must re-examine all practicable alternatives as judged against the new projected costs of Northern Water's preferred alternative.[2]

Third, the Corps and Northern Water previously rejected alternatives that included as a component alternative agricultural transfer methods (including agricultural leasing), and did so by implementing faulty screening criteria for proven technology—i.e., rejecting the leasing of agricultural water on the purported grounds that such methods are technologically unproven. *See* Final EIS at A-115 (EPA comments advocating the consideration of alternative agricultural transfer methods). Now that Northern Water has dramatically changed course and *is* purchasing and/or leasing water from northern Colorado farms, the Corps must revisit the concept of alternative agricultural transfers and analyze other alternatives involving this concept that is, in fact, feasible as demonstrated by Northern Water's selection of this new approach to acquire more than half of the water needed for this project to be viable.

Fourth, Northern Water's significant change in operations for the preferred alternative necessarily modifies many of the key factors under NEPA related to this project, such as the purpose and need and whether the preferred alternative can even achieve the purported need for this project. In particular, since there is much uncertainty as to whether and when Northern Water would be able to achieve its goal of purchasing 25,000 acre-feet of water from northern Colorado farms, it is highly speculative as to whether the preferred alternative can provide 40,000 acre-feet of water (which is a requirement to satisfy the project's stated need).[3] The Corps

[2] The costs associated with NISP have grown exponentially since the beginning of this project. In 2008, the Corps estimated that the project would cost $350 million. By the 2018 Final EIS, the Corps estimated that the project would cost $1.1 billion—i.e., three times what the Corps estimated only ten years earlier. With Northern Water's new approach, the estimated costs will increase at least another $275 million and likely much more than that as farms sell their water rights at higher per-unit rates.

[3] Northern Water has indicated that it intends to resell the purchased land, conditioned to allow the exchange to operate in perpetuity, and may claim that such transactions will allow them to make these purchases at zero cost. *See* Loveland Reporter, *supra* ("Eventually, the district plans to sell the farms to private owners, he said, with the stipulation that the water would stay with the property."). Until such a time as Northern Water can provide signed contracts for resale of all of the purchased land, this approach remains speculative at best. Even if Northern Water was able to eventually resell all of the properties at favorable prices—which is far from certain—the project would incur substantial carrying costs associated with land ownership in the interim.

must analyze the likelihood that Northern Water will be able to acquire the rights to 25,000 acre-feet of water, the estimated costs of doing so, the anticipated time frame before such acquisition is completed, and what happens in the event that Northern Water is not able to acquire 25,000 acre-feet of water through this new approach.[4]

Fifth, the modeling conducted to date by the Corps and/or Northern Water is no longer accurate since the modeling assumptions previously used in assessing mass-balance water quality and return flow obligations fail to include any analysis of this new approach and how those projections change if Northern Water is (or is not) able to purchase 25,000 acre-feet of water from farms.

Sixth, there will be highly significant environmental impacts under Northern Water's new approach, in which the project proponent will separate Poudre river water from the land and replace it with South Platte water (then reselling and/or leasing the land to an irrigated agricultural user). Because of the multi-river issues inherent in this approach, there are myriad adverse effects to water quality, wildlife, and other aspects of the ecosystem that the Corps has not yet examined. The need for a "hard look" at these new impacts counsels in favor of supplemental NEPA review.[5]

Seventh, now that Northern Water's preferred alternative and the no-action alternative *both* involve as a key component the purchase of many acre-feet of water from farms, there is not an alternative that is genuinely distinct from the action alternatives. Because the Corps must include an analysis of a true no-action alternative—which must be conceptually distinct in terms of its components from the action alternatives—supplemental NEPA review is necessary to ensure that the agency explores a genuine no-action alternative as a proper baseline for assessing the action alternatives against that no-action standard.

None of these costs have been disclosed in any of the NEPA documents to date, nor compared to alternatives in determining the practicability of other approaches.

[4] Not only will Northern Water's new approach dramatically increase overall project costs and the amount of time before the project is viable due to water rights acquisition, but there will be additional costs and time expended addressing water rights issues associated with this new approach in water court. These costs and delays must also be examined as part of a supplemental NEPA analysis.

[5] Under this new approach, every purchase/exchange allows Northern Water to displace clean Poudre River water with more contaminated and more polluted water from the South Platte River. The mixing of water from these two sources will very likely adversely impact water quality for all ditch customers, including landowners who have *not* sold or leased their water rights to Northern Water. The Corps must analysis these water quality impacts, which require landowners who refuse to sell to Northern Water to nevertheless accept more polluted and lesser-quality water from the South Platte that otherwise would flow from the much cleaner Poudre River, and would require this outcome presumably without any compensation for those landowners from Northern Water or the Corps.

Eighth, in conjunction with this new approach, Northern Water expects to exchange 25,000 acre-feet of water between several ditch companies and the NISP participants. However, there is nothing in the Final EIS or elsewhere quantifying the costs of any contracts or other agreements with these ditch companies, nor any evaluation of what happens if the ditch companies are unwilling to partner with Northern Water on this project. This, too, must be addressed through supplemental NEPA analysis.

Ninth, supplemental NEPA review is necessary because Northern Water's new approach to the preferred alternative changes the assessment of impacts to the irrigated agriculture-related economy of northern Colorado. Whereas the Final EIS stated that the no-action alternative "would likely result in a moderate to major effect on irrigated agricultural economy in the study" due to widescale purchase of water rights under the no action alternative, Final EIS at 4-541, the Corps stated that "[u]nlike the No Action Alternative, Alternative 2M would not relay on transfers of agricultural water rights as a source of supply"; "[c]onsequently, there would not be effects on the irrigated agriculture-related economy due to water transfers." *Id.* at 4-545. Clearly, the Corps' earlier assumption that the preferred alternative would not involve transfers of agricultural water rights is no longer accurate, nor is the conclusion accurate that the local agricultural economy will not be impacted by implementation of the preferred alternative. This aspect of the Final EIS needs to be revised to account for current information on the preferred alternative and to accurately identify economic and other effects that will reasonably flow from Northern Water's new approach.

Given the many areas of the Final EIS that are now outdated, inaccurate, or flawed, it is imperative that the Corps update its analysis of project impacts, alternatives, and purpose and need. This critically important information requires supplemental NEPA review addressing these concerns both because Northern Water has made "substantial changes in the proposed action that are relevant to environmental concerns," and the new approach constitutes "significant new circumstances or information relevant to environmental concerns and bearing on the proposed action or its impacts," 40 C.F.R. § 1502.9(c)(1). Thus, because agencies "shall prepare supplements" to final EISs where either criterion is satisfied, *id.*, the Corps must conduct supplemental NEPA review and issue an SEIS (or at least a supplemental EA) addressing this vitally important issue that is central to the Corps' purpose and need analysis, evaluation of reasonable alternatives that could satisfy the need for this project, and the ultimate decision as to whether the Corps should authorize this project under Section 404 of the Clean Water Act. In conducting supplemental NEPA review, Save The Poudre strongly urges the Corps to subject that document to public comment and input, in light of the controversial nature of this project and the immense public interest in this project shown to date by Colorado residents. In our view, absent a supplemental NEPA analysis incorporating the new elements of the preferred alternative and public comment on that evaluation, the Corps' action would not satisfy NEPA's "hard look" standard and would, instead, be sweeping vital aspects of this project and its effects under the rug,

CONCLUSION

For the reasons explained above, Save The Poudre believes that the Corps must conduct supplemental NEPA review as directed by the CEQ's NEPA regulations to analyze various aspects of Northern Water's new WaterSecure program and how it impacts this project, its purpose and need, its impacts, and feasible alternatives. Please let me know by **no later than March 29, 2019** if the Corps intends to prepare a Supplemental EIS or EA in response to this letter and the significant new information identified herein. If the Corps decides not to conduct any further NEPA review despite the new information set forth in this letter, please provide a written response by March 29 explaining the reasons why the Corps has declined this request. I look forward to hearing from the Corps about this matter. Please let me know if you would like to schedule a conference call to discuss this matter in person.

Respectfully submitted,

William S. Eubanks II

William S. Eubanks II

Memo to: Larimer County Commissioners

From: Dr. Yvonne M. Wittreich

Date: June 7, 2020

Regarding: No Pipe Dream and placement of Thornton and Northern Pipelines

I am writing an urgent memo to each of you, as we are still very concerned about the location of the Thornton and Northern Pipelines. The residents of Douglas Road, east and west, as well as residents of County Road 56 have been under so much pressure for nearly three years with the threat of cramming pipelines down our roads. Previously, in the past, we were threatened by a Truck Bypass rambling trucks down our roads. When will be have peace, harmony, and tranquility in our neighborhoods, instead of threat and intimidation?

In the meantime, we are pleased for our neighbors on Country Club Road who have enjoyed peace of mind with improvements such as the following:

- Signs restricting semi-trucks to use County Club Road (Unfortunately, now we get the trucks on Douglas Road)
- A new traffic light at the corner of Turn berry and Country Club Road
- A cross walk for residents and children on Country Club Road
- Road work and improvements at the corner of Colorado 1 and Country Club Road

For many years, we have written letters and appealed to you to put a traffic light at the corner of Colorado I and Douglas Road. We have described to you so often, how dangerous and treacherous this crossing is. Wellington has doubled in size, and traffic is very heavy on Colorado 1 and Douglas Roads. Increased Semi trucks have made this crossing even more horrific and dangerous!! We are hopeful that the traffic light can still be put in this summer, as we were recently told.

Now, we have a large number of semi-trucks speeding down Douglas Road as if it were a designated Truck Bypass. Could signs be put at the entries of Douglas Road asking the truck drivers to stay on Highway 287, a designated Truck by Pass? Signs such as "Residential Neighborhoods, Larimer County Encourages Truck Drivers to stay on Highway 287, a designated Truck Route", would be helpful. We are a residential neighborhood, too, and now we have many multi ton trucks rambling down our road from early am to late evening. What is a recent count per day of semi-trucks on Douglas Road, has one been completed?

The residents of Thornton and Northern Cities do not deserve your support and allegiance, as they do not care about you or us. Thornton can keep their water in the Poudre River as they originally bought farm water, not the pristine waters of the Poudre River!! Northern is too big of a project for Larimer County and it should be discontinued because of the danger it proposes to the water system as well as destruction in neighborhoods from a huge dam and monstrous water pipes!!

Have you seen the "disarray" on Remington and Parker Streets? This is a signal to all of us what our roads and neighborhoods could soon look like.

I have felt that you were our colleagues and friends as many of us attended your monthly public meetings. I hope that we can continue to feel this way about our elected officials, our commissioners.

Thank you for your time in reading this message, and I hope it will make you think what you are doing to the beautiful, rural northern areas of Larimer County. I write this memo in support of No Pipe Dream, Save the Poudre and Save Rural Northern Colorado neighborhood groups.

Most Sincerely,

Yvonne M. Wittreich

Dr. Yvonne M. Wittreich

Resident of Douglas Road

Dear Commisioners Donnelly, Johnson, and Kefalas,

I am writing you today to urge you to oppose NISP. The Cache la Poudre River is the heart and soul of Larimer County and Fort Collins, and allowing NISP to move forward would result in the destruction of the very river that provides irrigation for farmers, recreation, wildlife habitat, and aesthetics and beauty for our community.

You have the opportunity to provide a legacy for our children and grandchildren. If NISP is allowed to be built, the chance for them to enjoy the river as it now exists would disappear. Imagine if the National Park system was not created. We would have lost the public lands that we now enjoy, the incredible beauty of the country that we see every day. Without the Endangered Species Act, we would have lost many of the flora and fauna that are an essential part of a functioning ecosystem, and a chance to enjoy the plants and animals that Would have otherwise been lost. We would have lost our national symbol, the Bald Eagle, as well as many plant and animal species that have been saved because of the ESA.

You have heard the arguments for opposing NISP, but they are worth repeating here. Water from the reservoirs created by NISP would go outside of Larimer County, to Weld and Boulder County towns. It would reduce Poudre River flows to a trickle through Fort Collins and beyond, after the city spent millions building a new whitewater park. There would be massive dam construction impacts for local residents and massive pipeline construction impacts, destroying or damaging many Larimer County and Fort Collins natural areas. It would be necessary for NISP to buy 20,000 acres of farms for their water rights, taking farmland out of production that is needed for our future.

The impact on our rural communities would be huge. The noise, traffic, and air pollution caused by dam construction would negatively impact their way of life. Irreparable harm of the land, air, water and rural character would result from this project.

Pipeline construction impacts would be massive. Private property would need to be seized by eminent domain, road construction and environmental impacts would have a detrimental effects on day to day life. Natural areas would be lost, resulting in degraded ecosystems and recreational opportunities, not to mention the effects on wildlife and habitat.

NISP would result in the degradation of flows and water quality of the Poudre. It would mean the destruction of the river as we know it.

Is that the legacy you want to leave, or do you want to leave a legacy where the Poudre River would be protected and preserved for future generations? There are alternatives to provide water for future residents of Larimer County. But if you allow NISP to go forward, the loss of the river as we know it would be unimaginable.

Thank you for the opportunity to share my thoughts on this important subject. Please oppose NISP. Our children and grandchildren will thank you for the vision to make a very difficult decision.

Sincerely,

Dan and Val Teska

NISP 1041 is incomplete

2 messages

normanranch <normanranch@earthlink.net> Mon, Jun 8, 2020 at 10:20 AM
To: bocc@larimer.org, pcboard@larimer.org, rhelmick@larimer.org

Dear Commissioners,

NISP has its 1041 Glade Reservoir and Pipeline application deemed complete by the Planning Department. There are numerous deficiencies and the completeness determination should be reversed.

The issues below need to be addressed more thoroughly by NISP before ever going before the Planning Commissioners.

Here are just a few of the many concerns we have over NISP's 1041 application:

1. The relocation of 7 miles of Highway 287, a major federal highway, would not occur but for the NISP project. NISP is treating the 7 miles of highway 287 relocation as "not our problem" and is claiming the relocation and all of its impacts is a separate "CDOT" project, to be funded by taxpayers! The relocation of 287 started out in the NISP proposal, "NISP includes the following facilities located in Larimer County**: the Glade Unit**; the Glade Pump Station; raw water distribution piping; and the **relocation of U.S. Highway 287**." NISP then changed its mind and excluded the 287 relocation from the proposal. The relocation will have major impacts to Larimer County and its taxpayers, public safety, visual impacts, historic structures,etc.. The relocation of U.S. Highway 287 is part and parcel of NISP, please insist it is addressed in the 1041.

2. Not adequately addressing 1041 Criteria 6, "The proposal will not negatively impact public health and safety".

a. The proposal will push a missile site carcinogenic chlorinated solvent plume into domestic drinking water wells. As stated by geological expert, Tom Sales, "Historical operations at a DoD Nuclear Missile Site at the base of the Glade Dam created a large plume of carcinogenic chlorinated solvents in groundwater that currently passes out beneath the proposed forebay for Glade. Plumes of this nature last many lifetimes and it is implausible that site specific efforts to clean up the plume have been effective. Northern installed more than 20 monitoring wells in 2019 located through the plume, but no public records are available regarding data from the Northern 2019 monitoring well network." The forebay is a below dam small reservoir of the Poudre water which will be pumping water 375 feet up into Glade Reservoir. This groundwater carcinogenic contamination must be addressed thoroughly in the 1041. Why wasn't the NISP monitoring well information made public? Please insist this information is included in the 1041.

b. The relocation will take a benign straight highway alignment along a valley bottom and turn it into a dangerous road up and over a high hogback. This rocky terrain, and curvy reroute will be a longer and more dangerous road, causing higher accident rates. Blind corners will undoubtedly cause an increase in vehicle/vehicle and vehicle/wildlife accidents. I concur with attorney, John Barth's statement, "The new alignment will increase emergency response times by at least 5 minutes, critical minutes in a life-threatening emergency." This reroute is only for the benefit of NISP, and unnecessarily endangers Larimer County residents and visitors. Please insist these safety issues are addressed in the 1041 application.

c. Two large faults, the North Fork Fault and the Bellvue Fault, pass under the proposed Glade Dam site. Tom Sale, geological expert, states, " 1) the faults represent vertical intervals of broken rock and 2) that they pass directly under the proposed dam site (that will have up to 400 feet of differential water level) it seems highly likely that leakage under the dam along the faults will be severe. NISP's "Oh, by the way" inclusion in the application is**,** "There are two earthquake faults mapped within the Glade unit. The Bellvue Fault and North Fork Fault have been intercepted at depth by test holes advanced during the project's geotechnical investigations."…. "Both faults are inactive and do not present a seismic risk to the project." **All faults are inactive until they aren't**. NISP's remark of "Do not present a seismic risk to the project" has no reference to a government agency verifying there is no seismic risk. Any seismic risk, no matter how small, is unacceptable when it involves a dam holding back 170,000 acre feet of water!. Please demand a more thorough analysis from a federal authority and insist on a qualified government agency's certification that the two faults will never present a seismic risk to the project. Larimer County citizens lives depend on it!

3. Inadequate Criterion #5, "The proposal will not adversely affect any sites and structures listed on the State or National Registers of Historic Places." The Final EIS states there are 82 eligible or potentially eligible cultural sites present in the disturbed area. Eight of the sites are officially eligible and 74 require additional data and formal evaluation. These are dismissed by NISP as minor to moderate impacts. There are numerous additional sites in the APEs of the 287 reroute that are not even mentioned. The FEIS states mitigation will be decided at a future time. This is unacceptable. Please assure that historical sites are individually addressed, by appropriate historical societies as to impact.

4. Proposal has not addressed Criterion #4, "The proposal will not have a significant adverse affect on or will adequately mitigate significant adverse affects on the land or its natural resources, on which the proposal is situated and on lands adjacent to the proposal." To get the Poudre River water into Glade reservoir will take 80MW of power supplied by huge transmission towers similar to those used at Glen Canyon Dam (see below image).The forebay is the holding reservoir for water from the Poudre River, and from where the Poudre water will be pumped 400 feet up into the Glade Reservoir. "The proposed peak pumping rate in Northern's application to Larimer County, from the forebay, is 1,200 cubic feet per second and will require 81 MW (megawatt) of power. To put 81 MW in context, it is equivalent to the power required by Fort Collins' approximately 62,000 residences and 90% of the reported generation capacity of Glen Canyon Dam," states Tom Sale, civil and environmental engineering expert. We also want answers in the 1041 to Tom Sales questions of:

- How will NISP get the required electrical power to the pumps,
- Where is the approval for an 80 MW power line, and
- What is the visual impact of these enormous power lines?

We would like to add to that list:

- What is the carbon footprint in the producon, ins tallaon, and main tenance of the transmission towers and power lines, and

- What is the on going carbon footprint from the producon the electricity r equired to run those huge pumps?
- Where is the assessment assuring there are no protected and endangered species along the hogback that would be impacted by the towers and lines?

Below is the 90 MW power source illustration, from Tom Sales' comment letter, showing the transmission towers of 90 MW necessary for the Glen Canyon Dam. NISP has stated it will need 80 MW for the proposed Glade Reservoir. The towers needed will be unsightly in this beautiful valley and may have a huge impact of wildlife and human safety. Where is the assessment documentation that there are no protected and endangered species along the hogback?
Glen Canyon Electric Power Source

Some things just don't make sense, and Glade Reservoir is one of them.

Thank you,

Roberta and John Norman

Hello Larimer County Planning Commission and County Commissioners

Please take care regarding Northern Water's proposed pipelines through Larimer County.

I think Poudre River water should be left in the River through Fort Collins to be picked up by a pipeline east of I-25.

The County Commissioners declined to approve Thornton's pipeline which seems to be a similar route through Larimer County as the NISP Pipeline. Is the NISP Pipeline different?

The second additional Poudre Delivery Pipeline is touted by Northern Water as bringing water directly to the Poudre River and through Fort Collins with water being picked up east of Fort Collins. Please note the route of the Poudre Delivery Pipeline (see attached maps and links below). The Pipeline starts in the Homestead Natural Area in Fort Collins and the Pump Station is in the Kingfisher Natural Area in Fort Collins and takes a route through Kingfisher and River Bend Natural Areas as the pipeline heads southeast past I-25. The route is not "east of Fort Collins" as Northern Water claims on its NISPTalk page. The route goes through Fort Collins natural areas within City limits and the City's GMA area.

The Poudre Delivery Pipeline route is detrimental to the Natural Areas on which taxpayers have spent $millions to improve the health of the Poudre River, riparian areas, wildlife and recreation. As you know the health of Larimer County depends in part on the health of the Poudre River. The detriment to the River and Natural Areas includes pipeline construction with accompanying noise and air quality impacts on wildlife and area residents and businesses and includes Northern Water's permanent easement along the pipeline route. How can Northern Water mitigate the damage done to the Poudre River and surrounding area?

How does running a pipeline through Natural Areas and the River's riparian area "provide positive benefits to the river corridor and enhance the aquatic and riparian environment" as Northern Water claims? The proposed pipeline should be changed and ideally the water should run through in the Poudre River to be picked up east of I-25.

Fort Collins, CO 80524

June 9, 2020

Larimer County Planning Commission

Larimer County Board of County Commissioners

To all concerned,

I'm writing as a Larimer County resident, property owner and tax payer, with respect to the Northern Integrated Supply Project (NISP), and its pending 1041 Permit request.

For very many reasons, I believe the Planning Commission must reject the 1041 permit request by the project's proponents, Northern Water. Personally speaking, it is certainly not in my best interests. Nor, I believe, is it in the interest of those whom I suspect to be the vast majority of Larimer County residents. In fact, this project proposal represents significant public harms. I will only mention a few here, in partial explanation for why I oppose it and hope you will deny the 1041 permit.

As you likely know, the Poudre River is already stressed and endangered , in large part by diversions. NISP, if completed, will severely cut off the "peak flows" needed to maintain the river's health and habitats. There is no way to avoid this if this project is built as planned, and it is impossible to mitigate these system-wide impacts. One of the direct ones will likely be a reduction of habitat for trout species. While I'm not an angler myself, I have very many friends who are. Yet, even if there wasn't a single person who personally cared about fishing, we have a moral duty to preserve what we have.

Also with respect to the Poudre itself, I'm extremely concerned about the gradually increasing effects of climate change, whose effects may well be exacerbated by diversions from the river. What is the tipping point? Just how far are we willing to go? While I understand water rights, I would urge the Planning Commission and Board of Commissioners not to play a part in further damaging the river.

NISP's plan is also incompatible with Larimer County's Comprehensive Land Use Plan that pertains to the area in question. Larimer County should defend this plan and its visionary objectives, for the benefit of residents, both today's and tomorrow's; and put Larimer County's interests first.

That Northern Water will buy up farms in Weld County for their water rights is another reason for denial. Why does this matter? For one thing, the drying up of farms in Weld will be yet another heavy blow to agriculture in Northern Colorado, which has already been harmed by speculation in water and land. For another, all that "dry" land will then have only one perceived use- development. This will drive up vehicle miles traveled (VMT), a major contributor to both highway congestion and air quality problems that continue to lower quality of life while driving up costs for all. Several failed attempts to win public support for highway expansions illustrate the growing difficulty of ignoring this problem.

Unfortunately, the federal EIS missed the latter impacts, erroneously concluding that the project has no need for additional water rights (it will), and therefore, no farms would be purchased in order to fill the reservoir. This error alone casts significant doubt on the reliability of the federal EIS.

Of course, NISP won't just drive land development and sprawl in Weld County. The communities participating in NISP are faced with every-increasing costs to finance it. There will be even greater pressures on each for expansion for revenue development to cover these costs. This is ill-advised in an area already literally choking on the effects of high growth rates. NISP, in effect, creates a vicious cycle of deb-fueled expansion which leads to yet further costs for local governments and their taxpayers. This is madness. It is unsustainable and counters everything we try to do to keep Larimer County a great place to live.

Besides such harms, I'm also concerned about the potential long-term costs to residents here from trying to accommodate NISP. I marvel that this can even be considered without a prior public discussion and hearing on whether Larimer County should agree to the relocation of US287, along with the consequences of that.

Summing this up, this is a very bad deal for Larimer County and its residents. I hope that we, who will bear many (but not all) of the negative consequences will be your primary concern in this regard.

Respectfully,

Roger Hoffmann

Northern Integrated Supply Project

1 message

Darene Carter -Hiatt (dchiatt@yahoo.com) Sent You a Personal Message Fri, Jun 12, 2020 at 7:32 AM
<automail@knowwho.com>
To: pcboard@larimer.org

Dear Larimer County Commissioners,

I respectfully request that you deny 1041 permit for the proposed Northern Integrated Supply Project based on solid studies that show it would be destructive to the Poudre River and its ecosystem as it flows through Fort Collins and beyond.

Currently, almost 60% of the Poudre?s water is diverted for agricultural, municipal, and industrial uses. If built, during peak flows, NISP could dry up another 71% of the flow through Fort Collins. Studies show that such a reduction would have dire consequences to fish and other aquatic life, riparian ecosystems, water quality, flow volume, and recreation use.

The NISP is expected to cost at least $1.2 billion, although those costs will rise because Northern Water has not obtained enough water rights to date to fill the reservoir. Northern Water must buy ?dozens and dozens? of Larimer and Weld County farms to obtain the water rights needed. Of the 15 communities and water districts that hold shares in NISP, many are outside the Poudre?s watershed.

The NISP is an extremely expensive project that would cause great destruction; disrupt and displace residents around the proposed reservoir, residents along Highway 287, and residents along the proposed pipeline route; and it isn?t needed. There are many conservation actions that would provide all the water proposed to be delivered by Glade, including improved water efficiency by municipal districts, industry, and agriculture; public education and awareness programs; repairs to leaking ditches and pipelines, landscape irrigation improvements, and much more.

The NISP is a controversial project that is of great interest to many people in Larimer County who want full opportunity to comment on the permitting process and to appear at public hearings. Because of the scope and controversy surrounding this proposed project, the Commissioners should wait until the coronavirus pandemic has subsided enough to allow for full in-person public participation.

Sincerely,

Darene Carter -Hiatt

Dear Mr. Urbanic:

No Pipe Dream Corporation, Save Rural NoCo, and Save the Poudre collectively submit this letter specifically to express significant concerns regarding the inadequacy Final Environmental Impact Statement (FEIS dated July 2018) for the Northern Integrated Supply Project (NISP) prepared by the U.S. Army Corps of Engineers (Corps).

Within seven months after the publication of the FEIS, the applicant for the NISP announced a substantive change that renders each of the alternatives analyzed in the FEIS out-of-date and inaccurate, especially alternative 2M, the applicant's preferred alternative. Specifically, the applicant announced publicly in February 2019 that it would undertake a farm-buying program in order to acquire the rights to 22,000 acre-feet of water (Loveland Reporter, Northern Water Buys First Farm for NISP Water [Feb. 28, 2019], available at http://www.reporterherald.com /news/larimer-county/ci_32483944/northern-water-buys-first-farm-nisp-supply). For a project that requires about 40,000 acre-feet of water rights, the project currently lacks more that half of the rights it needs. The proponent has embarked on a farm-buying program, and between February 2019 and May 2019, has purchased just 94 acres of farmland in Weld County (Attachment A). The applicant's current proposed action, therefore, is not analyzed in the FEIS.

The FEIS (Table 2-14) estimates that costs for water rights acquisition under the No Action Alternative would be $700,000,000. Costs for water rights under the preferred alternative 2M is $0. The applicant has already spent almost $1,000,000 to purchase the three farms in Weld County, for a total of about 94 acres. At this rate, project costs for water rights acquisition would be at least $242,000,000 (e.g., 11,000 per acre * 22,000 acres), a cost that is not disclosed as part of any alternative in the FEIS. And, at this rate, water rights acquisition would take over 200 years; therefore, the current project cannot meet the purpose and need described in the FEIS (FEIS pg. 1-5). Even more relevant is, however, that the project is entirely speculative since there are no guarantees that the water rights can ever be obtained.

The FEIS must present a clear and accurate assessment of the proposed costs of the current project. Furthermore, other alternatives may now be less costly. So far, about 94 acres of farmland has cost the project almost $1,000,000, and no headway has been made in over a year. The feasibility of this project is highly questionable and must be independently, thoroughly reevaluated and its impacts disclosed.

Beginning on page 2-8 of the FEIS, Section 2.2.3.2 describes four scenarios for agriculture-to-municipal transfers and clearly discloses the reasons why the Corps determined that all four failed to meet the purpose and need for the project. Specifically:

In 2007, the Corps considered four scenarios of agricultural to municipal transfer concepts (HDR 2007):

- *Partial supply, preserve agriculture – obtain at least 30% (12,000 AF) of firm yield for NISP and preserve agriculture by leasing water back to agricultural users on a rotating basis*
- *Full supply, preserve agriculture – obtain all 40,000 AF* [acre-feet] *of firm yield, but preserve agriculture by leasing the water back to agricultural users through a rotating fallow program*
- *Full supply, permanently remove irrigation from agricultural lands*
- *Partial supply, permanently remove irrigation from agricultural lands*

With regards to the first scenario, the Corps determined the following:
As a result, the rotational fallowing concept has not progressed to the point of being considered a proven technology (Hydros 2012). Therefore, scenarios involving rotational fallowing would fail the NISP proven technology and firm yield screening criteria, if irrigators retained ownership of the water rights.

With regards to the second scenario, the Corp determined:
The full supply, preserve agriculture scenario would fail to meet the NISP firm yield for the same reasons as the partial supply, preserve agriculture scenario discussed above. The amount of agricultural water required to produce 40,000 AF of firm yield for NISP while running a successful rotating fallow program to keep agricultural land in production would be far in excess of the 103,000 AF required for the partial supply option (HDR 2007). It also would be nearly impossible to guarantee that enough water could be purchased to satisfy the full firm yield demand through this full supply, preserve agriculture scenario.

Similarly, the Corps dismissed one of two options for third scenario:
For the full supply, permanently remove irrigation from agricultural lands scenario, there would be two options. The first option would be to purchase C-BT units from ditch companies….. Because the objective of the first option is to produce the full 40,000 AF firm yield for NISP, the scenario failed to meet the NISP purpose and need.

The second option for the third scenario was retained and analyzed at Alternative 4, in the DEIS, but was eliminated and replaced with a different Alternative 4 in the FEIS.
The second option is the extensive transfer of agricultural water rights. It is estimated that about 12,000 AF of new firm yield required for NISP could be obtained. This is the partial supply, permanently remove irrigation from agricultural lands scenario, and was evaluated as Alternative 4 in the DEIS. The basis for eliminating Alternative 4 and the concept of the full supply, permanently remove irrigation from agricultural lands scenario is discussed in Section 2.3.1.1.3.

While this analysis explains that agriculture-to-municipal transfers must be dismissed or relegated to the No Action Alternative because they don't meet the project purpose and need, or are not otherwise feasible, they are currently a *large* part of the applicant's plan. Although they were previously rejected as "unproven", they are apparently now proven-enough for the applicant. Alternatives involving water transfers must now be considered feasible and worthy of analysis.

Throughout the FEIS, the current proposed action, including its agriculture-to-municipal transfers must be described in detail, and the impacts of the loss of over 20,000 acres of farmland must be analyzed before the Corps can prepare a Record of Decision for this project. Clearly, the loss of farmland would not be the only impact associated with this substantive change to the proposed action, and the associated direct, indirect, and cumulative effects must also be evaluated. Mitigation must be developed.

On March 12, 2019, Save the Poudre requested the Corps to prepare a Supplemental EIS or EA. It stated, as we have herein, that significant new information bearing on the proposed action had come to light and requested a response, and we hereby incorporate that letter as Attachment B. To our knowledge, the Corps has not taken any action to prepare a supplemental EIS, despite having been aware of it for over a year. It is contrary to NEPA that the Corps has not evaluated this substantive new information. This project would have significant and far-reaching environmental impacts, on the land, water, and communities across northern Colorado and on the Poudre River, which is a regional treasure. In the absence of a supplemental NEPA document, the Corps must deny the Section 404 permit since the effects of the current project are undisclosed and the NEPA requirements have not been met.

No Pipe Dream Corporation is a Colorado non-profit corporation composed of Larimer County property owners and taxpayers established to protect citizens from the intense adverse impacts of multiple proposed pipeline and reservoir projects in Larimer County, including but not limited to NISP. Save Rural NoCo is a Colorado non-profit organization composed of property owners and taxpayers whose mission is to protect existing land, water, and communities in rural northern Colorado from harmful development through research and public education. Save the Poudre is a Colorado non-profit membership organization primarily composed of residents of Larimer County, including outdoor recreationists, scientists, property owners, and taxpayers that would be adversely impacted by the construction and operation of NISP. Save the Poudre's members live, work, and recreate on and around the Cache la Poudre River in Larimer County. Some members own property or have residences near the Poudre River in the City of Fort Collins.

Sincerely,

s/ Robert Kitchell, President

Subject: Northern Integrated Supply Project
To: <bocc@larimer.org>

Dear Larimer County Commissioners,

I respectfully request that you deny 1041 permit for the proposed Northern Integrated Supply Project based on solid studies that show it would be destructive to the Poudre River and its ecosystem as it flows through Fort Collins and beyond.

Currently, almost 60% of the Poudre?s water is diverted for agricultural, municipal, and industrial uses. If built, during peak flows, NISP could dry up another 71% of the flow through Fort Collins. Studies show that such a reduction would have dire consequences to fish and other aquatic life, riparian ecosystems, water quality, flow volume, and recreation use.

The NISP is expected to cost at least $1.2 billion, although those costs will rise because Northern Water has not obtained enough water rights to date to fill the reservoir. Northern Water must buy ?dozens and dozens? of Larimer and Weld County farms to obtain the water rights needed. Of the 15 communities and water districts that hold shares in NISP, many are outside the Poudre?s watershed.

The NISP is an extremely expensive project that would cause great destruction; disrupt and displace residents around the proposed reservoir, residents along Highway 287, and residents along the proposed pipeline route; and it isn?t needed. There are many conservation actions that would provide all the water proposed to be delivered by Glade, including improved water efficiency by municipal districts, industry, and agriculture; public education and awareness programs; repairs to leaking ditches and pipelines, landscape irrigation improvements, and much more.

The NISP is a controversial project that is of great interest to many people in Larimer County who want full opportunity to comment on the permitting process and to appear at public hearings. Because of the scope and controversy surrounding this proposed project, the Commissioners should wait until the coronavirus pandemic has subsided enough to allow for full in-person public participation.

Sincerely,

To: rhelmick@larimer.org

Rob,
I realize I am sending this comment later than requested but I would like to make you aware of my concern about the noise this project will generate. I live in the city limits of Windsor and in Larimer county next to Weld county Rd 13. My property is impacted by construction traffic noise on a daily basis. Currently the noise almost exclusively is generated by construction truck traffic from 6;00am until 6;00 daily. This truck traffic noise for the most part is caused by large diesel engine trucks hauling construction materials that have no or inadequate muffled exhaust systems. Many of these trucks fail to comply with the traffic signage that requires engine brake mufflers. I have no problem with the water pipeline itself but I am really concerned about noise levels that this project will generate with truck traffic not only while construction is taking place next to my property but as the project continues to the south.

I would ask that Larimer county and the project manager provide monitoring and strict compliance of all contractors with the noise level restrictions as described in the project description Pipeline Noise Analysis. Also, please insure compliance with the Colorado state traffic signage CR 42.4.225 that requires the use of engine brake mufflers for trucks.

Respectfully,
Mike Lindsay

RE: Northern Integrated Supply Project (NISP) 1041

Dear Mr. Helmick,

Weaver Cattle Co., Inc. owns the property where NISP project Highway 287 realignment diverts from Highway 287 south of Owl Canyon. When the current highway was built, our predecessor in interest, the Ripple family, reserved a highway access at what is now 11700 North Highway 287. The Ripple family reserved this access when they granted the easement to the State of Colorado's predecessor in interest, Larimer County. While my family has ranched in Larimer County since 1886, we purchased the Ripple Ranch at Owl Canyon in 1969.

This access has been our main ranch access off of Highway 287 and on the west side of the mountain on our property. We access at this location to check the well that is the only water source in that pasture and is our only water source on the west side of the mountain south of County Road 72. We access at this location to check our cattle, pastures, salt, mineral, perform weed control and other issues related to our ranching operation. We also access our property at this location to get to our property on top of the mountain, again to perform our normal and usual ranching operation activities. At this time, this is our only access to the top of the mountain as we can not access with a vehicle from the east side of the mountain. As you can see, this access is important and vital to our ranching operation.

We have been supportive of the Northern Integrated Supply Project (NISP) and have been working with Northern Colorado Water Conservancy District (Northern) for many years. We have had numerous discussions but we have not started final discussions on the Highway 287 realignment right-of way that will be necessary for the NISP. Throughout these discussions, we have been clear the importance of this reserved access and that we will need a like access with the new alignment. The last time I met with Northern a couple of months ago, this access was not included on the current plans. I have been told the engineers are looking at it – but I have not seen anything in writing. I did note to Northern and their engineers, they are allowing an access almost across the road for the frontage road called Big Ridge Way. I told Northern, that it would make sense to put my access

across the road from the access for Big Ridge Way. While this would not be on the exact location as our reserved access, it would be close and would make sense for highway access control.

We believe this NISP will be very beneficial to agriculture and Larimer County and have been supportive of the project. However, to date, while Northern has been cooperative in other areas, they have not been willing to honor our reserved access. I am asking Larimer County to require Northern to honor this reserved access in the Highway 287 realignment in order for us to maintain our ranching operation. It would seem to be defeating the purpose of the reservoir to protect agriculture, if in the process we put agriculture producers out of business.

Thank you for the opportunity to present this issue to Larimer County. I will not be able to make the June 24, 2020 meeting, but I will plan on attending the July 8, 2020 meeting.

Sincerely yours,

Maxine Weaver

Maxine Weaver, President
Weaver Cattle Co., Inc.

CC: Carl Brouwer, Northern Integrated Supply Project

BEEF – IT'S WHAT'S FOR DINNER!!!

Charlotte Parman

A few questions from a resident, transcribed by Katie Beilby.

How much of the Poudre River flow will be diminished, how will it be affected or decreased by siphoning that water off? How big is the pipeline? Will there be clean up of the river and the ponds that will be decreased after this pipeline is put in?

Does the residents have any say about this, does our opinion really matter? Why does it have to be so close to the residents?

Our property taxes just went up, does this have anything to do with this project?

Comments to Commissioners on NISP from PCG Sierra Club.docx
47K

June 23, 2020
Larimer County Commissioners:

The Poudre Canyon Group (PCG) of the Sierra Club respectfully asks the Larimer County Commissioners to deny the 1041 permit for the proposed Northern Colorado Integrated Supply Project (NISP) based on scientific studies that show serious degradation to the Poudre River will occur if it is built, lack of adequate mitigation measures to address problems, and strong citizen opposition to the project.

Currently, almost 60% of the Poudre's water is diverted for agricultural, municipal, and industrial uses. Further diversion will cause major negative impacts to the river's ecology and function, damage the river's utility and use by tens of thousands of people and downstream communities, and harm the area's economy which depends on the river's health and continuing flows.

The State of the Poudre River 2017 study conducted by the City of Fort Collins, found that existing dam and diversion structures "cause unnatural fluctuations in flow volume, which likely affects critical habitat and the reproductive needs of fish and insects in the river." The report also states that "populations of native fish are in sharp decline…most likely due to fragmented habitat and extended periods of extremely low base flows. Other stresses likely influencing fishery health includes rapid fluctuation of flows…and altered water temperatures." If the Halligan and Seaman Reservoirs are expanded, even more water will be diverted from the Poudre, increasing flow and fluctuation disruptions. The massive amounts of water required for NISP can only increase the negative impacts.

Adding to the uncertainty of flows and fluctuations are the anticipated changes to the river due to climate change. The Final Environmental Impact Statement for NISP found extensive negative impacts to the river based on climate change predictions, including to the hydrology, temperature increases that adversely affect fish and other species, flows, changes in runoff timing that greatly affects agriculture, recreational uses, and much more.

Three groups–Save the Poudre, No Pipe Dream, and Save Rural NoCo–have clearly demonstrated the many issues that have been downplayed or ignored in the NISP application, and that are required by Larimer County's land use regulations. The issues include a broad range of serious violations of regulations, including the evaluation of:

- the lack of a permit for the "realignment" of Highway 287,
- the lack of water rights to operate the project,
- inconsistency with the County Master Plan,
- the complete lack of an alternatives analysis,
- the impact on public health and safety,
- the inability of the County to fund the project,

- the impact on the Cache la Poudre River of draining vast amounts of its water,
- the project relies on a huge farm-buying scheme that the Army Corps said was not feasible and too expensive,
- noise caused by power boats and recreation at the proposed Glade Reservoir; and
- the lack of mitigation.

These issues must be fully investigated and results considered in the application process *prior to approval of the 1041 permit*. Approval of the 1041 application while lacking adequate analysis and without meeting associated regulatory requirements would pose a significant vulnerability to litigation, with potential for substantial cost to County taxpayers.

It is ironic that the proposed pipeline route for NISP would follow closely or exactly the same route that was proposed for the Thornton pipeline. The County Commissioners have not forgotten that they unanimously denied the Thornton pipeline route last year. It does not follow that the same affected Larimer County residents would favor a NISP pipeline along the same route—and it would be quite contradictory for the Commissioners to approve it.

NISP is expected to cost at least $1.2 billion, although those costs will rise because Northern Water has not obtained enough water rights to date to fill the proposed Glade Reservoir. Northern Water plans to buy "dozens and dozens" of Larimer and Weld County farms and obtain exchange agreements with water users to obtain the 22,000 acre-feet needed to supply NISP—which is about one-half the water required for Glade Reservoir. According to an April 2020 article in the Coloradoan, Northern Water only purchased its first farm under their new scenario in February—to the cost of $330,000, which netted Northern Water 30 acre-feet.

Of the 15 communities and water districts that hold shares in NISP, most are outside the Poudre's watershed, giving them little stake in the overall health of the river. In fact, Larimer County residents will be left with a degraded river and with little to no benefit from the project.

In addition to its importance to agriculture, municipal, and industrial use, the Poudre is an important recreation source. Not only do boaters, anglers, picnickers, and hikers enjoy the upper stretches of the river, they also treasure its opportunity and beauty as it winds through Fort Collins and beyond. If NISP is permitted, the predicted drops in flows and fluctuations will negatively impact the riparian habitat, the fishery, and the aesthetics of the river as it flows through Fort Collins and beyond. The newly finished White Water Park near downtown Fort Collins is already so popular that it is hard to find parking near the access points. If NISP is allowed, the park may need to change its name to the "Puddle Park." Although NISP would bring a new reservoir that would attract similar recreation attention as Horsetooth Reservoir, flatwater recreation is not a substitute for the loss of river recreation options and negative riparian health impacts in the Poudre River corridor. In addition, NISP is strongly opposed by many of the people who would be displaced by the new Hwy. 287 road alignment and by the reservoir itself.

Earlier this month (June 2020), the City of Fort Collins' Land Conservation and Stewardship Board urged the Fort Collins City Council to strongly oppose NISP for myriad of reasons, including those discussed above. Their letter made worthy arguments: "Fort Collins taxpayers have invested tens of millions of dollars to conserve unmatched ecological resources running through the heart of the City. There are 18 Natural Areas that either border on the Poudre River or are connected to it by riverside forests and wetlands; they encompass 1800 acres…Riverside forests and wetlands do not drink primarily from rainfall; they drink from the river. NISP's removal of water from the river will, quite simply, dehydrate our Natural Areas' ecological resources and degrade them; hundred-year-old trees will die, understory

plants will shift to more drought tolerant species, biodiversity will decrease, and forest- and wetland-dependent animals will disappear.

“The citizens of Fort Collins, as they have invested in Natural Areas, have believed that those areas and their ecological resources and recreational opportunities would be protected in perpetuity. In the opinion of this Board, perpetuity ends on the day that NISP bulldozers arrive to divert water from the Poudre River.

“NISP brings no benefits to the City of Fort Collins, and City Staff previously identified dozens of risks to the physical river, its biota, and its surrounding ecosystems. We have watched, over many years, as Northern Water has proposed mitigations and how these mitigations have then required further mitigations. Continuing this pattern, the recent 1041 application to Larimer County proposes heretofore unseen details for which Staff and this Board have identified numerous unaddressed mitigation requirements. By now it is clear that the cascade of mitigations is unending. The impacts of NISP on the river and adjacent Natural Areas cannot be mitigated. Our Natural Area assets, assembled with decades of effort and tens of millions of dollars investment, will, under NISP, suffer devastating permanent harm.”

There are alternatives to NISP. Although some of the efforts to lower water consumption have been addressed or considered, much more could, and should be, done. Save the Poudre provides a plan forward that includes:

- Tiered water rates that reward conservation with lower costs to customers who conserve.
- Comprehensive public education and awareness programs about quick-payback water conservation measures.
- Rebate/retrofit programs for low-water use landscaping, low-water-use toilets, shower heads, washing machines, and dishwashers.
- Water fallowing contracts between municipal, industrial, and agricultural users, with investments in agricultural water conservation and water use efficiency in return for use of agricultural water.
- Use Growth-Displaced Water Transfers, i.e., transfer water rights from lands developed by growing communities to the communities needing water.
- Landscape irrigation monitoring and improvement programs to reduce water wasted in excessive irrigation.
- Reduce consumptive use on irrigated acreages and improve the efficiency of agricultural return flows to provide transferable water for other uses.
- Use of gray-water systems and interfacing gray-water systems with water recycling systems wherever possible.

Save The Poudre, in partnership with Western Resource Advocates, has developed an alternative to the destructive NISP/Glade Reservoir proposal that would supply the same amount of water for the growing municipalities at a fraction of the cost and environmental damage.

Northern Water has been proposing various projects to siphon the Poudre River since the 1980s. Those projects have not succeeded because they have all been destructive, expensive, unnecessary projects. It is time to put NISP and Glade Reservoir to rest.

We urge the Larimer County Commissioners to deny the 1041 permit.
Sincerely,
Sierra Club Poudre Canyon Group

Subject: NISP 1041 Conditions
To: Lesli Ellis <ellislk@co.larimer.co.us>
Cc: Christie Coleman <ccoleman@northernwater.org>, Rob Helmick <helmicrp@co.larimer.co.us>

Lesli,

As discussed last week, we do plan on touching on a few condions with some r ecommended minor wording changes. This is from our presentaon and includes the tw o condions:

Condition: Prior to construction, secure written confirmation from all affected irrigation companies that are impacted by this project by reservoir or pipelines.
There is no guarantee that each irrigation company will provide a written response.
Recommended condition: The applicant shall demonstrate that it has contacted all affected irrigation companies.

Condition: Pipeline alignment alterations greater than 50 feet must be evaluated by Larimer County and may be subject to reconsideration by the BOCC. All alignment changes on private property shall include approval of the landowner.
The Larimer County Land Use Code 14.13 has requirements for technical revisions or 1041 amendments that would need to go back in front of the BOCC.
Recommended condition: Alterations greater than 100 feet or that move within 100 feet of an existing structure must be evaluated by Larimer County staff. Alignment changes on private property shall be coordinated with the landowner in addition to staff review.

Thanks!

Dewberry HDR

MEMORANDUM

Date: June 12, 2020

To: Larimer County Planning Department

From: Randy Parks – Dewberry, Michael Gossett and Madeleine Harris - HDR

Subject: Northern Integrated Supply Project – Construction Approach in Residential Areas – Revised June 2020

Overview

Due to the proximity of the Northern Tier alignment to Eagle Lake Subdivision, County Road 52 and Bold Venture Way/Grey Rock Drive, the design team developed a preliminary approach to construction access and estimated construction duration so that the impacts to the residents in these areas and the traveling public could be better understood. The alignment was broken into several segments in each area in order to optimize analysis and construction traffic routing.

Construction Phasing

Construction phases throughout the different segments will be overlapping, not additive nor independent of each other. There are three major phases of construction, defined as follows:

Clearing/Site Prep/SWMP- This is a relatively light construction phase. This phase mainly involves preparing the area for installation. This includes removing vegetation/roots that are in the pipeline easement and stockpiling/protecting topsoil. It also includes other site prep work, including setting up signage, assembling equipment, and materials. Finally, this phase includes preparing the site for stormwater management, which could include installation of silt fences, or other best management practices to prevent erosion caused by stormwater drainage. This phase of construction requires small to medium-duty construction vehicles. There may also be larger delivery trucks who occasionally arrive to drop off pipe in preparation for construction.

Pipe Installation- This is the most significant phase of construction and includes digging the trench for the pipeline, laying the pipeline in the trench, welding joints as needed, backfilling the trench and compacting the area as needed. This construction phase will require larger tracked excavators, front-end loaders, dump trucks and stock-piling of materials to complete the work. Speed limits will be set for the delivery and construction vehicles of 10-15 mph to ensure safety of the site.

Restoration and Reclamation- This is also a relatively light construction phase. This phase mainly includes restoring the construction area to conditions prior to construction. This includes re-seeding as needed, and other restoration efforts. It will consist of small agricultural tractors and pick-up trucks. This phase is typically not consecutive like the other phases as the contractor will usually coordinate restoration/reclamation as needed as pipe installation progresses.

Dewberry HDR

MEMORANDUM

Individual Homeowner Impacts

A homeowner whose property is along the construction path will not experience construction on their property for the entire overall construction duration for that area. For example, a homeowner with a 500' stretch of their property abutting the alignment might expect about one week of clearing/site prep/SWMP, about one week of pipeline installation, and about one week of restoration/reclamation. In total, the 500' stretch will likely only see heavy activity for around 3 weeks. This work may be spaced out depending on weather, soil conditions, detailed reclamation plans and appurtenance requirements.

See Figure 1 below for a timeline and intensity of work diagram with photos of each construction phase activity a typical homeowner might experience.

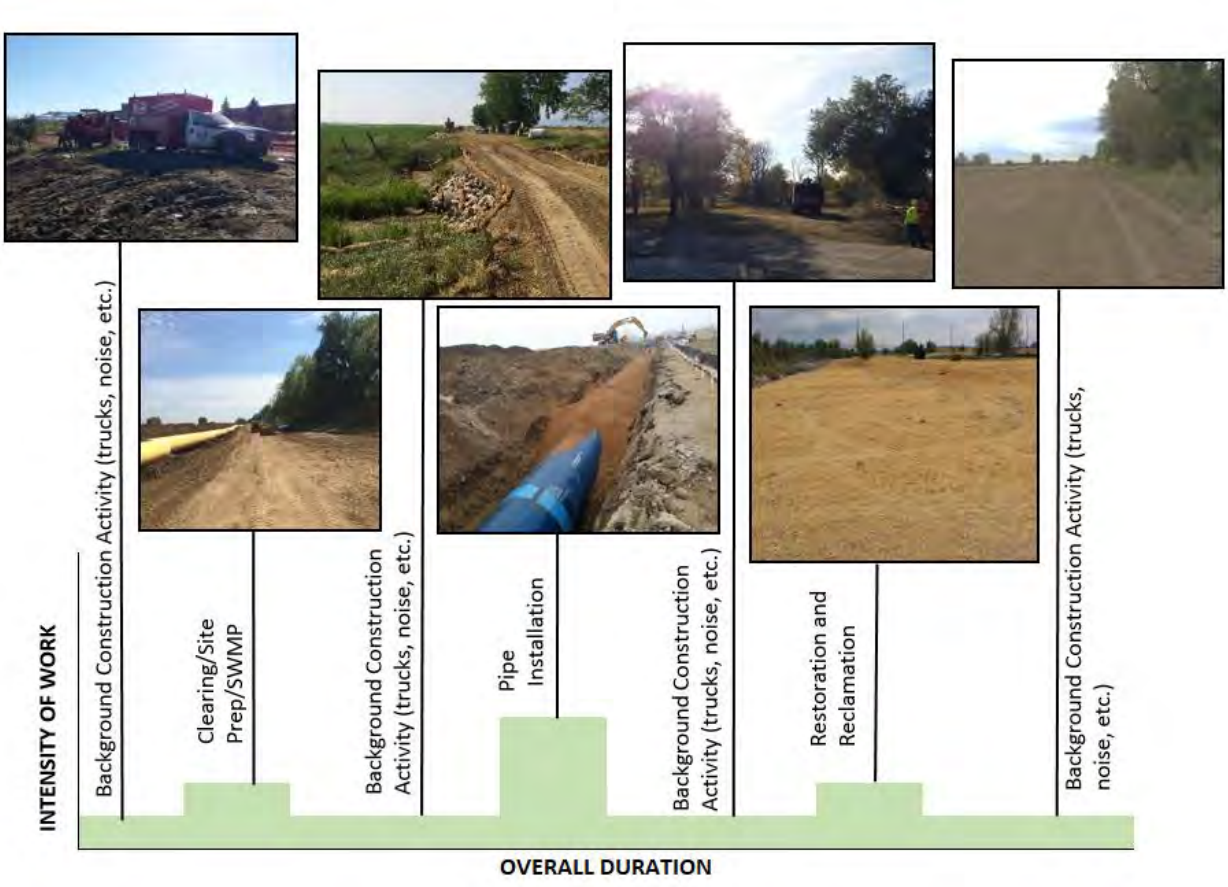

Figure 1: Typical Levels of Activity throughout Construction Duration

Dewberry HDR

MEMORANDUM

Eagle Lake Subdivision

The scope of analysis and segments through Eagle Lake Subdivision are shown in Figure 2 below. The alignment through this area was broken into five segments.

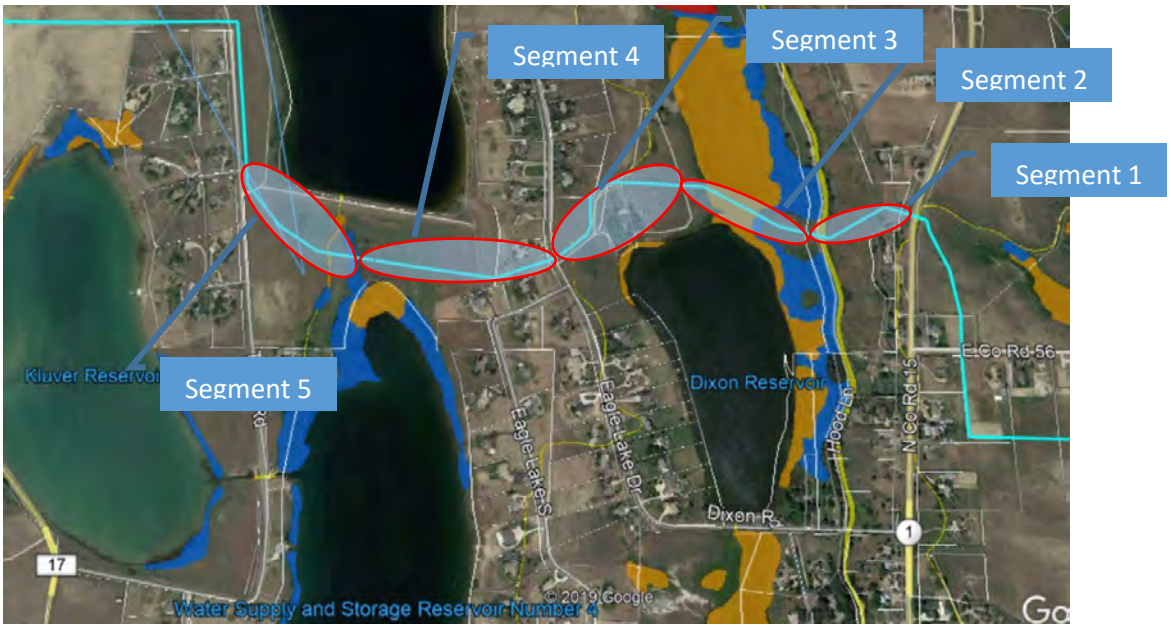

Figure 2: Scope of analysis and segments through Eagle Lake Subdivision

Overall Construction Duration

Construction through the five segments will be overlapping, not additive nor independent of each other. In total, estimated duration of construction through this area is around 14 weeks.

A proposed comprehensive timeline for construction throughout all five segments (approx. 6,000' in total) is displayed in Figure 3. The three major phases of construction are also indicated in the figure.

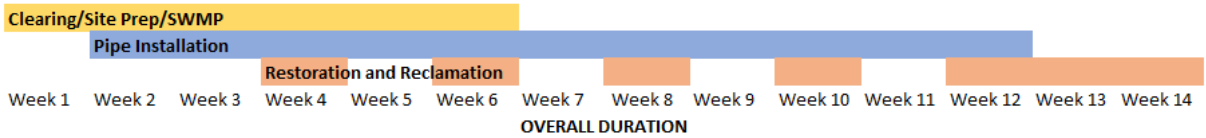

Figure 3: Overlapping construction timeline and phases

As illustrated in Figure 3 above, the estimated durations for each construction phase through the entire Eagle Lake area are as follows:

1. Clearing/Site Prep/SWMP – 6 weeks

2. Pipe Installation for All Segments – 7-11 weeks
3. Restoration and Reclamation – 7 weeks

Construction Duration and Access by Segment

Construction access will be specified by individual segments indicated in Figure 2. Specifying construction access points for each segment will ensure that the least amount of disruption to homeowners and private roadways is maintained. Construction access will be coordinated with individual landowners and the pipeline contractor. Access is subject to change.

Construction activities throughout all segments will occur concurrently to expedite the overall process. Approximate durations of impact provided below for each segment will are overlapping, and should not be summed for a total duration of impact.

Segment 1 – Highway 1 to Hood Lane. Construction and material delivery vehicles will access the alignment via the alignment as it connects to Highway 1. In most cases entering via Highway 1 and exiting via Hood Lane. This segment is approximately 800 feet in length. In total it is anticipated that this area will be impacted for approximately 4 weeks. Since Highway 1 is a paved and highly-trafficked road, construction across Highway 1 will consist of trenchless methods so traffic on that roadway will not be restricted by construction activity. Since Hood Lane is a semi-private gravel road, the pipeline across Hood Lane will be installed with an open cut method. However, homeowner access will be maintained at all times with temporary detours. The road will be returned to current conditions, so only temporary impacts to the roadway are expected.

Segment 2 – Wetlands North of Dixon Reservoir. Construction and material delivery vehicles will access the alignment via the alignment, Hood Lane and Eagle Lake Drive. In most cases entering via Hood Lane and Exiting via Eagle Lake Drive. This will require access to the Eagle Lake Subdivision via the gated entrance at Eagle Lake Drive and Highway 1. This segment is approximately 1,100 feet in length. In total it is anticipated that this area will be impacted for approximately 4 weeks. Because of the presence of wetlands in this segment, construction traffic will not access the alignment via Hood Lane once construction and restoration of this segment is completed. Unless otherwise requested by the County, it is proposed that the Contractor not be allowed to use Eagle Lake Court for construction access.

Segment 3 – Private Property East of Eagle Lake Drive (TIPS COREY ALLEN/KAREN KRISTIN). Construction and material delivery vehicles will access the alignment via Eagle Lake Drive and will use Eagle Lake Drive to both enter and exit the site. This will require access to the Eagle Lake Subdivision via the gated entrance at Eagle Lake Drive and Highway 1. It is anticipated that sufficient temporary easement will be obtained from TIPS COREY ALLEN/KAREN KRISTIN to allow construction vehicles to turn around at the eastern end of this segment and exit the same way they came in. This segment is approximately 1,500 feet in length. In total it is anticipated that this area will be impacted for approximately 5 weeks. Unless otherwise requested by the County, it is proposed that the Contractor not be allowed to use Eagle Lake Court for construction access. The pipeline across Eagle Lake Drive will be crossed using trenchless methods so residential traffic using Eagle Lake Drive will not be restricted.

Segment 4 – Private Property west of Eagle Lake Drive to drainage between Water Supply and Storage Reservoirs 3 and 4. Construction and material delivery vehicles will access the alignment via the Eagle Lake Drive both for construction traffic entering and exiting the site. This will require access to the Eagle Lake Subdivision via the gated entrance at Eagle Lake Drive and Highway 1. It is anticipated that sufficient temporary easement will be obtained from the Water Supply and Storage Company to allow construction vehicles to turn around at the eastern end of the wetland that connects the two reservoirs. This segment is approximately 1,500 feet in length. In total it is anticipated that this area will be impacted for approximately 5 weeks. Unless otherwise requested by the County, it is proposed that the Contractor not be allowed to use Eagle Lake Court for construction access. Because of the presence of wetlands in this segment, construction traffic will not access the alignment via Eagle Lake Drive once construction and restoration of this segment is completed.

Segment 5 – Private Property east of Travis Road to drainage between Water Supply and Storage Reservoirs 3 and 4. Construction and material delivery vehicles will access the alignment via Travis Road and will use Travis Road to both enter and exit the site. It is anticipated that sufficient temporary easement will be obtained from the Water Supply and Storage Company to allow construction vehicles to turn around at the western end of the wetland that connects the two reservoirs. This segment is approximately 1,100 feet in length. In total it is anticipated that this area will be impacted for approximately 4 weeks.

County Road 52

The scope of analysis and segments near County Road 52 are shown in Figure 4 on the next page. The alignment through this area was broken into seven segments.

Overall Construction Duration

Construction throughout the seven segments will be overlapping, not additive nor independent of each other. In total, estimated duration of construction through this area is around 20 weeks.

A proposed comprehensive timeline for construction throughout all seven segments (approx. 12,500' in total) is displayed in Figure 5 on the next page. The three major phases of construction are indicated in the figure.

As illustrated in Figure 5 on the following page, the estimated durations for each construction phase through the County Road 52 area are as follows:

1. Clearing/Site Prep/SWMP – 9 weeks
2. Pipe Installation for All Segments – 15-17 weeks
3. Restoration and Reclamation – 10 weeks

Dewberry HDR

MEMORANDUM

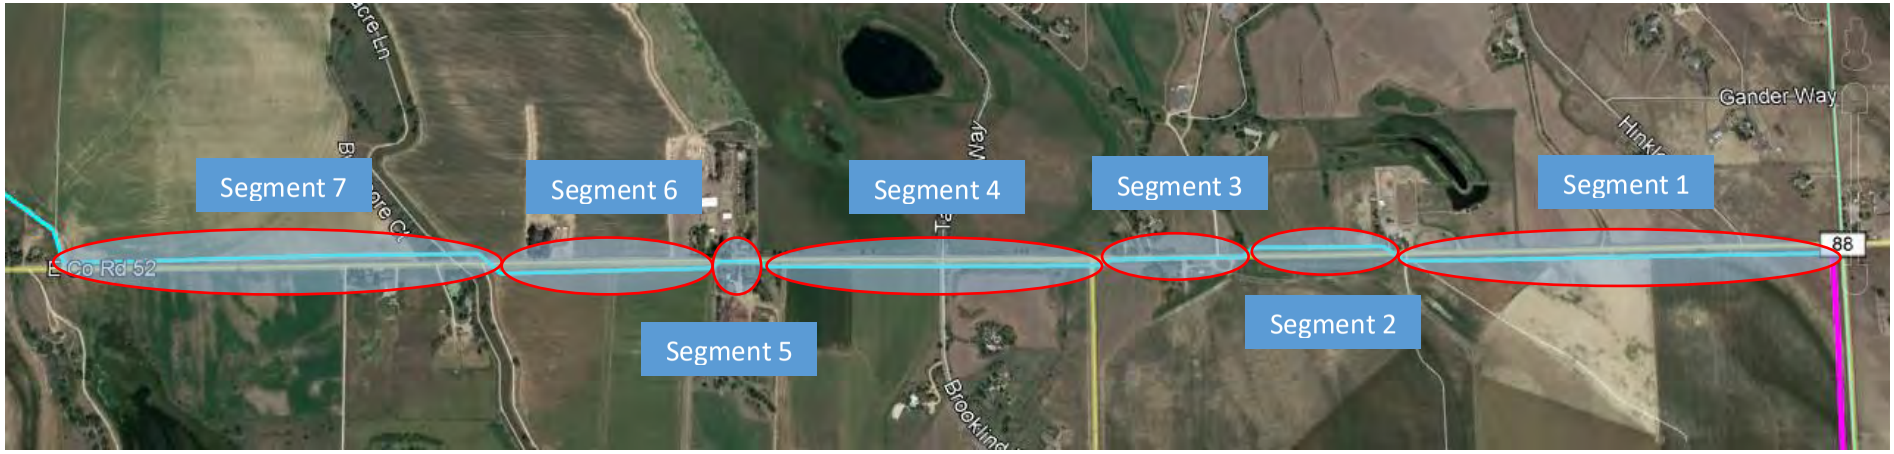

Figure 4: Scope of analysis and segments near CR 52

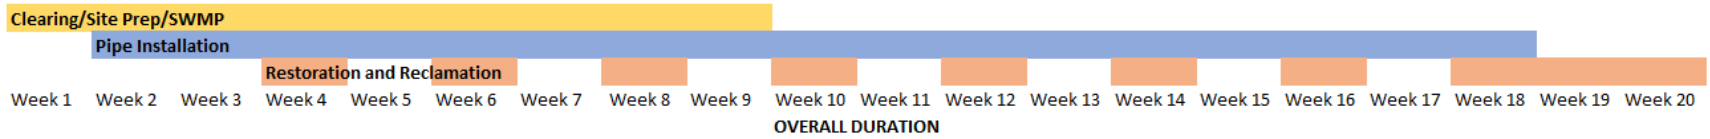

Figure 5: Overlapping construction timeline and phases for entire duration

Dewberry HDR

MEMORANDUM

Construction Duration and Access by Segment

Construction access will be specified by individual segments, as identified in Figure 4. Specifying construction access points for each segment will ensure that the least amount of disruption to homeowners and private roadways is maintained. Construction access will be coordinated with individual landowners and the pipeline contractor. Access is subject to change.

Construction activities throughout all segments will occur concurrently to expedite the overall process. Approximate durations of impact provided below for each segment will are overlapping, and should not be summed for a total duration of impact.

Segment 1 – From intersection with the County Line Pipeline on the west side of County Road 1 to the point where the alignment crosses CR 52 from the south of the road to the north. Construction and materials delivery vehicles will access the alignment via CR 52. In most cases, the vehicles will enter along CR 1 from the north, and exit along CR 3 to the south. This segment is approximately 3,100 feet in length. In total, it is anticipated that this area will be impacted for approximately 6 weeks. The alignment is south of CR 52 for the majority of the segment. The pipeline does cross CR 52 from the south side of the road to the north side of the road at the end of the segment. Since CR 52 is a gravel road in this area, the pipeline across County Road 52 will be installed with an open cut method. However, only one lane at a time will be closed and flaggers will be on site so traffic will not be restricted. The road will be restored to current conditions, so only temporary impacts to the roadway are expected.

Segment 2 – From the end of Segment 1, where the pipeline crossed to the north side of CR 52, through to the point where the alignment enters the CR 52 ROW. Construction and materials delivery vehicles will access the alignment via CR 52. In most cases, the vehicles will enter along CR 1 from the north, and exit along CR 3 to the south. This segment is approximately 1,000 feet in length. In total, it is anticipated that this area will be impacted for approximately 4 weeks. The alignment is north of CR 52 for the majority of the segment. The pipeline does cross into CR 52 ROW from the north side of the road at the end of the segment. The pipeline is shown in the ROW in this section to avoid impacts to residences in the area and avoid drainage ponds to the south. Since CR 52 is a gravel road in this area, the pipeline within County Road 52 will be installed with an open cut method. However, homeowner access will be maintained at all times with temporary detours.

Segment 3 – Includes the portion where the alignment is within the CR 52 until it crosses back to the south of CR 52, right before crossing CR 3. Construction and materials delivery vehicles will access the alignment via CR 52. In most cases, the vehicles will enter along CR 1 from the north, and exit along CR 3 to the south. This segment is approximately 950 feet in length. In total, it is anticipated that this area will be impacted for approximately 4 weeks. The alignment is within CR 52 ROW for most of the segment. The alignment is in the ROW in this area in order to minimize impacts to landowners and trees on either side of the road in this constricted area. Since CR 52 is a gravel road in this area, the pipeline within County Road 52 will be installed with an open cut method. However, homeowner access will be maintained at all times with temporary detours. The road will be restored to current conditions, so only temporary impacts to the roadway are expected.

Segment 4 – Includes the stretch that crosses CR 3, and Brooklind Estates/Barry Lane and continues to parallel the south side of CR 52 until the point where the alignment pinches in closer to the road near residences along CR 52. Construction and materials delivery vehicles will access the alignment via CR 52. In most cases, the vehicles will enter along N Frontage Road from the north, and exit along CR 3 to the south. This segment is approximately 2,400 feet in length. In total, it is anticipated that this area will be impacted for approximately 5 weeks. The alignment is south of CR 52 for the majority of the segment. The pipeline does cross CR 3 at the east end of the segment. Since CR 3 is a gravel road in this area, the pipeline across County Road 52 will be installed with an open cut method. However, only one lane at a time will be closed and flaggers will be on site so traffic will not be restricted. The road will be restored to current conditions, so only temporary impacts to the roadway are expected. The segment also crosses Barry Lane/Brooklind Estates. This crossing will be a trenchless crossing at the road is paved in this location. Since the crossing will be trenchless, no roadway or traffic impacts are expected.

Segment 5 – Includes the stretch that is very close to CR 52 ROW before it jogs back further to the south of CR 52. Construction and materials delivery vehicles will access the alignment via CR 52. In most cases, the vehicles will enter along N Frontage Road from the north, and exit along CR 3 to the south. This segment is approximately 400 feet in length. In total, it is anticipated that this area will be impacted for approximately 5 weeks. The alignment will be constructed closer to the CR 52 roadway than other segments. This was done to minimize impacts to landowners and trees on either side of the road in this constricted area. Due to the close proximity of the alignment to the road for this small segment, construction staging will likely occur in one lane, but there will be no excavation in the roadway. Only one lane at a time will be closed for staging and flaggers will be on site so traffic will not be restricted. Access to residences in the area will be maintained at all times.

Segment 6 – Includes the stretch that is south of CR 52 through the point where the alignment crosses CR 52 to be on the north side again. Construction and materials delivery vehicles will access the alignment via CR 52. In most cases, the vehicles will enter along N Frontage Road from the north, and exit along CR 3 to the south. This segment is approximately 1,750' feet in total length including the crossing of CR 52. In total, it is anticipated that this area will be impacted for approximately 5 weeks. The alignment is south of CR 52 for the majority of the segment. The pipeline does cross CR 52 from the south side of the road to the north side of the road at the end of the segment. This crossing was included in other to avoid impacts to residences on the south side of the road and avoid a pond. Since CR 52 is a paved road in this area, the pipeline across County Road 52 will be installed with a trenchless method. Since the crossing will be trenchless, no roadway or traffic impacts are expected.

Segment 7 – Includes the portion that parallels the north side of CR 52 before the alignment heads north east of the golf course and includes the crossing of Broadacre Lane. Construction and materials delivery vehicles will access the alignment via CR 52. In most cases, the vehicles will enter along N Frontage Road from the north, and exit along CR 3 to the south. This segment is approximately 2,900 feet in length, including the crossing of Broadacre Lane. In total, it is anticipated that this area will be impacted for approximately 6 weeks. The alignment is north of CR 52 for the entire length of the segment. The pipeline does cross Broadacre Lane at the east end of the segment. Since Broadacre Lane appears to be a gravel residential drive, the pipeline across Broadacre Lane will be installed with an open cut method.

However, homeowner access will be maintained at all times with temporary detours. The road will be restored to current conditions, so only temporary permanent impacts to the roadway are expected.

Bold Venture Way/Grey Rock Drive

The scope of analysis and segments near Bold Venture Way/Grey Rock Drive are shown in Figure 6 below. The alignment was broken into two segments.

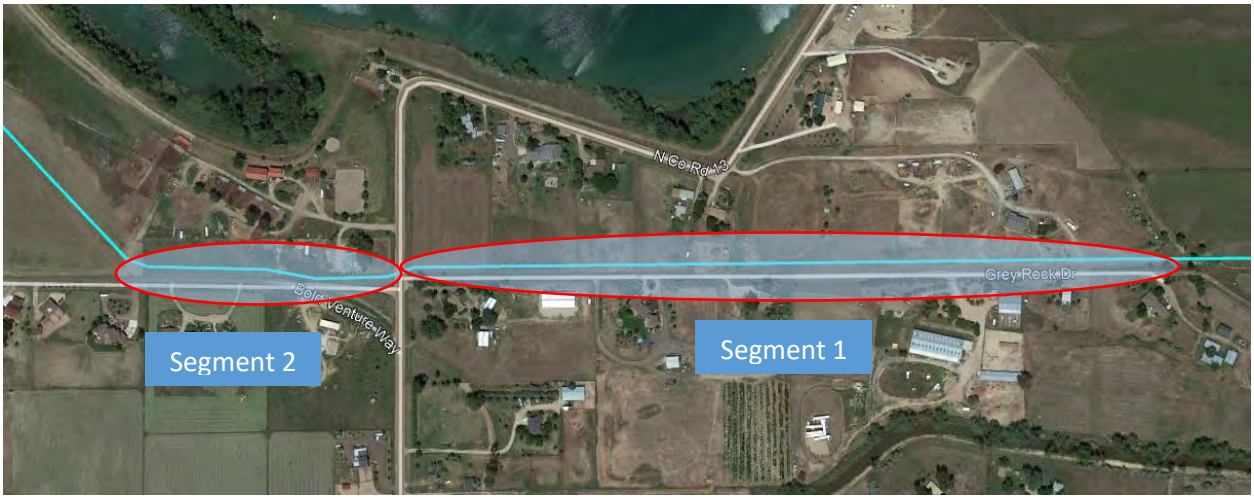

Figure 6: Scope of analysis and segments near Bold Venture Way and Grey Rock Drive

Overall Construction Duration

Construction throughout the two segments will be overlapping, not additive nor independent of each other. In total, estimated duration of construction through this area is around 10 weeks.

A proposed comprehensive timeline for construction throughout both segments (approx. 3,500' in total) is displayed in Figure 7. The three major phases of construction are indicated in the figure.

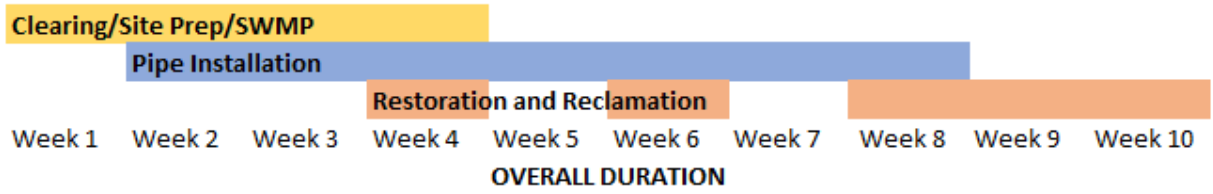

Figure 7: Overlapping construction timeline and phases

As illustrated in Figure 7 above, the estimated durations for each construction phase through Bold Venture Way/Grey Rock Drive area are as follows:

1. Clearing/Site Prep/SWMP – 4 weeks
2. Pipe Installation for All Segments – 5-7 weeks

3. Restoration and Reclamation – 5 weeks

Construction Duration/Access by Segment

Construction access will be specified by individual segments, as identified in Figure 6. Specifying construction access points for each segment will ensure that the least amount of disruption to homeowners and private roadways is maintained. Construction access will be coordinated with individual landowners and the pipeline contractor. Access is subject to change.

Construction activities throughout all segments will occur concurrently to expedite the overall process. Approximate durations of impact provided below for each segment will are overlapping, and should not be summed for a total duration of impact.

Segment 1 – Following the north side of Grey Rock Drive from the dead end to the east up to the crossing of County Road 13 to the west. Construction and materials delivery vehicles will access the alignment via the alignment as it connects to CR 54, to the southeast. In most cases, the vehicles will enter the site from CR 54 to the south, where they will follow the alignment until they reach Grey Rock Drive, and will exit along CR 13 headed south. This segment is approximately 2,500 feet in length. In total, it is anticipated that this area will be impacted for approximately 6 weeks. The alignment is north of Grey Rock Drive for the entire stretch, so no permanent impacts are expected to the roadway.

Segment 2 – Crossing of County Road 13 and paralleling of Bold Venture Way to the north. Construction and material delivery vehicles will access the alignment via the alignment as it connects to Highway 1 to the west. In most cases, the vehicles will enter the site from Highway 1, where they will follow the alignment until they reach Bold Venture Way, and will exit along CR 13 headed south. This segment is approximately 1,000 feet in length, including the crossing of CR 13. In total, it is anticipated that this area will be impacted for approximately 4 weeks. The pipeline across County Road 13 will be installed with an open cut method. However, only one lane at a time will be closed and flaggers will be on site so traffic will not be restricted. The road will be restored to current conditions, so only temporary impacts to the roadway are expected. Otherwise, the alignment is north of Bold Venture Way for the entire stretch, so no permanent impacts are expected to the roadway.

Availability of Space for Other Pipeline in Preferred Corridor

Northern Water has not identified a need for an additional pipe in this corridor for its conveyance needs. Should another entity petition the County for a permit to construct a pipeline in parallel to Northern Water's pipeline, adequate space generally exists to accommodate that pipeline. Northern Water will typically acquire 40 feet of permanent easement plus an additional 60 feet of temporary easement for this project. If another pipeline were to be approved by the County, its permanent easement could abut or overlap Northern Water's permanent easement and they could use Northern Water's permanent easement as their temporary easement.

MEMORANDUM

Northern Integrated Supply Project
Glade Reservoir
Construction Staging

B&V Project Number 403758
B&V File 188754/34.3000
June 10, 2020

To: Larimer County Planning Department

From: Tim Engemoen and Arlene Little, Black & Veatch

Introduction

This technical memorandum identifies probable construction staging areas and construction material sourcing associated with construction of the Glade Unit. This has been done in support of the Larimer County 1041 Permit for the Glade Unit construction. For purposes of this memorandum, construction staging areas are defined as locations used for the storage of construction related equipment and materials, such as office trailers, vehicles and stockpiles.

Project Background

The Northern Integrated Supply Project (NISP) will provide a new raw water supply to several municipal water providers in Northern Colorado. NISP includes the following facilities located in Larimer County: the Glade Unit; the Glade Pump Station; raw water distribution piping; and the relocation of U.S. Hwy. 287. The Glade Unit features the Glade Reservoir Dam, which is an earthen embankment that impounds an off-channel reservoir complete with hydraulic structures required by the State Engineer's Office: the High Level Outlet Works (HLOW); Low Level Outlet Works (LLOW); and spillway.

The Glade Unit also includes expansion of the existing Poudre Valley Canal (PVC) and a new forebay downstream of the dam. A Control Gate structure will be constructed to control flow to the existing portion of the PVC downstream of the forebay. The existing PVC Diversion Structure will be demolished and rebuilt to allow increased diversion of flow from the Poudre River. A portion of the existing Munroe Gravity Canal alignment will be inundated by Glade Reservoir, this open canal will be replaced by the Munroe Canal Bypass (MCB), a conduit and several control structures that will convey flow beneath the reservoir.

The Glade Unit also includes: the Glade Pump Station, which will pump water from the forebay into Glade Reservoir; the Electrical/Control building that will distribute power throughout the site and provide control of the various hydraulic features; the Surge Building that will house surge tanks to protect the pump station discharge conduit; and numerous buried conduits with control valve vaults that connect these facilities. Raw water will be conveyed off site via several buried conduits that are discussed in separate reports. The Glade Unit will include recreational amenities for the general public, including a Visitor Center, campgrounds, a boat ramp, trails and restroom facilities.

Glade Reservoir will submerge a portion of the existing U.S. Hwy. 287 alignment which will be relocated to the east of the reservoir. An existing power transmission line and several power distribution lines will be inundated by the reservoir which will be relocated as part of the Glade Unit construction. A general location map of the Glade Unit facilities is presented on Figure 1.

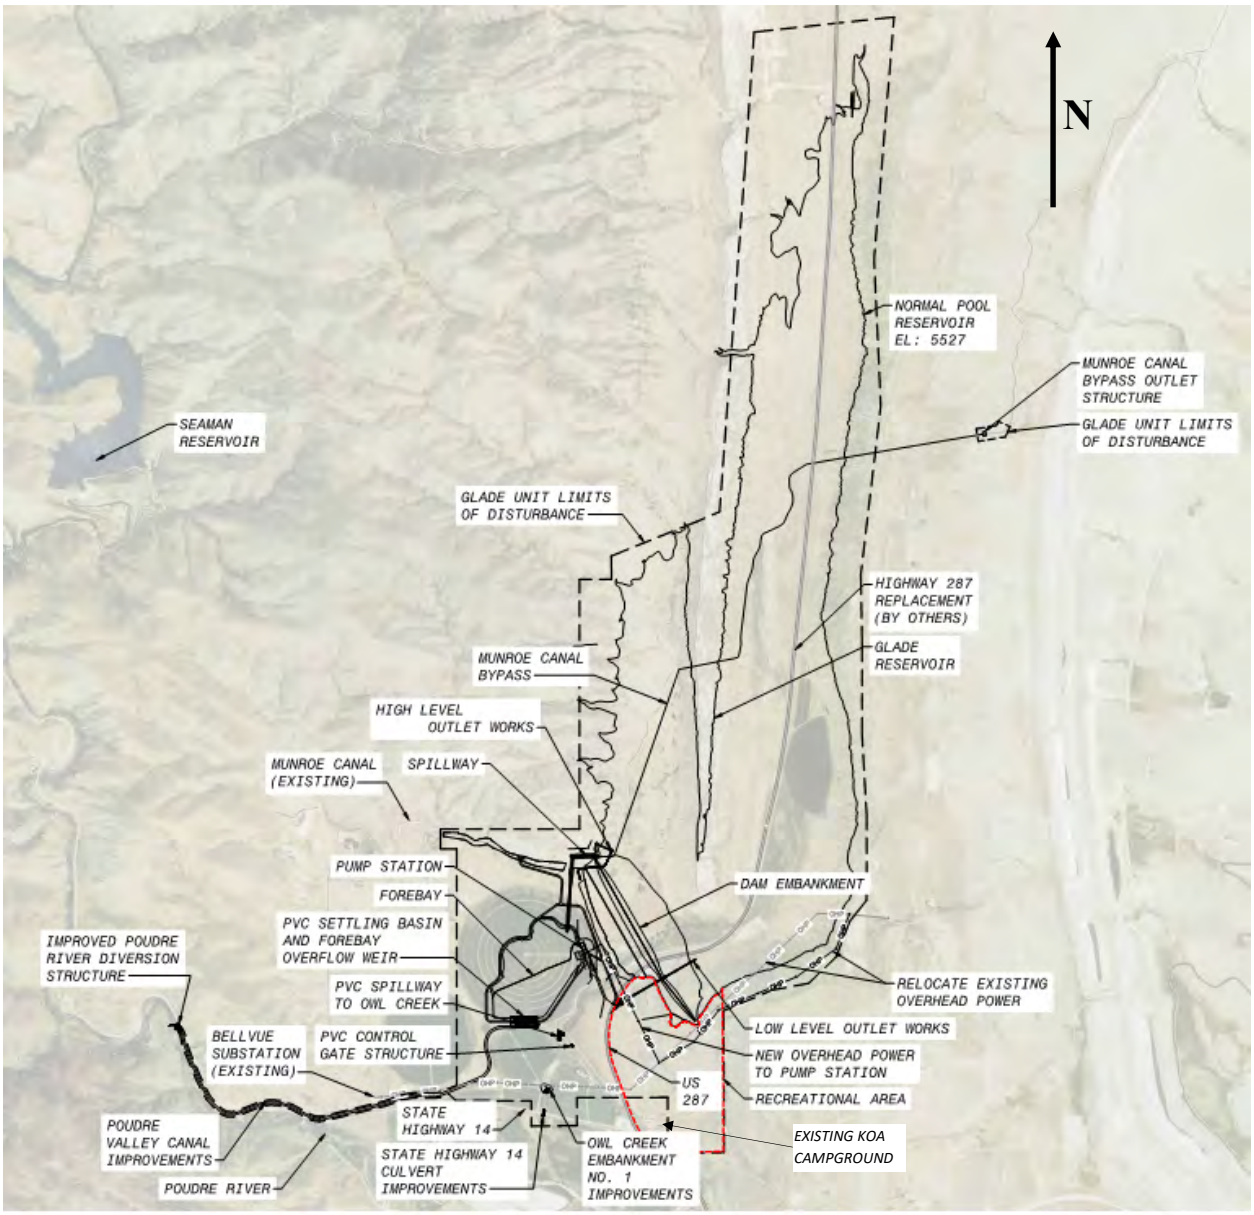

Figure 1 - Glade Unit Overview

Construction Staging Locations

The Glade Unit will be constructed under multiple construction contracts spread out over the project area depicted in Figure 1. The different contracts will likely be executed at different times. Therefore, construction associated with the Glade Unit will not occur concurrently. However, detailed scheduling of

the work will occur in discussion with the with the Construction Manager/General Contractor (CMGC) in 2021.

Without benefit of CMGC input at this time, the design engineer developed a construction contract breakdown and their associated estimated construction schedules.

- Contract 1 – Main Dam Embankment, Forebay, MCB – Construction early 2023 through 2027.
- Contract 2 – Poudre Valley Canal and Owl Creek Improvements – Construction during winters of 2022-2023, 2023-2024, 2024-2025, and 2025-2026. The work within the canal can only be completed when the canal is empty and not conveying irrigation water.
- Contract 3 – Glade Pump Station – Construction late 2024 through 2027.
- Contract 4 – 115 kV Overhead Powerline Relocation – Construction 2023.
- Contract 5 – Electrical Substation – Construction mid-2025 to mid-2027.

The following sections describe likely construction staging locations and strategies for the different components of the Glade Unit project.

Glade Reservoir, Forebay, and Wetlands

It is anticipated the construction of the reservoir, forebay, and wetlands will be completed in two phases to allow for continual presence of wetlands during construction. For both phases, the former KOA campground (east of Ted's Place at the intersection of U.S. Hwy. 287 and State Hwy. 14) will likely be used by the contractor as a temporary construction camp to include trailers, bathrooms, and laydown areas for equipment and materials.

Northern owns, or will own by the time of construction, all the land for the embankment, reservoir pool, and forebay; thus, the contractor will be able to use all this land for construction staging. Borrow material to construct the dam embankment will be taken from several locations across the project site (forebay location, east and west reservoir pool locations) so there will likely be heavy equipment and material stockpiles at various locations at any given time. It is anticipated that there will be routine construction traffic between the former KOA campground and the active construction site(s).

During Phase One, U.S. Hwy. 287 will still be in service through the project site. Phase One construction activities include the following:

- Excavation and foundation preparation for the embankment across the main valley to the west of the existing U.S. Hwy. 287 alignment.
- Tunneling of the LLOW, including upstream and downstream portal excavation which are located to the east of the existing U.S. Hwy. 287 alignment.
- Construction of new wetlands and habitat area on the east and west side of Owl Creek north of the PVC.

At the beginning of Phase Two construction, U.S. Hwy. 287 will be re-routed to its new alignment and the contractor will advance the construction of the embankment across the existing U.S. Hwy. 287 right-of-way. The tunnel for the LLOW will have been completed as part of the Phase One construction and this tunnel will now be used to bypass surface flows from Owl Creek around the construction site.

Glade Pump Station

The Glade Pump Station is located adjacent to the Forebay, just to the south of the dam embankment as shown in Figure 1. The exact staging area for the pump station will likely be adjacent to the forebay in the area between the forebay and the dam embankment.

Poudre Valley Canal

The PVC is being expanded from the Poudre River Diversion Structure to just east of the proposed forebay location. Temporary construction easement will be acquired along this stretch of the canal to provide the contractor adequate room for construction activities and for staging materials and equipment. Construction along the PVC will start at one end of the canal and progress either upstream or downstream so the entire area of the upgraded PVC will not all be impacted at the same time. Part of the PVC expansion will be widening the canal, and due to the proximity to State Hwy. 14, traffic will likely be temporarily reduced to a single lane during construction activities. As previously stated, construction of the canal will only take place during non-irrigating months when the canal is not flowing water.

One of the improvements to the PVC is the upgrade and expansion of the Poudre River Diversion Structure located at the west end of the Glade Unit (shown on Figure 1). The site of the Diversion Structure will likely be used by the Contractor as a main staging area for the PVC improvements for equipment and material storage.

Owl Creek

Improvements to Owl Creek include upgrading an embankment situated between the PVC and State Hwy. 14 and expanding the culvert crossing at State Hwy. 14. Access will come from State Highway 14. Temporary Construction easement will be acquired adjacent to Owl Creek to accommodate construction activities and materials staging.

Munroe Canal Bypass and 115 kV Overhead Powerline

The Munroe Canal is an existing irrigation canal that extends across the proposed Glade Reservoir pool. One of the components of construction Contract 1 is to convert a portion of the canal into a closed conduit system (steel pipe encased in concrete) through the reservoir pool. The MCB Inlet Structure is located on the right abutment of the main dam near the spillway and will likely share construction staging areas with the dam embankment work. The MCB Outlet Structure, located near the northeast portion of the reservoir (shown in Figure 1) is remote from other construction activities and will likely need temporary construction easement to provide adequate space for construction materials and equipment.

A portion of an existing 115 kV overhead powerline will be relocated since the existing alignment is partially contained within the reservoir pool. New permanent and temporary easement will be acquired as needed for material and equipment staging during the construction of the new overhead powerline. Like the work along the PVC, this work will progress in a linear fashion and the areas of disturbance will be limited at any given time.

Construction Material Sourcing

Construction of the dam embankment will require a vast amount of material including both soil and rock. The intent is to source most of the dam material on site from identified borrow areas located at the forebay location and the east and west reservoir pool locations. Analysis is still ongoing to determine the estimated amount of soil and rock available onsite for construction purposes. If adequate material cannot be produced from the borrow locations on site, some material may need to be imported from local quarries. It is anticipated that imported material will be brought to site using the I-25 and State Hwy. 14 haul route.

Dewberry HDR

MEMORANDUM

Date: June 10, 2020

To: Larimer County Planning Department

From: Randy Parks and Derek Nelson - Dewberry Engineers Inc.

Subject: Northern Integrated Supply Project – Traffic Impact Study – Revised June 2020

Northern Water
Northern Integrated Supply Project

This section addresses requirements of the 1041 Permit item 8.d for Traffic Impact Study. It describes the effects of the NISP conveyance facilities that are within unincorporated parts of Larimer County. Such facilities include:

- Northern Tier Pipeline
- Poudre Release/Glade Release Pipeline
- Poudre Intake Pipeline
- County Line Pipeline
- Glade Reservoir Pump Station
- Poudre Diversion Pump Station

Methods

Effects on traffic and transportation were assessed based on existing roadway information from the Larimer County Road Information Locator webpage and, when needed, from CDOT Road Traffic Count data. The most recent available data from Larimer County was used, which came from the years 2000, 2009, 2015, 2017, and 2018; depending upon the node. Traffic volumes obtained from CDOT were conducted in 2014. The road classification and Annual Average Daily Traffic (ADT) count from nodes that were available along the alignments can be seen in Map Series 6 in Attachment D to the Project Description.

Since the County Line Pipeline is parallel and adjacent to the roadway, good traffic data existed along the entire alignment. The tabulated data was taken from the ADT found after one another and averaged. The reach between nodes were then designated as a work area. This data is presented in table 4.

Since the Northern Tier Pipeline, Poudre Intake Pipeline, and Poudre Release/Glade Release Pipeline do not parallel roadways consistently, data was tabulated through an alternative method by creating “Traffic Study Areas” which can be seen in map series 6 in Attachment D to the Project Description. Additionally, the density of traffic station locations was significantly less than along the County Line Pipeline, which necessitated a modified approach. Tables 1-3 in this memo list all areas, relevant traffic stations, traffic counts, approximate length of crossing, street impact, closure requirements and estimated duration for the Northern Tier, Poudre Intake, and Poudre Release/Glade Release Pipelines. The Traffic Study Areas were broken up as portions of the pipeline that parallel roadways within 100 feet, cross roadways with trenchless crossings, or cross gravel roads.

Dewberry HDR

MEMORANDUM

General NISP Conveyance Information

An alternatives alignment study was performed and the preferred alignment for NISP conveyance can be found as part of the Conveyance Routing Assessment (Technical Memorandum 3). Although the final design of the pipeline will be developed at a later date, the NISP conveyance lines are expected to have a 60-foot permanent easement and a 40-foot temporary construction easement. The NISP pipelines are planned to be routed as much as possible in private easement rather than public right-of-way. By routing most of the pipeline in private easements traffic impacts will be lessened.

Crossings

Water pipeline road crossings in Larimer County will be constructed using trenchless methods on all paved roadways and open-cut construction on unpaved roadways. A list of all anticipated trenchless and open-cut crossings is presented in Tables 1-4. Trenchless construction methods would cause only minor disruption to traffic and would have negligible short-term effects. Any roadway that is unpaved (e.g. gravel) would use open-cut construction. Open-cut construction of pipelines would require a trench to be dug along the length of the pipeline, affecting the segment of the road that requires the trench. The pipeline would then be laid in the trench, and the trench would be backfilled to pre-existing conditions. Roadways that would be open-cut would either have temporary lane closures or would be closed to traffic, and a detour route would be provided during construction. The NISP conveyance will likely cross the Great Western and Union Pacific Railroads in several places. Trenchless construction methods would be used at the railroad crossings.

General Compliance

For all pipeline alignments adjacent to or crossing the road ROW, Northern Water and/or construction contractors would be required to develop traffic control plans. Traffic control plans would be subject to approval by the transportation agency responsible for the impacted roadway. As such, short-term effects on local roadways during construction are expected to be minor for construction areas. If the level of construction activity impacted traffic to a greater magnitude than anticipated, the construction contractor would work with the responsible transportation agency to reduce the traffic effect to an acceptable level based on their policies and standards.

Further, it is understood that during final design, Northern Water will be required to represent anticipated haul/delivery routes and coordinate same with Larimer County.

All activities in or adjacent to, access to and from, and including hauling/delivery on Larimer County roads/ROW must abide by the Larimer County Access Policy and Larimer County Land Use Code.

Mitigation

Mitigation of traffic impacts will be addressed on a road-by-road basis and for local community/residences/businesses during final design. General mitigation measures that may be implemented include:

- Utilization of major roads and bridges for haul routes whenever feasible.

Dewberry HDR

MEMORANDUM

- Minimization of hauling/deliveries during peak driving hours.
- Coordination with the County and other entities to avoid planned concurrent road construction.
- Coordination with local schools on bus routes and pickup or drop-off times.
- Maintenance of access to residents and businesses to include emergency vehicles, trash pickup, and postal/delivery services.
- Stabilized construction access in accordance with erosion control and streets ordinances.
- Dust control during construction.

Durations

Construction durations per work area were estimated with production rates using factors including pipe diameter, route complexity, route length, available construction corridor area and access, utility density, and terrain challenges. Estimated construction durations per work area can be found in Tables 1-4.

Revisions

Updates were made to the memo after receiving comments from the Larimer County Planning Department in May 2020. Public and private gravel road crossings were added to the ROW impact tables for Northern Tier, Poudre Intake and Glade/Poudre Release alignments, as well as other roadway impacts that were not included in the original memo. Lengths and duration of impact were updated as needed to account for additional crossings or other reasons.

RE: Review of Larimer County application # 20-ZONE2657

To whom it may concern:

This letter is confirmation that the Wellington Fire Protection District (WFPD) has completed the review of the application and has the following comments.

1.WFPD Western boundary will be the Eastern half of the proposed reservoir. This project will require the relocation of U.S. Hwy 287. The proposed relocation route will be in WFPD response area but will not provide direct access to the new Hwy 287. We have concerns with are ability to respond in an appropriate time due to the lack of access to the new Hwy. We are requesting that there be access provided either by way of W CR 64 and N CR 21 west to intersect with the new Hwy. or W CR66 and N CR 21 West to intersect with the new Hwy.

2. As stated above WFPD will also provide service to the east portion of Glade Reservoir as well as the new rout of Hwy 287. WFPD nearest station is Station 17 located at 108 W CR 66, which is approximately 4 miles east of the eastern edge of Glade Reservoir. WFPD is requesting that NISP provide the same provision that were given to Livermore Fire Protection District (LFPD). In the form of water storage tank (up to 10,000 gallons in size) at a location determined by WFPD for their use in staging water for firefighting and emergency-response capabilities. As stated by LFPD staff WFPD staff also fells that the Glad Reservoir will provide a strategic water source for future aerial firefighting efforts.

3.We also have concerns with the impact that rerouting of U.S. Hwy 287 will have on the intersection of U.S. Hwy 287 and W CR 72 also known as The Owl Canyon intersection. This intersection is also part of the Wellington Fire Protection District. We are requesting information on the estimated traffic flows at the intersection as this may have a direct impact on us as well.

My best,

Capt. Pettit
Deputy Fire Marshall

NISP Comments July 2020.docx
15K

Public Comments Regarding The NISP – File #20-ZONE2657:

Northern Water has worked extremely hard to provide an excellent water project for the 15 supporting members. Even though Northern Water has successfully worked to substantially decrease water consumption, storing water is absolutely critical for our region. We all enjoy the benefits of water projects completed by past visionaries; therefore, we must not allow this excellent project to be declined.

The NISP will provide a reservoir larger than Horsetooth and will include a huge increase in recreational opportunities for the residents of Fort Collins and Loveland. Those entities will receive economic benefit even though they will not be paying for this resource. Fort Collins will also benefit tremendously from the guarantee of the continuous Poudre River water flow through the City for the pleasure and enjoyment of the citizens. Currently, the Poudre is dry in the late summertime and the NISP will provide huge improvement with the continuous flow. This continuous water flow will also benefit and improve the health of the Poudre River, itself, as well as the environment along the waterway.

The City of Fort Collins is also asking to enlarge the Halligan Reservoir, which is a source for their water. Why would Fort Collins' residents oppose the NISP when the City understands the critical need for additional water storage?

Rivers, lakes, reservoirs and waterways define our outdoor experiences, and those experiences are enhanced with all the connecting trails and open spaces in Larimer County. More is better, but only if we complete the NISP.

Larimer County has proven its capabilities in managing other reservoirs, and have promised to require mitigations as are needed for the NISP. The NISP will provide all types of new recreational opportunities which are desperately needed in Northern Colorado because of overcrowding at the current recreational locations.

The dissent and game played by environment groups is fairly simple. They use every tool to drag the project into the courts, raise the cost as much as they can, they hope for an economic downturn and then they hope the project members will throw in the towel. The Glade Reservoir project has taken far too long and at a huge additional cost to the 15 member districts, cities and towns. Please delay no longer.

The 1041 Permit will allow the siting and development of the water storage project, which includes recreational uses, facilities and other items. It also allows the siting and development of four raw water lines to support the project.

We agree with the Development Services Review Team's Recommendation for Approval.

Please approve the NISP so the Glade Reservoir can be built for many to enjoy!

The Cache la Poudre River

1 message

DAVID ROY <david.roy@comcast.net> Tue, Jul 7, 2020 at 7:53 AM
To: "pcboard@larimer.org" <pcboard@larimer.org>, "pcboard@larimer.com" <pcboard@larimer.com>

Good morning, Larimer County Planning Commission Board Members;

The Cache la Poudre river is a special natural resource for every person who lives in Colorado, and especially anyone who lives in Fort Collins and Larimer County. It provides water, habitat, recreation, and solace; in short, the magic of nature, right through our backyards here in Northern Colorado.

NISP will destroy it. A flowing Cache la Poudre river and the habitat and wildlife it makes possible is worth protecting and preserving, and will be a legacy that future generations will enjoy.

As the Larimer County Planning Commission, your first responsibility is to the citizens of Larimer Country, and to protect the natural resources of this county. NISP will require 7 miles of new roadway east of the hogbacks, will drain the Cache la Poudre of water, while supporting a purely speculative project for 600,000 people yet to move to the Eastern Plains, largely outside of Larimer County.

The price for the project has risen to astronomical heights, while the science behind the project has not kept up, ignoring the effects of climate change on such a large capital outlay, and that will increase the already profound devastation that this project would cause to our natural environment.

Denying the permit that Northern Water is seeking is the best work you can do as a Board. Exchanging boating for the life of the Cache la Poudre river is a choice that would border on criminal. The high likelihood that Glade Reservoir will take over 30 years to fill, and the added effect of climate change on that number, makes recommending to the BOCC that it go forward an irresponsible choice for the communities downstream, and would still kill the the Cache la Poudre river as it flows through Fort Collins.

When uncertain, the best action is to do no harm. Make the choice that we know preserves the splendor of the Cache la Poudre. Support the investments that local citizens have made to protect and preserve the natural areas along our river. Position Larimer County to be the stewards of this priceless gem of a natural resource. Vote to create a flowing river through an urban setting, a vote that supports habitat and wildlife, and protects and preserves the natural resource for the citizens of Larimer County that is our Cache la Poudre river .

Thank you.

To: rhelmick@larimer.org

Dear Mr. Helmick,

I am writing to voice my strong disapproval for the NISP 1041 permit application. I firmly believe that moving forward with this water project would irrevocably damage the health and wellbeing of the Poudre and will diminish the irreplaceable natural value of our Northern Colorado environment. I strongly urge the County to disapprove this application. I believe firmly that the issues and concerns raised in Preston Brown's OpEd in the Coloradoan (https://www.coloradoan.com/story/opinion/2020/06/07/opinion-reject-nisp-to-keep-the-poudre-river-healthy/5313447002/) highlight some of the value of the Poudre and all we have to lose.

Let's be smarter and more progressive about how we approach these very real water challenges moving forward. Putting in the hard, smart work now will be worth it in the future. Let's not make mistakes or take for granted our precious natural resources.

Sincerely,
Jessica Elf

To: rhelmick@larimer.org

The fact is we need the water.

As the climate gets hotter and drier, there aren't going to be any trout that can live in the waters here on the plains. Best to do one's trout fishing in the mountains. That is, until they get too hot, too.

I can remember the Cache La Poudre river in the winter here in Fort Collins having a flow so small that I could easily place one dry foot on one side and the other dry foot on the other, spanning the flow. This BS about flow and "preserving" it is a fantasy created by people who haven't been here very long.

Ed Beattie's parents owned the ranch at the mouth of the Poudre. He remembered picking feathers out of his mom's pillows to make flies to fish. There was no road into the canyon at that time. He recalled that he would fish in the pools of the river in the fall. Back then, there wasn't enough flow to fish anywhere else. He recounted this to his fly-tying class, that I attended, back in the 1970s.

The river is and has been for a long time, the way that water gets from the mountains to the thirsty prairie, to farms and ranches and cities. We need the water, therefore the flow is regulated by the river commissioner. Those who propose to regulate it for recreation and esthetics forgot who is paying for the water and what it is really needed for.

All one has to do is watch the river for awhile. See when it rises (during the week) and when it lowers (on weekends). See how the flow can be radically increased for a short time in the winter, and then reduced when there is not a call for the water. This is what the river has been about for over a century: a conduit for water.

Face facts. The river does not access the flood plain that is there, so we can't use the argument that the flow needs to be there for the floodplain ecosystem. It would be a disaster if it was allowed to flood every spring. We try very hard to keep the river in its channel. All the time.

As rainfall gets less predictable, a reliable reservoir is needed. One might suspect that those who oppose NISP, also oppose growth. Once they have settled here, nobody else can, because, gee, we don't have the water. NISP is a well-thought out, responsible and careful way that we can have the water that we desperately need. It supports recreation and would take, just temporarily, some of the recreation pressure off of the river.

I am sure that those who oppose this project have good intentions. They just seem to be ignoring some of the facts. Here in Colorado, water is money and money talks.

Thank you for the opportunity to speak my peace,
Judith D. Putnam, retired

NISP-CCHEARINGS.pdf
52K

July 6, 2020

To: **Larimer County Commissioners** (via email)

From: Jerrold Pault
President - The Hill Community Homeowners Association (HOA)
President – Cobb Lake Preservation & Recreation Association (CLPRA)

Subject: NISP - Commissioners' Hearings

Dear Commissioners,

On behalf of The Hill Community HOA (60 homeowners) and CLPRA (104 members), we strongly oppose the Northern Integrated Supply Project (NISP) and request that you vote against this environmentally devastating project.
The following concerns are cited:

- This project would take additional water from the Poudre River, which is already seriously depleted by agriculture and residential use. The diminished flows would due irreparable harm to the riverbed and its wildlife habitat and the City of Fort Collins beautiful new water park would be rendered virtually useless. We are grateful for the efforts of the **Save The Poudre** organization and support their efforts to protect this precious resource for our children and future generations.
- This project does not own sufficient water rights to be feasible, which will result in NISP purchasing additional water rights, likely from our local farms. While NISP has promised not to "Buy and Dry" farms like Thornton did, we do not believe they will honor this commitment after spending a Billion dollars and then not be able to fill Glade Reservoir. We must protect the rich tradition of family farming in our region before it is lost forever!
- NISP originally planned to run a huge 54" pipeline thru the middle of deeded conservation space owned by The Hill HOA (600 acres of native grasses full of wildlife). Now they are proposing a different route along CR 52, which will impact access and egress to our community along with the many residents who live along this route. Why do we need more massive and disruptive pipelines in Larimer County, when we have nature's solution for moving this water in the Poudre River? We are thankful for the efforts of the **No Pipe Dream** organization in opposition to both NISP and Thornton's Pipeline last year.
- NISP will bring unwanted growth, development and urban sprawl to the areas north west of Fort Collins. These quiet and peaceful rural areas will be forever changed and overrun with traffic, noise and residential and commercial development. We need to preserve the remaining open spaces and rural character of our county. We support **Save Rural NOCO**, another

organization against NISP, and think it is important that we protect the lifestyle of our rural residents.

- Cobb Lake is a pristine recreation and preservation area that is nourished by the clean waters from the Poudre River every year. NISP could be potentially devastating to our lake if they are permitted to utilize water exchanges, which would divert clean Poudre River water from Cobb Lake to Glade Reservoir and replace it with dirty water from the South Platte. **CLPRA is against NISP.**

Why should we agree to all of these environmentally devastating and permanent impacts to Larimer County … just to send water to municipalities and water districts in other counties so that they can develop more housing, water more lawns and grow their tax base? **We feel that it is time to start planning responsible for the future of all of Colorado, live within the constraints of our natural resource and stop enabling developers and unchecked growth to destroy the quality of life that is Northern Colorado.**

Dear Members of the Larimer County Planning Commission of Larimer County (with a cc to the Larimer County Board of Commissioners) –

I will not be able to attend your meeting this Wednesday, but wanted to register my strong opposition to the Northern Integrated Supply Project (NISP). A few of the reasons I oppose this project are:

1. It would kill the Cache la Poudre river through Fort Collins, which is already dry in spots at times through the year from being overworked.

2. The models and assumptions of water flows used by Northern Water don't take climate change into account.

3. Fort Collins residents would lose tremendous amounts of the natural resources they have chosen to protect with their sales tax dollars.

4. The destruction of those natural resources would mean the decimation of the riparian edge through Fort Collins, and the wildlife it supports.

Thank you for your consideration.

Sincerely,

Kevin Cross

Do Not Approve NISP 1041 Project No. 20-ZONE 2- Save Our Rural Northern Colorado

1 message

Kit Nielsen <kfn5454@gmail.com> Wed, Jul 1, 2020 at 6:24 PM
To: rhelmick@larimer.org, tdonnelly@larimer.org, swjohnson@larimer.org, jkefalas@larimer.org

Dear Commissioners and Planning Commission:

Commissioner Johnson
Commissioner Kefalas
Commissioner Donnelly
Rob Helmick

We are landowners residing in the area of the proposed Glade reservoir that have concerns with the proposed Glade Project and the negative impacts that would occur if the project moves forward.

The primary benefits of this proposed reservoir would be enjoyed by the 15 subscriber towns or agencies that receive the proposed Glade water. Most of these towns and agencies are outside Larimer County. The most obvious and intense costs would be borne by local and other surrounding communities.

In general, our concerns are that the scope and scale of this proposed project, if approved, would have significant, detrimental, and permanent impact on our rural community, environment, and lifestyle we enjoy today and desire to have in the future.

Specifically, our rural environment we believe would be negatively impacted in the following ways:

1) Noise - The rerouted highway over the most eastern hogback would have an unobstructed view from residences in the foothills, there would be no middle hogback to block truck and auto noise. The NISP publications suggest that recreation would include motorboats and jet skis. Boats and skis are loud, they would likely be louder than current road traffic.

2) Light Pollution – This rural area enjoys fairly dark skies. The proposed recreational activities would generate significant exterior lighting for boats, facilities, camping, pumping facilities, traffic, etc. and headlights from traffic coming down the hogback on the rerouted 287 would shine into the adjacent private property. This could destroy the enjoyment of our night skies.

3) New development - We do not know what sort of development would occur near and north of proposed Glade. The rerouted highway 287 would invite more residential development on the plains. The reservoir would invite more development in the adjacent foothills and valleys. It's not inconceivable that more commercial development catering to visitors would encroach into currently uncommercialized lands, forever altering the rural nature of the area.

4) Trespass – Plans for proposed Glade project almost 400,000 visitors per year. This would include boaters, campers, fishers and hikers and bikers, among others. There is every reason to believe that not all these visitors would stay within the confines of designated recreational areas. Some visitors are likely to explore the inviting foothills that border the reservoir and trespass, however inadvertently, on our private property.

5) Wildlife – Proposed Glade would become a significant barrier to the permanent and migratory herds of deer and elk that reside in our area and would be disruptive to other wildlife. In a world where wildlife and nature are under stress, and is diminishing generally owing to human activities, should we be contributing to those activities for unnecessary purposes? We encourage the county to find alternatives that don't result in the significant loss of open space and wildlife habitat that this project would cause.

6) Wildfires – In this century three major wildfires burned over 100,000 acres on and around Glade. Two of the three forest fires were caused by careless people. Can we rely on the >1000 daily visitors to proposed Glade to be careful?

7) Emergency response – The recreation on the proposed reservoir is projected to be almost 400,000 visitors per year. Such a large increase in recreationalists would likely increase the number of emergency calls thereby further stretching emergency response agency resources. Costs would be borne by Larimer County taxpayers, and emergency services

that are diverted to Glade would not be readily available to serve the local communities.

8) Air quality – Because Glade would have junior water rights, the water level of the proposed reservoir would be highly variable, unlike Horsetooth. The water level frequently would drop precipitously, often changing proposed Glade Reservoir to Glade Mudflats, and could stay that way for years. The large “bathtub ring” that would materialize around the reservoir would become dry soil that would blow in our strong winds causing air quality and visual concerns. The hundreds or thousands of vehicles that would travel to the area emit gases, particulates, and ozone precursors (i.e., health hazards).

9) Climate change – the pumps, the construction vehicles, the recreational vehicles: the project would result in considerable burning of fossil fuels, forever, and the emission of greenhouse gases. The pumping stations alone would emit the equivalent of adding 7000 GHG emitting cars at a time when Colorado is implementing zero emissions vehicle standards.

10) State Land Usage - The large area of state land west of the proposed reservoir is devoted to hunting and cattle grazing. The state and federal lands in this region of northern Colorado provide abundant and easily accessible opportunities for recreation, which we gratefully utilize. Impacts to use of or access to the state land is a negative impact to our communities.

11) Aesthetic - The drive from Livermore to Laporte would no longer be through the heritage rangeland and the familiar hogbacks. Since the proposed reservoir would likely be only partially filled much of the time, instead of beautiful hogbacks and grassy foothills, our viewshed would be marred by the barren sides (bathtub ring) and murky surface of a partially filled reservoir.

12) Lack of combined Project evaluation/coordination - There is no apparent coordination of the NISP or the proposed Seaman’s expansion or the Halligan expansion. All these projects surround our properties and would leave us on a peninsula of land cut from the rural environment we now enjoy. We met with the City of Greeley in August 2018 and learned that they are not planning to cooperate with other cities due to “challenges” and are proceeding on an expansion of Seamen’s reservoir from 5,000 to 80,000 acre-feet. In the 21st century, surface storage just doesn’t make sense; this is a semi-arid climate that is getting drier. Alternatives are available and should be seriously considered.

13) Social justice - While the benefits of proposed Glade would be enjoyed by people who live and work far from the reservoir site, the costs would be borne by those whose quality of life would be severely lessened.

14) Conservation and Alternatives – Conservation is not begin adequately considered. While the Colorado Front Range is land-rich for development, it is semi-arid and thus water-limited. About 2/3 of the Poudre is already taken out, and Glade would take another 40% of what’s left. Yet another reservoir is nothing but a temporary fix for a small portion of the state’s water needs; but one with permanent, destructive impacts on a large part of rural northern Colorado. The time is way past due for developing long-term solutions based on state-of-the-art technologies and widespread education on the absolute necessity to conserve water, and to stop relying on 19th century solutions for 21st century challenges.

The Larimer County Commissioners must save our rural communities and be good stewards of our natural resources by saying no Glade Reservoir!

Sincerely,

--

Do Not Approve NISP 1041 Project No. 20-ZONE 2- Save Our Rural Northern Colorado

1 message

Lori Nielsen <lorikitnielsen@msn.com> Wed, Jul 1, 2020 at 7:10 PM
To: rhelmick@larimer.org, tdonnelly@larimer.org, swjohnson@larimer.org, jkefalas@larimer.org

Dear Commissioners and Planning Commission:

Commissioner Johnson
Commissioner Kefalas
Commissioner Donnelly
Rob Helmick

Dear Larimer County Commissioners:

I grew up in conservative Oklahoma and have lived in Larimer County for 34 years. I currently reside in the Bonner Peak subdivision. I am a professional Wildlife Biologist and have over 33 years experience in environmental impact reviews. Although my focus has been on wildlife resources as part of my career, I also am familiar with a number of other environmental resource issues. I am not nor have been a member of any local environmental organization, although I have been monitoring the "water wars" throughout the West and in the County.

I have tried to be succinct, given the number of comment letters I anticipate you will be receiving. However, please do not interpret brevity as a lower level of interest. The following points are key to the rural lifestyle Larimer County has come to represent both locally and globally.

I reference the latter, since Bonner Peak supports a diversity of residents, and my first question to them moving from all walks of life and the globe has been, "Why Bonner Peak? Why Larimer County?" The answers are parallel in that this area is unique in many different ways. Quality of life and opportunities are the nucleus. Northern Colorado is rare in merging interests from the far right to the far left, and Bonner Peak is a good example of this diversity.

Now for the substantive comments.

I have reviewed a number of sources and have found Save Rural NoCo as a pretty impressive, science-based constituent. Having worked on National Environmental Policy Act (NEPA) and local permitting for well over 30 years, they provide substantive points. I am providing my own perspective, based on my 30+years in the County, but I also use some of their talking points, where stated.

#1: Direct adverse effects to local landowners and natural resources resulting in direct benefits to communities exterior to Larimer County is negative to all Larimer County residents, no matter their political bent. I'm surprised even conservative constituents would be in favor of this proposal? Using impact terminology, this project would result in irreversible, irretrievable adverse impacts to local residents, water users within Larimer County, and the myriad of natural resources from wildlife to wetlands.

#2: The level of construction and increased noise levels from project construction has not been adequately addressed in the environmental analysis to date.

#3: Operational noise levels from recreational use will forever result in lower property values for homeowners within that noise diameter, reduced wildlife presence, and long-term effects to locals.

#4: The reservoir would present a permanent barrier to terrestrial wildlife east-west movement. This week, we had two bighorn sheep and 12 elk along the Bonner Peak area, moving east. This would prevent free movement all the way north to Cherokee Park and beyond.

#5: The most dangerous thing we do each day is drive Highway 287. However, no matter this level of danger, rerouting the highway as proposed would result in irreversible impacts to residents currently living along Highway 287 as the road would exit the hogback (lights into homes, noise, and no buffer). Additionally, no increased safety would be recognized as the road is currently planned.

#6: Save Rural NoCo mentions light pollution. They are correct, the added effect to this area would essentially extend light pollution north of Fort Collins and Laporte, negating any night sky access until approaching Virginia Dale.

#7: Water is key, obviously. Will the pool size truly fill? With junior water rights, the water level of the proposed reservoir would be highly variable.

#8: Cultural Resources: the loss of haystack rock

#9: Wildfire risk is ever increasing. We have survived six wildfires in 24 years, with the most destructive being in the last 8 years. Loss of 80+ homes in this overall region would have significant costs to the homeowners, community, and the county. Increased recreational use could be devastating.

#10: The State and County and local utilities all have their renewable energy portfolios and target emission reductions. This project would significantly increase emissions in this region during both construction and operation (pump stations).

#11: I'll reiterate Save Rural NoCo's statement on cumulative effects. It is well state: No apparent coordination of the NISP or the proposed Seaman's expansion or the Halligan expansion. All these projects surround our properties and would leave us on a peninsula of land cut from the rural environment. We met with the City of Greeley in August 2018 and learned that they are not planning to cooperate with other cities due to "challenges" and are proceeding on an expansion of Seamen's reservoir from 5,000 to 80,000 acre-feet. In the 21st century, surface storage just doesn't make sense; this is a semi-arid climate that is getting drier. Alternatives are available and should be seriously considered.

#12 Same for Conservation and Alternatives – Conservation is not begin adequately considered. While the Colorado Front Range is land-rich for development, it is semi-arid and thus water-limited. About 2/3 of the Poudre is already taken out, and Glade would take another 40% of what's left. Yet another reservoir is nothing but a temporary fix for a small portion of the state's water needs; but one with permanent, destructive impacts on a large part of rural northern Colorado. The time is way past due for developing long-term solutions based on state-of-the-art technologies and widespread education on the absolute necessity to conserve water, and to stop relying on 19th century solutions for 21st century challenges.

This Reservoir Project represents a water project that may have been in process for decades, but reflects a time long gone for both inefficiencies and lack of support. It's fairly easy to become angry to think of losing so much in this area to the benefit of other communities. Larimer County is unique, more unique than you may realize. So, I appeal to your common sense and long-term thinking. Please vote no.

Sincerely,
Lori Nielsen

Larimer County Planning Commission
Sean Dougherty, Chair
Re: File #20-Zone 2657
** Submitted electronically via website*

Dear Commissioners,

The members of the Larimer County Farm Bureau urge you to approve the 1041 permit for the Northern Integrated Supply Project. This project is critical for the future of Larimer County, its agriculture industry, and the future of irrigated agriculture across northeastern Colorado.

Water supplies are critical to farmers and ranchers in Larimer County and across the state, and a huge part of our agricultural industry activity relies on surface water that will be managed and protected by NISP. Agriculture and food is the second largest industry in the state of Colorado, so it is imperative that we do everything we can to increase Colorado's water storage capacity and reduce the potential for future conflicts that arise when resources become scarce.

NISP will help provide additional supply for the future growth of Larimer County, ultimately protecting the water resources used to drive production of more than 64,000 acres of irrigated farmland. Our community must work now to provide the resources to fuel our growth and allow other families and businesses to enjoy the quality of life we currently have. The potential for recreational opportunities is also important to our community and the projected economic boost from that activity is far too great to pass up.

Both municipal and agricultural water users in Colorado have made significant strides in improving water efficiency and reducing consumptive use, but we can save enough water to make up for future demand. We must store more water now. After more than a decade its time to build NISP!

We urge you to approve the 1041 permit and help ensure a secure future for Larimer County, and our region.

Sincerely,

Arthur Bee
President
Larimer County Farm Bureau

Why No Lake Tap Alternative?

3 messages

Mark Heiden <mheiden@eaglelakefchoa.com> Fri, Jun 26, 2020 at 7:48 AM
To: "pcboard@larimer.org" <pcboard@larimer.org>

Planning Commission Board –

Did you know that during the Thornton proceedings currently in court that the Board of County Commissioners felt a lake tap alternative through Reservoir 3 was a routing option that should be considered?

In the County's Answer Brief to Thornton, they say "The Board found the potential use of lake taps **may mitigate significant impacts** on established neighborhoods around reservoirs, such as the Braidwood and Eagle Lake neighborhoods. (R6836 – emphasis added by me) The Board does not dispute that lake taps cost more and have some inherent risks…..The Board agrees that more information about the reasonableness and viability of lake taps is needed."

Has this been forgotten already? The planning department should know this was an option the Board felt was important to explore to save neighborhoods. Why isn't it being requested of Northern?

I look forward to exploring this further with you during my talk on July 8th.

Best regards,

Mark Heiden

Meet Bonnie and John

1 message

Mark Heiden <mheiden@eaglelakefchoa.com> Sat, Jun 27, 2020 at 5:09 PM
To: "pcboard@larimer.org" <pcboard@larimer.org>

Planning Commission Board –

I hope you are all enjoying your weekend at your home, your castle, or whatever you may call your private nesting place. I hope for your peace and tranquility there is no construction in your back yard.

Please meet Bonnie and John Helgeson – one of the property owners in Eagle Lake whose life and property will be greatly disrupted and harmed by the Northern pipeline **through their yard.**

Bonnie and John bought their home in 1999 and have completely remodeled it over the years to meet their vision of life in retirement. Both retired, Bonnie is in her late 70's and John his mid-80's. Bonnie is a master gardener who has put extensive work into their quiet spaces in the yard for their peaceful enjoyment. They have mature bushes and trees as wind and sight breaks that are in the proposed easement for the pipeline on their property that will probably be destroyed in the project. Both their septic and utilities are also located in the proposed easement. If Northern uses the property line separating the Helgeson's from their neighbor also in the pipeline path and it extends half of the easement amount of 50' into their property, it will only be approximately 15 feet from their garage. But some of this is just a guess since no one from Northern has ever spoken to the Helgesons.

It's important to know the people you will be affecting with a vote in favor of the proposed pipeline path so you can ask yourself – how would I feel if this were me?

See you all on July 8th.

Don't Be Fooled by Open Spaces

1 message

Mark Heiden <mheiden@eaglelakefchoa.com> Sun, Jun 28, 2020 at 6:00 PM
To: "pcboard@larimer.org" <pcboard@larimer.org>

Planning Commission Board

The County staff presentation last Wednesday of the Northern Water pipeline routing preferences included pictures of siting in Eagle Lake. The pictures were taken with a wide angle lens from who knows where to make it look like there is nothing but open ground for Northern to plow through our neighborhood. Nothing could be further from the truth.

The pictures below show you the homes that are affected by the construction hauling route Northern is proposing to use on our private roads through the neighborhood to haul materials, pipe sections, excavation and other heavy equipment during the 14+ weeks they project this phase of construction will occur. The first three are in close proximity to where they want to use private land through an easement for a turnaround for trucks.

The fourth is mere feet from Hood Lane where they want ingress and egress on a dirt and gravel ditch road for construction traffic – the owner of which (Hood Lane and the house) they have not even approached or talked to about usage.

I'll share with you more pictures of the home sites they are actually proposing to cross and maps of the area for a better overall understanding of what they are proposing on private roads and property at the July 8 meeting.

The question you have to ask yourselves is, would you want heavy truck traffic maneuvering through your neighborhood and within close proximity to your home for trucks and construction equipement coming and going for weeks on end with the associated noise, dust, diesel exhaust and disruption of your home life when there are better alternatives that don' include going through a neighborhood?

Respectfully,

Mark Heiden, President

LARIMER COUNTY

Rob Helmick <helmicrp@co.larimer.co.us>

Location, Location, Location

1 message

Mark Heiden <mheiden@eaglelakefchoa.com> Mon, Jun 29, 2020 at 1:37 PM
To: "pcboard@larimer.org" <pcboard@larimer.org>

Planning Commission Board –

You've probably heard this 'best practices' saying about retailing success many times. It turns out to be true.

As a variant on that theme, we should be discussing Co-Location, Co-Location, Co-Location as a 'best practices' approach for the siting of pipelines. Especially when you've got the perfect storm in Larimer County's case of two projects very close together in timeframe, and two projects with nearly identical preferred routes through the County.

The attached letter from Brad Wind, General Manager of Northern Water who you heard from at the Planning Commission meeting last Wednesday, details their commitment to cooperate with both Larimer County and Thornton and "supports minimizing impacts to citizens of Larimer County by co-locating the pipelines adjacent and/or overlapping easements in the corridor shown in the attached Exhibit A".

The attached map shows the route that the County, Thornton and NSIP were cooperatively working on to mitigate impact throughout the County to the point where the pipelines directions diverge.

One of the objections the Board of County Commissioners expressed to deny the Thornton pipeline by submitting an application for only one of their proposed pipelines was, **"Thornton deprives the Board and public of the opportunity to consider cumulative impacts and the effectiveness of mitigation. A route that may be appropriate for a single pipeline may be inappropriate for additional pipelines. If this information is not considered now, future pipelines may not be able to co-locate which would result in the disorderly development of Thornton's project and compound the impacts on Larimer County through multiple different pipelines in separate locations."**

The County recognizes the need for evaluating cumulative impacts of multiple projects. The same should hold true for two projects by different entities.

Do your job and plan with vision – the NISP route should not be approved until there is resolution to the Thornton pipeline in the event they receive approval for an overland pipeline route. Everyone – the County, NISP and Thornton – were on board with a co-location best practice for impact mitigation. You should be as well. A mutually agreed upon co-located route can be found, avoiding double the pain for residents in the path of both pipelines.

Respectfully,

Mark Heiden, President

Eagle Lake Association

Mr. Rob Helmick, Senior Planner
Larimer County Planning Department
200 West Oak Street
Fort Collins, Colorado 80521

Re: Northern Integrated Supply Project and Thornton Water Project Coordination

To Whom It May Concern:

The purpose of this letter is to clarify the commitment and support by the Northern Integrated Supply Project (NISP) to work with the City of Thornton to co-locate conveyance pipelines on the respective projects from the vicinity of Water Supply and Storage Company Reservoir Number 3 along Larimer County Road 56 to approximately the Turnberry Road intersection (see attached Exhibit A).

Larimer County Staff, in response to direction from the Larimer County Commissioners during recent Thornton Water Project hearings, invited Northern Water to participate in the Larimer Water Projects Working Group process along with various community stakeholders and to also participate in several related public meetings. This collaborative process helped inform the pipeline route proposed by the City of Thornton in its 1041 Permit Application Supplement 3 (dated December 10, 2018). By working cooperatively with the City of Thornton, NISP supports minimizing impacts to citizens of Larimer County by co-locating the pipelines adjacent and/or overlapping easements in the corridor shown on the attached Exhibit A. Additionally, NISP supports jointly or cooperatively constructing two segments of this reach with the City of Thornton: 1) from below Water Supply and Storage Company Reservoir Number 3 to north of Eagle Lake; and 2) the reach from southwest of North Poudre Irrigation Company Reservoir Number 10 to Larimer County Road 13. Such cooperation would, however, be contingent upon NISP: 1) securing the appropriate federal, state, and local permits; 2) successfully acquiring easements in the general alignment outlined in Exhibit A; and, 3) that no unforeseen significant challenges are presented throughout the permitting process or encountered during the detailed design and construction phase.

NISP and its participants appreciate the opportunity to work cooperatively with Larimer County Staff & Commissioners, the citizens of Larimer County, and the City of Thornton as these important water projects move forward.

Regards,

Brad

Meet Tricia, Jim, Trey, Jace and dog Drake

1 message

Mark Heiden <mheiden@eaglelakefchoa.com> Tue, Jun 30, 2020 at 1:13 PM
To: "pcboard@larimer.org" <pcboard@larimer.org>

Planning Commission Board –

NISP is proposing to use the privately owned dirt road along the Larimer Canal behind the Hauan residence as a hauling route during construction of the pipeline from Highway 1 to Eagle Lake. Their house sits below the road (Hood Lane) and is only 20-30 feet from parts of the road.

Tricia and Jim have owned the house for 16 years and have raised their two sons, Trey -13, and Jace -8 there in a quiet, rural setting.

Tricia walks dog Drake every morning down their road where there's an abundance of birds, deer, and the occasional stray cow from the ranch behind their property. The boys frequently ride their bikes there and Tricia is comfortable in the knowledge they are safe from traffic, poor drivers and danger.

It is not a place for construction or truck traffic. Northern hasn't done their homework on this (they maybe have only looked at a map and never visited the site). They have never talked to the Hauans about the usage of their road or how incredibly disruptive it will be to their life for months on end.

Wait until you see the dangerous condition of the road that makes it unsuitable for any truck traffic at all, much less a continuous stream of large construction vehicles hauling material, excavation equipment and construction crews. I'll show you on July 8th. (The two family shots are from the front and back of the house on the road – you can see how close to their house it is.)

Respectfully,

Mark Heiden, President

The People Left Out

1 message

Mark Heiden <mheiden@eaglelakefchoa.com> Wed, Jul 1, 2020 at 12:02 PM
To: "pcboard@larimer.org" <pcboard@larimer.org>

Planning Commission Board –

No where in the route descriptions that NISP has submitted in their 1041 application do they account for the people and homes that will be impacted by their proposed hauling routes through residential neighborhoods.

The attached map shows the two hauling routes proposed for the Eagle Lake segment of the Northern Tier of pipeline construction – privately owned dirt road Hood Lane (in red) and HOA owned Eagle Lake Drive (in blue) off of our Highway 1 private entrance.

Should our private roads – that are inadequately built for heavy construction truck traffic – be a hauling route and construction staging area for materials, pipeline sections, construction crew traffic, and equipment hauling? Past **29 different residences** with dust, traffic noise, vibrations, and diesel exhaust in a quiet residential neighborhood with children playing, residents coming and going, and retirees enjoying the peaceful time they've earned for a project that has no benefit for its residents and even minimal benefit to Larimer County as a whole?

These 29 residences (from the homes that back to Hood Lane off Highway 1 to all of the residences on Eagle Lake Drive up to and including the ones impacted by the proposed truck turnaround at the north end) are the uncounted casualties of NISP's proposal that only counts 2 or 3 residences directly impacted by construction in their yard. For up to 14 weeks if you believe their timeline estimates.

You have the option to put an end to this untenable proposal by recommending different route options. I'll share those possibilities with you on July 8.

Respectfully submitted,

Mark Heiden, President

Eagle Lake Association

Rob Helmick <helmicrp@co.larimer.co.us>

"Demystifying the Process"

1 message

Mark Heiden <mheiden@eaglelakefchoa.com> Thu, Jul 2, 2020 at 1:38 PM
To: "pcboard@larimer.org" <pcboard@larimer.org>

Planning Commission Board –

When asked in an interview in the Fort Collins Coloradoan on March 21, 2019, what would be different about the approach NISP was going to take to get their pipeline approved over the process Thornton went through, NISP Project Manager Carl Brouwer said,

“Northern Water leaders hope a "no surprises" approach can shake the shroud of distrust left behind by the contentious Thornton pipeline public review process, Brouwer said. They plan to talk to every resident in the pipeline path and "demystify the process" before county commissioners review the route. Their proposal will also include detailed plans for reducing impacts to wildlife and reclaiming the land disturbed by the pipeline.
Brouwer admitted construction can be “annoying” for residents in the pipeline’s path. But he said individual property owners will only see active construction near their homes for one or two months because of the “train of activity” that moves a few hundred feet a day.”

NISP may yet scramble to talk to people in advance of the Commissioner’s meetings scheduled for August now that this will bring attention to their pledge, but that’s doubtful. To date, here is the list of people affected by the pipeline in our neighborhood who are waiting to be demystified and when they’ve been talked to:

- The two homeowners in Eagle Lake whose property will be crossed for the pipeline: Never.
- The developer of the newly annexed parcels to Eagle Lake (Corey Tips) to cross his property and use his gravel road turnaround for construction staging: Not in ‘years’.
- The 4 homeowners in Eagle Lake whose properties are in close proximity and overlook the proposed pipeline construction and turnaround: Never.
- The 3 property owners of the dirt and gravel road next to the Larimer Canal (Hood Lane) for permission to use it as a hauling route for construction materials and construction vehicle traffic: Never.
- The owner of the open land NISP proposes to cross north of Eagle Lake through wetlands there (Charlie Meserlian): Not in ‘years’.
- The Eagle Lake Homeowner’s Association about the proposed usage of the Association’s private entrance and roads for construction vehicle access throughout the “Construction Approach”: Never.
- The 29 homeowners on Eagle Lake Drive or private roads who will be impacted by the proposed construction vehicle traffic in front of their homes: Never.

The two homeowners who are retired and in their 70’s and 80’s whose land will be crossed are as mystified, worried, anxious, perplexed, uninformed, concerned and sleepless as ever.

Please apply an equal standard to your decision as was applied for Thornton. These folks are worse. At least Thornton talked to us.

Respectfully submitted,

Mark Heiden, President

Do No Harm

1 message

Mark Heiden <mheiden@eaglelakefchoa.com> Fri, Jul 3, 2020 at 10:53 AM
To: "pcboard@larimer.org" <pcboard@larimer.org>

Planning Commission Board –

The Land Use Code was quoted extensively in Larimer County's decision to reject Thornton's 1041 application. One of the criteria in the

code the County used for consideration of their application is Criteria C whose purpose is to "Promote the economic stability of existing

land uses that are consistent with the Master Plan and protect them by incompatible or harmful land uses." The proposed NISP pipeline is

certainly an incompatible and harmful use of the land in the Eagle Lake neighborhood.

We recently annexed three parcels to our HOA (the TIPS Development) whose owner was required by the County to development certain aspects of the land (drainage, roads, etc) to be approved by the County before being allowed to offer the plots for sale and final residential development. The owner has spent thousands of dollars to prepare this land, yet the proposed pipeline path crosses near or on some of the new parcels rendering them virtually unsellable until the pipeline is built and completed.

No buyer will pay a premium price for a parcel with the amount of disruption, uncertainty of building site and septic placement, and ongoing nuisance this project will cause to these three parcels for well over a year. The County is in effect killing the owner's ability to sell his parcels and recoup his already substantial investment that the County has made him invest to get the land ready for development. This is not "promoting the economic stability of existing land uses" (ie. Residential development) or "protecting incompatible and harmful land uses".

Other residents in our neighborhood who may be contemplating or are in the process of listing their property are also economically negatively impacted by the proposed pipeline. Buyers will use every reason to lower the price on a sale and the uncertainty of construction traffic, noise, dirt and dust flying in the neighborhood are good leverage points for them to either not buy at all, or attempt to attain a lower selling price than normal. The County is truly hurting the economic stability of the whole neighborhood with this proposal and hundreds of thousands of dollars in values may be lost if the application is approved.

Please consider these important Land Use points as you assess whether to agree to a pipeline path directly through our neighborhood or ask NISP to consider alternate routes that can avoid negative impacts entirely. I'll share those with you on July 8.

Respectfully,

Mark Heiden, President

Eagle Lake Association

Meeting Last Night

1 message

Mark Heiden <mheiden@eaglelakefchoa.com> Thu, Jun 25, 2020 at 7:52 AM
To: "pcboard@larimer.org" <pcboard@larimer.org>

Planning Commission Board –

Did anyone else notice that of all the various pictures shown last night of pipeline construction by either Northern or County planning that none of them were in residential neighborhoods – just wide open country spaces? Why?

Because pipelines of this magnitude do not belong in neighborhoods, crossing between homes with only 30 feet to the residence from the easement. There are better alternatives and I'll show you some during my talk on July 8th. Look forward to seeing you then.

Oh, and I'll have some different, more revealing photos to share.

Best regards,

Mark Heiden

Northern Integrated Supply Project

2 messages

Meghan Olafson (tirelesstigress@gmail.com) Sent You a Personal Message Thu, Jun 25, 2020 at 4:31 PM
<automail@knowwho.com>
To: pcboard@larimer.org

Dear Larimer County Commissioners,

I respectfully request that you deny 1041 permit for the proposed Northern Integrated Supply Project based on solid studies that show it would be destructive to the Poudre River and its ecosystem as it flows through Fort Collins and beyond.

Currently, almost 60% of the Poudre?s water is diverted for agricultural, municipal, and industrial uses. If built, during peak flows, NISP could dry up another 71% of the flow through Fort Collins. Studies show that such a reduction would have dire consequences to fish and other aquatic life, riparian ecosystems, water quality, flow volume, and recreation use.

The NISP is expected to cost at least $1.2 billion, although those costs will rise because Northern Water has not obtained enough water rights to date to fill the reservoir. Northern Water must buy ?dozens and dozens? of Larimer and Weld County farms to obtain the water rights needed. Of the 15 communities and water districts that hold shares in NISP, many are outside the Poudre?s watershed.

The NISP is an extremely expensive project that would cause great destruction; disrupt and displace residents around the proposed reservoir, residents along Highway 287, and residents along the proposed pipeline route; and it isn?t needed. There are many conservation actions that would provide all the water proposed to be delivered by Glade, including improved water efficiency by municipal districts, industry, and agriculture; public education and awareness programs; repairs to leaking ditches and pipelines, landscape irrigation improvements, and much more.

The NISP is a controversial project that is of great interest to many people in Larimer County who want full opportunity to comment on the permitting process and to appear at public hearings. Because of the scope and controversy surrounding this proposed project, the Commissioners should wait until the coronavirus pandemic has subsided enough to allow for full in-person public participation.

Sincerely,

Meghan Olafson

Larimer County Planning Commission
Sean Dougherty, Chair
Re: File #20-Zone 2657
** Submitted electronically via website*

Dear Commissioners,

The Morgan County County Farm Bureau asks you to vote YES to approve the 1041 permit for the Northern Integrated Supply Project. The project is incredibly important to the future success of irrigated agriculture in Morgan County.

NISP will help provide new water storage for the future growth of both Larimer county, and future supply for agriculture production in Morgan County. Easing the pressure on buy-and-dry will help secure the future for irrigated agriculture, both in the area serviced by the NISP project, but also by water users further downstream, like those in Morgan County. New storage is a benefit to all Colorado water users, especially agricultural users who lack the resources to simply purchase needed supplies.

Population growth in Larimer and other Front Range counties will ultimately put pressure on resources in Morgan County. The added storage in Glade Reservoir will help reduce that pressure in the future.

After much study, Northern Water, the NISP participants, and your county staff believe this project can be completed in a way that both protects and benefits residents in Larimer County. And it has the added benefit of helping residents and businesses in downstream communities like ours.

We urge you to approve the 1041 permit in question and help ensure a secure future for Larimer County, Morgan County, and our region.

Sincerely,

Corey Ruple

Subject: I strongly oppose NISP
To: bocc@larimer.org <bocc@larimer.org>

Why I oppose the Northern Integrated Supply Project (NISP):

1.) It will kill the Cache la Poudre river through Fort Collins, which is already dry in spots at times through the year from being overworked
2.) It is a speculation project, projected to bring over 600,000 people to the Eastern Plains, increasing green house gas emissions in Northeast Colorado
3.) 7 miles of Highway 287 would be diverted East of the hogbacks
4.) The models and assumptions of water flows used by Northern Water don't take climate change into account
5.) Citizens of Fort Collins would lose tremendous amounts of the natural resources they have chosen to protect with their sales tax dollars
6.) The destruction of those natural resources means the decimation of the riparian edge through Fort Collins, and the wildlife it supports.

Larimer County Planning Commission
RE: NISP 1041 application

Dear Commissioners:

I am writing to ask that you recommend denial of the 1041 permit application for the Northern Integrated Supply Project.

Please: don't miss the forest for the trees. Northern Water and Larimer County together have severely restricted the scope of what's being considered in the current 1041 application. This is potentially illegal and, in any case, does a huge disservice to LC residents. You're being asked to put blinders on in your deliberations. I encourage you to take off those blinders and look bigger picture. NISP, if approved, will be the biggest construction project in the history of Larimer County.

Don't forget:

- NISP will export large amounts of Cache La Poudre river water out of the watershed.
- NISP will take an additional large portion of the already decimated peak flow from the river (already decimated by existing water diversions). This will have huge negative impacts on many aspects - physical, biological, recreational - of the river and the riparian corridor.
- The so-called "Fish and Wildlife Mitigation and Enhancement Plan" is an example of the "doublespeak" that Northern Water uses to spin this project. The negative peak flow diversion impacts cannot be mitigated. Providing a year-round, 18-to-25 cfs trickle on a short stretch of the river will mean the river behaves even more like a ditch than it has already become. Other touted benefits, such as improved fish passage at existing diversions, can be done independently of a new, billion-plus dollar water diversion project.
- We don't need a huge new reservoir to "bring tourism and economic growth to Larimer County." This has been happening for decades without NISP. Larimer County is already booming. We're seeing visitation to the County's on a steep growth curve, with attendant negative impacts to the Poudre Canyon, wildlife and environment in general. Poudre Canyon residents and other users can bear witness to the damage currently being done by increased visitation during the Covid-19 pandemic.
- Northern Water's presentation of the project vastly overexaggerates project benefits while vastly understating the project's negative impacts on the river and county residents.

Please: don't be dazzled by Northern Water dollars. Please don't sell the Cache la Poudre River, an extremely important part of the county's soul. Once it's gone, we won't have the chance to get it back.

Thank you for recommending denial of the 1041 permit application.

Sincerely,
Douglas Swartz

COLORADO FARM BUREAU
Promoting and protecting the future of agriculture and rural values.

June 30, 2020

Larimer County Planning Commission
Sean Dougherty, Chair
Re: File #20-Zone 2657
** Submitted electronically via website*

Dear Commissioners,

On behalf of the Colorado Farm Bureau, I write in support of granting a 1041 permit to Northern Water and the Northern Integrated Supply Project. The reservoir and pipelines subject to the permit are an extremely important part of future water storage and management in the Northeast region of the state, and will benefit all Coloradans upon its completion.

The Colorado Farm Bureau is the state's largest agricultural organization with more than 24,000 members across Colorado. We have a long history of engagement in water-related activities in Colorado and have been strong supporters of the NISP project from its inception. Production agriculture is responsible for more than $20 billion in economic activity and more than 200,000 jobs in Colorado. A strong water supply is critical to the current and future success of agriculture in the state of Colorado

We believe that the construction of Glade Reservoir and its attendant pipelines will help significantly improve water management in the South Platte River Basin. The project will help to achieve the Colorado State Water Plan's goal of constructing 400,000 acre-feet of new storage capacity while protecting water quality and the ecosystems that water nourishes. NISP will help provide additional supply for the future growth of the region and protect water resources used to drive production on more than 64,000 acres of irrigated farmland, which in turn generates hundreds of millions of dollars in economic activity, tax payments and payrolls to the region.

In addition to protecting the economic activity associated with historic irrigated agriculture production, the project will also generate an estimated $13-$30 million in new economic activity, in Larimer County alone. Overall the project will drive economic growth and sustain irrigated agriculture across the South Platte River Basin, far beyond where the reservoir itself is to be situated. Both municipal and agricultural water users in Colorado have made significant strides in improving water efficiency and reducing consumptive use. But future population growth necessitates the need for additional storage capacity.

Without NISP, tens of thousands of acres of productive farmland in Colorado's most productive agricultural region would be dried, as municipalities would be forced to purchase water from agricultural users. Entire segments of the local economy would shutter and thousands of employees would lose their jobs. All while thousands of acre-feet of Colorado's water ran out of the state to be put to use by others.

303.749.7500 (phone) | 303.749.7703 (fax) | 9177 E. Mineral Circle, Centennial, CO 80112 | www.ColoradoFarmBureau.org

COLORADO FARM BUREAU
Promoting and protecting the future of agriculture and rural values.

After more than a decade of study, research and planning, the NISP Project is ready for construction. We know this project can be done in a way that minimizes impacts to the community and the environment while providing lasting benefits to both. This is why the project enjoys broad support from federal, state and local leaders, industry groups, farmers, ranchers, business owners, and residents.

We urge you to approve the 1041 permit in question and help ensure a secure future for Larimer County, the surrounding region and the entire state of Colorado.

Sincerely,

Donald J Shawcroft

Don Shawcroft
President

June 30, 2020

Larimer County Planning Commission
Sean Dougherty, Chair
Re: File #20-Zone 2657
** Submitted electronically via website*

Dear Commissioners,

The Weld County Farm Bureau urges you to grant the needed 1041 permit to Northern Water and the Northern Integrated Supply Project. The project is incredibly important to the future success of irrigated agriculture in Weld County.

Production agriculture is responsible for more than $20 billion in economic activity and more than 200,000 jobs in Colorado. Water supplies are critical to farmers and ranchers in Weld County and across the state. Weld makes up more than $2 billion in agricultural sales, which is more than one-quarter of total agricultural sales in Colorado. The vast majority of that agricultural activity relies on surface water that will be managed and protected by NISP.

NISP will help provide additional supply for the future growth of both Larimer and Weld counties, ultimately protecting the water resources used to drive production of more than 64,000 acres of irrigated farmland. The project will help to achieve the Colorado State Water Plan's goal of constructing 400,000 acre-feet of new storage capacity. While much more will be needed, this project is shovel ready and a great way to advance the overall storage goal.

Both municipal and agricultural water users in Colorado have made significant strides in improving water efficiency and reducing consumptive use. But future population growth necessitates the need for additional storage capacity. After more than a decade its time to build NISP!

We urge you to approve the 1041 permit in question and help ensure a secure future for Larimer County, Weld County, and our region.

Sincerely,

Tom Honn
President
Weld County Farm Bureau

Dear Planning Commissioners and Mr. Helmick:

Attached please find a supplemental comment letter and 2 exhibits submitted by No Pipe Dream Corporation, Save Rural NoCo Corporation, and Save the Poudre. The attached letter and exhibits highlight significant deficiencies with the recreational benefit analysis of Glade reservoir in Northern's 1041 permit application. Please confirm receipt of the attached and please review before tomorrow night's Planning Commission hearing. Please include the letter and exhibits into the Administrative Record for this permit proceeding. Thank you.

Re: Supplemental comment letter to the Larimer County Planning Commission regarding the Northern Integrated Supply Project (NISP) Pending 1041 Permit Application, Project No. 20-ZONE 2657

Dear Mr. Helmick and Planning Commissioners:

On behalf of No Pipe Dream Corporation, Save Rural NoCo Corporation, and Save the Poudre (collectively "Larimer County NGOs"), we submit the following supplemental comment letter regarding Northern Colorado Water Conservancy District's ("Northern") pending 1041 permit application ("1041 application") for the Northern Integrated Supply Project ("NISP").

The purpose of this supplemental comment letter is to convey the attached report entitled, "A review and independent analysis of the feasibility of recreation at the proposed Glade Reservoir" authored by Rodger Ames in coordination with Save Rural NoCo. Mr. Ames resume is also attached.

As the title suggests, Mr. Ames report analyzes whether the promised recreational benefits to Larimer County from the proposed Glade Reservoir will be realized. Mr. Ames scrutinizes Northern's evidence and analysis that Glade will add $13 to $30 million dollars annually to the Larimer County economy. Mr. Ames applies a statistical model used to estimate a range of likely future operations of Glade that were not addressed in the federal Environmental Impact Statement process. Mr. Ames concludes that Northern's economic benefit estimates are highly overestimated and its analysis is highly speculative. Mr. Ames concludes that, at best, the recreational revenue from Glade would be approximately $1.2 million per year, possibly less than the cost of operation.

Below is a summary of the deficiencies with Northern's recreational benefit analysis:

1) **Without evidence, Northern's analysis assumes Glade's initial water storage would be 100,000 acre-feet, instead of <u>zero</u> acre-feet.**

After Northern completes construction of Glade, it will be a large, dry basin. Yet Northern's analysis assumes the initial water storage in Glade will be 100,000 acre-feet. Northern states that the initial fill will come from Horsetooth Reservoir. However, the details of this water transfer are lacking from Northern's 1041 application. Horsetooth's capacity is only 151,750 acre feet of water, so system and recreational impacts using water from Horsetooth to fill Glade must be evaluated and disclosed in the 1041 process. Ames Report, p. 8.

2) **Northern's junior Grey Mountain water right will not provide dependable flow to Glade.**

Northern's Grey Mountain Water right is a junior water right. Accordingly to Northern's own EIS, "[u]ntil the SPWCP in online, Glade Reservoir will be wholly dependent on the Grey Mountain water right. The water right has the capability of yielding water in about 4 out of 10 years. Modeling indicates that there can be several years in a row of divertible flow followed by as many as 8 years with no flow available." NISP DEIS, 2008, Section 2.4.1.3. Northern's South Platte River water rights are also relatively junior water rights. Eight years of no flows from Grey Mountain water rights could empty the reservoir in less than eight years. Combined, Northern's analysis of flow to Glade Reservoir from junior Grey Mountain and South Platte water rights is very speculative and could adversely impact recreational opportunities at Glade. Ames Report, p. 7.

3) **Northern's Water Secure Program is very <u>Insecure</u>.**

Implementation of NISP is wholly dependent on Northern's ill-defined Water Secure Program. Northern has failed to provide any detailed information on its Water Secure Program in its 1041 application. We know however that, to date, Northern has only acquired a small fraction (less than 1%) of the land and/or water rights agreements, necessary for the SPWCP. Future uncertainties, such as the high cost of land purchased and/or water rights agreements required to bring the SPWCP online, were also not evaluated in the NISP FEIS. Failure to fully implement the Water Secure Program will severely limit recreational opportunities at Glade. Ames Report, p. 7.

4) **Recreational benefits at 40,000 AF are inaccurate.**

Northern claims that recreation on Glade is viable at water storage levels higher than 40,000 AF. This claim is misleading and inaccurate. At this level, the reservoir's surface area would be 663 acre-feet (roughly 40% of the maximum surface area) and the water line would be 122 feet below the high water line. The proposed boat ramp and fishing pier would be unusable, and opportunities for hand-launched watercraft limited. For example, hand launching from the northern access road would require carrying a

watercraft across more than 1.5 miles of the lake bed to reach the reservoir's north shore. Ames Report, p. 10.

5) **The stream flow data used by Northern is not current and is incomplete.**

Northern's analysis uses historical stream flow data from 1950-2005 for the Cache la Poudre River. These data are not current and are also incomplete. For example, drought conditions that produced historic low stream flows in the early 2000s continued through 2005 and after. As such, levels of water in Glade would have been extremely depleted. Further, flows in the years following 2005 were also extremely low, resulting in a long period of time to replenish the reservoir. However, because Northern did not provide readily available flow data post-2005 its analysis intentionally hides these facts and their implications for Glade reservoir levels. Ames Report, p. 12.

6) **Northern failed to adequately consider drought and climate change.**

It is widely accepted in the scientific community that climate change will result in longer, and more pronounced, drought in the Interior West, including in the Cache la Poudre basin. The combination of climate change and drought were not adequately considered in Northern's FEIS process or 1041 application. As noted above, Northern's reliance on pre-2006 river flow data further ignores the recent evidence of drought and reduced flows in the Cache la Poudre River over the last two decades. Northern's EIS and 1041 application ignored the inconvenient truth that its junior water rights creates significant future uncertainty of the viability of NISP.

Conclusion

For the reasons stated herein, the NISP 1041 application should be denied because Northern has failed to comply with the following Land Use Code criteria:

A) Criteria #1- Northern has failed to prove that Glade is consistent with the County Master Plan and Recreation Plan because the recreational opportunities are unlikely to be realized.
B) Criteria #2- Northern has failed to present any alternative to Glade Reservoir.
C) Criteria #8- Northern has failed to prove that there will be adequate water in Glade and thus has failed to prove there will be adequate public facilities for the promised recreational benefits.
D) Criteria #10- Northern has failed to meet its burden of proving that the recreational benefits of Glade will be realized.
E) Criteria #11- Northern defers much of the mitigation measures to a later planning process and thus fails to comply with this criteria at the time of submission of the 1041 permit application.

Please ensure that the Planning Commissioners receive this letter and the exhibits prior to July 8, 2020 Planning Commission hearing. Also, please include this letter and the attached exhibits in the Administrative Record for this permit proceeding. Thank you.

A review and independent analysis of the feasibility of recreation at the proposed Glade Reservoir

Prepared by Rodger Ames in coordination with Save Rural NoCo

Table of Contents

Executive Summary

This report provides additional information to inform Larimer County's decision making process regarding Northern Water's 1041 application for the Northern Integrated Supply Project (NISP). Northern's claim of economic benefits to the County, and the assertion that Glade would provide additional recreation services to meet future demand in Larimer County, is speculative.

Extended periods of low water levels, lasting years to decades, are likely future scenarios at Glade. There is overwhelming scientific consensus that runoff will decrease in response to regional climate warming. Despite this evidence, hydrological modeling for the NISP relies on historical streamflows to predict future operations at Glade. Impacts of low water levels on recreation use, and potential adverse local and environmental impacts from prolonged severe water drawdowns at Glade, are not addressed in Northern's 1041 application.

Water supplies to Glade are extremely vulnerable to droughts

- Glade would rely on junior water rights on the Cache la Poudre to fill. Severe water drawdowns could last years to decades during which water-based recreation would not be available, revenues would be a fraction of operation and maintenance budgets, and Glade's reputation as a reliable recreation venue would suffer.

Glade will not provide another recreation venue similar to Horsetooth

- Horsetooth, and other reservoirs operated by Larimer County, are supplied by water from the Colorado - Big Thompson System, which is much larger and more drought resilient than the Poudre in part because of the more reliable water rights.
- Junior Rights to Poudre water supplies would severely limit Glade's ability to support consistent recreational use. During droughts access to the proposed boat ramp would be limited, and often curtailed altogether, for years to decades.

The management priority of Glade is to deliver water to NISP participants, not recreation or river health

- As water levels at Glade drop, recreation access would also drop, and purported benefits the NISP Alternative 2M, such as flow augmentations through the stretch of the Poudre that runs through Fort Collins, would be tiered out.

Hydrological modeling for the NISP is based on outmoded assumptions

- Northern's modeling neglects recent science that predicts declines in future runoff in response to climate warming.
- modeling assumes an initial storage volume of 100,000 acre-feet, rather than 0, creating a false impression of initial fill times.
- modeling omits the past 15 years Poudre streamflow data, denying the county valuable information on refill characteristics of Glade following severe water drawdowns.

Estimates of the economic value of proposed recreation at Glade are overestimated

- Northern Water claims economic benefits of $13-$30 million per year from recreation at Glade.
- In contrast, recreation at Horsetooth generated $2.5 million for Larimer County in FY 2019.
- Actual revenue to the County from recreation at Glade could be much less than at Horsetooth due to reduced visitation and limited recreation access during droughts.

Northern's water rights are relatively junior, adding to risk and uncertainty

- NISP relies on a 1980 storage right on the Poudre River and a 1992 water right on the South Platte River, in addition to exchanges with two local ditch companies. Given that the most senior water rights in Colorado date to the 1860s, these are very junior rights
- Adding to the uncertainty and risk, NISP relies on *both* the South Platte and the Poudre River receiving "average" or high flows in any given year to work. Prolonged drought in either basin will affect the ability to fill Glade.

1. Introduction

This report fills a knowledge gap regarding the feasibility of recreation at the proposed Glade Reservoir. Northern Water promises Glade will provide Larimer County with a “high-quality” recreation venue, and claims recreation, most prominently the lure of more flat water recreation, will pump 13 to 30 million dollars per year into the local economy (NISP FEIS, 2018). However, Northern’s 1041 application lacks evidence to support this revenue projection. Uncertainties in future water supplies to Glade make estimates of recreation value highly speculative. Informed estimates of potential recreational use and realistic assessments of adverse environmental and local impacts are important considerations as Larimer County reviews Northern Water’s 1041 permit application.

This report reviews operational characters at Glade presented in the NISP FEIS. A simple statistical model is used to estimate a range of likely future operations that were not addressed in the FEIS. This analysis suggests that Northern’s estimates of recreational use at Glade are likely to be highly overestimated. We show that prolonged low water levels, resulting from realistic estimates of the time required for the initial fill; the time required for Glade to refill following severe water drawdowns; inclusion of recent Cache la Poudre streamflow data; and consideration of plausible risks to future water supplies, combine to significantly reduce estimates of recreation use at Glade.

Cyclical droughts, which are common throughout this climate region, are increasing in frequency and duration in response to climate warming (Udall and Overpeck, 2017; Williams, 2020). Hydrological modeling conducted for the NISP DEIS indicates that water levels at Glade are particularly sensitive to prolonged droughts. For example, in the year 2005 of the NISP modeling simulation, storage volumes at Glade dropped to 11% of maximum capacity, causing predicted water levels to plummet 160 feet below the high water line. Unfortunately, hydrological modeling for the NISP ended in the same year, thus refill characteristics following this severe water drawdown were not evaluated. Since streamflow data are readily available, it is particularly concerning that recent Cache la Poudre streamflow data were not included in hydrological modeling for the NISP FEIS.

Neither the NSIP FEIS nor this analysis consider the full range of water supply risks to Glade. To date, Northern Water has obtained only half of the water rights required for the NISP. Northern’s Grey Mountain Right is estimated to provide half of the required water supplies, with the remainder coming from the proposed South Platte Water Conservation Project (SPWCP) exchanges. Until the SPWCP is online and at full projected yields, NISP will fall well short of its water delivery commitments, and Glade will rarely, if ever, fill.

The lack of a robust water supply vulnerability study that evaluates plausible water supply vulnerabilities denies the public and the county valuable information on future operational characteristics at Glade. The City of Fort Collins recently commissioned a comprehensive water supply vulnerability study (Stanec, 2019), which concluded that climate change is the most significant risk facing the CIty’s future water supplies. However, hydrological modeling for the NISP relies on the outdated assumption that past water supplies can be used to predict future hydrology. As it stands, Northern Water’s 1041 application fails to provide adequate information for the county to make informed decisions on recreation value and overall feasibility of Glade as a new recreation venue for Larimer County.

2. Conformity with Larimer County's 1041 Issuance Criteria

The list below summarizes deficiencies that Save Rural NoCo (SRN) has identified in Northern Water's (the Applicant) 1041 permit application. The full list of issuance criteria is specified in Sec. 14.10 of the Larimer County Land Use Code (Larimer County, 2020). Because this technical document focuses on the proposed Glade Reservoir, recreation components, and siting issues related to Glade are highlighted.

Criterion 1. Conformity with Larimer County's Comprehensive Plan: Northern's application does not demonstrate how the project protects air and water quality, cultural and natural resources, minimizes fragmentation of the landscape; it does not consider the natural terrain in its design and siting to minimize environmental impacts; it does not adequately mitigate risks and reduce economic costs of natural hazard events to increase resiliency; it does not conform with the county's vision for environmental stewardship, and it does not promote "overall community interests" because most of the benefits of the project would accrue to communities outside Larimer County. **Proposed recreational benefits would likely never materialize because the water to fill the reservoir will not be available to keep the reservoir at levels suitable for boat access in most years. Adverse environmental impacts resulting from persistent low water levels at Glade are at odds with the County's Resiliency Framework. Rather than promote resiliency, NISP would increase Larimer County's exposure to the impacts of a rapidly changing climate.**

Criterion 2. Reasonable siting and design alternatives: No alternatives are presented. The applicant refers to the alternatives analysis conducted for the federal process, which is unnecessarily limited to a water storage project and is out of date. There are many less costly and less environmentally destructive alternatives for water development now available. Alternatives must be presented in the 1041 application to Larimer County consistent with the land use code and 1041 review provisions. Finally, the application is for an alternative that involves both the Glade Reservoir and a farm-buying scheme which has not been evaluated in any of the environmental documents. Analysis of the farm-buying scheme in the existing 1041 application falls short of providing adequate information to meet the review criteria. In addition, NISP admits that the farm acreage needed to implement this scheme has yet to be obtained, a fatal deficiency. **Pointing to alternatives presented to or developed by a federal agency subject to different legal frameworks than County law and policy is an admission that the 1041 proposal is incomplete.**

Criterion 4. Environmental impacts: The application does not adequately identify environmental impacts. Analysis of key impacts to the land and natural resources is incorrect or inadequate, is not specific enough for local land-use decision-making, or is deferred to some later permitting/approval process. Adverse impacts, including **increased noise levels from recreation activities at Glade and Highway 287 realignment; visual, aesthetic and potential air quality degradation during prolonged (multi-year) water drawdowns at Glade;** increased wildfire and trespass risks, increased GHG emissions from pumping operations and inundation, are either dismissed, not addressed, or mitigation plans for environmental impacts are either inadequate or not provided.

Criterion 5. Cultural sites: The Final EIS states there are 82 eligible or potentially eligible cultural sites present in the Glade Reservoir APE. The County cannot approve a proposal that will adversely affect any sites and structures listed on the State or National Registers of Historic Places. Sites that would be inundated by the proposed reservoir or highway location would be entirely lost. They must be fully surveyed, identified and analyzed prior to obtaining a permit. Criterion 5 is not met because the sites have only been generally listed, but not specifically evaluated, inventoried or disclosed.

Criterion 6. Public health and safety: Wildfire hazard will increase, and Northern cannot ensure adequate mitigation. Furthermore, the **public health and aesthetic issues surrounding fugitive dust from exposed lake bed during prolonged water drawdowns, as noted above, and increased ozone precursors from motorized boating,** are not addressed**.** Wildfires are a very real risk that threaten homes and private property adjoining the reservoir as well as natural resources (forests, grasslands, rangeland and forage for wildlife).

Criterion 8. Adequate public facilities and services: The Applicant should commit the full amount of financial resources required to develop proposed recreation facilities at Glade, rather than having the county and its taxpayers pay for one-quarter of the development costs. Furthermore, the application fails to disclose how the siting, construction, and operation of a massive facility in a rural setting will impact sheriff, fire, and other emergency services. Budgetary analysis needs to include total costs, breakdowns and funding; including analysis in light of the fiscal challenges to County and other budgets resulting from Covid. Finally, the proposed recreation facilities are designed to accommodate levels of visitation that may be grossly overestimated. **The Applicant has not demonstrated that water supplies to Glade would be adequate for the proposed recreation use, particularly during prolonged droughts.**

Criterion 10. Cost benefits: **The benefits of this proposed Project likely cannot be achieved because the water to support prosed recreation activities is not available in the quantities and number of years asserted by Northern.** Reduced recreational use during prolonged droughts could significantly undermine revenue to the county, rendering Glade financially unsustainable over the Project's lifespan. Risks to future water supplies to Glade make estimates of recreation value at Glade highly speculative. The Applicant's estimates of the economic value of recreation at Glade are overestimated, based on unsupported assumptions about future flows, precipitation and runoff that fails to account for climate change. A robust evaluation of risks facing water supplies to Glade should be part of Larimer County's decision-making process when considering Northern's 1041 permit application. **Currently, the application is incomplete and/or based on flawed data and analysis.**

Criterion 11. Reasonable balance between costs to mitigate significant adverse affects and the benefits achieved by such mitigation: The application defers much mitigation planning to a later permit or process, so for many resources, insufficient information has been provided to assess whether this criterion is met. The applicant must provide concrete, not conceptual, mitigation plans, and the costs thereof and the benefits to be achieved. The application should also disclose which adverse effects cannot be mitigated.

3. Hydrological Modeling

1. Water supplies

Northern Water proposes delivering 40,000 acre-feet of water to NISP participants each year, mainly to municipal water districts outside Larimer County (12/15 participants are outside the County). Water supplies for the NISP would come from a combination of Northern's Grey Mountain Right and proposed SPWCP exchanges. The junior status of Northern's Grey Mountain Right allows for water diversions to Glade only during high flow conditions. During dry years, water supplies to Glade would be wholly dependent on SPWCP exchanges. As noted in the NISP DEIS:

> "*Until the SPWCP is online, Glade Reservoir will be wholly dependent on the Grey Mountain water right. This water right has the capability of yielding water in about 4 out of 10 years. Modeling indicates that there can be several years in a row of divertible flow followed by as many as 8 years with no flow available."* (NISP DEIS, 2008)[1]

Reliance on the junior Grey Mountain Right, and relatively junior South Platte Rights from proposed SPWCP exchanges, represent significant risks to the NISP's water supplies. To date, Northern Water has acquired only a small fraction (less than 1%) of the land necessary for the SPWCP (AKA, Water Secure). Future uncertainties, such as the high cost of land purchases required to bring SPWCP online, were not evaluated in the NISP FEIS (STP 2019).

8 years of no flows from Grey Mountain water rights would empty the reservoir in less than 8 years, depending on the water level before the sustained drought resulting in these water deficits. To the extent that projection dates to the 2008 DEIS, 12 subsequent years of climate science and hydrological understanding all contributes to a mountain of evidence (including Udall and Overpeck 2017) that droughts and aridification will be far in excess of what hydrological modeling for the NISP EIS predicted.

Furthermore, because hydrological modeling for the NISP is based on historical water availability, and due to uncertainties associated with Northern's proposed SPWCP exchanges, actual operations at Glade may provide significantly lower levels of service than predicted by Northern's modeling.

2. NISP modeling

The Common Technical Platform (CTP) modeling system (CDM Smith and DiNatale, 2018) was used to estimate operational characteristics of the NISP. Streamflows below the Poudre Valley Canal (PVC), the proposed diversion point for water to fill Glade, and operational characteristics at Glade were simulated for three scenarios.

Hydrological modeling for the NISP Preferred Alternative (Alternative 2M) includes "current conditions (NISP run 3a2)", "future conditions" (NISP run 4a2), and "cumulative effects" (NISP run 5a2) simulations. All modeling performed for the NISP use historic (1950-2005) naturalized Poudre River streamflows. Run 3a2 assumes 2010 water demands; Run 4a2 assumes demands projected to the year 2050; and Run 5a2 includes both 2050 demands and Reasonable Foreseeable Future Actions (RFFAs) of the Halligan and Seaman Reservoir Water Supply Projects (HSWSP).

---

[1] NISP DEIS, 2008, Sec 2.4.1.3.

Hydrological modeling for the NISP assumes that historical (1950-2005) naturalized streamflows can be used to predict future water supplies. Other assumptions are an initial storage volume of 100,000 AF, and that the SPWCP is both online and operating at maxim yield throughout the simulation period.

We raise the following questions regarding assumptions in Northern's hydrological modeling:

- **Why was the initial water storage in Glade assumed to be 100,000 AF, rather than 0?** Northern states that water for the initial fill will come from Horsetooth, however details on the conveyance of water to Glade, and broader systems impacts, such reduced water supplies and recreation opportunities at Horsetooth, were not evaluated. Analysis of direct, indirect and cumulative impacts to Horsetooth and all rivers and reservoirs on both sides of the Divide that would be impacted by a fill from Horsetooth is lacking from the 1041 application. Also lacking from Northern's 1041 application is a legal analysis of whether water rights now stored in Horsetooth could be diverted to and stored in Glade for use by the Participants. Horsetooth's capacity is 151,750 acre feet, so the system impacts of using water from Horsetooth, or other supplies, for Glade's initial fill must be evaluated.
- **Why are recent Poudre River streamflow data not included in hydrological modeling?** The importance of recent streamflow observations cannot be understated because hydrological modeling following predicted severe low water levels in year the 2005 of the modeling simulation provides valuable information on the refill characteristics of Glade following severe water drawdowns. Absent current and updated streamflow data from the Poudre, the application is incomplete.
- **Why does hydrological modeling for the NISP rely solely on historical (1950-2005) streamflows to predict future operations?** The assumption that historical streamflows can predict future flows and be relied on for future water development projects and operations is outdated and neglects current scientific consensus on impacts of climate change on future runoff.

---

a. Water levels

Figure 1 shows water levels at Glade predicted from hydrological modeling performed for the NISP EIS. Streamflows measured at the Cache la Poudre Canyon Mouth station[2], the minimum water level for recreational boat access via the proposed boat ramp[3], and cyclical droughts are superimposed on Figure 1.

[2] Colorado Department of Water Resources, https://dwr.state.co.us/surfacewater/

[3] Assuming a 35 vertical foot boat ramp (Northern Water, 2019)

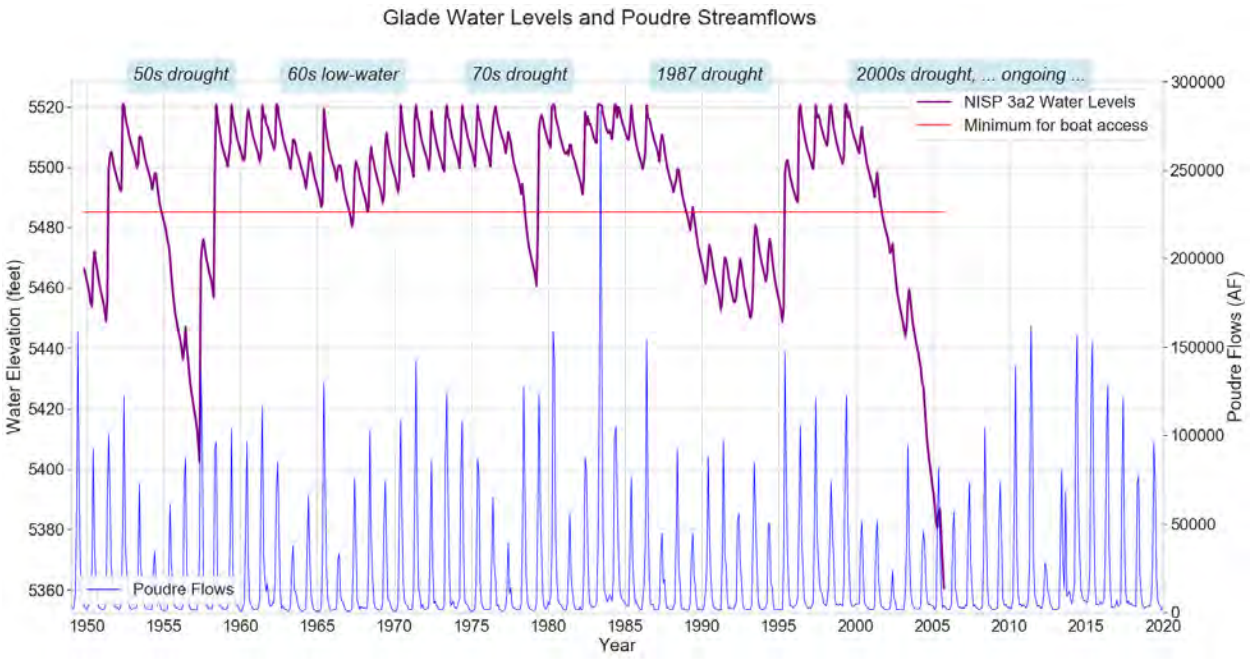

Figure 1. Predicted monthly water levels at Glade (NISP run 3a2) and streamflows at the Poudre Canyon Mouth. The horizontal red line indicates the minimum water level required for recreational boat access via the proposed boat ramp.

Figure 1 demonstrates the sensitivity of water levels at Glade to droughts. Due to their junior status, the NISP's water rights quickly fall out of priority during dry years. With inflows to Glade quickly outpaced by demands during drought conditions, water levels plummet and often remain low for multiple years. The refill characteristics of Glade following major water drawdowns, such as what is predicted at the end of 2005, are critical to the informed assessment of recreation value at Glade. Since streamflow data are readily available, it is particularly concerning that recent Cache la Poudre streamflow data were not included before the publication of the NISP FEIS in 2018.

---

b. Surface area

A map view illustrates the relationship between water storage and water surface area at Glade. Figure 2 shows water surface area at three operational levels: full capacity, 70% storage (which corresponds to 35 feet below the high water line), and 11% storage (the level predicted in the year 2005 of Northern's hydrological modeling for the NISP). The low water level, shown in orange, represents a 75% reduction in the water surface area, which would expose 1183 acres of the lakebed.

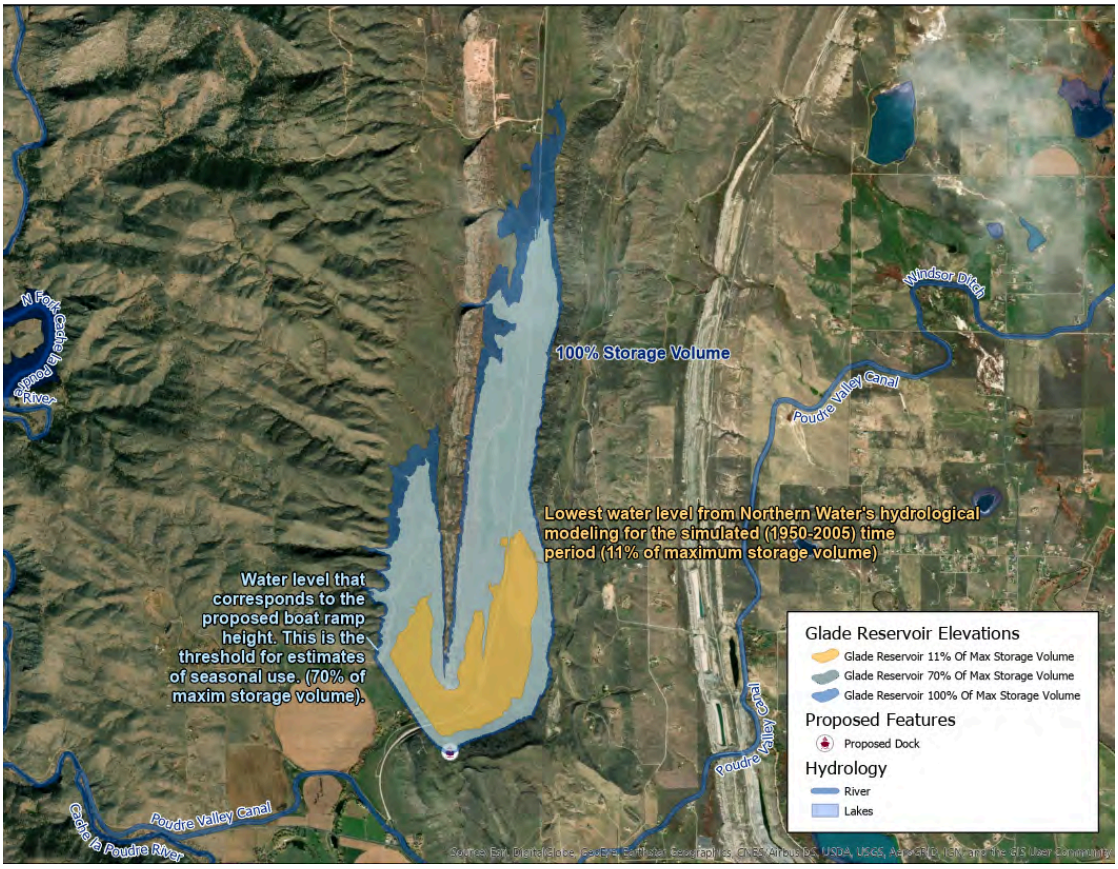

Figure 2. Map of simulated Glade water levels at capacity (dark blue), the water level corresponding to the bottom of the proposed boat ramp (35 feet below the high-water line) (light blue), and the lowest water level predicted from Northern Water's hydrological modeling (orange).

Northern Water claims that recreation at Glade would be viable when storage is higher than 40,000 AF. At this level, the Reservoir's surface area would be 663 AF (roughly 40% of maximum surface area), and the water line would be 122 ft below the high water line. The proposed boat ramp and fishing pier would be unusable, and opportunities for hand-launched watercraft limited. For example, hand launching from the northern access road would require carrying a "watercraft" across more than 1.5 miles of the lake bed to reach the Reservoir's north shore.

3. SRN modeling

A simple statistical approach is presented to estimate a range of likely future operations at Glade. The model used for this analysis is based on results from the NISP hydrological modeling run 3a2. Thus, the statistical analysis's underlying data model is based on historical hydrology used for the NISP simulation.

Furthermore, this analysis adopts the assumption from the NISP modeling that the SPWCP is online and operating at full projected yields throughout the simulation period. However, the NISP FEIS states that the SPWCP will not be online until after Glade is constructed. Thus, water supplies to Glade would be further limited until the SPWCP is online. Without SPWCP online, it would be virtually impossible for water levels at Glade to support viable recreation, and the reservoir would likely never fill during this period. Nonetheless, this analysis assumes the SPWCP is online from the start of the simulation. Goals for this analysis:

1. Estimate diversions, or inflows, to Glade for 1950 to 2019 (e.g., for a 70 year simulation vs. the 56 year period modeled in the NISP FEIS), and

2. evaluate the effects of alternative streamflow scenarios (i.e., inflows) and operations (e.g., different initial storage volumes) on predicted operational characteristics at Glade.

---

a. Inflows

i. 1950-2005

Northern Water provided monthly storage volumes at Glade corresponding to the NISP Run 3a2.[4] Inflows were derived from monthly storage volume changes (dS). First, monthly demand was estimated by taking the minimum dS and assuming the absolute value, $|dS_{min}|$, equals monthly demand. Applying the resulting monthly demand profile across all years yields monthly inflows:

$$\text{Eqn. 1: Inflow} = dS + \text{demand}$$

This approach yields an annual average inflow of 43,500 AF per year, which is close to the 43,400 AF per year annual average diversion to Glade reported in the NISP FEIS (NISP FEIS, 2018)[5]. Storage volumes can be estimated from the inflows by rearranging Eqn. 1, and assuming an initial storage volume:

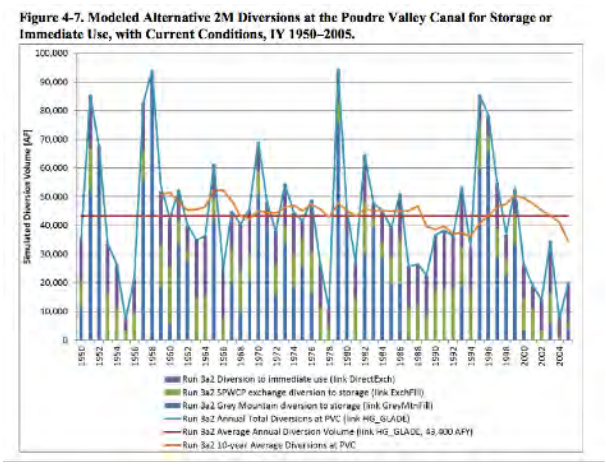
$$\text{Eqn. 2: } S(i) = S(i-1) + \text{inflow}(i) - \text{demand}(i)$$

Where S is the storage at time step *i*. Figure 2 shows diversions to Glade from the NISP 3a2 run (Figure 3a) and inflows calculated for this analysis (Figure 3b). Annual, 10-year running mean, and long-term mean inflows for the two simulations are virtually identical.

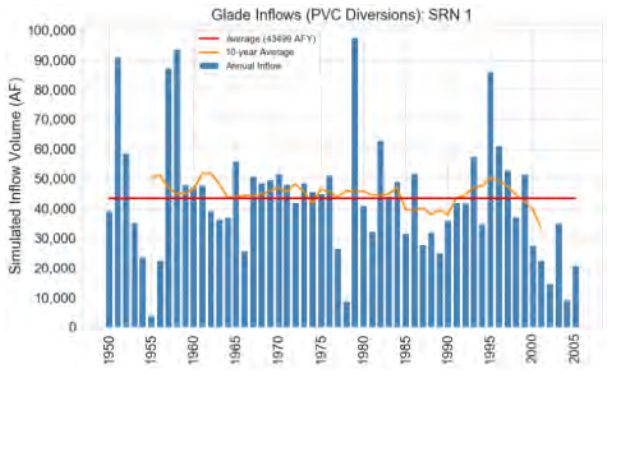
---

[4] A request to Norther Water to confirm that the storage volume data provided for this analysis corresponded to NISP run 3a2 was not received. Additional requests to Northern for other modeling results, including results from NISP Runs 4a2 and 5a2, were deferred to the USACE.

[5] NISP FEIS (2018), Ch. 4, pg. 4-31.



a. NISP run 3a2 annual diversion to Glade



b. SRN run 1 annual inflows to Glade

Figure 3. Predicted diversions to Glade from the NISP 3a2 modeling simulation (a) and the inflows used for this analysis (b) for 1950-2006. The 10-year running mean for the NISP data reflects the average of the previous 10-years of inflows, while in the SRN plot the 10-year running mean is positioned over the midpoint of the averaging period.

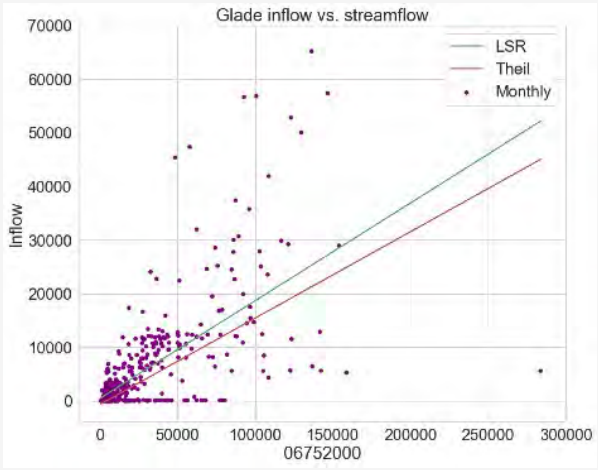
Note that the long term average diversion at the PVC from the NISP modeling is 43,400 AF. That is, Northern has used the entirety of its combined Grey Mountain and projected SPWCP exchange water rights. At the end of 2005, when Glade is predicted to be nearly empty, there is no “money in the bank” to refill Glade, maintain water deliveries to NISP Participants, and sustain water levels sufficiently for “high-quality” flat water recreation. To fill Glade by 2019, Northern would need to borrow heavily against future year allocations.

ii. 2006-2019

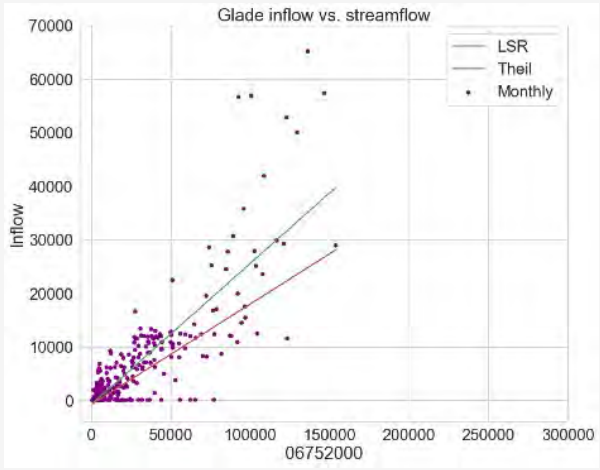
Glade inflows from 2006 - 2019 were estimated from streamflows measured at the Cache la Poudre Canyon Mouth station. Monthly streamflow observations from 1950-2005 were fit to inflows from Eqn. 1 over the same period using linear regression. Observed 2006-2019 streamflows were then scaled to inflows.

Two regression methods were used for this analysis: the nonparametric Theil regression and a least squares regression (LSR). Figure 4a shows 1950-2005 monthly inflows vs. Poudre streamflows. LSR and Theil recreation lines are superimposed as green and red lines, respectively. Figure 4b shows monthly inflows vs. streamflows from a subset of years (43 out of the 56 year simulation period) where the annual LSR regression coefficient is highly significant (p-value < 0.05). The regression slopes in Figure 4b maximize monthly inflow estimates, and likely corresponding to operational conditions where NISP water rights are in priority and inflows are not constrained (e.g., times when storage volumes are low enough that predicted inflows would not exceed reservoir capacity).

SRN 1. Estimated inflows for the SRN 2005 - 2019 simulation period



a. SRN 1a Inflows



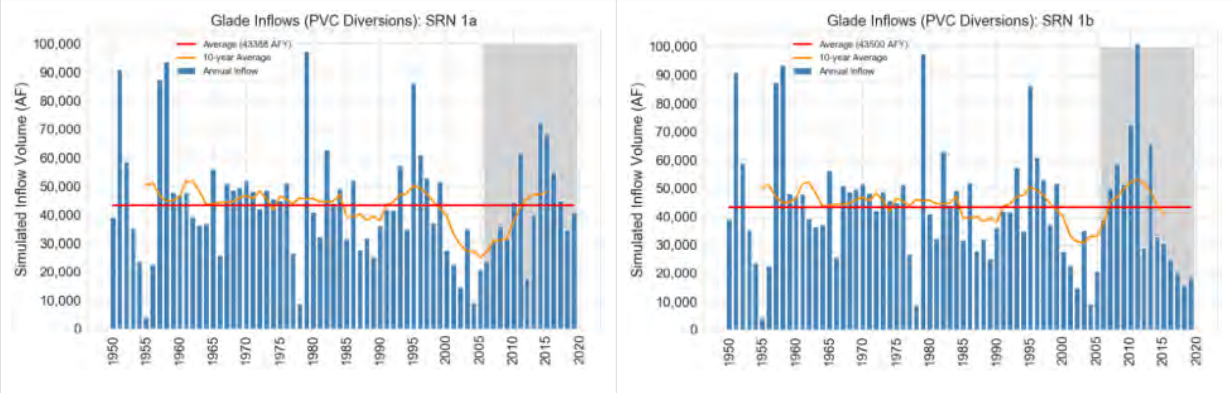
b. SRN 1b inflows

Figure 4. Monthly inflow vs. Poudre streamflows (AF per month). Figure 3a shows Theil and LSR fits to all data for the 1950-2005. Figure 3b shows data and corresponding regression slopes from years where annual coefficients are highly significant (p value < .05).

Inflows derived from Eqn. 1 (1950-2005) and inflows derived from the respective regression methods (2006 - 2019) are shown in Figure 5. Inflows predicted from the Theil estimator (Figure 5a, shaded region) predicts average inflows for 2006-2019 that closely match the 43,400 AF per year annual average for the 1950-2005 data.

On the other hand, the LSR method described above over-predicts average inflows for 2006-2019 (70,280 AF per year). To keep the average inflows in line with the NISP water right, while also maximizing inflows following 2005, inflows from 2006-2013 were prescribed from the LSR coefficient, and inflows from 2014-2019 were reduced so that the long-term annual inflow equaled 43,500 AF per year. Inflows corresponding to the LSR method are shown in Figures 5b.

In Figure 5, inflows using the Theil method are referred to as "SRN 1a", and inflows derived from the LSR are referred to as "SRN 1b".



a. SRN 1a **b.** SRN 1b

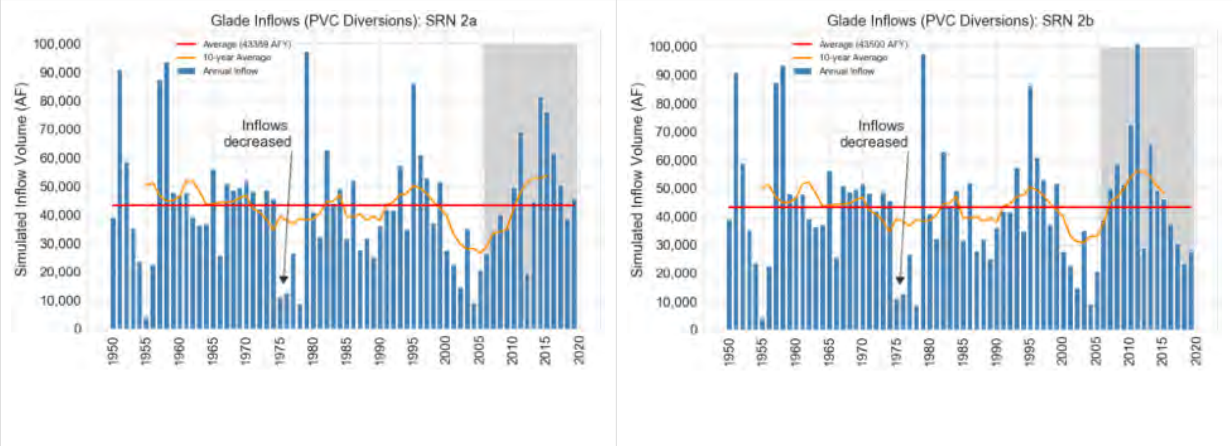
Figure 5. Estimated inflows for 1950-2019. Inflows for 2006-2019 (grey background) are estimated from streamflows measured at the Poudre Canyon Mouth. 10-year running mean (orange line) and long-term annual mean (red line) inflows are superimposed.

iii. Simulated drought

Cyclical droughts, which are common throughout this climate region, are increasing in frequency and duration in response to climate warming (Udall and Overpeck, 2017; Williams, 2020). Hydrological modeling for the NISP FEIS does not address future water availability scenarios. This analysis attempts to fill this gap by simulating impacts of “additional” drought frequency, while not decreasing average inflows.

To simulate the effects of increased droughts on storage at Glade, inflows during two years of the 70-year simulation were reduced by 75%. Inflows for 1975 and 1976 were reduced to create a four-year drought interval (1975-1978). The simulated inflows are consistent with inflows during other droughts in the historical record (e.g., 1954, 1978, 2002, and 2004). To maintain long-term annual average inflows at 43,500 AF per year, inflows during the later part of the 2006-2019 simulation (e.g., 2014-2019) were increased to compensate for the reduced inflows.

Figure 6 shows the modified inflows for the “SRN 2a” and “SRN 2b” “drought” simulations. As with the SRN 1 simulations, SRN 2a uses the Theil method to estimate 2006-2019 inflows, and SRN 2b uses the LSR method described above.



a. SRN 2a Inflows

b. SRN 2b Inflows

Figure 6. Annual inflows for the SRN 2 simulations. Inflows for 2006-2019 (grey background) were estimated from Cache la Poudre streamflows. Inflows during 1975 and 1976 were artificially reduced to simulate effects of more frequent prolonged droughts on storage volumes. Inflows during 2014-2019 were increased so that long-term average inflows were consistent with the SRN 1 simulations.

b. Stochastic model

A “bootstrap” statistical model was developed to evaluate operational characteristics at Glade for a range of likely future operations and streamflow sequences. The model presented here follows other data-driven stochastic approaches for streamflow modeling (Laal and Sharma, 1996; Nowak et al., 2010).

The model developed for this analysis generates an ensemble of inflow “traces” by randomizing inflows (e.g., from Eqn. 1). Storage traces are built from individual inflow traces (e.g., using Eqn. 2). The ensemble of storage traces can be used to calculate statistics, including confidence intervals, for specific operational characteristics. Model criteria:

1. Statistics of simulated storage volumes profiles should reproduce characteristics of the *a posteriori* data (e.g., storage volumes from the NISP 3a2 run), such as mean storage volume, and

2. the model should have the flexibility to mimic reservoir operations in response to alternate conditions or hydrological scenarios, such as changes in initial storage volume or simulated droughts.

Inflows from Eqn. 1 were used as inputs (e.g., the a posteriori data). Inflow traces were generated by disaggregating annual inflows using a K Nearest Neighbor (K-NN) approach (Nowak et al., 2010) to create monthly inflows. Inflow traces were then converted to storage traces following Eqn. 2. As the storage traces evolved in time, storage was confined to the lower and upper storage limits for Glade (2005 AF, or the “dead pool” volume, and 170000 AF, or “maximum storage capacity”, respectively).

The K-NN disaggregation effectively randomized monthly inflows, generating an ensemble of traces with statistics that matched those of the a posteriori distribution (K=7 was used based on literature values). However, the disaggregation approach did not sufficiently randomize annual inflows to satisfy the second model criteria, above. For example, the storage traces could not reach full capacity if the initial storage volume was lower than what was used in the NISP simulation.

To create a model that satisfied the second model criteria, two modifications were made to the K-NN disaggregation approach. First, a moving window was placed on the annual inflows by selecting the K nearest neighbors for each annual inflow value. Second, a subset of storage traces was selected by selecting traces with means within 10% of the a posteriori mean. This modification essentially “self selects” traces that maximize storage volume within the range of simulated inflows.

Unlike naturalized streamflows, reservoir inflows (and hence, storage volumes) cannot necessarily be represented by a fully stochastic process. The first modification (describe above) provides sufficient randomization to allow the model to respond to alternate scenarios, while the second modification allows the model to mimic likely reservoir operations. Ideally, a stochastic approach would be applied to naturalized streamflows. The randomized streamflow sequences would then be used as inputs to decision support tools, such as the CTP used for the NISP hydrological modeling. However, such modeling was beyond the scope of this analysis.

Figure 6 shows storage traces generated with the SRN statistical model. In this example, the initial storage volume was set to 100,000 AF to match the NISP 3a2 simulation. Individual storage traces from the SRN model are shown in green, and the median of all traces from the SRN model is shown in red. The NISP 3a2 simulation is shown in blue. Annual mean storage from the NISP and SRN simulations are within 3%. This “SRN benchmark” simulation indicates that the SRN model can reproduce statistics of the NISP run, while also providing a range of expected storage volumes to estimate confidence intervals for specific operational characteristics.

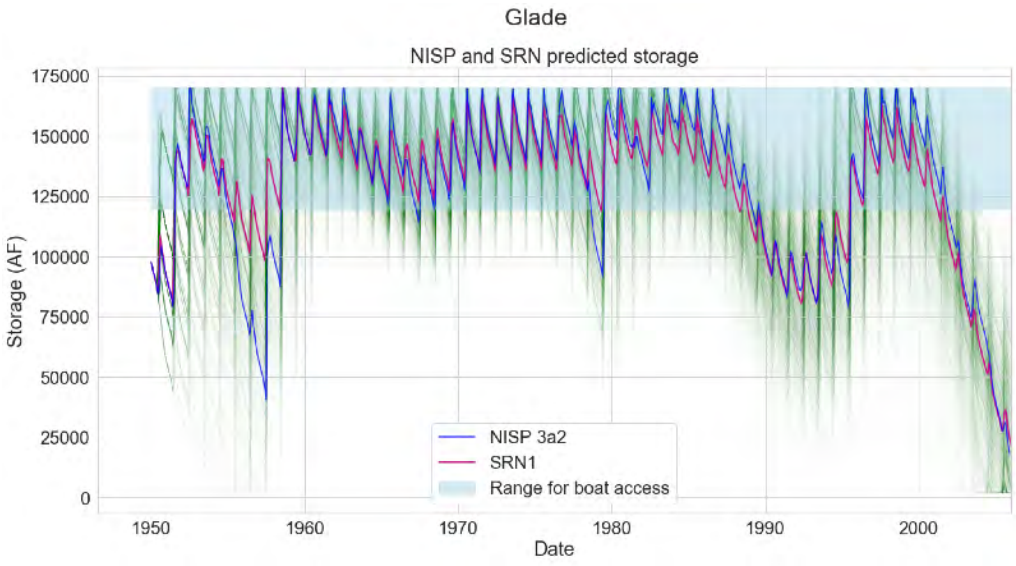


Figure 7. Storage volumes from the NISP 3a2 simulation (blue) and SRN “benchmark” simulation. Individual traces from the SRN simulation are shown in green and the median of all storage traces is shown in red. Initial storage is 100,000 AF for NISP and SRN simulations.

c. Predicted storage volumes

Figure 8 shows predicted storage volumes for the SRN modeling scenarios. The "SRN 1" simulations (top row) includes 1950-2019 hydrology, and the "SRN 2" simulations (bottom row) includes a simulated drought during 1975 and 1976. Versions "a" and "b" correspond to the method used to estimate 2006 - 2019 inflows.

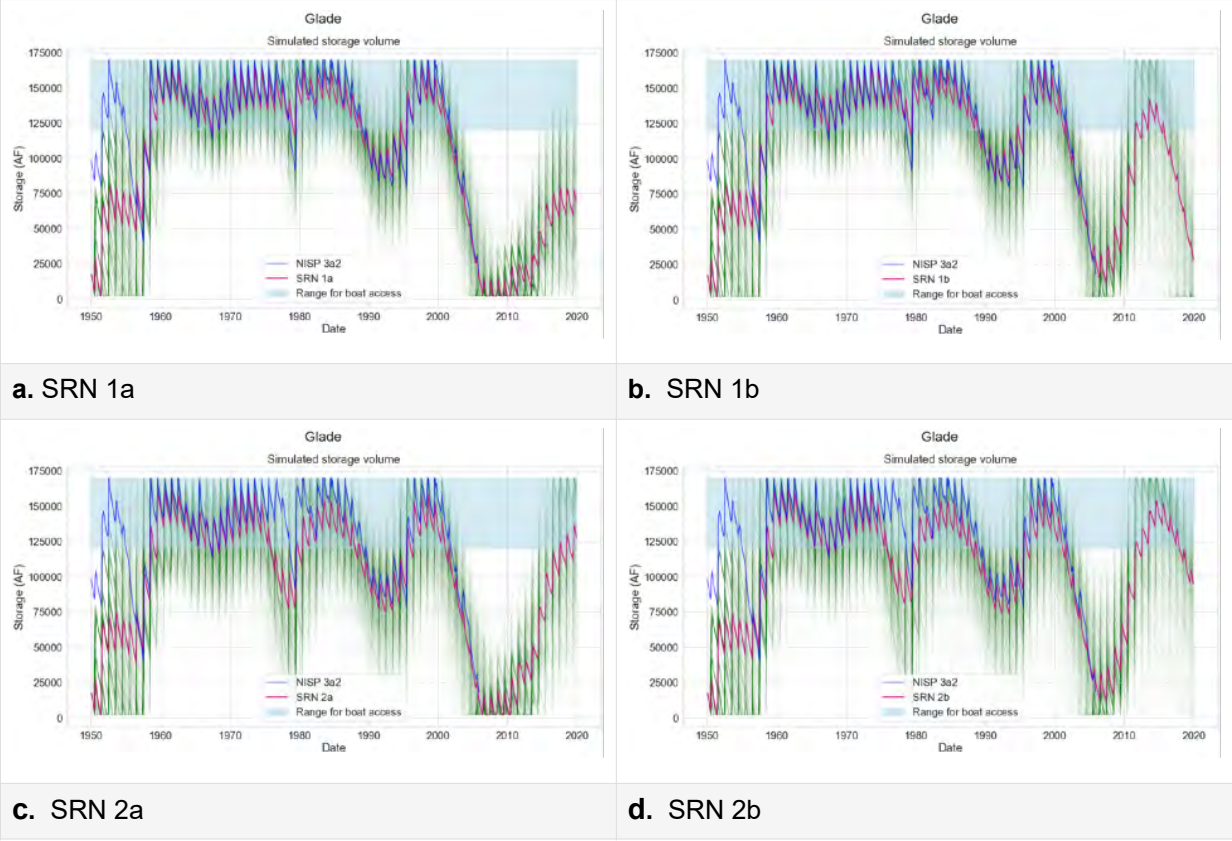
All SRN simulations shown in Figure 8 assume an initial storage volume of 20,000 AF. The NISP 3a2 simulation, which assumes initial storage is 100,000 AF, is shown for comparison. The SRN model demonstrates "realistic" operational characteristics, allowing simulated storage to reach capacity. Confidence intervals for specific operational characteristics, such as the time to fill, are estimated from the ensemble of storage traces.

The top row of plots in Figure 8 shows storage trajectories corresponding to the "SRN 1" inflows shown in Figure 5. The bottom row shows storage trajectories corresponding to the "SRN 2" inflows.

All four SRN simulations have nearly identical initial fill profiles, which is expected because the inflows and initial storage volumes are the same. The median fill time is approximately ten years, with initial storage of 20,000 AF.

"SRN 1a" and "SRN 1b" simulations differ in their refill characteristics following the severe water drawdown predicted in 2005. In the "SRN 1a" simulation (Figure 8a), storage hovers near the Glade's "dead pool" volume following 2005 and remains below 50% of capacity through 2019. In the "SRN 1b" simulation (Figure 8b), which has larger inflows following 2005 to allow Glade to refill as quickly as possible, storage volumes were able to reach the minimum required for boat ramp access. However, storage volumes declined at the end of the simulation because inflows were reduced to keep average diversions within NISP's allocation.

The bottom row of plots in Figure 8 (Figure 8c and 8d) show storage trajectories for simulations where inflows were artificially reduced in 1975 and 1976 to simulate an extended drought. Average diversions for the SRN simulations were set to match average diversions in the NISP simulations. The amount of flow reduction during the "induced" drought was added to the 2014-2019 inflows to maintain this balance. The additional inflow at the end of the simulation period explains why storage for the "SRN 2" simulations ends higher than the corresponding "SRN 1" simulations.



a. SRN 1a **b.** SRN 1b

c. SRN 2a **d.** SRN 2b

Figure 8. Storage volumes from the NISP 3a2 simulation (blue) and four SRN simulations. Individual traces from the SRN simulations are shown in green and the median of all traces is shown in red. Initial storage is 100,000 AF for the NISP Run and 20,000 AF for the SRN simulations. SRN 1 (top row) uses 1950-2019 hydrology, and SRN 2 (bottom row) includes an artificial drought during 1975 and 1976.

All simulations in Figure 8, including the NISP Run, use the same annual average inflows across the simulation period. Differences in the individual storage profiles result primarily from the temporal sequence of storage and available inflows. The SRN 1 simulations show that a possible refill characteristic following the 2005 water drawdown is a prolonged operational mode in which Glade is unable to accumulate storage. The SRN 2 simulations reveal another possible operational mode, where refill is more rapid following 2005. However, water rights limitations cause storage to decline at the end of the simulation. In any of the SRN simulations, Glade would be unable to reach full capacity following 2005 without borrowing heavily against future year's water allocations.

4. Recreation

1. Levels of Service

Neither Northern's Recreation Plan for Glade nor their 1041 permit application, address ***Levels of Service*** for recreation at Glade. For example, ***how often*** would water levels be high enough to provide access for motorized boating, ***how long*** would low water levels last, and ***how severe*** would water drawdowns be during droughts? This analysis attempts to answer these questions by evaluating four specific metrics:

1. How often would water levels be high enough to provide access for motorized boating via the proposed boat ramp,
2. how often would water levels be high enough to provide fishing from the proposed fishing pier,
3. how severe would water drawdowns be, and 4. how long would severe low water levels persist?

---

a. Boat ramp and fishing pier use

To address the first two metrics, the SRN simulations were evaluated to determine the amount of time water levels at Glade would support boat ramp access and fishing pier use during the peak recreation season (May - August). Boat ramp access is determined from the number of months water levels are within the height of the proposed 35 (vertical) foot boat ramp[6]. Fishing pier use assumes water levels are within 25 feet of the high water line[7].

Table 1 shows levels of service for Metrics 1 & 2 for the NISP and SRN simulations. The SRN benchmark and NISP simulation predict similar boat ramp access (roughly 73% of peak seasons months, or 41 out of 56 years). However, if the initial storage volume is reduced to 20,000 AF (from 100,000 AF as assumed in the NISP simulation), and recent Cache la Poudre streamflows are included, boat ramp access drops to 54%-59% (38-41 years out of 70). Adding two additional drought years further reduced boat ramp access to 47%-51% (33-36 years out of 70).

---

[6] The proposed boat ramp height is taken from the Glade Recreation Plan (Northern Water, 2019).

[7] Water level required for the fishing pier were estimated from drawings in the May 2020 NISP E-Water News.

Level of Service Metrics: Boat ramp and fishing pier use				
Simulation (description)	**Simulation period**	**Initial storage volume (AF)**	**Peak season months with motorized boat access**	**Peak season months with fishing pier access**
NISP Run 3a2	1950-2005	100,000	73%	68%
SRN 1 “Benchmark” (initial storage = 100,000 AF)	1950-2005	100,000	74%	63%
SRN 1a (Theil regression to estimate 2006-2019 inflows)	1950-2019	20,000	54%	45%
SRN 1b (LSR regression to estimate 2006-2019 inflows)	1950-2019	20,000	59%	50%
SRN 2a (Run 1a with simulated drought in ’76 and ’77)	1950-2019	20,000	47%	37%
SRN 2b (Run 1b with simulated drought in ’76 and ’77)	1950-2019	20,000	51%	40%

Table 1. Estimated levels of service for motorized boat and fishing access via the proposed Glade boat ramp and fishing pier. The fishing pier requires higher water levels, thus estimated use is less than for the boat ramp.

As mentioned earlier, the NISP and SRN simulations assume the proposed SPWCP is online and at full yield throughout the modeling period. Because the SPWCP is not expected to come online until after Glade begins operation, actual levels of service would be lower than shown in Table 1, particularly during initial operations.

---

b. Time to fill

Hydrological modeling for the NISP assumes an initial storage volume of 100,000 AF. In practice, the initial storage volume would be close to zero, and the time required for the initial fill would be significantly longer than indicated by the NSIP modeling.

The SRN simulations were used to estimate the time required for Glade to fill assuming initial storage volumes of 20,000 and 100,000 AF. 20,000 AF was chosen because it is a reasonable proxy for filling an “empty” reservoir. 100,000 AF matches the initial storage used in the NISP modeling. Initial fill times are six years when initial storage is 100,000 AF, and ten years when storage is initialized at 20,000 AF. Table 2 shows the median time for the initial fill from 1000 traces in each SRN simulation. Note that the upper confidence intervals suggest the initial fill could take decades.

Time required for initial fill			
Simulation	**Starting Volume**	**Median**	**Range (95% Confidence Interval)**
SRN 1a. (Years to reach full storage starting in year 1950)	20,000	9.7 years	4.7 - 30 years
	100,000	4.7 years	1.7 - 15 years

Table 2. The number of years required to reach full storage from initial storage volumes of 20,000 and 100,000 AF. The median time in years, and 95% confidence interval, are estimated from 1000 storage volume traces.

Figure 9 shows the time required for traces to reach full storage (170,000 AF) starting from an initial storage volume of 20,000 AF. Note that fill times shown in Figure 9 and Table 2 are tied to the hydrological sequence used for the modeling simulation.

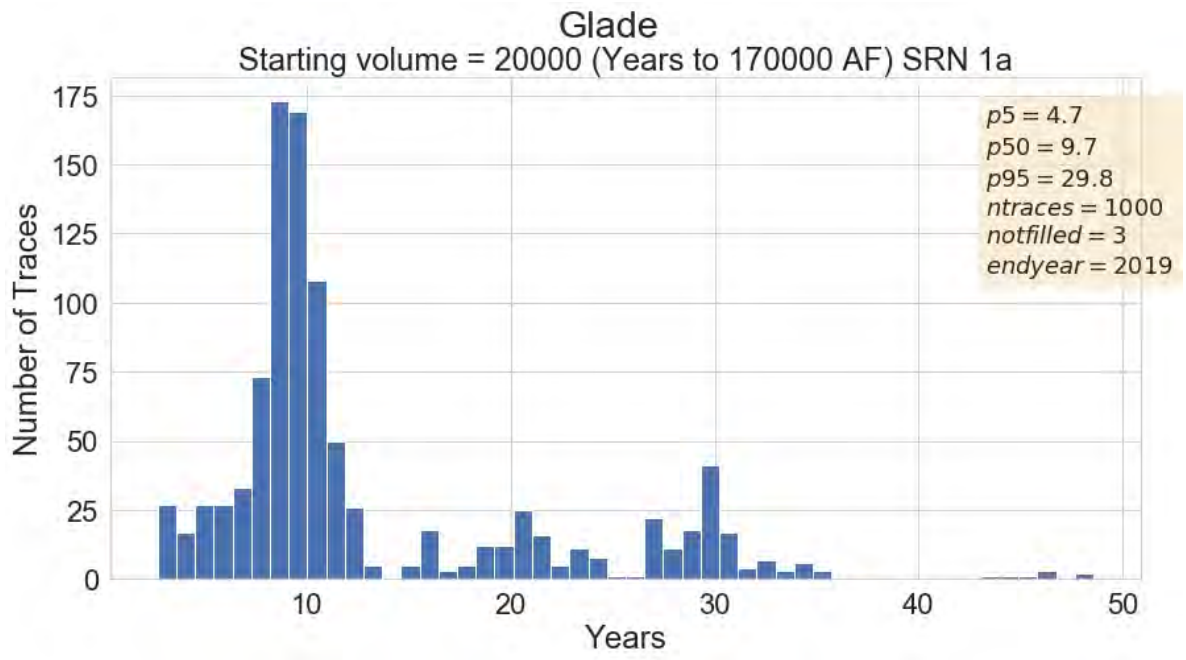


Figure 9. Time to reach full capacity assuming an initial storage volume of 20,000 AF and hydrological sequence starting in 1950.

Estimated refill characteristics following the severe water drawdown predicted at Glade in 2005 are shown in the series of plots in Figure 8. The SRN simulations indicate that low water levels would likely be an ongoing operational mode for Glade from 2000 through 2019.

An accurate evaluation of refill times based on 2000s hydrology would require a longer simulation period. Ideally, hydrological modeling for the NISP would include a robust modeling study that evaluates impacts on recreation levels of service from a range of plausible risks to water supply at Glade.

5. Economic Value

The Glade Recreation Plan (Northern Water, 2019) states that Glade will provide a “high quality” recreation experience. Estimates of annual visitation at Glade range from 45,000 to 379,000 visitors per year (Headwaters, 2017). The FEIS mentions only the high end of this estimate:

> “*Visitation at Glade Reservoir is estimated to be 379,000 visitors annually at full development (Headwaters 2017). Visitation at Horsetooth Reservoir is currently near 660,000 visitors annually. Based on the ranges identified for possible visitation and its value, total economic effects of Glade Reservoir would be a major benefit under any combination and may range from about $13 million per year to $30 million per year.”* (NISP FEIS, 2018)[8]

The FEIS does not provide documentation to support the $13 to $30 million per year range of economic value. The economic analysis referenced in the NISP FEIS (BBC and Honey Creek, 2015) estimates economic value using a "unit-day approximation of willingness-to-pay" approach, which is roughly $39 per visitor day. Applying this daily rate to the Headwaters Report's visitation range yields a range of annual recreation revenue from $1.8 to $15 million per year. The proposed broader economic value of recreation at Glade is not addressed in the NISP FEIS or Northern’s 1041 application.

In comparison, Larimer County's FY 2019 revenue from recreation at Horsetooth Reservoir was $2.5 million. Since visitation at Glade is estimated to be roughly half that of Horsetooth, a reasonable estimate of the county's revenue from recreation at Glade, assuming similar operational characteristics for the two reservoirs, would be in the neighborhood of $1.2 million per year.

However, the assumption of operational similarities between Glade and Horsetooth is misleading, and leads to potential overestimates of recreation value at Glade. Supplemental documents to the NISP FEIS point out the vulnerability of recreation vulnerability at Glade due to low priority water rights. "… Glade's recreation value may diminish toward the end of prolonged dry periods." (BBC and Honey Creek, 2015). Actual revenue to the County from recreation at Glade could be much less than at Horsetooth due to reduced visitation and reduced levels of service for recreation during droughts.

Northern's 1041 application does not account for diminished recreation value due to prolonged droughts. As climate warming advances, more frequent prolonged droughts will add additional stress to Glade water supplies. A robust evaluation of the risks facing water supplies to Glade should be part of Larimer County's decision-making process when considering Northern's 1041 permit application.

Are Larimer County residents better served by investments in traditional open space and conserving natural resources with natural habitat and ecosystem values that compliment recreational values? Climate change will increasingly stress natural resources and landscapes, necessitating greater investments and more intensive management for existing holdings. Climate change adaptation and resiliency makes it important to better protect the Poudre River ecosystem and corridor, the most valuable natural asset in the County; as well as to connect existing protected areas including federal lands, state parks and wildlife areas, and local government-owned or managed conservation properties.

[8] NISP FEIS, 2018. Ch. 4, Sec 4.16.3.5

6. What About the Future?

There is overwhelming scientific consensus that temperatures in the Colorado and Cache la Poudre River Basins have increased during the last part of the 20th Century, and that warming will continue in the 21st Century. (WRF, 2012; Cook et al., 2015). Streamflows across the U.S. Southwest are in decline, and some of the most severe droughts on record have occurred in recent years. While some climate models predict increases in precipitation, overall projections for the next Century are uncertain. Furthermore, recent studies show that regional climate warming would largely offset any future increases in precipitation.

> "*Moreover, we make a novel—and important—case that there is a high likelihood that the impacts of continued atmospheric warming will overwhelm any future increases in precipitation because prolonged dry periods lasting multiple decades are likely to negate the beneficial impacts of additional precipitation during other times."* (Udall and Overpeck, 2017).

A recent USGS study found natural flows in the Upper Colorado River Basin have decreased by 20% in the past century, with declines of 16% during 2000-2017. The study suggests that evapotranspiration will moderate moisture added from increased precipitation.

> "*Projected precipitation increases likely will not suffice to counter fully the robust, thermodynamically induced drying. Increasing risk of severe water shortages is expected."* (Milly and Dunne, 2020).

Recent droughts stand out in the long-term hydrological record. Analysis of tree ring data shows that droughts in the late 1990s and 2000s are the two driest in the historical record, going back to Medieval times.

> "*Temperatures keep going up," said Meko, of the University of Arizona tree ring lab.* "*We keep breaking records year after year. It's additional stress on the water system." Meanwhile, the two driest years all the way back to the 1200s occurred in 1996 and 2002.* "*It's a little worrisome to see the most extreme years right near the present,"* (Robbins, 2019).

> "*Anthropogenic trends in temperature, relative humidity, and precipitation estimated from 31 climate models account for 47% … of the 2000–2018 drought severity, pushing an otherwise moderate drought onto a trajectory comparable to the worst [Southwest] megadroughts since 800 CE."* (Williams et al., 2020)

Storage volumes at reservoirs in the Colorado River Basin are at record lows, and the threat of a "compact call" looms over Front Range water projects (Aspen Times, 2019; Childs, 2020; Denver Post, 2019, STC, 2019). In recent testimony to Congress, Dr. Brad Udall emphasized the severity of the current water shortage in the Upper Colorado River Basin and the vulnerability of Front Range reservoirs to Colorado River water supplies.

> "*Were [a compact call] to occur, the Upper [Colorado] Basin would have been in serious drought for a number of years and its reservoirs would likely be empty. In addition, water to meet such a* '*compact call*' *would come disproportionately from already suffering Upper Basin municipalities including Colorado*'*s Front Range, Albuquerque, and Salt Lake City."* (Udall, 2019).

The City of Fort Collins Utilities (FCU) recently commissioned a Water Supply Vulnerability Study to evaluate the vulnerability of the City's water supplies to a range of future risks, including climate change:

> "*Uncertain future hydrology is the most significant threat to FCU's future water supply, as global climate models have a wide range of predictions for the Poudre River and Upper Colorado River basins."* (Stanec, 2019)

We face a different climatological landscape than when NISP was conceived over 20 years ago. The omission of recent streamflow data, the reliance on historical water supplies to predict storage volumes at Glade, and the lack of a robust water supply vulnerability study deny the public and the County valuable information on likely operational characteristics at Glade. The current application is incomplete. The missing data and analysis goes to the heart of viability. As presented, the proposal is deficient under the 1041 review criteria.

7. Local and Environmental Impacts

The NISP FEIS also fails to adequately address local impacts from future operations at Glade, including construction, proposed recreation activities, and impacts of severe water drawdowns during droughts.

Local impacts include noise from motorized watercraft, pumping facilities, increased vehicle noise from the proposed realignment of highway 287 (Tschirhart 2020a), increased likelihood of trespass, and increased risk of wildfires (Tshirhart 2020b). Mitigation plans for these impacts are either lacking from Northern's 1041 application or are woefully inadequate.

Hydrological modeling, both for the NISP FEIS and from this report, indicate that low water levels at Glade levels could persist for multiple years, rendering the proposed Reservoir a vast dry lake bed and an eyesore to local residents. Local impacts resulting from persistent low water levels include adverse air quality from windblown dust, reduced property values, and degradation of the natural environment. These impacts must be thoroughly disclosed through analysis by an independent expert.

Adverse environmental impacts related to persistent low water levels at Glade are at odds with the the County's climate resiliency planning. Larimer County's 2016 Resiliency Framework (Larimer County, 2016) identifies droughts as a significant natural hazard facing Larimer County. The Framework's Resilient Natural and Built Infrastructure section recommends projects that have a system-wide ecosystem benefit. However, rather than promoting resiliency, the NISP would increase Larimer County's exposure to the impacts of a rapidly changing climate.

An overarching themes of the County's Comprehensive Plan (Larimer County, 2019) calls for Environmental Stewardship:

> *"Valuing, identifying, protecting, and responsibly managing its natural and cultural resources to minimize impact and protect our air, soil, open spaces, watersheds, water supply, and other ecosystem services."* (Larimer County, 2019)

Pumping activities alone would add the equivalent of 7000 fossil fuel burning vehicles to the County's GHG emissions inventory. Potential local air quality impacts of exposed lake beds are inadequately addressed, and a robust assessment of risks to water supplies are serious omissions from Northern's 1041 Application.

8. Conclusion

This report fills a knowledge gap regarding the feasibility of recreation at the proposed Glade Reservoir. Northern Water promises Glade will provide Larimer County with a "high-quality" recreation venue, and claims recreation, most prominently the lure of more flat water recreation, will pump 13 to 30 million dollars per year into the local economy (NISP FEIS, 2018). However, Northern's 1041 application lacks evidence to support this claim. Uncertainties in future water supplies to Glade make estimates of recreation value highly speculative. Northern either ignores or gives little or no credence to an emerging body of science that undercuts core assumptions for the NISP.

We review hydrological modeling from the NISP FEIS to illustrate the potential impacts of historical droughts on recreation at Glade, including several prolonged dry periods that would have severely limited, and at times curtailed, access to flatwater recreation for multi-year periods. Furthermore, because the NISP modeling is based on historical water availability, and due to lingering uncertainties associated with Northern's proposed SPWCP exchanges, actual operations at Glade may in fact provide significantly lower levels of service the predicted by Northern's modeling.

There is overwhelming scientific consensus that impacts of regional climate change will add additional stress on future water supplies. Despite this evidence, modeling for the NISP relies on historical streamflows to predict future operations at Glade. A landmark paper by USGS scientists points out the fallacy of this assumption in light of the current scientific understanding of climate change and its impacts on natural water supplies:

> *"Projected changes in runoff during the multi-decade lifetime of major water infrastructure projects begun now are large enough to push hydroclimate beyond the range of historical behaviors."* (Milly et al., 2008).

We present results from a simple statistical model that considers recent Cache la Poudre streamflows, realistic initial fill conditions, and plausible future hydrologies. Under these scenarios, our analysis indicates levels of service for specific recreation metrics, such as access to the proposed boat ramp, would be significantly lower than those claimed by Northern Water.

It speculative at best to portray the proposed Glade Reservoir as a boon for recreation in Larimer County. This massive water storage project's management priority is to deliver water to growing municipalities, the majority of which are outside Larimer County. Recreation is not a priority, and Larimer County residents could get left holding the bag for costs of recreational facilities that sit idle when water levels are too low to provide boat access and attract other feepaying visitors.

A robust water supply vulnerability study that considers the range of plausible risks to water supplies at Glade, akin to the recent Fort Collins Water Supply Vulnerability Study (Stanec, 2019), should be part of the County's review process. As it stands, Northern Water's 1041 application does not provide decision-makers and the public the information necessary to evaluate the feasibility and potential value of proposed recreation at Glade. It should be denied because it fails to meet the County’s review criteria.

Overview

I am passionate about promoting evidence-based understanding of environmental science. I have extensive experience in climate and atmospheric science, data analysis, air quality modeling and evaluation, and statistical methods.

Education

- M.S., Atmospheric Science, Colorado State University (CSU)
- B.A., Chemistry, the University of California at Santa Cruz (UCSC)

Postgraduate Courses & Trainings

- Global Carbon Cycle, Chemical Kinetics and Photochemistry of the Atmosphere, Atmospheric Boundary Layer, Remote Sensing, General Circulation (CSU Atmospheric Science Department)
- Applied Remote Sensing Training in scenario-based ecological forecasting (NASA/ARSET)
- Renewable Energy and Photovoltaic Systems (Solar Energy International)

Employment

Cooperative Institute for Research in the Atmosphere (CIRA), Fort Collins, CO

Research Associate III, 2014 – 2019

My recent work focused on providing support for air quality modeling studies sponsored by the National Park Service Air Resources Division. Other roles included project coordination, data analysis, and stakeholder interactions to ensure high-quality and timely deliverables.

- I worked on a National Park Service sponsored air quality modeling study that will contribute to exploring Rocky Mountain National Park's vulnerability to Front Range pollution sources;
- Worked on air quality projects to support regulatory planning for the National Ambient Air Quality Standards and Haze Regulations;
- Engaged with state, local, tribal and federal air agencies, led multi-stakeholder working groups, and provided policy-relevant analysis to project stakeholders;
- Proven track record developing innovative tools to analyze and visualize large air quality datasets.

Center for Multiscale Modeling of Atmospheric Processes (CMMAP), CSU Atmospheric Sci. Department

Knowledge Transfer Manager, 2007 – 2014

I managed Knowledge Transfer (K.T.) activities for a National Science Foundation (NSF) funded Science and Technology Center based at CSU. I worked closely with the Center's Directors to advance the Center's K.T., education and climate science outreach goals.

- I contributed to the Center's annual reporting to NSF, participated in the Center's annual NSF reviews, and helped organize the Center's Science Team Meetings;
- Helped advance the scientific publication projects, including a new peer-reviewed journal, and book on the history of climate models;
- Mentored student interns on projects to support climate science education and curriculum development for global carbon cycling, climate warming and adaptation;
- Co-founded a nonprofit organization to sustain the Center's education and outreach activities, and organized public events to increase public awareness of climate science. I currently serve as the organization's Director.

Cooperative Institute for Research in the Atmosphere, Fort Collins, CO

Research Associate II, 2001 – 2007

I performed research to support air quality policy development and regulatory compliance. I developed data driven decision support systems. I published research results in peer-reviewed journals and presented research results at conferences and workshops.

Cooperative Institute for Research in the Atmosphere, NPS Air Resources Division, Fort Collins, CO

Research Coordinator, 1996 – 2001

I researched ambient air quality monitoring networks and participated in fieldwork at Grand Canyon and Great Smoky Mountains National Parks.

CSU Atmospheric Science Department, Fort Collins, CO

Graduate Research Assistant, 1994 – 1996

I conducted research in atmospheric chemistry and participated in the 1995 Southeastern Aerosol and Visibility Study (SEAVS) field program.

Ocean Genetics, Superior Analytical, and Glycomed, Santa Cruz, Martinez and Alameda, CA

Chemist, 1990 – 1996

I headed a laboratory teams for environmental analysis and performed chemical analysis and processes development.

Department of Earth Sciences, UCSC

Research Assistant/Geophysical Field Assistant, 1985 – 1987

I conducted research leading to my undergraduate thesis. I utilized electron microscopy and X-ray fluorescence facilities at UCSC, UC Berkeley and Cal Tech, and participated in fieldwork in the Los Padres State Forest and Point Reyes National Seashore.

6	6/19/2020 8:57	Bieritz	Serena	serenaservicesco@gmail.com	We are Terry and Serena Bieritz. We have lived at 4835 Eagle Lake Drive in Fort Collins 80524 for 10 years. We are in our 70's and this is our retirement home. We both worked full time for 50 years to save for a happy and peaceful retirement. Our home is located in Segment 4 of the NISP "Construction Approach" document. That document states they expect to interrupt our lives for 16 weeks of construction. From the south wall of our home to the southern property line is 92.5 feet. That south wall is where our master bedroom and office are located on the first floor. That south wall is where two more bedrooms are located on the second floor. That south wall is where the finished portion of our basement is located. Another south wall on the first floor is our sunroom which is all glass on 3 sides. These rooms constitute the majority of our daily living area. From our south wall to our southern property line is 92.5 feet. NISP proposes an easement of 100 feet running west to east along the ENTIRE south side of our property, from our back yard through our front yard to the street. That path includes fruit trees, irrigation, our septic system, and underground utilities. That is in essence ONE-THIRD of our 2.6 acre lot!!! We would not be able to plant trees or build anything EVER AGAIN on that easement. We would be required to have NISP maintenane people on our property regularly and in perpetuity. We are concerned about subsidence issues as a result of drilling so close to our home. NISP should not be allowed to plow through someone's yard in a private neighborhood. PERIOD There are many empty lots of 10 to 100 acres North of our neighborhood, some of which are for sale right now. They can easily find another route with no improvements. PLEASE do not allow NISP to ruin our retirement years and disrupt our neighborhood. You are welcome to come and see our lot for yourself.... call us at 970.672.3772 ... leave a message and we will return your call. And by the way, Northern Water has never contacted us to discuss their plans. As a resident of the Eagle Lake neighborhood, I am writing you to ask that Larimer County not approve the 1041 Application that is before you for a pipeline through the county by Northern Water (NISP). The issues revolving around this application and the reasons it should be denied closely mirror that of the City of Thornton 1041 pipeline application that was rejected by the Board of County Commissioners.

10	6/22/2020 9:47	Bartecchi	David	dbartecchi@gmail.com	I can't believe it's 2020 and after all we know about the impacts and inefficiencies of dams, we're here debating building another one northern Colorado. The science is clear but what is not clear is the political economy behind dam construction. NISP is not driven by science and best practices but rather the short-sighted selfish interests of housing developers and municipalities through unplanned and unsustainable growth - building dense communities of McMansion in some of the most prime farmland in Northern Colorado. And now they want to tax payers to reward them and ensure the continuation their unsustainable growth by building a dam. When will it stop? Are we going to drain every last drop of Colorado's only Wild and Scenic River while we make virtually no sacrifices to better utilize and conserve the water we already have.

17	6/24/2020 11:52	Finnman	Doug	dfinnman72@yahoo.com	Dear County Commissioners, I ask that you oppose the NISP and the related 1041 permit. My reasoning? Allow me to put into context the negative environmental impacts, risks, and sacrifices the people of Larimer County (especially those who reside in the immediate vicinity of the proposed Glade Reservoir), will end up bearing for NISP. -Residents and landowners in rural areas and communities in the vicinity of Glade (including myself, a resident of the Bellvue area) will endure an estimated 4-6 year massive construction project with the attendant noise, traffic, pollution, and overall disruption of a quiet lifestyle residents enjoy in this area. It is likely that some will experience a de-valuation of their property as a result of NISP. -Most Larimer County residents value our wildlife resources very highly. Make no mistake about it: NISP will adversely impact the wildlife that now flourishes in and around the Glade site. Construction of the dam, forebay, , the reservoir, the re-routed highway, and related pipelines will negatively affect the movement of deer and elk herds that reside in the footlhills. Other animals and birds will also suffer through loss of habitat. -As a result of NISP, residents will witness the degradation of the Poudre River itself, as well as existing Natural Areas that are part of the river corridor. Fish, plants, and animals that depend on this riparian habitat will be irreparably harmed or destroyed by further de-watering of the Poudre. These concerns have been clearly articulated by the City of Fort Collins Land Conservation and Steward Board in a memo they issued earlier in June 2020. -If NISP is approved and moves forward, County residents will also witness violations of several elements of the Larimer County Comprehensive Master Plan for the mountains, foothills, and natural resource areas that Glade would occupy. -County residents are well aware of climate change impacts. Yet the architects of NISP seem to conveniently ignore the realities climate change. The recreation and water resource benefits touted for the NISP will likely not be realized if Glade cannot be filled in an era of frequent droughts. The price of NISP is way too steep for Larimer County in terms of the negative impacts on its people, land, water, and wildlife. For Larimer County NISP is simply a lousy deal. As stewards of this County, please make a bold and courageous statement by voting 'No' on NISP. Thank you for your consideration, Doug Finnman, Bellvue, CO
23	6/29/2020 5:40	Sondrup	Carole	Scooter-pookie@hotmail.com	This pipeline is scheduled to go down Larimer County Road 1 (aka: Weld County Road 13, Colorado Blvd and Latham Parkway) Have ANY of the commissioners driven this little two lane road? Currently we have a large electrical line and fiber optics line down the side of the road. With the massive Thornton water pipeline coming with in the next 18 months. This little Road and the surrounding property owners can not take another public utilities project! Please reconsider this route...Thank you.

29	7/1/2020 11:56	Pixler	Dennis	dpbendur38@gmail.com	The Poudre River should not be damned. It is one part of what makes Colorado great, it's beauty. Northern Colorado is beautiful and damming the Poudre River takes away that natural beauty. Why should the enjoyment of all Coloadoans, especially us in the north, be sacrificed to water the lawns in the Denver area. The Denver area needs to learn to live with what the water resources they already have. If they have a right to this water, figure out another way to get it without imposing their will on us to the north. Thanks for letting me have a voice.
35	7/3/2020 9:53	Aravis	Dori	dori.aravis@gmail.com	I am Dori Aravis, 49 years a resident of Fort Collins, Larimer County, and I can't believe that I am once again having to stand up to save the Poudre from the vested interests that would destroy it. Glade Reservoir, Glade freaking reservoir - a monster that should have been laid to rest many, many years ago. It is an ill-conceived disaster that would destroy not only the land it would go on, the Poudre River, who's water would be stolen, but the lives of the people who live around it and the people whose land would be stolen by pipe lines needed to deliver water to communities beyond Larimer County. But like a Walking Dead Zombie, it's rearing its ugly head again. And like a zombie we need to shoot this thing in the head - get rid of it once and for all. It is the ONLY right thing to do. Thank you.
42	7/5/2020 11:43	Madsen-Pixler	Stephanie	stephaniegmp@gmail.com	Please do not allow the Poudre to be dammed in this way to feed the interests of other communities. It will be Northern Colorado that pays the price in lost water, land, recreation, not the communities that the dam will serve. The cost is too great.

46	7/6/2020 7:59	Pault	Jerrold	jerroldpault@gmail.com	July 6, 2020 To: Larimer County Planning Commissioners (via email) From: Jerrold Pault President - The Hill Community Homeowners Association (HOA) President – Cobb Lake Preservation & Recreation Association (CLPRA) Subject: NISP Planning Commissioners' Hearings Dear Commissioners, On behalf of The Hill Community HOA (60 homeowners) and CLPRA (104 members), we strongly oppose NISP and request that you vote against this environmentally devastating project. The following concerns are cited: • This project would take additional water from the Poudre River, which is already seriously depleted by agriculture and residential use. The diminished flows would due irreparable harm to the riverbed and its wildlife habitat and the City of Fort Collins beautiful new water park would be rendered virtually useless. We are grateful for the efforts of the Save The Poudre organization and support their efforts to protect this precious resource for our children and future generations. • This project does not own sufficient water rights to be feasible, which will result in NISP purchasing additional water rights, likely from our local farms. While NISP has promised not to "Buy and Dry" farms like Thornton did, we do not believe they will honor this commitment after spending a Billion dollars and then not be able to fill Glade Reservoir. We must protect the rich tradition of family farming in our region before it is lost forever! • NISP originally planned to run a huge 54" pipeline thru the middle of deeded conservation space owned by The Hill HOA (600 acres of native grasses full of wildlife). Now they are proposing a different route along CR 52, which will impact access and egress to our community along with the many residents who live along this route. Why do we need more massive and disruptive pipelines in Larimer County, when we have nature's solution for moving this water in the Poudre River? We are thankful for the efforts of the No Pipe Dream organization in opposition to both NISP and Thornton's Pipeline last year. • NISP will bring unwanted growth, development and urban sprawl to the areas north west of Fort Collins. These quiet and peaceful rural areas will be forever changed and overrun with traffic, noise and residential and commercial development. We need to preserve the remaining open spaces and rural character of our county. We support Save Rural NOCO, another organization against NISP, and think it is important that we protect the lifestyle of our rural residents. • Cobb Lake is a pristine recreation and preservation area that is nourished by the clean waters from the Poudre River every year. NISP could be potentially devastating to our lake if they are permitted to utilize water exchanges, which would divert clean Poudre River water from Cobb Lake to Glade Reservoir and replace it with dirty water from the South Platte. CLPRA is against NISP. Why should we agree to all of these environmentally devastating and permanent impacts to Larimer County ... just to send water to municipalities and water districts in other counties so that they can develop more

48	7/6/2020 8:35	Williams	Dolores	tinytornado@mac.com	NISP simply would kill a wild and science river -- one of the last wild rivers in the US. The huge pipeline required to carry this off would be a huge disruption in Larimer County and of little benefit to the people of Fort Collins. Conservation in all of the cities hoping to benefit from this disruption and death of the river has not been implemented. The necessary drying up of farmland to acquire irrigation rights (not domestic drinking water rights) should not be allowed because agriculture is second to tourism it the State. Staying sustainable locally required keeping farming land in use into the future. Please use the 1041 law to deny this killing of the Poudre River and let it run through Fort Collins and along to contribute to natural waterways as in the past.
54	7/6/2020 9:18	Eisenberg	Cailea	caijeis1092@gmail.com	The migratory and native bird populations would be decimated, if NISP was confirmed. Birds evolved and adapted to every continent before the humans were even bipedal! Let us be better than the original settlers of Northern Colorado who came in, massacred the Native peoples and claimed the area through "Manifest Destiny". Please break the cycle of raping the land of its resources. If the region does not have enough water it should not be building human communities to further destroy the natural habitats of creatures that have been there for thousands of years.

55	7/6/2020 10:40	Rothe	Jan	lemmule@gmail.com	As a retired wildlife ecologist, who has lived in Larimer County for over 35 years, I cherish our beautiful rural landscapes and incredible natural resources. I believe that all of us living here do. Therefore, we all must carefully consider the long term, cumulative effects of the Glade Reservoir development project on the natural resources of Larimer County. I am asking you to read my testimony and please reject Northern Irrigated Supply Project's (NISP) 1041 application. Section 8.4.1 of the Larimer County Land Use Code states that all developers are obligated to "maintain and enhance diversity of wildlife species and habitat in Larimer County and to plan and design land uses to be harmonious with wildlife habitat and the species that depend on that habitat....". And in NISP's Wildlife Conservation Plan (Technical Memorandum No. 7), they state the purpose of their plan is "to document impacts to wildlife, identify strategies for avoiding, minimizing, mitigating and enhancing wildlife...". Clearly, the NISP project will not be maintaining or enhancing any existing wildlife, nor their habitat. They will, in fact, be flooding well over 1600 acres of land and taking even more water out of the Poudre River than is currently being diverted, causing unforeseen damage to the riparian corridor and all the wildlife species residing there, including the federally-listed Preble's Meadow Jumping Mouse. I also fail to see how they will be "avoiding or minimizing" damage to wildlife species in general, when they will most likely be killing large numbers of small mammals, ground-nesting birds, and reptiles by drowning, digging them up, or driving over them with heavy machinery during the construction of this project. According to Webster's Dictionary, to mitigate is "to cause to become less harsh or hostile". The NISP planners, designers, and engineers all appear to be either completely oblivious or totally insensitive to the huge environmental and aesthetic destruction they will be causing. The devastation they will cause is impossible "to mitigate"! The Glade Reservoir project cannot be mitigated because its effects are too serious and far-reaching. It will be an enormous undertaking, which will include flooding 1600 acres of a relatively pristine valley, moving 7 miles of federal highway, installing miles and miles of water pipeline, digging a 2,000 acre foot forebay, building a visitor center, paving parking lots for up to 500 cars, and building a 40,000 horsepower electrical pumping station to transfer water from the forebay up and over a 275 foot dam. How is it possible to mitigate all that incredible damage and destruction? NISP states, as one of the key components in their enhancement plan, that they will be "protecting additional lands west of Glade Reservoir for wildlife habitat". I fail to see, exactly, how protecting land, which I'm assuming means buying and holding for perpetuity, that wildlife is currently using (I'm guessing wild animals don't really understand real estate ownership and probably think the land they inhabit belongs to them already) will "enhance" all the thousands of acres of habitat that will

57	7/6/2020 13:20	REDMOND-OTT	randy	randyredmondott23@gmail.com	Water storage and availability will continue to be a growth limiting factor in Colorado and the West. NISP has always been a poorly conceived on many levels, especially that of putting a burden on Larimer County residents without benefit to them. Degradation of water quality was one of the primary reasons the City of Fort Collins was historically opposed to this project, both in stream flow and drinking water quality. The impact on private landowners in Northern Fort Collins for forced easements is reprehensible, considering the availability of both water transfers and the use of existing easements for development of this project. The scope of the proposed reservoir, the rerouting of US 287 and associated costs seem out of touch with reality in this current time. The amount of water lost to evaporation will be significant. Data is available from the cooling pond at the Rawhide Power Plant that can easily be extrapolated to this project to demonstrate just how much of the diverted flow would never be realized at the destination. This project is not a "win" for Larimer County or its citizens. I urge you to deny it as it exists. Thank You.
58	7/6/2020 13:30	Pierro	Dennis	dpierro437@gmail.com	I am in favor of the NISP project and their submitted application with one major condition: The route of the pipeline. Please divert the pipeline around the Eagle Lake Subdivision. There is plenty of undeveloped land to the north of this community. it would be an unfair burden on the community if homes are disrupted due to construction and long-term easements if this open land is not used. If diversion to the north is not technically feasible, please force the approval of the NISP pipeline to be conditional on co-location with the Thornton pipeline if their route is ultimately approved through Eagle Lake as well.

61	7/6/2020 14:28	Fankhauser	Terry	terry@coloradocattle.org	On behalf of the beef producing families and businesses throughout Colorado, our 5,000 members have affirmed and then reaffirmed our policy in support for the Northern Integrated Supply Project. Colorado is need of additional water storage in order to meet demands associated with population growth, specifically in north central Colorado. Without increased storage, inevitable harm will come to our business and environmental interested in the region and state. Without said storage, an exacerbated trend toward permanent buy and dry of agriculture irrigation water will become the norm. Agriculture irrigation water returns a broad spectrum of ecosystem services that currently are not reflected as beneficial uses per Colorado Water Law, such as return flows in the fall of the year, stream temperature, wetlands, wildlife habitat, etc. Without agriculture actually irrigating in Colorado, those uses will cease to exist and have a fundamental impact on the naturally function environment and economy in Colorado. In short, there exists a choice. Maintain the viability of water consumers in NE Colorado with smartly planned storage projects like the Northern Integrated Water Supply Project or place Colorado's water resources in direct harm due to the manifestation of concerns that have been adequately debunked by the Northern Colorado Water Conservancy District. In closing, CCA requests that Larimer County illustrate its public support of agriculture, business the environment and our economy by endorsing the Northern Integrated Supply Project. Sincerely Terry R. Fankhauser, EVP Colorado Cattlemen's Association
62	7/6/2020 15:04	Kerig	Daniel	dankerig@yahoo.com	The proposed pipeline path along Greyrock rd. would cut right through the back of our property. Our property is a Designated Wildlife Habitat for migrating birds and butterflies. The proposed area for the pipeline would wipe out the 25 trees that we planted twelve years ago to provide food and shelter for visiting and permanent wildlife. We've spent a lot of time and money to establish this habitat and don't believe NISP have come close to proving that pipeline route is the best option. Please do what's best for our community as well as the Poudre River and have their water taken out down stream. Thank you for your attention.

63	7/6/2020 17:10	Kopp	Charles	charleskop@centurylink.net	Dear Planning Commissioners: I strongly urge you to NOT support the NISP application, because I, like most of the people I know in the county, are staunchly opposed to it. There's really nothing in it that will benefit Larimer County, unless you think we need another big recreational reservoir in such proximity to Horsetooth---which we don't. And I'm sure you've heard enough, and will be reminded more, that maintaining a water level in proposed Glade Reservoir suitable for recreation is very dicey in our semi-arid climate, especially considering the latest patterns; and that Glade would look terrible as a puddled mud hole. If providing recreation is a factor in the whole issue, NISP will degrade the Poudre River to the point that it's recreational uses downstream will greatly suffer----despite claims about "mitigation" of these destructive effects. The potential "mudhole" seems to me like a classic boondoggle of enormous expense pushed by vested outside interests. And please put Larimer County's interests first! I could go on to enumerate many very practical, evidence-based objections to NISP, which I'm sure are very familiar. But instead I'll conclude with what I see as the real driving force behind it, which is pretty obvious. Namely, the excessive development in NOCO that's behind the demand for increasing water supply. Contrary to popular opinion,this high degree of anticipated development is not inevitable, but a choice we make and have control over. Unfortunately, it seems that the big profit-driven development companies who are behind it have found allies with many municipal planning boards, and city and state officials. And I hope that your board will not succumb to their influence and be an enabler of NISP. I"m certainly not against all development, and even think that much that's been happening in NOCO for years has had a lot of very positive results. But I believe that we're reaching a tipping point where if it continues to projected levels, it will ruin not just a lot of our great natural resources in the county---like the Poudre River---but also our quality of life. I came from northern New Jersey, and would absolutely hate to see the over- development and crowding that has plagued that state for so long happen in our still spectacular part of Colorado. So please be good stewards of our environment in your planning. Lastly, if NISP is rejected----like I certainly hope and wish---I believe the outside communities who need more water to continue with their growth plans can still find ways to supply it if they really want it through more innovative ways than 19th and 20th Century projects like dams and reservoirs----starting with simple, sensible, and practical conservation measures, which are also a helluva lot cheaper. Please-------NO TO NISP!! Let's discourage over-development and not encourage it. Sincerely, Charles Kopp Fort Collins

64	7/6/2020 18:27	Webber	Sheila	13sheilaw@gmail.com	Dear Planning Commission, I deeply oppose the NISP project. The Cache La Poudre is a treasure right here is Fort Collins. We are losing our natural treasures at an alarming pace. Please do not allow the Poudre to be drained further and ruined. Real water conservation effort should be made. The Poudre can sustain our communities without the NISP project. Some conservation is being done, I am sure, but not enough. The conservation efforts Northern Water presented in the hearing on June 24th were very feeble. Everywhere I look, thirsty grass is being planted in new subdivisions. Lawns are being watered in rainstorms and there are always some sprinklers spraying utility boxes and the street with abandon. There is not enough effort to put into native, xeric landscapes. We live in an arid climate, not the tropics!! If we would have the wisdom to use our water carefully, we would avoid more devastating harm to the ecosystems on which we rely. The Poudre River is an Important Bird Area. There are birds that do not occur outside this corridor in Larimer County. Birding contributes to the economy of Fort Collins in the tourism it brings. The river is the lifeblood for our wildlife. We have lost 3 billion birds since 1970, and we cannot afford to ruin this IBA. As an Important Bird Area, "The River Corridor sustains some of the most important bird habitat in the region," remarked Joel Hurmence, President of FCAS, the local chapter of the National Audubon Society. "This IBA nomination seeks to preserve this important resource for our children and grandchildren." (FCAS Save the Poudre December 11, 2007) I love the Cache La Poudre River. I enjoy hiking and bird watching along every stretch! The biodiversity along this riparian habitat is breathtaking and life giving. I love the Fort Collins Natural Areas. The river and Natural Areas are the reason I loved moving here. I will be heartbroken if this project moves forward. I would not visit Glade or recreate anywhere near it. It would be the loss of what I love. Respectfully, Sheila Webber
65	7/6/2020 19:30	Lauritzen	Mariah	mariah.lauritzen@gmail.com	This is an ineffective band-aid on the water crisis. Why haven't we looked to things like water recycling, that would actually be a sustainable solutions? A dam is choosing an ecologically destructive solution in the face of a problem which is already exacerbated by the ecological destruction of global warming. We can't keep choosing destruction of natural processes. We should instead work with natural processes and join the reset of the earth in the natural water cycle. Instead we think we are special. Invest in water recycling where we clean the water we have already used. Learn from nature for once and pick a sustainable solution.
67	7/7/2020 4:40	Tornatzky	Jacob	jake.tornatzky@gmail.com	The economic, natural and cultural value of a healthy Poudre river is immense. I would encourage the stakeholders to seek other alternatives to the NISP project.

70	7/7/2020 8:16	McCall	Dale	dale.mccall@rmfu.org	Rocky Mountain Farmers Union (RMFU) supports those water projects that retain water use in the State of Colorado and encourage construction of additional projects which are directly beneficial to agriculture and the economy of our state, such as the Northern Integrated Supply Project (NISP). The Colorado Water Plan identifies the need for 400,000 acre-feet of additional storage. The Northern Integrated Supply Project, with its two new reservoirs, would help meet that demand while also implementing about $60 million in mitigation and enhancement measures for local wildlife and the environment, and creating new recreation opportunities, along with numerous other benefits for northern Colorado. Recreation at Glade Reservoir will provide an estimated $13-$30 million in additional economic activity annually for Larimer County – yet another one of NISP's extensive benefits to Larimer County and rest of the region. The 15 municipalities and water districts participating in NISP have collectively reduced per capita water use by about 30 percent since 2000 and continue exploring ways to be more efficient. But with populations expected to double by mid-century, water-storage projects like NISP will also be vital to meet their demands. Without NISP, the communities participating in the project will most likely be left to purchase more water from existing farms and ranches -- needing to dry up more than 64,000 acres of irrigated farmground to attain the amount of water that NISP would provide. In addition to NISP helping slow the ongoing buy-and-dry trend, we'll also be collaborating with and compensating local farmers who take part in NISP's water exchanges and the project's WaterSecure program, which will help enhance the long-term viability of those ag operations. Because NISP is widely recognized as a project that will provide much-needed water storage, benefit local wildlife and the environment, bring new recreation opportunities to region, and help protect local farms, it's been endorsed by numerous public officials, organizations, publications and others. Northern Water has worked with local, state and federal entities for decades to responsibly supply the vital resource that grows northern Colorado's food, arrives at local residents' taps, offers recreation and more. And we trust them to continue that legacy with NISP – a project our region's future generations desperately need. Dr. Dale McCall President Rocky Mountain Farmers Union
74	7/7/2020 11:00	easton	robert	robert.easton@colorado.edu	I am concerned that the RailTieWind project in combination with the Glade Resevoir project could open Larimer County Colorado to a massive explosion of population and unwelcome development. The Rail Tie Wind project is a proposal to build a massive wind farm in Albany County Wyoming close to the Colorado border. Water and energy are the key ingredients that developers need to build housing. While the developers prosper, the natural environment is destroyed.

76	7/7/2020 12:29	Caswell	Margaret	margiemc214@aol.com	I have been a resident of Larimer County for over 55 years. I have deep concerns about the NISP Project. I am concerned about the effects on the historic Poudre River as it flows through Fort Collins. Peak flow would be taken to fill Glade, thus eliminating the high flow necessary to cleanse the Poudre River. Fort Collins has invested in bike trails, natural areas, and a water park that also requires this flow for recreational, aesthetic, ecological, and historical benefits for it users. Reduced flow levels will decrease the water quality as less water is available to dilute the pollution.. The native trout population would be threatened and more fish kills would occur. It would also impact Public Health as low flows and stagnant water pooling would create habitats in the river and at Glade Reservoir for the Culex mosquito that carry West Nile virus. The dam is proposed along a fault line that will require extra building precautions to protect the dam again movement along the fault. It will require relocating US 287 and cutting through a hog back. I appreciate the time your committee is taking to hear testimony via in-person, Zoom, and written comments.

78	7/7/2020 14:15	Caswell	Larry	lcasbike@aol.com	I am against the Glade Reservoir water project for the following reasons. This project assumes that the current rate of run away growth in the Front Range is inevitable and will continue . More analysis needs to be done on the effects of this type of growth on the economics, quality of life, and environment of the region as a whole. There needs to be a discussion amongst the citizens of the northern Front Range concerning the type and extent of growth and sprawl that we wish to enable with a project of this type and the discussion should be followed by a vote of the citizens. The justification that the project will serve to preserve irrigated agriculture in northern Colorado in the face of continued urban growth is unsubstantiated. There needs to be an analysis of this project on the regional agricultural economy. Specifically, I question whether agriculture will be able to compete for water considering the effect on overall water values resulting from the costs of constructing this project. Due to urban growth in Larimer County and its effect on water prices, for example, farmers can no longer compete for irrigation water on the market, and must instead rely on short term leasing of city of Fort Collins surplus water to keep all the remaining farmland irrigated. It is also important to consider the effect on the agricultural sector of the loss of thousands of acres of farmland to the urban development which will result as the communities realize the projected population growth mentioned in the EIS. There needs to be serious discussion of possible alternatives. We need to evaluate how the alternative of no action would compare to this project . How would the effects on agriculture in Northern Colorado from building the Glade alternative compare to the effects if this project were not built? There are a number of cheaper alternatives that could be combined to meet the needs of this region. In fact there are other mixes of alternatives that haven't even been considered. The EIS only considered alternatives that would individually yield 30% of the needed firm yield of 40,000 acre feet from the project. This left out numerous alternatives, that when aggregated, might also provide the same yield with much smaller negative impacts and costs than other alternatives considered. An example might be some combination of area-wide increased levels of conservation in urban water use, improvements in irrigation efficiency, changes to more appropriate crops that would yield more income per unit of water applied, and gravel mine storage ponds. The far-reaching environmental effects on the ecosystems which depend upon the river below the takeout point need to be given the weight they deserve. We need to give proper emphasis to all of the effects on the riparian and aquatic environments of the Poudre River below the point where the water is extracted. Many of these effects will be gradual, occurring over a long period of time with potential detrimental effects on the very nature of the aquatic ecosystems and the species found there. We are experiencing a change in climate, the effects of which we aren't certain. Climate

79	7/7/2020 14:20	Madsen	Laurel	Laurel2m@comcast.net	It is evident from myriad studies over many years that the NISP plan to dam and drain huge amounts of water from the Poudre River to fill a reservoir will essentially destroy the river as it runs through Fort Collins and northern Colorado. Our beautiful river, useful for many purposes, already suffering from diversion of much of its water, must be protected and preserved, not only for the present population but for future generations as well. Once gone, it cannot be replaced. The need for water can be met by carefully planned conservation methods at a tremendously lower cost. Please do not allow the destruction of the Poudre River, as well as the beautiful valley along Highway 287, where people live, for a massively expensive and unnecessary dam and reservoir.

83	7/7/2020 19:07	McCulough	Ken	k.mcculough1231@gmail.com	Dear Planning Commision, Commissioner Johnson, Commissioner Kefalas, and Commissioner Donnelly, My name is Ken McCullough, I am a life-long resident of Larimer County and a third-generation alfalfa farmer. My 45-acre farm is irrigated with water diverted directly out of the Cache la Poudre River via a canal operated by the Larimer and Weld Irrigation Company. This canal is located just east of Taft Hill Road and is downstream of the diversion point for the proposed Glade Reservoir. As someone with deep ties to the agricultural economy and rural culture of the Fort Collins area, I am opposed to the Northern Integrated Supply Project (NISP) being pushed by the Northern CO. Water District. For many reasons, I urge you as Commissioners and County Staff to oppose this God-awful project. Let me explain why I am so strongly opposed to this project and believe you should be too. My farm diverts about 30-acre feet of water from the river annually, primarily June through September. This is a reliable water right, although my water rights are not senior to many upstream and downstream users, I have never suffered from an inadequate supply when I needed it most. There have been many years when I don't get my full 30-acre feet, but my alfalfa operation has always received enough water, even in the driest years of 2000-2006, to get a reliable crop and stay in the black. After review of the NISP project and discussions with others in the agricultural economy, including leadership Larimer and Weld Irrigation Company, the NISP project will not benefit me at all, in fact, it could make me lose my farm. The NISP project does not supply any new additional water to irrigators, agricultural users, or farmers in Larimer County. However, the water diverted into Glade Reservoir would be water that is already allocated and exists in paper water rights with farms in Larimer and Weld Counties. A major problem with NISP is that the water to be stored in Glade would need to be purchased in order to be allocated to the project, which it isn't, and unless Northern Water and NISP customers purchase thousands of acres of farmland, that water will never make it to Glade except for years with incredibly exceptional runoff. Since most of the water NISP is hoping to capture is already allocated for downstream users, NISP would need to purchase the farmland where the water rights are held in order to divert and eventually sell that water to customers. This issue was pointed out in the 2018 Final Environmental Impact Statement for the NISP project produced by the United States Army Corps of Engineers. Despite this incredibly problematic detail, Northern Water thinks they can purchase these farms eventually over the next 30-40 years. Frankly, that is unrealistic, this is a billion-dollar pipe dream that won't likely operate at full capacity unless billions of more dollars are sourced to purchase farmland. The issue I fear most that could jeopardize my farm is if Northern Water begins purchasing farmland and water rights in Larimer and Weld Counties. If farms are purchased for their water rights, the value of the

84	7/7/2020 19:09	Brown	Preston	pbrown.eco@gmail.com	Dear Commissioner Johnson, Commissioner Kefalas, Commissioner Donnelly, and Planning Commission: I am writing to express my opposition to the Northern Integrated Supply Project NISP and encourage the Larimer County Planning Commission and County Commissioners to reject the 1041 County permit for the project. Let me explain why I do not support this project and encourage you to reject the permit. This annual spring "rise" on the Cache la Poudre River is a sacred event, a living pulse of water that lasts just about a month but refreshes and re-nourishes the entire river ecology. As the Poudre reaches Fort Collins these floodwaters spill the banks, filling secondary channels where frogs, birds, and fish rear and lay eggs. Fresh layers of sediments drop out over the floodplains, nourishing the deep, lush cottonwood forests and marshes. Something unique about the Poudre is that despite roughly 2/3 of the flow already diverted out, there is still enough of a spring "rise" to flood the banks, clean out the river of lingering sediments, redeposit nutrients, and refresh the ecology. This is rare, nearly all of the rivers and creeks along Colorado's Front Range have been dammed or diverted where the natural rhythm of the spring "rise" is gone, turning the echoing drumbeat of the river into a muted whine. The Poudre still has its spring heartbeat, but not for long if the Northern Colorado Water Conservancy District builds their gluttonous Northern Integrated Supply Project (NISP). If this project is built it will take 71% of the water out of the river during the spring "rise", flat-lining the river and putting it on life support. My expertise is in river restoration and geomorphology, it's my job to know how river and stream mechanics respond to changes in flow. A major problem that NISP would have on the river is that by reducing the spring "rise", the river will not be able to redistribute and transport sediments out of the river channel where they can deposit onto floodplains and wetlands. By eliminating the peak flow and eliminating the annual flushing effect, those sediments will stack up in the channel year after year, eventually raising the channel higher and higher to a point that will create regular flooding problems. The annual flush is needed to improve hydraulic conveyance and move sediments downstream. Not allowing this annual pulse will create a clog, similar to a blood clot. Additionally, if NISP were built and the sediments are not annually flushed out with large spring pulses, the water quality will greatly suffer. This will occur because the sediment and nutrients trapped in the channel will decompose and consume oxygen levels within the water, thereby decreasing dissolved oxygen available for fish and other wildlife. The annual spring "rise" is not "extra unused water", it's the force that cleans the river environment, flushing sediments and nutrients out and distributing them on floodplains. Taking the last of the peak flow and storing it behind a dam to feed sprawling suburbs, while turning the river into a putrid algae-filled ditch, is not a good starting point. This is not my vision for the
86	7/7/2020 21:27	Brunswig	Lori	lbrunswig@comcast.net	Please don't allow this project in Larimer County. We have nothing to gain and everything to lose. Thank you, Lori Brunswig

91	7/8/2020 9:25	Fisher	Rich	ben993q@gmail.com	NISP hearing I am Rich Fisher. I have a small irrigated organic farm near Wellington Colorado. I am very strongly opposed to NISP. NISP will encourage additional water usage that we can ill afford. This is an arid region that is getting drier. Every drop of water needs to be reserved for the highest and best use and that includes keeping riparian areas sufficiently watered especially on the public lands. Growth that requires additional water along and near the Front Range should be discouraged. Water intensive growth in this country should instead be placed in relatively water rich areas in the midwest. Better water conservation requirements here in Colorado can be a source of available water to replace a predicted decline in precipitation and earlier and more rapid mountain snow melt. We are destroying dams in other parts of the country because we have discovered just how destructive they are to the entire ecosystem. Creating yet another one here in Colorado is narrowly self-serving, short-sighted and ignores decades of knowledge about dams and stored water. In sum, I urge the County leadership to vote against NISP, a very bad idea.

92	7/8/2020 9:28	Cruse	Pamela	pjody@lpbroadband.net	The NISP idea began almost 2 decades ago adhering to the age old concept of the destruction of nature for an unsustainable growth and development along the Front Range. It is now 2020 and what is happening in Ft. Collins and surrounding communities is beyond normal population growth. When will the leaders in our communities see what they are doing to the livability and quality of life that we once had here in Northern Colorado? Traffic, pollution, and non-stop development of what was once open space is everywhere we look now. Nothing about that is healthy for mind or body. Why are "we" wanting to destroy what we have been given by nature and what brought many of us here to enjoy? When is enough, enough? What good does supplying more precious water to nearby towns for their future growth when all it will do is bring in more traffic, pollution, and ruin of the last open spaces in our towns? I believe we are at a critical point right now where we must stand up to development and unchecked growth and stop the madness! Envision what we want to see in the future for us and our children and ask ourselves if this is really what we want to do to this amazingly beautiful area that we live in. Because what we are doing and considering doing with NISP can never be repaired. The damage to the Poudre River, the valley, wildlife, and residents who call this area home will never be able to be undone. My husband and I live in a home that was built 101 years ago in Pleasant Valley, in Bellvue. The people who built it were obviously appreciative of the natural beauty here and positioned the windows to frame as much of that beauty as possible. They would not have framed the kitchen window to look out at a mile long dam! Nor can we watch that process happen from our window for 5 years. We are in our 60's and have lived in the area for over 49 years. In the 15 years we've lived in our home we have remodeled every room, added gardens, outbuildings and landscaping. Our son and his family live in town. We love them. We love much about Ft. Collins. But the Front Range is on a fast track to ruination. I am hoping that our county commissioners will listen to the science and to the people who are against NISP and what it will do to the environment of Northern Colorado. We will move out of the home we love and away from the Front Range if NISP is allowed to happen. But thousands more will come. It will not be pretty.

93	7/8/2020 9:29	Young-Buckert	Patricia	singingdolphin9@aol.com	My husband and I have owned our home at 4612 North Highway1 for over 32 years. Our property is listed to encompass 2.2 acres of land. To give an overview of easements already on the property, we need to look at the west and north property lines. More than two thirds (2/3) of the west property dimension gives a twenty (20) foot easement for a water supply ditch line. The entire length of the north property line gives a thirty (30) foot easement for CR56E as well as the actual space for power lines down this road. The pipeline project would impact the entire length of the eastern property line. This seems to be a burden on our civic duty to allow easements on a limited acreage. The thirty (30) foot proposed removal of land use land use has a number of impacts which I will list from north to south. 1) Windbreak trees planted along property line. 2) An existing leach field. 3) A storage building. 4) A two (2) stall garage. 5) A 36' x 12 1/4' horse or equipment metal structure. 6) A twenty (20) foot shipping container for hay storage. 7) An existing well used for irrigation.

95	7/8/2020 10:09	Desheart	Ann	ann11desheart@gmail.com	Dear County Commissioners, I am writing to strongly urge your board to REJECT the NISP Permit. The Cache la Poudre river is a unique gem, and the peak spring flows are the most important element of the river. Removing the peak flows would negatively affect the river environment. Smaller peak flows would not transport sediments out and distribute them on the floodplains, harm fish including at least two threatened species, and negatively affect water quality by leading to warmer temperatures and excessive nutrients.NISP would also reduce peak flows in the Platte River, where endangered sandhill cranes depend on the high flows to create sandbars. NISP would also be to be more expensive than other reasonable water supply alternatives, such as water sharing agreements between farms and cities, efficiency upgrades, lawn removal, water conservation, recycling, and re-use. NISP would cost upwards of one billion dollars, burdening participant community ratepayers, stimulating the need for cities to grow more and grow faster to pay off utility debts. This would lead to urban sprawl and conversion of farmland to subdivisions. Additionally, NISP is opposed by the City of Fort Collins and highly questioned by the City of Greeley for a variety of reasons, including water and wastewater treatment costs, water contamination issues, increased flooding rise, and many others mentioned above. River recreation is a critical component of the Larimer County economy and way of life. The Poudre River is regarded for fantastic boating, floating, rafting and kayaking. NISP would reduce the length and magnitude of the recreational; boating/floating season through Fort Collins, Windsor, and Greeley, as well as degrade water quality for body contact sports during that season Lastly, NISP would ultimately harm our region's agricultural community through accelerated salinization, more rapid suburban development, and most of NISP's water would benefit people outside the Poudre basin, while most of the impacts would be left for people inside the basin to deal with. The Poudre River is a treasure and should be maintained in its current state to benefit the ecological, economic, and social conditions of Larimer County. Sincerely, Ann Desheart

96	7/8/2020 10:26	Lipstrue	Jeff	j.lipstrue49@gmail.com	Hello Commissioners, Please consider these comments when making the decision regarding NISP. I am urging you as Larimer County Commissioners, to reject the NISP Permit! The Cache la Poudre river is a unique gem, and the peak spring flows are the most important element of the river. Removing the peak flows would negatively affect the river environment. Smaller peak flows would not transport sediments out and distribute them on the floodplains, harm fish including at least two threatened species, and negatively affect water quality by leading to warmer temperatures and excessive nutrients.NISP would also reduce peak flows in the Platte River, where endangered sandhill cranes depend on the high flows to create sandbars. NISP would also be to be more expensive than other reasonable water supply alternatives, such as water sharing agreements between farms and cities, efficiency upgrades, lawn removal, water conservation, recyclung, and re-use. NISP would cost upwards of one billion dollars, burdening participant community ratepayers, stimulating the need for cities to grow more and grow faster to pay off utility debts. This would lead to urban sprawl and conversion of farmland to subdivisions. Additionally, NISP is opposed by the City of Fort Collins and highly questioned by the City of Greeley for a variety of reasons, including water and wastewater treatment costs, water contamination issues, increased flooding rise, and many others mentioned above. Free-flowing River Recreation is a critical component of the Larimer County economy and way of life. The Poudre River is regarded for fantastic boating, floating, rafting and kayaking. NISP would reduce the length and magnitude of the recreational; boating/floating season through Fort Collins, Windsor, and Greeley, as well as degrade water quality for body contact sports during that season Lasly, NISP would ultimately harm our region's agricultural community through accelerated salinization, more rapid suburban development, and most of NISP's water would benefit people outside the Poudre basin, while most of the impacts would be left for people inside the basin to deal with. The Poudre River is a treasure and should be maintained in its current state to benefit the ecological, economic, and social conditions of Larimer County. Thank you, Jeff

97	7/8/2020 10:53	Terry	Nancy	nterry@pmglending.com	The County should decline NISP's 1041 application for the same reason Thornton's 1041 was denied: County Commissioners first sent Thornton back to the drawing board because they (the County) said Thornton had not sufficiently researched other routes. The County denied the final 1041 application citing "the project's anticipated impact on private lands." Thornton's preferred route along Douglas Rd. was largely in the public right-of-way or road easements. NISP's 1041 application is primarily through private land: Hood Lane, owned by Hauan, Tips and Miserlian, Eagle Lake, owned by our neighborhood, through the Bieritz and Helgeson lots, across Tips' land, impacting his three new lots, just north of Belcher's lot, etc. And the planned route presented by NISP now is the same route they identified 3 or 4 years ago when we first learned of NISP's plans. Where is their serious vetting of alternative routes?
98	7/8/2020 11:37	Madsen Rubilar	Lisa	lisa.m.rubilar@gmail.com	I am writing as a citizen who has loved the Poudre River, as well as and the land along the Highway 287 corridor, for over fifty years. Our family has a small cabin in the Crystal Lakes area, so we travel frequently through the corridor that will be under water if NISP is allowed to go forward. We never tire of the pristine beauty of the landscape. We also frequently enjoy the beauty and tranquility of the Poudre River in various locations in and near Fort Collins. It breaks my heart to think of the river withering, wetlands turning to desert, wildlife disappearing, and natural habitats lost forever. And for what? So that Denver suburbs can continue to expand without consideration for water resources? If Thornton needs more water, the place to look is water conservation. Population growth in the area MUST depend on decreased water use through water-saving technologies, watering restrictions and xeriscaping using native plants. These are sustainable, realistic alternatives to a plan that would decimate natural areas in Northern Colorado. There is absolutely NO NEED and NO JUSTIFICATION for NISP, which will have a direct, negative impact on the quality of life of those living in its path.

LARIMER COUNTY | Community Development

Hello Planning Commission

1) Thanks for your effort with the NISP 1041 hearing

2) I pulled the following questions from my comments of 4.29.20(provided to Rob Helmick and the County Commissioners) that you may want to consider in meeting with Northern on 7.15.20

Best Regards, Tom Sale

Regarding: Comments on Northern Integrated Supply Project (NISP) 1041 Permit

Siting

Fault Questions:
- Why is it that neither the North Fork or Bellvue Faults have ever been mentioned in public NISP documents to date?
- What contingency plans are available to address fault-controlled leakage under the dams, what are the associated costs (e.g. following work on the North Dam on Horsetooth), and are the related costs being shared with participants and lending agencies?
- In your recent multiple year (undocumented?) drilling programs were “subsurface voids” encountered that could lead to severe seepage losses and/or washout under the Glade Dam? Have the results from recent subsurface investigations been shared with the public?

Seepage Loss Questions:
- Given up to 400 feet of water over the conductive sandstone beds, and the likelihood of large seepage losses, how can you advocate that Glade is a suitable site for a reservoir?
- The county requires groundwater models for projects where groundwater issues exist. What types of groundwater modeling has been conducted for Glade and have the results been shared with the public?
- Per Northern’s recent public open house on NISP, there are NO plans to place a seepage control liner in Glade (as was ultimately required at the North Dam on Horsetooth). If a liner were required how would it effect the costs for NISP and are the parties that will cover the cost aware of the associated risks?
- Given effective subsurface water storage alternatives, how much money could be saved by eliminating seepage losses?

Munroe Ditch Questions:
• The proposed steel pipeline in cement will see dynamic vertical stresses. What kind of foundations are required, what are the costs for the submerged conveyance, are the costs currently included in the estimates provided to the participants?
• How do you plan on dealing with large volumes of water flowing into the submerged tunnels when they become submerged drains?

• Given prior experience with collapsing formations due to exposure to fresh water in the vicinity of Glade, why would the Munroe Ditch Tunnels not collapse when they become submerged drains?
• Are there any successful engineering precedents for the proposed submerged conveyance of the Munroe Ditch through Glade?
• How will you safely remove sediments that will inevitably fill the submerged pipeline?
• What are the anticipated costs of the submerged conveyance, its maintenance, and its periodic replacement?
• Are the costs for the submerged Munroe Ditch conveyance through Glade included in current estimates of the cost for NISP and are the related cost/concerns being shared with participants and lending agencies?
• What is Northern's contingency plan given the likelihood of the Munroe Ditch conveyance failing?

Pushing the Missile Site Chlorinated Solvent Plume into Domestic Drinking Water Wells Fault Questions:
- Why did Northern install 20 plus monitor wells in the missile site plume?

- Were water samples collected from the wells?
o If yes, when will the data be made available? One might think that if the news was good, we would already know the results.
o If no, isn't it in the best interest of protection to human health and to the environment, to accurately sample the wells and share the results prior to any approval of the NISP 1041 Permit?

- What are the contingency plans for adverse impact to domestic water supplies?

- Is it appropriate to proceed with a decision on the NISP 1041 Permit absent public documentation of the water quality in Northern's 20+ monitoring wells in the vicinity of the missile plume?

Off the Main Stem of the Cache La Poudre Questions:
• How will NISP capture peak flows if the diversion from the Cache La Poudre River is constrained by the hydraulic capacity of the diversion?
• Why should NISP be approved if there are lower cost/less harmful alternatives for surface water storage projects that the project proponents can participate in?
• How will NISP get the required electrical power to the pumps at the forebay?
• Has Northern provided the required information for approval of an 80 MW power line?
• How will required power lines impact the aesthetic of the views in Pleasant Valley and the new recreational facilities?

Alternatives

Mining Water Losses from Antiquated Water Storage and Transmission Infrastructure Question:
• Given a viable alternative that is less damaging, low risk and suited to uncertain times – why should the (NISP) 1041 Permit be approved if it is, in contrast, severe in its impacts, more costly, and poorly suited to the State's current conditions?

Subsurface Water Storage Question:
• Given all that is happening with Subsurface Water Storage in Colorado, and Dr. Sale's comments, why would you dismiss Subsurface Water Storage?

Conservation Questions:
• How can Northern justify requesting further surface water diversions, billions of dollars from Colorado's residents, and destruction of Larimer's County's limited wild lands when so much can still be done with conservation?

RE: NISP 1041 Permit Application; Project No. 20-ZONE 2657

Dear Commissioner Johnson, Commissioner Kefalas, Commissioner Donnelly, and Planning Commission:

I am writing to express my opposition to the Northern Integrated Supply Project NISP and encourage the Larimer County Planning Commission and County Commissioners to reject the 1041 County permit for the project. Let me explain why I do not support this project and encourage you to reject the permit.

This annual spring "rise" on the Cache la Poudre River is a sacred event, a living pulse of water that lasts just about a month but refreshes and re-nourishes the entire river ecology. As the Poudre reaches Fort Collins these floodwaters spill the banks, filling secondary channels where frogs, birds, and fish rear and lay eggs. Fresh layers of sediments drop out over the floodplains, nourishing the deep, lush cottonwood forests and marshes.

Something unique about the Poudre is that despite roughly 2/3 of the flow already diverted out, there is still enough of a spring "rise" to flood the banks, clean out the river of lingering sediments, redeposit nutrients, and refresh the ecology. This is rare, nearly all of the rivers and creeks along Colorado's Front Range have been dammed or diverted where the natural rhythm of the spring "rise" is gone, turning the echoing drumbeat of the river into a muted whine.

The Poudre still has its spring heartbeat, but not for long if the Northern Colorado Water Conservancy District builds their gluttonous Northern Integrated Supply Project (NISP). If this project is built it will take 71% of the water out of the river during the spring "rise", flat-lining the river and putting it on life support.

My expertise is in river restoration and geomorphology, it's my job to know how river and stream mechanics respond to changes in flow. A major problem that NISP would have on the river is that by reducing the spring "rise", the river will not be able to redistribute and transport sediments out of the river channel where they can deposit onto floodplains and wetlands. By functionally limiting the peak flow and eliminating the annual flushing effect, those sediments will stack up in the channel year after year, eventually raising the channel higher and higher to a point that will create regular flooding problems. The annual flush is needed to improve hydraulic conveyance and move sediments downstream. Not allowing this annual pulse will create a clog, similar to a blood clot.

Additionally, if NISP were built and the sediments are not annually flushed out with large spring pulses, the water quality will greatly suffer. This will occur because the sediment and nutrients trapped in the channel will decompose and consume oxygen levels within the water, thereby decreasing dissolved oxygen available for fish and other wildlife. The annual spring "rise" is not "extra unused water", it's the force that cleans the river environment, flushing sediments and nutrients out and distributing them on floodplains.

Taking the last of the peak flow and storing it behind a dam to feed sprawling suburbs, while turning the river into a putrid algae-filled ditch, is not a good starting point.

This is not my vision for the Poudre River or the Northern Colorado region. Instead, my vision is to keep the wild character of the river, meet growing water needs, and retain the farmland and rustic character of the region. We don't need another river-destroying boondoggle like NISP that creates more urban sprawl. We need intelligent planning, water conservation, recycling, water sharing agreements between cities and farms, and water efficiency upgrades. These solutions have been done in places like Las Vegas where water use has gone down even through growth has skyrocketed. These methods are common and would be significantly cheaper than a billion-dollar dam, paid for by ratepayers.

Only 35 years ago, a 415 ft tall dam was proposed along highway 14 near the mouth of the Poudre Canyon. The Grey Mountain Reservoir proposal was pushed by Northern Water, the same agency pushing NISP. Thankfully Grey Mountain Dam was rejected by Larimer County, and I hope that NISP will be defeated too, but only with your help in rejecting the 1041 County Permit.

Please stand with the river and all the constituents in Larimer County that do not want to see our beloved river put on life support to feed the growth of cities in other Counties.

Thank you,

Preston Brown

RE: NISP 1041 Permit Application; Project No. 20-ZONE 2657

Dear Planning Commision, Commissioner Johnson, Commissioner Kefalas, Commissioner Donnelly, and Planning Staff:

My name is Ken McCullough, I am a life-long resident of Larimer County and a third-generation alfalfa farmer. My 45-acre farm is irrigated with water diverted directly out of the Cache la Poudre River via a canal operated by the Larimer and Weld Irrigation Company. This canal is located just east of Taft Hill Road and is downstream of the diversion point for the proposed Glade Reservoir. As someone with deep ties to the agricultural economy and rural culture of the Fort Collins area, I am opposed to the Northern Integrated Supply Project (NISP) being pushed by the Northern CO. Water District. For many reasons, I urge you as Commissioners and County Staff to oppose this God-awful project. Let me explain why I am so strongly opposed to this project and believe you should be too.

My farm diverts about 30-acre feet of water from the river annually, primarily June through September. This is a reliable water right, although my water rights are not senior to many upstream and down-stream users, I have never suffered from an inadequate supply when I needed it most. There have been many years when I don't get my full 30-acre feet, but my alfalfa operation has always received enough water, even in the driest years of 2000-2006, to get a reliable crop and stay in the black. After review of the NISP project and discussions with others in the agricultural economy, including leadership Larimer and Weld Irrigation Company, the NISP project will not benefit me at all, in fact, it could make me lose my farm.

The NISP project does not supply any new additional water to irrigators, agricultural users, or farmers in Larimer County. However, the water diverted into Glade Reservoir would be water that is *already* allo-cated and exists in paper water rights with farms in Larimer and Weld Counties. A major problem with NISP is that the water to be stored in Glade would need to be purchased in order to be allocated to the project, which it isn't, and unless Northern Water and NISP customers purchase thousands of acres of farmland, that water will never make it to Glade except for years with incredibly exceptional runoff. Since most of the water NISP is hoping to capture is already allocated for downstream users, NISP would need to purchase the farmland where the water rights are held in order to divert and eventually sell that water to customers. This issue was pointed out in the 2018 Final Environmental Impact Statement for the NISP project produced by the United States Army Corps of Engineers. Despite this incredibly prob-lematic detail, Northern Water thinks they can purchase these farms eventually over the next 30-40 years. Frankly, that is unrealistic, this is a billion-dollar pipe dream that won't likely operate at full capac-ity unless billions of more dollars are sourced to purchase farmland.

The issue I fear most that could jeopardize my farm is if Northern Water begins purchasing farmland and water rights in Larimer and Weld Counties. If farms are purchased for their water rights, the value of the

farmland will skyrocket because the water rights associated with the land will be “developed” and stored behind a dam and made available for urban users instead of kept in the river. This would result in a major *negative* economic incentive for farmers to sell their land and water rights to NISP in order to “cash out”. Farmers would of course have to sell their land willingly but imagine if a big fat “green carrot” was dangled in front of a working-class family? We all know what will happen, the pressure to sell the land for cash would be too overwhelming for most, and the multi-generation farms will be turned over for a quick buck.

Developers would then be able to buy the land from NISP and turn the land into homes and subdivisions, knowing that the farmland being paved over and has fed the Country for generations and will forever be lost.

My biggest fear about NISP is that if it were successful, which is unlikely, it would incentivize the development of Larimer and Weld Counties rich farmlands and rural charters, resulting in appalling urban sprawl and will contribute to the loss of a stable and reliable agricultural economy. At best NISP would waste billions of dollars and never become operational, but at worst, it would turn our beautiful rich agricultural lands into cement cul-de-sacs and parking lots.

My family and I have weathered through many years of drought, lost revenue, pest diseases, broken equipment, labor disputes, and market swings, but we’ve always kept our heads above water. However, I see NISP as the grim reaper, a sign of danger coming to turn my farm and our neighbors’ farms into lawns and asphalt driveways, forever destroying the traditions we have established in Larimer County.

This is not the future I want to leave my daughter, who will inherit the farm and be the first woman in the family to run it. I want her to have the same lifestyle and traditions that my grandfather had when he came to Larimer County in 1910 to farm alfalfa and corn. As someone who is trying to find their way in this chaotic world and walk tall as a steady and honorable person, I find myself feeling helpless and in utter despair if NISP were built. That’s why I am writing, to urge you to hear my story and see my perspective as a farmer who wishes the best for his home. Please stand with me and do not issue a 1041 permit for the Northern Integrated Supply Project.

Sincerely,

Ken McCullough

Laporte, Colorado

With boom in visitation comes safety concerns for recreators at Horsetooth Reservoir

Kevin Duggan, Fort Collins Coloradoan Published 7:00 a.m. MT July 3, 2020 | **Updated 4:08 p.m. MT July 3, 2020**

Fans of Horsetooth Reservoir have taken to heart the message that it's OK to enjoy the great outdoors during the coronavirus pandemic.

Crowds flocked to the reservoir west of Fort Collins as well as other sites managed by Larimer County Natural Resources as they reopened in spring to boating, camping and hiking. The surge in visitation has carried over to summer.

And with the people have come problems with safety and parking, county officials say.

Parking issues in the Horsetooth area came to a head in mid-June as hundreds of vehicles pulled over along sections of Centennial Drive and county roads 38E and 23 during weekends because the reservoir's parking lots were full.

Any spot that wasn't signed "no parking" had a parked car, said Senior Ranger Luke Brough during a recent meeting with the county commissioners.

Pay up: State wildlife areas require licenses for all users (/story/sports/outdoors/2020/06/30/new-rule-requires-colorado-hunting-fishing-license-on-larimer-public-lands-watson-lake-poudre-river/5349078002/)

Vehicles lined both sides of the narrow-shouldered roads, and cars sped through even as cyclists rode along and paddleboarders and kayakers hauled gear across the roads to reach the water.

Given the dangerous circumstances, Brough said "it was a miracle" no one was seriously injured.

"It was a blessing at the end of the day to say no one got ran over," he said.

Placing 40 temporary no-parking signs along the county roads plus stepped up traffic enforcement by Larimer County sheriff's deputies and the Colorado State Patrol helped calm the situation.

But the crowding is a sign of things to come as the region grows and more people seek outdoor recreation spots.

Visitation is booming

Cars fill a pullout along Centennial Drive near Horsetooth Reservoir over Memorial Day weekend in Fort Collins, Colo. on Saturday, May 23, 2020. *(Photo: Bethany Baker / The Coloradoan)*

A visitor count conducted two years ago found 1.2 million people visited the Horsetooth area, which covers the reservoir and Horsetooth Mountain Open Space, said Mark Caughlan, manager of the Horsetooth District, in an interview.

“That’s a tremendous amount of people to run through a fairly small park area,” Caughlan said.

The number seems to have increased. As of mid-June, visitation to the reservoir and open space was up 40% from a year ago, Caughlan said.

On weekends, parking lots at the reservoir are full by 9 a.m. Latecomers might have to wait in line more than an hour to launch their boats. Some weekdays can be as busy as Saturdays and Sundays.

A sign that reads "No Parking" is located along Shore Access Road beside Horsetooth Reservoir in Fort Collins, Colo. on Wednesday, July 1, 2020. *(Photo: Bethany Baker / The Coloradoan)*

Through mid-June, boat inspectors checking for invasive aquatic species had conducted 8,300 inspections. By that time a year ago, they had done 3,500 inspections.

About half of the visitors have come from outside the county, Caughlan said. Many visitors come from Weld County.

Guide: Summer fun in Larimer County during a pandemic (/story/life/2020/06/23/coronavirus-summer-things-to-do-fort-collins-colorado-covid-19/3235464001/)

Carter Lake near Loveland has seen a similar boom in visitation, as have other recreation facilities along the Front Range.

At Boyd Lake State Park in Loveland, waits to get in the park and launch a boat can exceed two hours, Park Manager Eric Grey told the commissioners.

The park has 1,200 parking spaces. When those spaces fill, traffic is stacked at entry points, where variable message boards advise drivers on the potential lengths of wait times.

Traffic coming in from the south backs up along Boise Avenue toward McKee Medical Center. The backup can hamper emergency vehicle access and the ability of residents to park in front of their houses.

“In the past four years, we only had that happen five times,” Grey said. “We had it happen six times this spring.”

Safety issues a concern

In anticipation of the crowding, Larimer County Natural Resources hired its full contingent of 15 seasonal rangers even though the potential impact of the pandemic was not clear. The department has four year-round rangers.

Caughlan said he’s grateful to have the help. On busy days, rangers run from service call to service call, often focusing on traffic mitigation rather than “doing real ranger work.”

“We’re doing the best job we can to address public safety, to address visitor needs, to make sure to protect the resources,” he said. “As you can imagine, it’s difficult at best with these visitation numbers to manage those.”

During major events, such as a June 20 medical emergency at Satanka Bay in which a 36-year-old man suffered a heart attack and died, park resources get spread thin, Brough told the commissioners.

Without rangers keeping track of things, parking lots, boat ramps and other facilities at the reservoir can become chaotic.

Accident: Climber seriously injured in Horsetooth fall (/story/news/2020/06/29/colorado-climber-airlifted-after-fall-near-fort-collins/3279557001/)

“Once that bottle is open, it’s a continuous flow and we can’t contain it,” he said.

Water safety is a major concern at the reservoir, Caughlan said.

Visitors should heed regulations limit swimming to designated areas. Inflatable tubes, mattresses and other toys are not allowed outside swim areas.

In 2019, a record 18 people drowned in Colorado lakes. This year, the state has already seen 15 drownings, he said.

“We just want people to make good decisions and wear life jackets,” he said.

Cliff diving is prohibited at Horsetooth Reservoir, but it still happens. People risk serious injuries from hitting rocks hidden beneath the surface.

The reservoir’s elevation can go down 6 inches in a day as water is pulled from the reservoir for irrigation. People may not realize that a location where they dived before might be 3 to 4 feet shallower a week later, Caughlan said.

Options for crowd management

Satanka Bay at Horsetooth Reservoir is crowded with boats and paddleboards in mid-June 2020. *(Photo: Mark Caughlan)*

With so many people vying to get on the water at Horsetooth Reservoir, officials are looking into options for managing crowds. That could include hiring additional rangers.

Potential remedies include setting up a reservation system for boat launching for entering the park.

“Imagine what it’s going to be like 10 years from now,” Caughlan said. “We’re going to have to start implementing some of the entry processes other agencies are trying.”

Caughlan said Horsetooth hit its capacity about 10 years ago. There is little room for expansion.

Officials plan to “harden” the park’s infrastructure, such as paving roads and parking facilities, to keep up with the impact of having so many visitors.

At the same time, they want to preserve the area’s natural resources to provide good visitor experiences.

Opinion: Ease up on Estes Park tourists (/story/news/2020/06/27/opinion-estes-park-rejects-message-targeting-out-state-tourists/3260113001/)

The demand for recreational facilities has been growing for several years, Grey told the commissioners. The surge this spring and summer continues that trend.

“I think this is kind of a wake-up call,” Grey said. “Our population is not shrinking, and if we don’t have places to send people, we’re going to be seeing these problems moving forward in the next several years.”

NISP

1 message

David Marvin <dmarvin55@gmail.com> Tue, Jul 14, 2020 at 11:10 AM
To: Helmicrp@larimer.org

Mr. Helmic,

The NISP pipeline may be routed through Cooperslew Open Space, immediately adjacent to Boxelder Estates in Larimer County. I have attached a letter that addresses our concerns. I have also sent an email with the letter to the Planning Commission Board.

Let me know if you have any questions.

--
Dave Marvin

letter to planning commission on NISP.pdf
45K

To: Larimer County Planning Commission and Larimer County Commissioners
From: Cooperslew Open Space Association
Regarding: NISP Pipeline
Date: July 14, 2020

Dear Planning Commission Board and Commissioners,

Cooperslew Open Space Association is a Colorado non-profit entity that was formed for the purpose of acquiring and maintaining as Open Space a narrow five-acre strip of land immediately adjacent to the east side of Boxelder Estates, Larimer County, Colorado. The Association recently received notice that a portion of the pipeline for NISP could be placed within Cooperslew Open Space along its entire length from north to south.

The construction of the pipeline within Cooperslew Open Space is of particular concern, as follows:

1. When you consider the surface disturbance that will result from installing a 54-inch pipeline, most of Cooperslew Open Space will be impacted. Consequently, the enjoyable use of Cooperslew by its current members (pedestrian use and riding horses) will cease, both during construction and potentially for a long time after reclamation.

2. Reestablishing grasses on areas disturbed by construction will be a slow process, particularly since Cooperslew Open Space is not irrigated. This will further hinder/delay use of the area by members and may also impose an extraordinary expense on Cooperslew Open Space Association to control weeds until revegetation is successful, and to amend and reseed areas where it is not.

3. Drainage tiles underlay the entire Boxelder Estates subdivision, and from what we know, Cooperslew Open Space. Pipeline construction has the potential to damage a portion of these tiles and thereby negatively affect drainage and potentially the groundwater irrigation wells in the area.

4. Construction noise and dust will impact Boxelder Estates, especially the Boxelder properties immediately adjacent to Cooperslew Open Space.

5. Until revegetation efforts are successful, the aesthetics of Cooperslew Open Space will change dramatically because the current healthy grassland will be substantially disturbed by construction activity. This will be of major consequence to Boxelder homeowners immediately adjacent to the Open Space and could negatively affect property values.

6. The roads within Boxelder Estates are private and maintained by the Boxelder Estates Homeowners Association. If NISP plans to use these roads for access to the pipeline ROW during construction, the impact to traffic flow and road surfaces in the subdivision would be substantial and unacceptable.

Thank you for considering our concerns.

Respectfully,

David W. Marvin
President, Cooperslew Open Space Association

Documents Outlining Project Mitigation

APPENDIX A – FISH AND WILDLIFE MITIGATION AND ENHANCEMENT PLAN SUMMARY TABLES

Table A1. Mitigation and Enhancement Plan Summary Table - By Mitigation Action Item

Measure No.	Mitigation and/or Enhancement Measure [1]	Mitigation and/or Enhancement Commitment [2]	Resource Considerations (see Table A.2 for complete list of mitigated effects; see text for description of enhanced resources)	Capitalized Cost [3]	Cost Note [4]	Mitigation			Enhancement [1]	Resources Involved								
						Avoidance	Minimization	Compensation		Aquatic Life	Recreation	Riparian Veg/Wetlands	Special Status Species	Stream Morphology	Terrestrial Wildlife	Water Quality	Wetlands	Other
Aquatic Life and Stream Morphology																		
AG-01	Stream Channel and Habitat Improvement Plan	Fund stream channel and habitat improvement plan	Compensation for accelerated degradation of channel geomorphology, increased flooding risk downstream of I-25, reduced Poudre River flows, reduced aquatic habitat, reduced water availability for riparian vegetation, reduced habitat for riverine special status species, increased water temperature and DO concentrations; Enhanced and accelerated channel restoration, aquatic habitat, riparian vegetation, riverine special status species, temperature and DO concentrations	$1,000,000	a			X	X	X	X	X	X	X		X		
AG-02	Stream Channel and Habitat Improvements	Construct stream channel improvements (2.4 miles)		$1,800,000	b			X	X	X		X	X	X		X		
AG-03	Poudre River Adaptive Management Program	Implement and fund Poudre River Adaptive Management Program in coordination with other Poudre River stakeholders	Enhanced and accelerated channel restoration, aquatic habitat, riparian vegetation, riverine special status species, temperature and DO concentrations	$5,930,000	a				X	X	X	X	X	X		X		
AG-04	Poudre Valley Canal Diversion Structure Reconstruction	Reconstruct Poudre Valley Canal with improvements in sediment diversion, fish passage, and boating safety	Minimization of reduced sediment transport capabilities; enhance Poudre River connectivity for aquatic migration, enhance boater safety	$300,000	b		X		X	X	X			X				

Table A1. Mitigation and Enhancement Plan Summary Table - By Mitigation Action Item

Measure No.	Mitigation and/or Enhancement Measure [1]	Mitigation and/or Enhancement Commitment [2]	Resource Considerations (see Table A.2 for complete list of mitigated effects; see text for description of enhanced resources)	Capitalized Cost [3]	Cost Note [4]	Mitigation			Enhancement [1]	Resources Involved								
						Avoidance	Minimization	Compensation		Aquatic Life	Recreation	Riparian Veg/Wetlands	Special Status Species	Stream Morphology	Terrestrial Wildlife	Water Quality	Wetlands	Other
AG-05	Multi-Objective Diversion Structure Retrofits	Construct multi-objective diversion structure retrofits that include fish passage, low flow conveyance and flow monitoring capabilities (4 sites)	Enhance Poudre River connectivity for aquatic migration, monitor and administer flow releases	$1,200,000	b				X	X			X					
AG-06	Glade Reservoir Fishery	Establish and maintain recreational cool water fishery at Glade Resevoir	Enhance regional recreational opportunities	$4,070,000	a				X	X	X							
AG-07	SPWCP Diversion Construction	Construct SPWCP diversion to avoid fish entrainment and allow fish passage	Avoidance and minimization of entrainment of fish in SPWCP diversion structure and decreased fish migration past diversion	$300,000	b	X	X			X								
AG-08	Galeton Reservoir Native Fish Rearing	Make Galeton Reservoir available to CPW for raising native warmwater fish for reintroduction	Compensation for reduced habitat availability and quality for native warmwater fish	$100,000	a				X	X								
AG-09	Galeton Reservoir Fish Screening	N/A [6]																
Streamflow Commitments																		
FW-01	Avoid Munroe Canal Diversions	Avoid NISP-related diversions through Munroe Canal	Avoidance of reduced Poudre River flows, reduced aquatic habitat, reduced river-based boating days, increased water quality concentrations	[5]	c	X				X	X	X	X			X		

Table A1. Mitigation and Enhancement Plan Summary Table - By Mitigation Action Item

Measure No.	Mitigation and/or Enhancement Measure [1]	Mitigation and/or Enhancement Commitment [2]	Resource Considerations (see Table A.2 for complete list of mitigated effects; see text for description of enhanced resources)	Capitalized Cost [3]	Cost Note [4]	Mitigation			Enhancement [1]	Resources Involved								
						Avoidance	Minimization	Compensation		Aquatic Life	Recreation	Riparian Veg/Wetlands	Special Status Species	Stream Morphology	Terrestrial Wildlife	Water Quality	Wetlands	Other
FW-02	Curtail Diversions for Non-Consumptive Water Rights	Curtail NISP diversions for existing Poudre River non-consumptive water rights (5-50 cfs), including those for Bellvue Fish Hatchery at Watson Lake	Avoidance and minimization of reduced Poudre River flows below Poudre Valley Canal diversion, reduced aquatic habitat, reduced water availability for riparian vegetation, reduced habitat for riverine special status species, increased water quality concentrations and DO, reduced river recreational value, nonuse value impacts; enhancement of low flows in conveyance refinement reach	[5]	c	X	X			X	X	X	X			X		
FW-03	Summer and Winter Diversion Curtailments	Curtail diversions when flow is less than 50 cfs during the summer, and 25 cfs during the winter		[5]	c	X				X		X				X		
FW-04	Conveyance Refinement - Poudre River Intake	Convey 18 cfs (winter) to 25 cfs (summer) of deliveries to NISP participants by releasing from Glade Reservoir to the Poudre River, and rediverting at Timnath Inlet; prior to full buildout, convey a minimum of 35% of NISP deliveries through Poudre River Intake		$24,520,000	b	X	X		X	X		X	X			X		
FW-05	Poudre River Flow Augmentation Program	Assist with securing Flow Augmentation Protection for the Poudre River		[5]	c	X	X		X	X	X	X	X					

Table A1. Mitigation and Enhancement Plan Summary Table - By Mitigation Action Item

Measure No.	Mitigation and/or Enhancement Measure [1]	Mitigation and/or Enhancement Commitment [2]	Resource Considerations (see Table A.2 for complete list of mitigated effects; see text for description of enhanced resources)	Capitalized Cost [3]	Cost Note [4]	Mitigation			Enhancement [1]	Resources Involved								
						Avoidance	Minimization	Compensation		Aquatic Life	Recreation	Riparian Veg/Wetlands	Special Status Species	Stream Morphology	Terrestrial Wildlife	Water Quality	Wetlands	Other
FW-06	Glade Reservoir Enlargement for Water Quality Purposes	N/A [6]																
FW-07	Ramp Hansen Supply Canal Releases	Work with CPW and water commissioner to ramp Hansen Supply Canal releases	Enhancement of aquatic habitat	[5]	c				X	X			X			X		
FW-08	Peak Flow Operations Program	Curtail SPWCP exchanges for peak 3 days each year. Bypass Grey Mountain water rights based on Tier (see text for details): • Tier 1 (>76% full and likely to fill) - bypass during peak 3 days each year • Tier 2 (>76% full, not likely to fill; >50% full) - bypass during peak 2 days to meet 2,800 cfs for Tier 2a; bypass up to 1,200 ac-ft for Tier 2b • Tier 3 (<50% full) - no bypass, except bypass for peak 1 day if 2,800 cfs flow trigger has not been met in previous 3 years (see text for detailed tier classifications and actions)	Avoidance and minimization of reduced sediment transport capability, reduced aquatic habitat	[5]	c	X	X			X			X			X		
FW-09	Ramp NISP Diversions at PVC	Limit changes in NISP diversions at the PVC headgate to no more than 500 cfs in 24 hours.	Avoidance and miniminzation of impacts on aquatic species.	[5]	c	X	X			X								

Table A1. Mitigation and Enhancement Plan Summary Table - By Mitigation Action Item

Measure No.	Mitigation and/or Enhancement Measure [1]	Mitigation and/or Enhancement Commitment [2]	Resource Considerations (see Table A.2 for complete list of mitigated effects; see text for description of enhanced resources)	Capitalized Cost [3]	Cost Note [4]	Mitigation			Enhancement [1]	Resources Involved								
						Avoidance	Minimization	Compensation		Aquatic Life	Recreation	Riparian Veg/Wetlands	Special Status Species	Stream Morphology	Terrestrial Wildlife	Water Quality	Wetlands	Other
Noxious Weeds																		
NW-01	Noxious and Invasive Weed Control Plan	Develop and implement noxious weed control plan during construction	Avoidance and minimization of potential spread of noxious weeds during construction activities.	[5]	c	X	X											X
Recreation																		
RC-01	Glade Reservoir Recreation	Allow public access to Glade Reservoir fishery; investigate opportunities for recreation management and develop management plan that may include motorized boating, fishing and camping	Enhanced regional recreational opportunities	$200,000	a				X		X							X
RC-02	Glade Reservoir and State Land Hunting Access	Provide replacement access to State Trust Lands near Glade Reservoir and allow hunting access adjacent to Glade Reservoir	Compensation for inundation of existing access to State Trust Lands west of Glade Reservoir, reduced hunter access and game harvest near Glade Reservoir	[5]	c			X			X				X			X
RC-03	Glade Reservoir Recreation and Wildlife Adaptive Management Plan	Provide habitat for affected wildlife species while allowing the public to have reasonable access for recreation throughout the area	Enhanced regional recreational opportunities	[5]	c				X		X				X			X
RC-04	Mitani-Tokuyasu State Wildlife Area	Replace facilities at Mitani-Tokuyasu State Wildlife Area	Compensation for loss of land and impact on facilities at Mitani-Tokuyasu State Wildlife Area due to construction of SPWCP infrastructure, wildlife impacts at Galeton Reservoir	$50,000	b			X			X							X
RC-05	Land Acquisition in Confluence Area	Provide partial funding for land acquisition in Poudre - South Platte confluence area		$500,000	a			X			X							X

Table A1. Mitigation and Enhancement Plan Summary Table - By Mitigation Action Item

Measure No.	Mitigation and/or Enhancement Measure [1]	Mitigation and/or Enhancement Commitment [2]	Resource Considerations (see Table A.2 for complete list of mitigated effects; see text for description of enhanced resources)	Capitalized Cost [3]	Cost Note [4]	Mitigation			Enhancement [1]	Resources Involved								
						Avoidance	Minimization	Compensation		Aquatic Life	Recreation	Riparian Veg/Wetlands	Special Status Species	Stream Morphology	Terrestrial Wildlife	Water Quality	Wetlands	Other
RC-06	Glade Reservoir Poudre River Recreator Parking	Construct parking lot at Glade Reservoir complex for use by Poudre River recreators	Compensation for drive-by traffic at Ted's Place; enhanced regional recreational opportunities	$40,000	b			X	X		X							X
RC-07	Glade Reservoir Visitor's Center	Construct Visitor's Center at Glade Reservoir	Compensation for loss of prime farmland, geologic construction disturbance, other general minor environmental effects	$940,000	a			X		X	X	X	X	X	X	X	X	X
Riparian Vegetation																		
RV-01	Riparian Vegetation - Cottonwood Regeneration Areas	Develop cottonwood regeneration areas in 3 specific reaches (58 acres) and adjacent to channel and habitat improvement reaches (2.4 miles)	Compensation for accelerated decline of plains cottonwood, increased water temperatures	$130,000	b			X				X	X			X		
RV-02	Riparian Vegetation - Channel Improvements	Reconnect channel to floodplain in channel and habitat improvement reaches, re-establish connection with backwater sloughs in Windsor area	Compensation for adverse effects on plant communities sensitive to alluvial groundwater levels	$280,000	b			X		X		X	X	X		X		
Special Status Species																		
SS-01	Preble's	N/A [7]																
SS-02	Bald Eagle	Conduct surveys for bald eagles and nests; meet CPW buffer requirements; take actions according to Bald Eagle and Golden Eagle Protection Act and Migratory Bird Treaty Act (MTBA)	Avoidance and minimization of, and compensation for, potential effects to bald eagle	[5]	c	X	X	X					X					
SS-03	Colorado Butterfly Plant	Conduct surveys of Colorado butteryfly plant for 2 years prior to construction, implement conservation measures if needed	Avoidance of and compensation for potential effects to Colorado butterfly plant	[5]	c	X		X					X					

Table A1. Mitigation and Enhancement Plan Summary Table - By Mitigation Action Item

Measure No.	Mitigation and/or Enhancement Measure [1]	Mitigation and/or Enhancement Commitment [2]	Resource Considerations (see Table A.2 for complete list of mitigated effects; see text for description of enhanced resources)	Capitalized Cost [3]	Cost Note [4]	Mitigation			Enhancement [1]	Resources Involved								
						Avoidance	Minimization	Compensation		Aquatic Life	Recreation	Riparian Veg/Wetlands	Special Status Species	Stream Morphology	Terrestrial Wildlife	Water Quality	Wetlands	Other
SS-04	Ute Ladies'-Tresses Orchid	Conduct surveys for Ute ladies'-tresses orchid for 2 years prior to construction, implement conservation measures if needed	Avoidance of and compensation for potential effects to Ute ladies'-tresses orchid	[5]	c	X		X					X					
SS-05	Platte River Target Species	Offset depletions through membership in SPWRAP	Compensation for effects to Platte River target species	$1,550,000	b			X					X					
SS-06	Black-Footed Ferret	Reevaluate and resurvey prairie dog colonies potentially impacted during construction	Avoidance and minimization of, and compensation for, potential impacts to black-footed ferret	[5]	c	X	X	X					X					
SS-07	Black-Tailed Prairie Dog	Relocate black-tailed prairie dogs prior to construction, follow CDOT guidelines	Avoidance and minimization of potential impacts to black-tailed prairie dog	[5]	c	X	X						X					
SS-08	Swift Fox	Survey for swift fox den sites, coordinate conservation measures with CPW	Avoidance and minimization of, and compensation for, potential impacts to swift fox	[5]	c	X	X	X					X					
SS-09	Burrowing Owl	Resurvey prairie dog colonies for proposed disturbances, coordinate with CPW for any burrowing owls found	Avoidance and minimization of, and compensation for, potential impacts to burrowing owl	[5]	c	X	X	X					X					
SS-10	Other Riparian Species	Implement proposed mitigation for wetlands and riparian habitat to benefit these species.	Compensation for potential impacts to common gartersnake, northern leopard frog, smokey-eyed brown butterfly, two-spotted skipper, American currant	[5]	c			X				X	X				X	
SS-11	Bell's Twinpod	Conduct surveys in potential habitat prior to construction, reestablish populations where impacts are unavoidable	Avoidance and minimization of, and compensation for, potential impacts to Bell's twinpod	[5]	c	X	X	X					X					
SS-12	Townsend's Big-Eared Bat	Protect entrance to exisiting cave	Avoidance of potential impacts to Townsend's Big-Eared Bat	[5]	c	X							X

Terrestrial and Avian Wildlife																		
TW-01	U.S. 287 - Big Game Underpass and Fencing	Construct one big-game underpass, and identify other crossings that could potential be designed to accommodate wildlife movement	Compensation for potential impacts to big game migration in the area inundated by Glade Reservoir and affected by U.S. 287 realignment; enhanced opportunities for big-game migration across U.S. 287 corridor, enhanced habitat protection west of Glade Reservoir	$500,000	b			X	X						X			
TW-02	U.S. 287 - Big Game Movement Adaptive Management Plan	Monitor road kills for 10 years and implement adaptive management actions as needed		$280,000	a			X	X						X			
TW-03	Migrating Birds and Raptors - Surveys and No Work Zones	Survey and mark active nests to establish no-work zones during breading seasons in accordance with MBTA	Avoidance and minimization of, and compensation for, potential effects on migrating birds, raptors, amphibians, reptiles and other wildlife	[5]	c	X	X	X							X			
TW-04	Migrating Birds and Raptors - Vegetation Clearing	Conduct vegetation clearing during nonbreeding season, when possible in accordance with MBTA		[5]	c	X	X	X							X			
TW-05	Migrating Birds and Raptors - Buffer Zones	Follow CPW recommended buffer zones and seasonal restrictions within certain distances of nest sites for raptors in accordance with MBTA. Follow MBTA regulations and permits for incidental or unavoidable takes		[5]	c	X	X	X							X			

Table A1. Mitigation and Enhancement Plan Summary Table - By Mitigation Action Item

Measure No.	Mitigation and/or Enhancement Measure [1]	Mitigation and/or Enhancement Commitment [2]	Resource Considerations (see Table A.2 for complete list of mitigated effects; see text for description of enhanced resources)	Capitalized Cost [3]	Cost Note [4]	Mitigation			Enhancement [1]	Resources Involved								
						Avoidance	Minimization	Compensation		Aquatic Life	Recreation	Riparian Veg/Wetlands	Special Status Species	Stream Morphology	Terrestrial Wildlife	Water Quality	Wetlands	Other
TW-06	Wildlife Habitat - Glade Reservoir Conservation Mitigation	Conserve approximately 1,080 acres of land owned or required for purchase surrounding Glade Reservoir as wildlife habitat using a conservation easement or other legal instrument; see TW-07 for additional commitments	Compensation for loss of winter range big-game habitat at Glade Reservoir	$2,920,000	b			X			X				X			
TW-07	Wildlife Habitat - Glade Reservoir Conservation Enhancement	Acquire and conserve approximately 300 acres of additional land surrounding Glade Reservoir as wildlife habitat using a conservation easement or other legal instrument; engage in conserving additional land west of Glade for big-game habitat, allow use of Glade conserved land for GOCO match, and consent to GOCO requirements	Enhancement of regional big-game habitat at Glade Reservoir	$810,000	a				X		X				X			
Water Quality																		
WQ-01	Glade Reservoir - Multi-Level Outlet Tower	Construct multi-level outlet tower at Glade Reservoir to convey Poudre River releases	Avoidance and minimization of potential increases in temperature, DO, copper, manganese, nutrients and selenium, and other conservative constituents especially during times of reduced flows; enhancement of temperature and DO (through introduction of cooler water) in Poudre River	$1,000,000	b	X	X		X	X						X		
WQ-02	Glade Reservoir - Release Structure Aeration	Construct Glade Reservoir release structures with baffling to provide aeration		$200,000	b	X				X						X		

Table A1. Mitigation and Enhancement Plan Summary Table - By Mitigation Action Item

Measure No.	Mitigation and/or Enhancement Measure [1]	Mitigation and/or Enhancement Commitment [2]	Resource Considerations (see Table A.2 for complete list of mitigated effects; see text for description of enhanced resources)	Capitalized Cost [3]	Cost Note [4]	Mitigation			Enhancement [1]	Resources Involved								
						Avoidance	Minimization	Compensation		Aquatic Life	Recreation	Riparian Veg/Wetlands	Special Status Species	Stream Morphology	Terrestrial Wildlife	Water Quality	Wetlands	Other
WQ-03	Eaton Draw Water Quality Wetlands	Construct approximately 10 acres of wetlands in Eaton Draw to reduce ambient water quality concentrations in Lower Poudre River	Compensation for potential increased WQ concentrations in Poudre River near Greeley , increased sedimentation in lower Poudre, direct impacts to 0.3 acres of wetlands at Galeton Reservoir; enhancement of WQ concentrations in Poudre River near Greeley	$1,340,000	b			X	X							X	X	
WQ-04	Streamflow and Water Quality Monitoring	Establish/enhance streamflow and water quality monitoring network	Compensation for general water quality effects, monitoring required to implement provisions of this mitigation plan	$2,310,000	b			X		X	X			X		X		X
WQ-05	Coalition for the Poudre River Watershed	Provide funding and participate in Coalition for the Poudre River Watershed	Enhancement of general water quality, aquatics, vegetation, noxious weeds, recreation, riparian resources	$750,000	b				X	X	X	X				X		X
WQ-06	Stream Temperature Mitigation	Reduce or curtail NISP diversions if and as necessary to prevent new or exacerbated temperature standard exceedances	Avoidance and minimzation of potential increases in stream temperature, DO	[5]	c	X	X			X						X		
WQ-07	Mercury Bioaccumulation Mitigation	Support monitoring and management by CPW, provide Fish Consumption Advisory Signage as needed	Mitigation for potential bioaccumulation of mercury in fish tissue in Glade Reservoir and Glade Reservoir forebay	$220,000	a	X	X	X		X						X		
				Total	$53,240,000													

Notes:

[1] Green shaded rows indicate that the measure is entirely an enhancement mesaure. Green shading in Enhancement column only indicates the mitigation measure has an enhancment component.

Table A1. Mitigation and Enhancement Plan Summary Table - By Mitigation Action Item

Measure No.	Mitigation and/or Enhancement Measure [1]	Mitigation and/or Enhancement Commitment [2]	Resource Considerations (see Table A.2 for complete list of mitigated effects; see text for description of enhanced resources)	Capitalized Cost [3]	Cost Note [4]	Mitigation			Enhancement [1]	Resources Involved								
						Avoidance	Minimization	Compensation		Aquatic Life	Recreation	Riparian Veg/Wetlands	Special Status Species	Stream Morphology	Terrestrial Wildlife	Water Quality	Wetlands	Other

[2] The description of mitigation commitments is at a summary level - see text for details of the commitment. The text shall take precedent over any discrepancies between this table and the text.

[3] Capitalized cost is the sum of the capital cost plus any annual operations and maintenance costs capitalized over the life of the commitment, or 50 years for those commitments that are perpetual.

[4] Cost notes: a = cost is a firm not-to-exceed monetary commitment in this amount, see text for details.
b = approximate implementation or construction cost of this commitment
c = implementation cost has not been quantified.

[5] Implementation cost has not been quantified.

[6] AC-09 and FW-06 were not carried forward to final mitigation plans - see text for explanation.

[7] Because Preble's Meadow Jumping Mouse habitat mitigation is covered under federal statute with specific jurisdictional requirements, these mitigation activities are not further covered under this State FWMEP.

Table A2. Mitigation and Enhancement Plan Summary Table - By SDEIS Resource Effect [1]

Row	Resource	Summary of Effects Alternative 2 (Proposed Action Glade and SPWCP – Reclamation Action Option) [2]	Mitigation Measure No.
Surface Water			
1	*Surface Water*	**Poudre River** - Average diversion of **35,100** AFY at Poudre Valley Canal (Poudre Valley Canal) to Glade Reservoir. - Flows in 1.48 mile river reach between Poudre Valley Canal and Hansen Supply Canal would be greater (average 8,200 AFY) than No Reclamation Action Option. - Due to exchanges with CB-T, average reduction of 7,700 AFY in releases to Poudre River at Hansen Supply Canal. - Flows in Poudre River downstream of Hansen Supply Canal essentially same for Reclamation Action and No Reclamation Action Options due to releases from Glade Reservoir for Reclamation Action Option. - Diversions would primarily reduce peak flows during May and June in years with average to above average flows. - Reduced flows between Poudre Valley Canal and Larimer-Weld and New Cache headgates due to direct flow and storage exchanges during April-October (irrigation season). - Flow augmentation program would release water from Glade Reservoir to maintain flow of 10 cfs at downstream side of Larimer-Weld Canal headgate from November 1 through April 30 and September 1 through September 30. **South Platte River** - Average diversion of **28,400** AFY just downstream of confluence of Poudre and South Platte Rivers. - Diversions would be limited to a maximum of 200 cfs and could occur in all months when water rights are in priority. - Change in flow would be less than 10% of average monthly flows at Kersey Gage. **Horsetooth Reservoir** Variations in water levels would be similar to existing conditions. **Carter Lake** Variations in water levels would be similar to existing conditions.	FW-01; FW-02; FW-03; FW-04; FW-05; FW-08
Surface Water Quality			
Poudre and South Platte River Constituents			
2	*Nutrients*	Ammonia and total phosphorus increases may be measurable below WWTPs due to reduced river flows, may exceed standard at some locations in Segment 12 of Poudre River and 1b on South Platte River (standards are exceeded under Current Conditions for these nutrients).	WQ-03; WQ-04
3	*Metals*	Increases and decreases in metal concentrations due to flow changes may not be measurable. Medium chance of copper and dissolved manganese standard exceedance in Segment 10 of Poudre River. Medium chance of exceeding total phosphorus standard and a high potential for continued exceedance of selenium standard in Segment 11 of Poudre River. Iron, ammonia, total phosphorus, and selenium concentrations currently exceed standards in Segment 12 of Poudre River and likely to remain above standards. Iron, total phosphorus, and sulfate concentrations remain above standard in Segment 1b of South Platte River. Ammonia and dissolved manganese have a medium chance of exceeding standard in Segment 1b of South Platte River.	FW-03; WQ-01; WQ-04; WQ-07

Table A2. Mitigation and Enhancement Plan Summary Table - By SDEIS Resource Effect [1]

Row	Resource	Summary of Effects Alternative 2 (Proposed Action Glade and SPWCP – Reclamation Action Option) [2]	Mitigation Measure No.
4	*Temperature*	Adverse effects on stream temperature possible in sensitive reaches of Segment 10 and Segment 11 including key months of July and August. Flow augmentation program would provide net benefit in parts of Segments 10 and 11 (from 0.37 miles upstream of Larimer County Canal to Timnath Inlet headgate) in key months of March and September.	AG-01; AG-02; FW-04; WQ-01; WQ-02; WQ-04; WQ-06
5	*Dissolved Oxygen*	Diversions at Poudre Valley Canal could exacerbate occasionally observed DO issues in July and August in Segment 11. Flow augmentation would likely provide DO benefit November through April and in September. Aeration of releases from Glade Reservoir should also help maintain DO concentrations within standards.	WQ-02; WQ-04
Larimer-Weld and New Cache Canal			
6	*Crop Yield*	Elevated salinity and selenium concentrations in Galeton Reservoir releases to canals would result in decrease in crop yields where water used for irrigation.	SE-01; SE-02
Channel Morphology and Sediment Transport			
7	*Change in flow regime*	Mean flow reduced **20-30%** mid-April to mid-July. Duration of flows at or above 1,000 cfs reduced **30-35%**. 2% flow reduced 10-30%. 10-year flood peak reduced up to **21%**. *Laporte Reach:* 1, 2, and 5% exceedance flows reduced **11-26%**. Lower flows (10 and 25% flows) reduced **16-28%**. *Fort Collins Reach:* Winter low flows increased up to 35% from flow augmentation. 1, 2, and 5% flows reduced **13-47%**. Lower flows (10 and 25% flows) reduced **12-41%**. 2-year flood reduced **19-36%** in Fort Collins and upper Timnath reaches. 25-year flood reduced up to **10%** in Fort Collins. *Timnath, Windsor, Greeley Upstream, Greeley Channelized, and Greeley Reaches:* Impact greatest on 5% exceedance flows, reduced **25-42%**. Impact on floods up to 25-year flood reasonably uniform, with 2, 10, and 25-year flood peaks all reduced **16-21%**.	AG-01; AG-02; FW-08

Table A2. Mitigation and Enhancement Plan Summary Table - By SDEIS Resource Effect [1]

Row	Resource	Summary of Effects Alternative 2 (Proposed Action Glade and SPWCP – Reclamation Action Option) [2]	Mitigation Measure No.
8	*Fining of surficial material*	At 55% of cross sections duration of flows that flush river bed fines reduced **5-50%**. For remaining 45% of cross sections no flushing or no change in duration of flushing flows. *Laporte Reach:* 15 flushing events under Current Conditions lasting 132 days total reduced to **10** flushing events lasting **94** days total (26-year period of record) *Fort Collins Reach:* 23 flushing events under Current Conditions lasting 325 days total reduced to **16** flushing events lasting **222** days total (26-year period of record) *Timnath, Windsor, Greeley Upstream, Greeley Channelized, and Greeley Reaches:* 18 flushing events under Current Conditions lasting 292 days total for Windsor reach reduced to **19** flushing events lasting **218** days total (26-year period of record)	AG-01; AG-02; AG-04; FW-08
9	*Loss of morphologic complexity*	Duration of bed material movement reduced on average **21%** and up to **40%** in some locations. Temporal variability of habitats reduced throughout. Spatial variability reduced downstream of I-25. *Laporte Reach:* Channel has barely responded to historical changes in flow regime over last two centuries. Any change predicted to be similarly constrained by lack of sediment supply. *Fort Collins Reach:* Effective discharge of 2,000 cfs remains unchanged from Current Conditions hydrology. Channel capacity similar unless quantity or size distribution of available sediment changes. Current channel still undergoing slow adjustment in response to historical changes in flow regime. Any change would be incremental to that existing response. *Timnath, Windsor, Greeley Upstream, Greeley Channelized, and Greeley Reaches:* Complexity of in-channel morphologic features already low in reaches downstream of I-25 from sand deposition smothering bed and reducing magnitude and frequency of pool and riffle sequences. Further channel contraction would exacerbate this condition.	AG-01; AG-02; FW-08

Table A2. Mitigation and Enhancement Plan Summary Table - By SDEIS Resource Effect [1]

Row	Resource	Summary of Effects Alternative 2 (Proposed Action Glade and SPWCP – Reclamation Action Option) [2]	Mitigation Measure No.
10	*Channel contraction*	Sediment transport potential reduced throughout river. Capability of river to move bed material reduced **12-31%** (upstream of I-25) and **8-18%** (downstream of I-25). Propensity toward channel contraction throughout system but mainly downstream of I-25 where material of relevant size fraction available for deposition and bio-geomorphic feedback loops would prevail. Likely acceleration of channel contraction would lead to increased frequency of flooding downstream of 1-25. *Laporte Reach:* Channel capacity similar to Current Conditions unless quantity or size distribution of available sediment changes. *Fort Collins Reach:* Channel capacity similar under Current Conditions unless quantity or size distribution of available sediment changes. *Timnath Reach:* Channel contraction would occur as extension of processes already underway by deposition on bars, islands, riffles, and channel margins.	AG-01; RV-02; FW-08
11	*South Platte River*	Minor effects to river morphology and sediment transport. Channel-forming flows (1.5-year peak flows of 3,858 cfs) would be reduced from ~ 3% to less than 1% of the time. Scouring flows equivalent to 25-year peak flows would continue to occur.	N/A
Ground Water			
12	*Ground Water*	Minimal effects to ground water from reduced river flows and associated changes in river stage. Greatest changes would be within 50 feet of Poudre River. Minimal seepage from reservoir to alluvium could increase water availability to vegetation. No impacts on ground water quality.	
Geology			
13	*Geology*	Disturbance from construction activities and excavation of sand, gravel, and bedrock for Glade Dam and Galeton Dam embankments, foundation, and rip rap. Excavation and removal of Paleozoic and Mesozoic sedimentary rocks associated with the U.S. 287 realignment. excavation of sand, gravel, and bedrock for Glade Dam and Galeton Dam embankments, foundation, and rip rap. Excavation and removal of Paleozoic and Mesozoic sedimentary rocks associated with the U.S. 287 realignment.	GC-04; RC-07
Prime Farmland if Irrigated (acres lost)			
14	*Prime Farmland if Irrigated (acres lost)*	686	RC-07
Vegetation			
15	*Permanent impacts on all vegetation (acres)*	3,895	N/A

Table A2. Mitigation and Enhancement Plan Summary Table - By SDEIS Resource Effect [1]

Migratory birds and raptors, amphibians and reptiles, and other wildlife			
65	*Migratory birds and raptors, amphibians and reptiles, and other wildlife (acres)*	Loss of **44** acres of wetlands, **12** acres of aquatic habitat, **537** acres of shrublands, **29** acres of riparian woodlands, and **2,929** acres of grassland habitat. Mortality and nest destruction could occur during construction. Temporary impacts include disturbance of vegetation and increased noise and human presence. Reductions in streamflows on Poudre and South Platte Rivers not anticipated to cause loss of riparian and/or wetland habitat. **9** acres of wetland habitat along banks could experience change in species composition.	TW-03; TW-04; TW-05
Aquatic Biological Resources			
Poudre River Fish, Macroinvertebrates, Periphyton, and Plants			
66	Segment A	Fish: Minor adverse impact to adult trout due to reduced runoff flows, negligible impacts to other species/life stages Macroinvertebrates: Minor adverse impact with changes in species composition due to reduced peak flows Periphyton and Plants: Minor adverse impact with increases in filamentous green algae due to reduced peak flows	AG-01; AG-02; AG-04; FW-02; FW-03; FW-04; FW-08; FW-09

Table A2. Mitigation and Enhancement Plan Summary Table - By SDEIS Resource Effect [1]

Row	Resource	Summary of Effects Alternative 2 (Proposed Action Glade and SPWCP – Reclamation Action Option)[2]	Mitigation Measure No.
67	Segment B	Fish: Minor to moderate beneficial impact to most species of fish with augmented low flows Macroinvertebrates: Beneficial impact to abundance, minor adverse impact with changes in species composition due to reduced peak flows Periphyton and Plants: Minor adverse impact with increases in filamentous green algae due to reduced peak flows	AG-01; FW-03; FW-04; FW-05; RV-01; RV-02; FW-08; FW-09
68	Segment C	Fish: Negligible impact to most species, moderate adverse impact to trout with reduced runoff flows and higher temperatures Macroinvertebrates: Minor adverse impact with changes in species composition due to reduced peak flows Periphyton and Plants: Minor adverse impact with increases in filamentous green algae due to reduced peak flows	AG-01; FW-02; FW-03; FW-08; FW-09
69	Segment D	Fish: Minor adverse impact for some species with reductions in runoff flows, negligible impact for others Macroinvertebrates: Minor adverse impact with changes in species composition due to reduced peak flows Periphyton and Plants: Minor adverse impact with increases in filamentous green algae due to reduced peak flows	AG-01; FW-03; RV-01; RV-02; FW-08; FW-09
70	Segment E	Fish: Minor adverse impact for most species with reduced runoff flows Macroinvertebrates: Minor adverse impact with changes in species composition due to reduced peak flows Periphyton and Plants: Minor adverse impact with increases in filamentous green algae due to reduced peak flows	AG-01; FW-03; FW-08; FW-09
71	Segment F	Fish: Minor adverse impact for most species with reduced runoff flows Macroinvertebrates: Minor adverse impact with changes in species composition due to reduced peak flows Periphyton and Plants: Minor adverse impact with increases in filamentous green algae due to reduced peak flows	AG-01; FW-03; FW-08; FW-09
South Platte River Fish, Macroinvertebrates, Periphyton, and Plants			
72		Negligible	AG-07

Table A2. Mitigation and Enhancement Plan Summary Table - By SDEIS Resource Effect [1]

Row	Resource	Summary of Effects Alternative 2 (Proposed Action Glade and SPWCP – Reclamation Action Option)[2]	Mitigation Measure No.
Special Status Species			
73	*Preble's meadow jumping mouse*	Permanent loss of **53** acres of known Preble's habitat. Temporary disturbance to **24** acres of Preble's habitat. Potential disturbance of Preble's behavior due to increased noise and human presence and physical harm to individual Preble's from construction machinery and future recreational activities at Glade. Changes in flows in Poudre River unlikely to affect Preble's habitat.	SS-01
74	*Bald eagle*	Permanent impacts of **21** acres and temporary impacts of **13** acres of winter concentration area. **Less than 1** acre of nest buffer permanently affected and **8** acres temporarily affected. Pipeline construction impacts could result in nest abandonment or decreased nesting success if conducted during sensitive breeding and nesting periods. Glade Reservoir could provide additional summer foraging habitat, especially if stocked with fish. Galeton Reservoir could provide additional summer foraging habitat.	SS-02
75	*Colorado butterfly plant (CBP)*	**No effect.** No known populations occur in study area and is unlikely to occur in study area. Changes in flows in Poudre River unlikely to affect CBP.	SS-03
76	*Ute ladies'-tresses orchid (ULTO)*	**No effect.** None found during surveys of study area. No known populations occur in study areas and is unlikely to occur in SPWCP pipeline study area. Glade to Horsetooth pipeline route less than 1 mile from currently known populations of ULTO. Prior to construction, ULTO habitat assessments and/or final surveys would be conducted for potentially impacted suitable habitat not previously evaluated. Changes in flows in Poudre River unlikely to affect ULTO.	SS-04
77	*Black-tailed prairie dog and burrowing owl*	Permanent impacts on **367** acres of prairie dog habitat, mostly from construction of Galeton Reservoir.	SS-07; SS-09
78	*Swift fox*	Permanent impacts on **1,928** acres of overall swift fox range (**0.3 to 1.0** home ranges/pair).	SS-08
79	*Common gartersnake and northern leopard frog*	Permanent loss of **44** acres of wetland habitat, **11** acres of aquatic habitat, and **28** acres of riparian woodland habitat (gartersnake only). Temporary impacts on **8** acres of wetland habitat, **3** acres of aquatic habitat, and **8** acres of riparian woodland (gartersnake only).	SS-10
80	*Smokey-eyed brown butterfly, two-spotted skipper, and American currant*	No effect.	SS-10
81	*Bell's twinpod*	Permanent loss of **29** acres and temporary impacts on **45** acres from western realignment of U.S. 287.	SS-11
82	*Brassy minnow and common shiner*	No effect	N/A
83	*Iowa darter*	Negligible except Segment B, which would be moderate beneficial	FW-03; FW-04

Table A2. Mitigation and Enhancement Plan Summary Table - By SDEIS Resource Effect [1]

Row	Resource	Summary of Effects Alternative 2 (Proposed Action Glade and SPWCP – Reclamation Action Option) [2]	Mitigation Measure No.
Recreation Resources			
84	*Boating (kayaking and canoeing)*	If Glade is managed for recreation, new flat water boating opportunities would exist, a major beneficial effect. No public access planned at Galeton Reservoir. Poudre River Segment A: Negligible effects. Poudre River Segment B: Moderate to major effects with 3 to 7 fewer boating days per month (total of 19 fewer days over May-August period) based on target flows of 150 cfs or greater. Poudre River Segments C, D, E, and F: No effects.	FW-02; FW-03; FW-04; RC-06; FW-08
85	*Fishing*	If Glade is managed for recreation, would provide a new fishery, a major beneficial effect. No public access planned at Galeton Reservoir. Poudre River Segment A: Reductions in habitat for brown and rainbow trout would be a minor adverse effect on fishing. Poudre River Segment B: Augmented winter flows would result in minor beneficial effects on recreational fishing. Poudre River Segments C, D, E, and F: Negligible effects.	AG-02; FW-02; FW-03; FW-04; RC-06; FW-08
86	*Hunting*	Loss of **340** acres of Poudre River State Trust Land, which is managed for hunting and fishing by CPW. Construction of Glade Reservoir may improve habitat, therefore improving hunting opportunities. Loss of **21** acres of Mitani-Tokuyasu SWA. Mule deer and white-tailed deer winter range may be affected at SPWCP forebay, thus affecting nearby big game hunting. Pronghorn winter and severe winter range and mule deer winter range affected at Galeton Reservoir and may have an effect on nearby big game hunting. Construction of Galeton Reservoir may improve waterfowl habitat in area, which may improve nearby hunting opportunities.	RC-02; RC-04; RC-05
87	*Other Recreational Activities*	Construction of Glade to Horsetooth pipeline would temporarily disrupt dispersed recreational uses along its alignment. Reductions in flows on Poudre River not expected to affect aesthetic qualities of riparian habitat of Poudre River, Poudre River Trail, or natural areas. Construction of Galeton Reservoir may improve habitat in area, which may improve nearby wildlife viewing or photography opportunities. Construction of SPWCP pipelines is not expected to affect recreation resources.	N/A

Table A2. Mitigation and Enhancement Plan Summary Table - By SDEIS Resource Effect [1]

Row	Resource	Summary of Effects Alternative 2 (Proposed Action Glade and SPWCP – Reclamation Action Option) [2]	Mitigation Measure No.
Cultural Resources			
88	*Cultural Resources*	**2** known cultural resources and an estimated **35** NRHP eligible sites affected by construction of Glade Dam and Reservoir and associated facilities or would be inundated by reservoir. **7** known cultural resources and **7** unrecorded cultural resources would be affected by western realignment of U.S. 287. Of the known cultural sites, 3 of these are eligible sites, 1 is not eligible, and 3 have not been assessed. **15** known cultural resources occur within areas that would be disturbed by construction of Galeton Dam and Reservoir and associated facilities or would be inundated by reservoir. Of these 15 sites, 13 have not had an official determination and may be eligible for listing in NRHP and two are not eligible.	CR-01; CR-02; CR-03
Paleontological Resources			
89	*Paleontological Resources - U.S. 287*	Adverse impacts on subsurface fossils in areas underlain by Class 5 geologic units (Morrison Formation). Adverse impacts on potentially substantial vertebrate, invertebrate, plant, and trace fossils possible in Class 3 geologic units (Niobrara Formation, Benton Group, Dakota Group, Undivided Jelm, and Sundance Formations). Adverse impacts on potentially substantial vertebrate, invertebrate, plant, and trace fossils unlikely but possible in Class 2 geologic units (Lykins Formation). Adverse impacts consist of destruction of fossils by breakage and crushing during construction-related ground disturbance.	CR-04; CR-05
Aesthetics and Visual Resources			
90	*Aesthetics and Visual Resources*	Change in landscape from terrestrial to open water for Glade and Galeton Reservoirs. Reservoir dams would change current visual character of sites. One-third of Mitani-Tokuyasu SWA would be replaced by Galeton forebay resulting in substantial reduction in scenic quality. Realignment of U.S. 287 would create contrast in scenic quality elements where it cuts through hogback formation.	VS-01
Traffic and Transportation			
91	*Traffic Volumes*	Existing traffic patterns not expected to change so reduced traffic volumes along SH 14 between Overland Trail and Ted's Place. If recreation provided at Glade Reservoir minor seasonal fluctuations in vehicle volumes can be anticipated. reduced traffic volumes along SH 14 between Overland Trail and Ted's Place. If recreation provided at Glade Reservoir minor seasonal fluctuations in vehicle volumes can be anticipated.	GC-03
92	*Existing Roadways*	7-mile portion of U.S. 287 relocated. New alignment 2.3 miles shorter. Location of Galeton Reservoir would not infringe on or disturb any existing roadways. 2.3 miles shorter. Location of Galeton Reservoir would not infringe on or disturb any existing roadways.	GC-05

Table A2. Mitigation and Enhancement Plan Summary Table - By SDEIS Resource Effect [1]

Row	Resource	Summary of Effects Alternative 2 (Proposed Action Glade and SPWCP – Reclamation Action Option) [2]	Mitigation Measure No.
93	*Current Travel Patterns*	New U.S. 287 alignment would be about 2.3 miles shorter. Access to Bonner Spring Ranch Road may be affected by realignment and new access would be provided. Pipeline construction would potentially temporarily disrupt some transportation, depending upon alignment.	GC-01; GC-03
94	*Site Access*	Construction of Galeton Reservoir would require extension an existing roadway or construction of a private drive for purposes of accessing and maintaining facility.	GC-01
Land Use			
95	*Agriculture*	Portion of Munroe Canal inundated by Glade Reservoir. Canal would be realigned with Poudre Valley Canal or routed under Glade Reservoir.	GC-01
96	*Grazing*	Grazing permittee would lose use of District lands at Glade Reservoir. 26 acres of BLM land used for grazing inundated by Glade Reservoir. About 36 acres of grazing lease affected on State Land Board lands at Galeton Reservoir site.	GC-01
97	*Access*	CSU and Poudre School District access road into State Trust Land inundated. Existing access to Bonner Springs Ranch residential area from south altered by U.S. 287 realignment. Construction of SPWCP forebay would inundate a portion of access road and parking area of Mitani- Tokuyasu SWA.	RC-02; GC-03; RC-04
98	*Utilities*	Two towers on Platte River Power Authority 230-kV transmission line relocated. Realignment of four H- frame structures and 0.6 miles of a 69-kV electric transmission line owned by Poudre Valley REA. Proposed Cheyenne-Totem gas pipeline is shown to partially parallel SPWCP pipelines and cross proposed Galeton Reservoir forebay. Thirty-one producing oil and gas wells are within Galeton Reservoir footprint. District would relocate any well that would interfere with reservoir operations. District anticipates all wells would be abandoned by operator before Galeton Reservoir was built.	GC-01; HZ-02
99	*Natural Areas*	Reservoir Ridge Natural Area temporarily affected during construction of Glade to Horsetooth pipeline.	GC-01
100	*Urban/Residential*	2 residences inundated during construction of Glade Reservoir and 1 residence located within 500 feet of the reservoir. Construction of Glade to Horsetooth pipeline and other pipelines could potentially temporarily affect some urban and residential uses, depending upon final alignments.	LU-01; GC-01

Table A2. Mitigation and Enhancement Plan Summary Table - By SDEIS Resource Effect [1]

Row	Resource	Summary of Effects Alternative 2 (Proposed Action Glade and SPWCP – Reclamation Action Option)[2]	Mitigation Measure No.
101	*Industry*	No impact to industry.	N/A
Socioeconomic Resources			
Study area			
102	Water Rates/Affordability	Minor impact on rates and affordability for some Participants.	RC-07
103	Population growth	No effect.	N/A
Poudre River Communities			
104	Recreation Resources	Major impact on boating recreational value in Fort Collins. Moderate impact on recreational value of Poudre River Trail in Fort Collins. No effect on fishing recreation values.	FW-02; FW-03; FW-04
105	Property Values	No effect in Fort Collins. Potential minor effects downstream of I-25 due to changes in flood risks.	AG-01
106	Water/Wastewater Treatment Costs	No effect.	N/A
107	Other Socioeconomic Effects	Likely no additional effect on Fort Collins economy/economic development. Potential major impact on nonuse values associated with Poudre River for Fort Collins residents.	FW-03; FW-04
Broader Study Area			
108	Regional Recreation Resources	Major benefit from recreation at Glade Reservoir.	N/A
109	Irrigated Agriculture-Related Economy	No effect under average conditions. Minor effect under potential worst-case conditions due to increased salinity associated with the SPWCP ditch exchange.	SE-02
110	Road Relocation Effects	Moderate to major impact on gasoline station and campground at Ted's Place. No net effect on value of residential properties.	RC-06
111	Construction Effects	Construction stimulus paid for by regional residents over future years. No net effect.	N/A
112	Agricultural-related economy	Estimated annual impact on agricultural-related economic output in the study area of approximately $34 million and an estimated reduction in agriculture- related employment of about 291 jobs associated with growth onto agricultural lands and their conversion to municipal uses.	N/A
Hazardous Sites			
113	*Hazardous Sites*	Proposed Glade Reservoir forebay located near Atlas "E" Missile Site 13 and known TCE plume associated with missile site. Currently no detectable TCE within footprint of proposed forebay. Soil containing TCE not expected within proposed footprint of forebay. As contaminant mass continues to naturally attenuate TCE plume will continue to decrease in size.	HZ-01

Table A2. Mitigation and Enhancement Plan Summary Table - By SDEIS Resource Effect [1]

Row	Resource	Summary of Effects Alternative 2 (Proposed Action Glade and SPWCP – Reclamation Action Option) [2]	Mitigation Measure No.
Noise			
114	*Noise*	Increased noise associated with reservoir and pipeline construction and realignment of U.S. 287 would occur in localized areas temporarily.	GC-01
Air Quality			
115	*Air Quality*	Same as Alternative 1.	AQ-01; GC-01
Energy Use/Greenhouse Gases			
116	*Energy Use/Greenhouse Gases*	Electrical energy used to pump water up to reservoirs and for conveyance of water and for SPWCP exchange; includes additional pumping of water to Carter Lake. Projected annual electricity requirements at full utilization = 48,135,987 KwH Projected annual carbon dioxide emissions at full utilization (English tons) = 37,259	EG-01
Construction Duration			
117	*Construction Duration*	6 years.	GC-01; GC-02; GC-03; GC-04
Other CPW Effects [3]			
118	*Townsend's big-eared bat*	The inundation by Glade Reservoir of approximately seven miles of U.S. Highway 287, includes the 'loss' by flooding of the State Land Board parcel (T9N, R70W, S36) which contains a known roost site for the Townsend's big-eared bat (Corynorhinus townsendii), a State Species of Special Concern. CPW suggests that further ground surveys for additional roost sites should be conducted across the area to be inundated, and compensatory mitigation for loss of these sites should be considered if the project is approved.	SS-12

Notes:

1 Source of table is SDEIS Table 4-109 for Alternative 2 (Northern Water's Preferred Alternative)

2 Dark gray shading indicates those effects from SDEIS 4-109 that are not covered under this Fish and Wildlife Mitigation and Enhancement Plan. See Conceptual Mitigation Plan (SDEIS Appendix F) for mitigation information on these items.

3 Effects were not included in the SDEIS, but were comments and/or proposed mitigation measures by CDNR.

3RD ADDENDUM
PC HEARING 07/15/20

NISP

Northern Water and the NISP participants are also exploring various options to keep supplies in the ditch systems and available for these exchanges, to help ensure a **WaterSecure** future for Northern Colorado.

To avoid water permanently leaving farms in the New Cache and Larimer & Weld systems, **Northern Water and the NISP participants are exploring purchases of land and water from willing sellers** in the two systems, as well as looking at various other avenues to keep water on the farms. This will help ensure those supplies remain available for the NISP exchanges.

Rather than "buy-and-dry," this is an **outside-the-box, "buy-and-*supply*" approach** to address tightening supplies.

Farms in the New Cache and Larimer & Weld systems purchased by Northern Water and the NISP participants will remain in production through:

- **Limited land-use easements on the property**
- **Lease-back agreements**
- **Other arrangements that will require continued irrigation on those farms**

Furthermore, the purchase of any irrigated lands will be done with the goal to eventually **return the operations to private ownership**.

We are also exploring agreements in which New Cache and Larimer & Weld shareholders could be compensated for giving Northern Water and the NISP participants first priority in buying their land and water assets if they are planning to sell them in the future.

Water quality questions addressed

Water quality and agronomy experts have examined the water quality issues, and with proper water blending, no impacts on crop yields would occur in nearly all anticipated operating conditions, and only minor impacts on specific crops in some instances. NISP participants would certainly factor any such impacts on crops into mitigation and compensation packages, and Northern Water will also continue monitoring water quality long into the future to address any potential issues.

We encourage anyone who wants to learn more to go to **www.gladereservoir.org**, or contact **Greg Dewey** at Northern Water at **970-622-2300** or **gdewey@northernwater.org**.

NISP: Striving to develop a **WaterSecure** future for Northern Colorado's communities and farms

Northern Water
Northern Integrated Supply Project

Collaborating in a shift away from the 'buy-and-dry' approach that has stressed our agriculture communities

As part of a long-term strategy that's consistent with the goals and principles established in the Colorado Water Plan, Northern Water and the NISP participants are working to implement various measures – including a collaborative effort with the New Cache and Larimer & Weld ditch systems – that will provide supplemental water to approximately 500,000 residents in Northern Colorado while also helping preserve tens of thousands of irrigated farm acres.

Without these innovative approaches, the region is on pace to see hundreds of thousands of irrigated acres dried up by mid-century.

3970

NISP at a glance

Once constructed, the **Northern Integrated Supply Project** will consist of:

- **Glade Reservoir** northwest of Fort Collins, which will divert water from the Poudre River
- **Galeton Reservoir** east of Ault, which will store water piped from the South Platte River
- Pipelines, pump plants and other infrastructure needed for operations

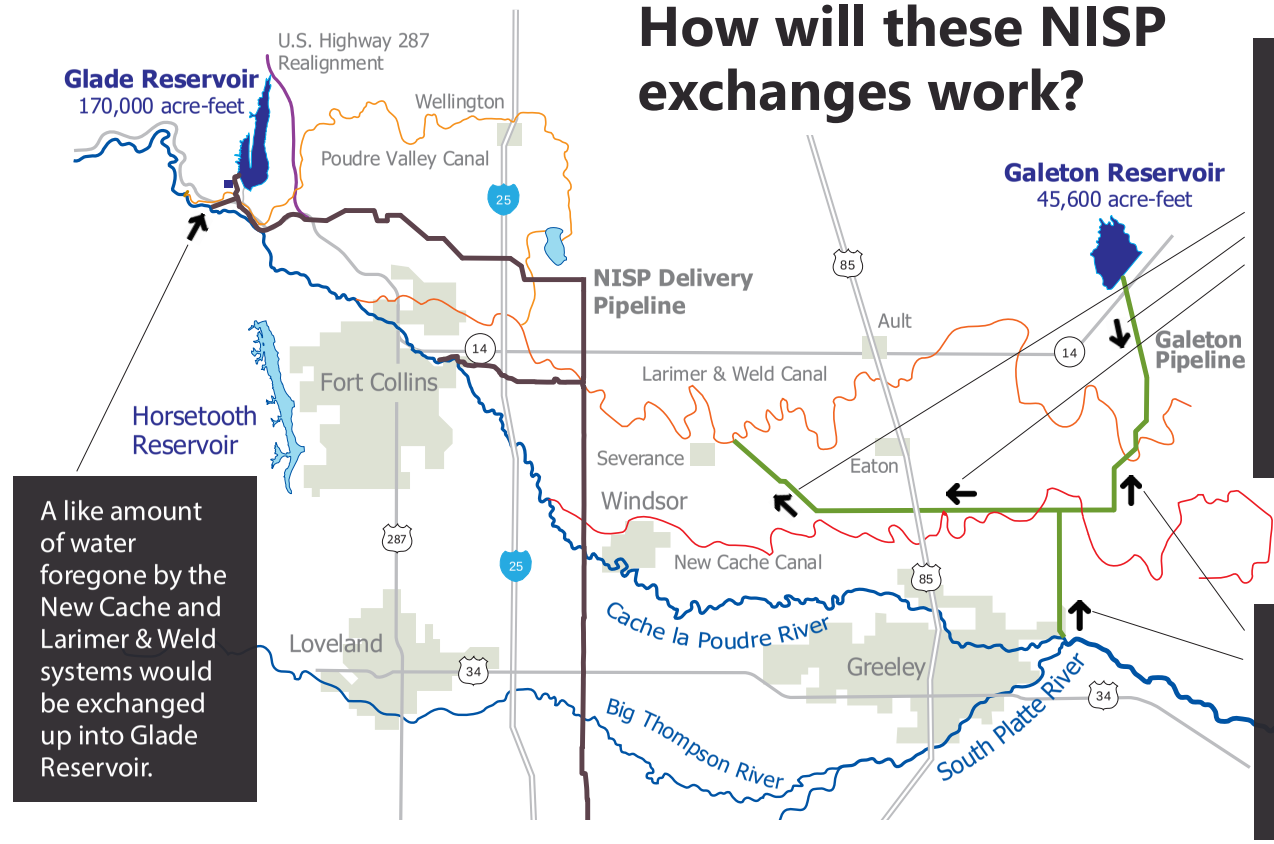
40,000 acre-feet
of additional water will be made available annually for
15 rapidly growing communities and water districts
across northern Colorado

A key component of NISP will be **water substitutions and exchanges,** in which Northern Water and the NISP participants will work with the New Cache and Larimer & Weld ditch systems. NISP will provide new water supplies to the ditch systems in order to allow Glade Reservoir to store water, by exchange, for the communities in need of those supplies.

In return, the NISP participants will provide **compensation for the two participating ditch systems, including:**

- **Monetary payments**
- **Additional water supplies from Galeton Reservoir**
- **Ditch-system improvements**

How will these NISP exchanges work?



A like amount of water foregone by the New Cache and Larimer & Weld systems would be exchanged up into Glade Reservoir.

In addition to filling Galeton Reservoir, a new pipeline system will also deliver Galeton water to the New Cache and Larimer & Weld canals, to compensate the farms in those systems.

Water will be diverted via pipeline from the South Platte River to fill Galeton Reservoir.

The NISP exchanges: A **win-win** for the farms

The NISP water exchanges are designed to be a win-win for the farms in the two ditch systems, in that:

- **Shareholders maintain control of their water, and water will continue flowing to the farms**
- Compensation from the NISP participants will **enhance the long-term viability of those ag operations**
- The ditch systems will receive additional **water later in the growing season**
- These exchanges **will not reduce the value of their water shares**
- These exchanges have been adjudicated and approved by the water court, and **will not subject the two systems' water rights to a change case**

About 25,000 acre-feet would be exchanged annually between the ditch companies and NISP participants.

This is NOT an alternative transfer method, or ATM, as they're often called. **Farms participating in the NISP exchanges will receive water each and every year**.

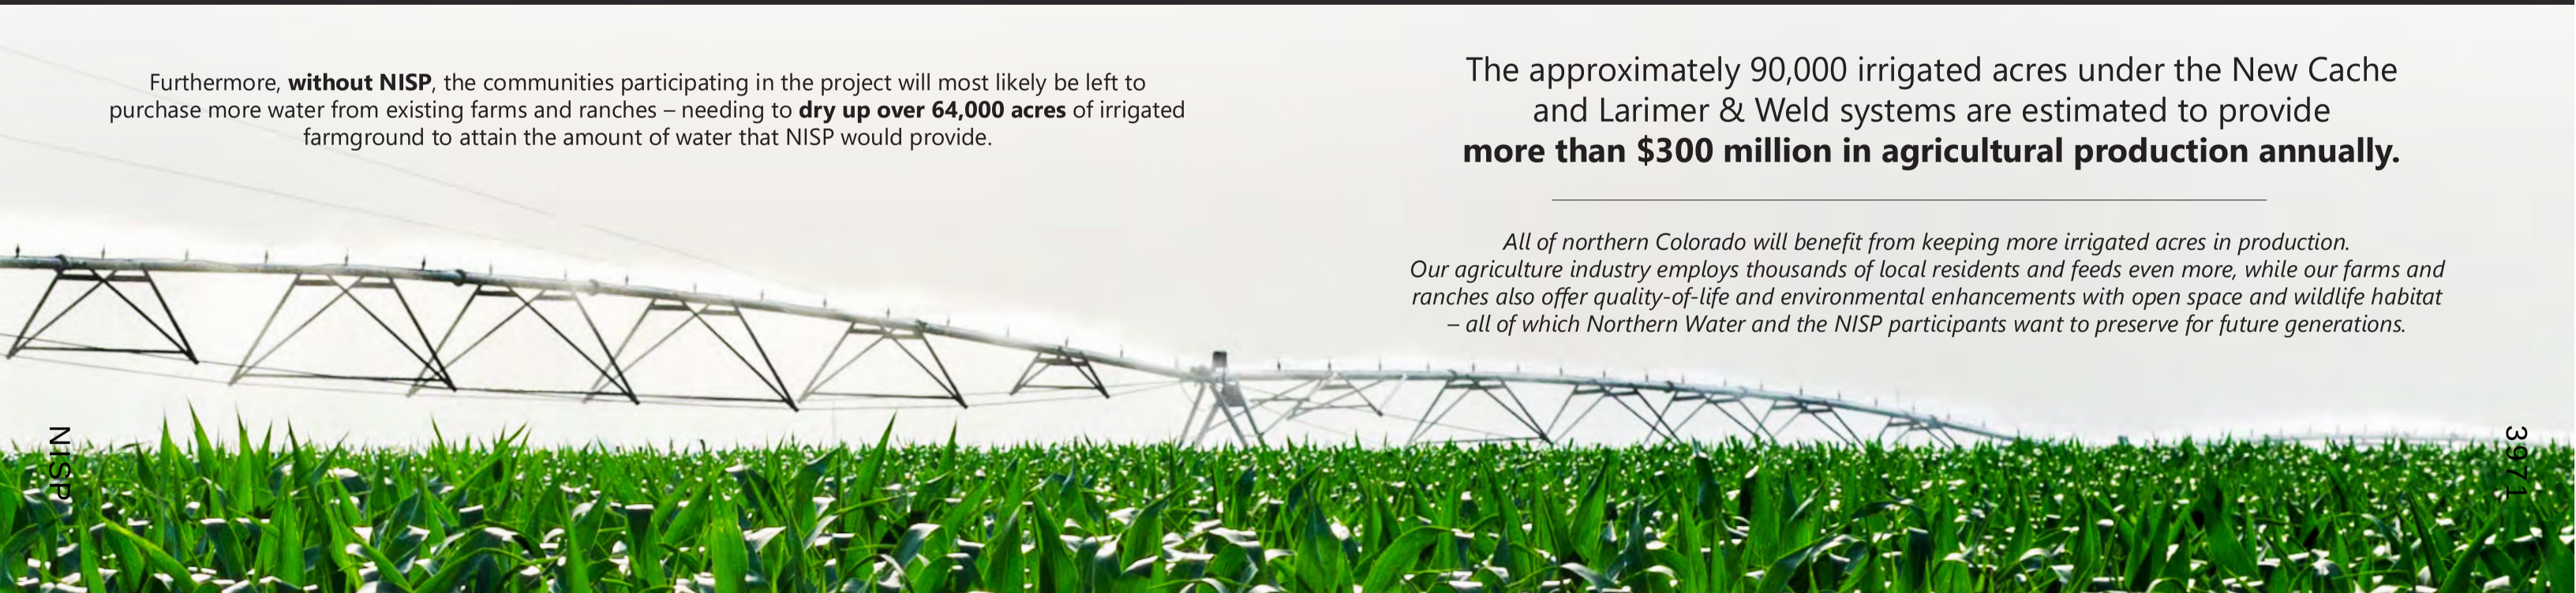
With this arrangement, the New Cache and Larimer & Weld shareholders **could receive more water for irrigation than they currently receive**.

NISP is expected to receive its Record of Decision from the Army Corps of Engineers in 2020, and following final design and construction, **the exchanges could be operational by about 2027**.

Furthermore, **without NISP**, the communities participating in the project will most likely be left to purchase more water from existing farms and ranches – needing to **dry up over 64,000 acres** of irrigated farmground to attain the amount of water that NISP would provide.

The approximately 90,000 irrigated acres under the New Cache and Larimer & Weld systems are estimated to provide **more than $300 million in agricultural production annually.**

All of northern Colorado will benefit from keeping more irrigated acres in production. Our agriculture industry employs thousands of local residents and feeds even more, while our farms and ranches also offer quality-of-life and environmental enhancements with open space and wildlife habitat – all of which Northern Water and the NISP participants want to preserve for future generations.



BCC 08/17/20

3RD ADDENDUM

PC HEARING 07/15/20

NISP

NISP's **401 Water Quality Certification**

As part of NISP's approval process, the State of Colorado granted a 401 Water Quality Certification to the project in January 2020. The state concluded that no significant water quality degradation is expected because of NISP, and **"the commitments for mitigation and water quality improvement measures are sufficient to result in positive net effects."**

Northern Water
Northern Integrated Supply Project

The 401 Water Quality Certification was issued following the State's year-long review of an extensive NISP application, which considered public comments.

The certification outlines 30 conditions in which Northern Water and the NISP participants will implement a wide array of measures and processes to ensure, for years to come, that the project's operations won't negatively affect the Poudre River's health, and that any potential impacts can be mitigated.

The commitments outlined in the NISP 401 Certification include long-term **MONITORING, REPORTING and MODELING**, to help maintain and even enhance the health of the Poudre River.

We'll collaborate with local and regional partners to implement **MITIGATION and ADAPTIVE MANAGEMENT** measures that will further enhance the Poudre River – an ecologically vibrant stream – for local residents and wildlife.

The NISP participants are committed to contributing millions of dollars in **FUNDING** to implement these efforts, as well as others, so the Poudre River can continue serving as a reliable and safe water supply for years to come.

NISP's Adaptive Management Program

Northern Water
Northern Integrated Supply Project

3RD ADDENDUM
PC HEARING 07/15/20

As part of measures outlined in NISP's 401 Water Quality Certification and its Fish and Wildlife Mitigation and Enhancement Plan, an Adaptive Management program will be implemented, in which Northern Water will collaborate on river health initiatives with Colorado Parks and Wildlife, the Colorado Water Quality Control Division, and other partners.

An unprecedented opportunity for collaboration focused on the health of the Poudre River

Learn more at gladereservoir.org

The Northern Integrated Supply Project is a water-storage endeavor that will help rapidly growing Front Range communities meet their future water needs, while also implementing protections for the environment and wildlife, creating new recreation opportunities, and helping preserve our local farms. Additionally, through this Adaptive Management program, NISP will also implement an array of components that will help further develop an ecologically vibrant and resilient Poudre River corridor, by utilizing existing and new partnerships in a holistic approach to the river's health.

Improved Water Quality • Enhanced Poudre River Recreation • Better Aquatic Health
Increased Flood Resilience • Improved Wildlife Habitat

NISP

3974

The Adaptive Management program's various monitoring, funding, mitigation and enhancement measures will be **implemented across a 42-mile stretch of the Poudre River**, from its mouth at the canyon to its confluence with the South Platte River.

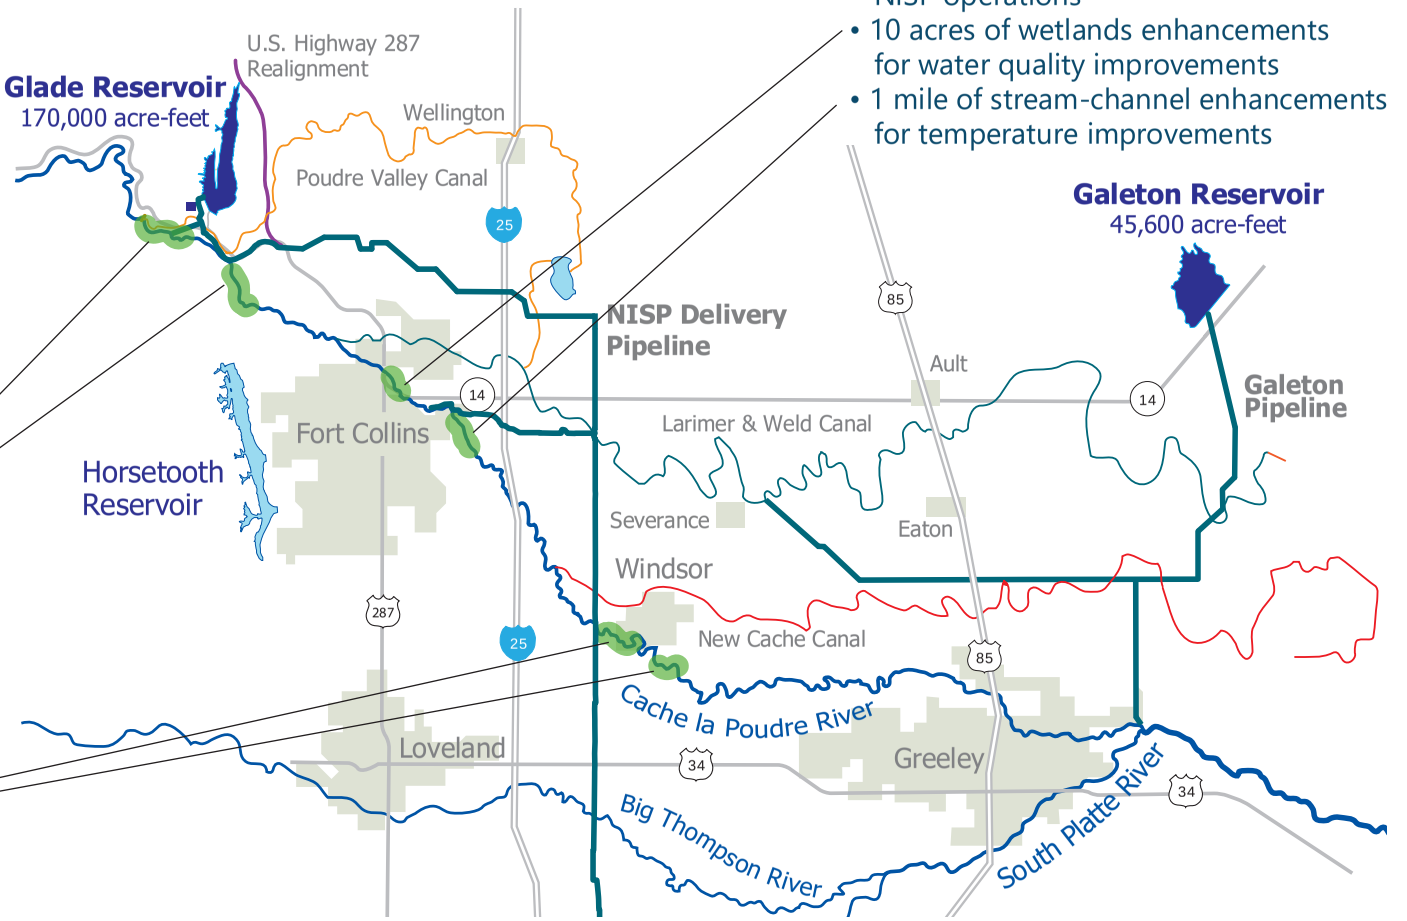
Fish Ladders • Cottonwood Regeneration • Creation of Wetlands to Improve Water Quality
Stormwater System Upgrades • Channel Reconfiguration for Habitat Enhancements
Sediment Management • Development of a Temperature Refuge

Key Adaptive Management Commitments from NISP's Fish and Wildlife Mitigation and Enhancement Plan

- $1 million for River Master Plan development
- $5.9 million in total costs to implement various Adaptive Management measures
- Monitoring of potential impacts from Adaptive Management measures and NISP operations
- 2.4 miles of stream-channel improvement projects (two 1.2-mile stretches), where flood plain-channel connectivity restoration will take place, as well as 54 total acres of riparian vegetation improvements in the surrounding area, including cottonwood regeneration
- 48 total acres across two sites of riparian vegetation improvements

Key Adaptive Management Commitments from NISP's 401 Water Quality Certification

- $1.5 million for E.Coli reduction measures and studies
- $925,000 for nutrient reduction measures and studies
- Monitoring of potential impacts from Adaptive Management measures and NISP operations
- 10 acres of wetlands enhancements for water quality improvements
- 1 mile of stream-channel enhancements for temperature improvements



The measures identified in the Adaptive Management program only account for a portion of the NISP components that will benefit the region's watershed and ecosystem. Through all of its various programs, NISP is all together committing nearly $60 million toward mitigation and enhancement for the local environment and wildlife.

BCC 08/17/20

Two reservoirs that will help Northern Colorado meet its future water needs

NISP will supply 15 water providers with **40,000 acre-feet of new, reliable water supplies**. Northern Water is pursuing permitting, design and construction of this estimated **$1.2 billion project** on behalf of the participants, who will be providing water to nearly half a million residents by 2050.

The project's main components include:
- Two new reservoirs (Glade Reservoir northwest of Fort Collins, and Galeton Reservoir northeast of Greeley)
- Pipelines to deliver water to the participants and for water exchanges with two irrigation companies
- Five pump plants

Growing communities taking diverse steps to meet future demands

Central Weld County Water District • Dacono • Eaton • Erie
Evans • Firestone • Fort Collins-Loveland Water District • Fort Lupton
Fort Morgan • Frederick • Lafayette • Left Hand Water District
Morgan County Quality Water District • Severance • Windsor

These 11 fast-growing communities and four water districts **currently serve water to about 250,000 residents, with that expected to double by 2050.** In addition to NISP, they are embracing conservation efforts, reuse and other opportunities to meet their future water demands, **having already collectively reduced their per capita water consumption by nearly 30 percent** since 2000.

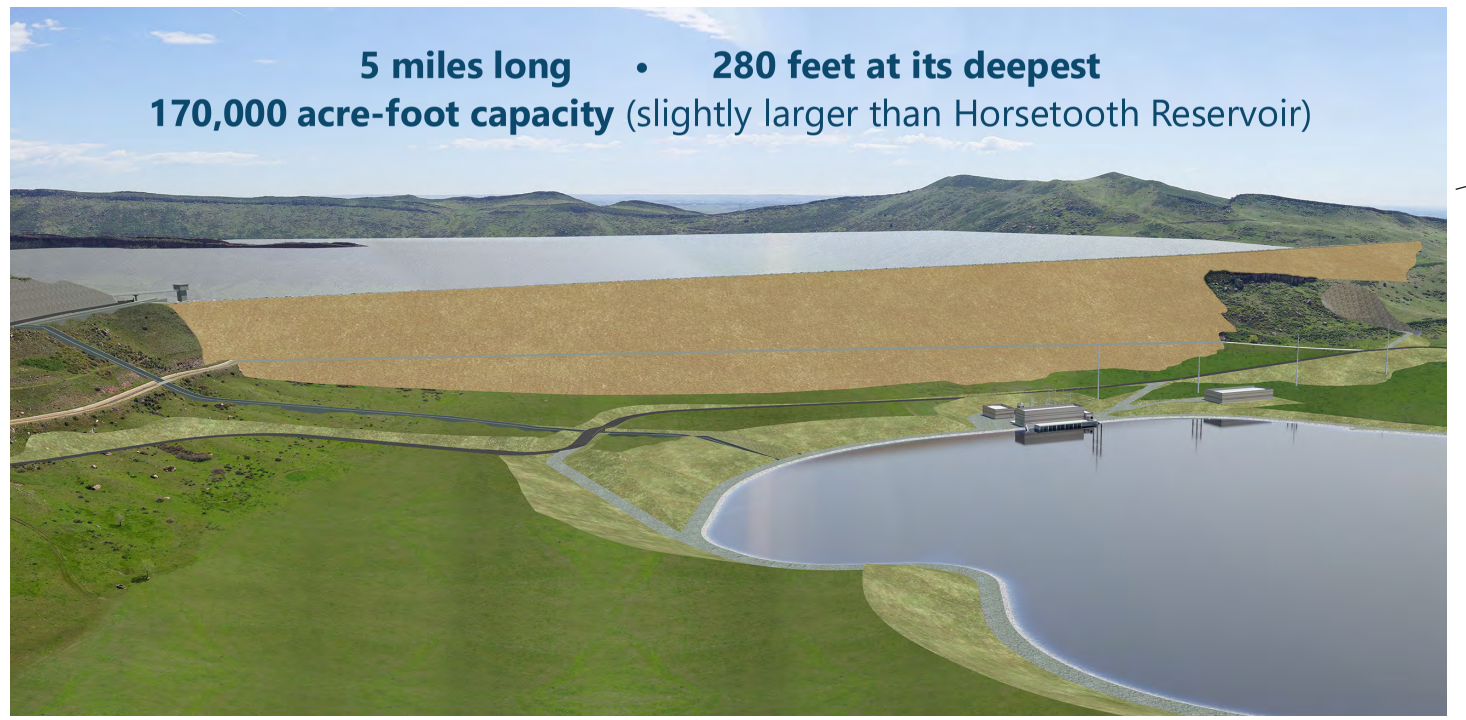
A project that aligns with the goals of the Colorado Water Plan

The Colorado Water Plan reinforced the necessity of additional water storage to help meet the state's future water gap. The gap is the difference between the estimated future water demands and existing supplies by the year 2060.

The Colorado Water Plan identifies the need for 400,000 acre-feet of additional storage statewide. NISP can play a role in meeting a portion of the impending water gap in Colorado.

The plan also identifies water conservation and increased water transfers between the agricultural and municipal sectors as additional solutions to help meet the impending gap.

Glade Reservoir



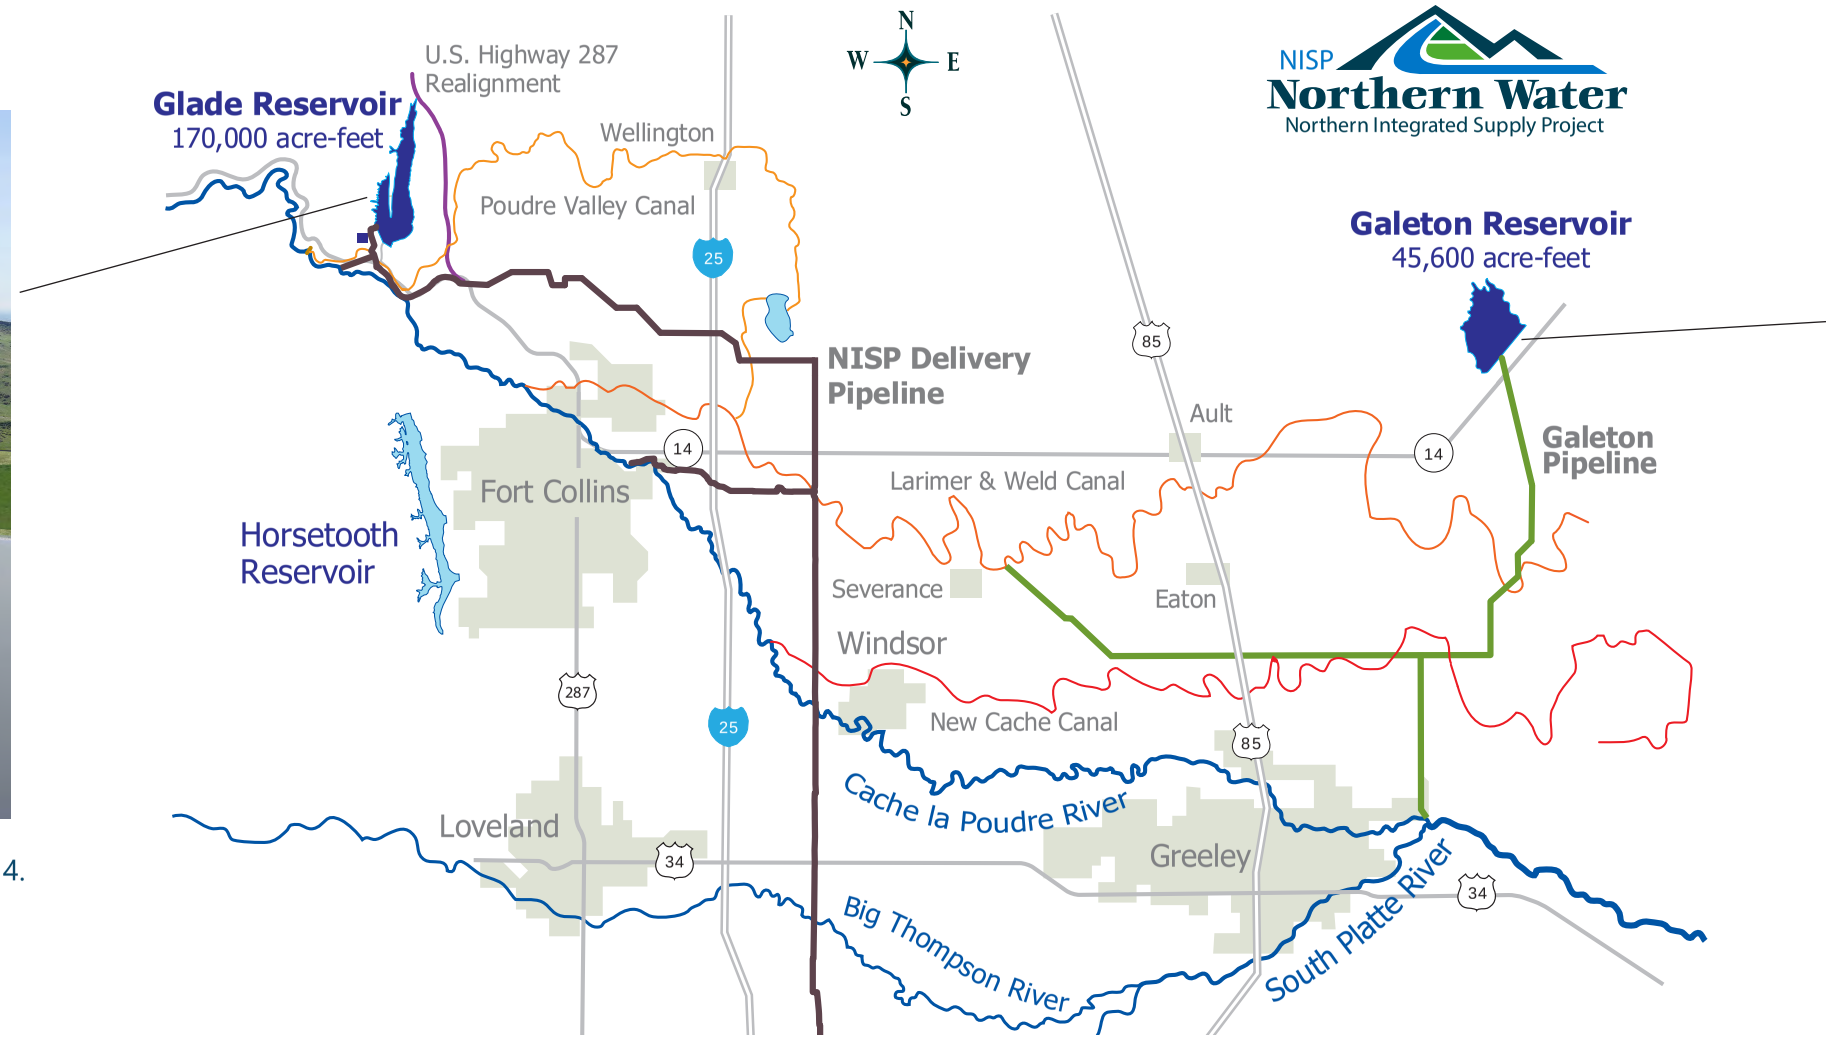
3RD ADDENDUM
PC HEARING 07/15/20

- Glade will be located northwest of Fort Collins near the intersection of U.S. Highway 287 and State Highway 14.
- The reservoir will divert water from the Poudre River during mostly high-flow times.
- The project will use the already existing Poudre Valley Canal near the canyon mouth to divert water from the river to the Glade Reservoir forebay. As part of NISP, the PVC's diversion structure will be upgraded.
- The reservoir site is divided by U.S. Highway 287, and therefore, about seven miles of the highway will be relocated to the east.

Bringing new recreation opportunities to the region

In addition to needed water storage and environmental-protection measures, NISP will bring new recreation opportunities to Northern Colorado, with a recreation concept plan that calls for **motorized and non-motorized boating, fishing, camping, hiking and biking at Glade Reservoir.**

NISP



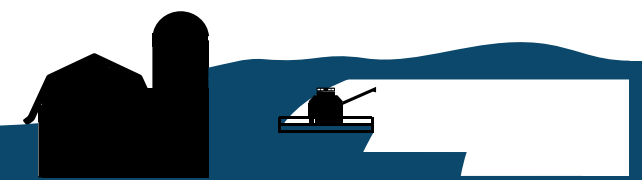
You can learn more about NISP at **www.gladereservoir.org**.

Current status and upcoming timeline

2017 – Approval of Fish and Wildlife Mitigation and Enhancement Plan
2018 – Final Environmental Impact Statement released
2020 – Anticipated 401 Water Quality Certification Permit from the State of Colorado
2020 – Anticipated Record of Decision and 404 Permit from the U.S. Army Corps of Engineers
2019-2022 – Project design to be finalized
2023-2027 – Anticipated construction dates
2028 – First water stored in Glade Reservoir

Galeton Reservoir

- This reservoir will be located east of Ault and northeast of Greeley.
- Water will be diverted from the South Platte River downstream from Greeley at high flow times.
- Galeton Reservoir water will be delivered to the Larimer-Weld and New Cache ditch companies in exchange for a portion of the Poudre River water they currently use. (About half of NISP's planned diversion from the Poudre River includes water that's already been diverted for decades by these two ditch companies.)



A project that will also help protect local farms

In order to fill Glade Reservoir, NISP will strategically utilize water exchanges with the Larimer-Weld and New Cache ditch companies in Weld County, both of which have senior rights on the Poudre River. In return, the NISP participants will provide compensation for the two participating ditch companies, including:
- **Monetary payments**
- **Additional water supplies from Galeton Reservoir**
- **Ditch-system improvements**

Additionally, the ditch-company shareholders will maintain control of their water and water will continue flowing to their farms and ranches, while the compensation from the NISP participants will enhance the long-term viability of those ag operations.

Furthermore, without NISP, the communities participating in the project will most likely be left to purchase more water from existing farms and ranches — needing to dry up more than 64,000 acres of irrigated farmground to attain the amount of water that NISP would provide.

3976

BCC 08/17/20

3RD ADDENDUM

PC HEARING 07/15/20

NISP

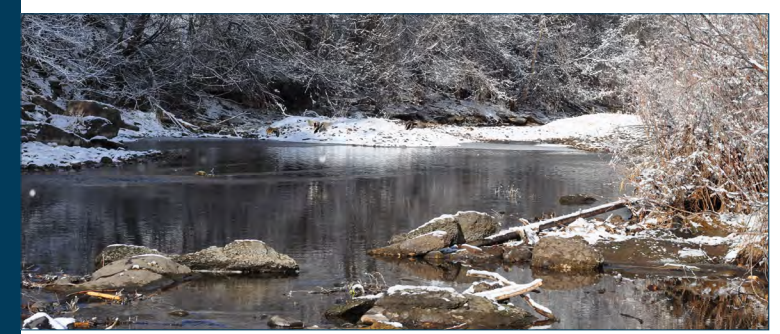
A project that will help maintain the Poudre River's streamflows and protect our environment and wildlife

The NISP Fish and Wildlife Mitigation and Enhancement Plan – approved by the Colorado Parks and Wildlife Commission, Colorado Water Conservation Board and Gov. John Hickenlooper in 2017 – includes an array of components that will benefit our environment and local wildlife. Northern Water has also made additional environmental commitments in its Conceptual Mitigation Plan that are included in the Final Environmental Impact Statement.

Overall, NISP is committing nearly $60 million toward mitigation and enhancement for the local environment and wildlife. These measures include:

Streamflow Commitments

- Water releases from Glade Reservoir of 18 cubic feet per second in the winter and 25 cfs in the summer, which will eliminate existing dry-up points in the river through downtown Fort Collins and improve streamflows year-round.
- Curtailing diversions when Poudre River flows are less than 50 cfs in the summer and less than 25 cfs in the winter.

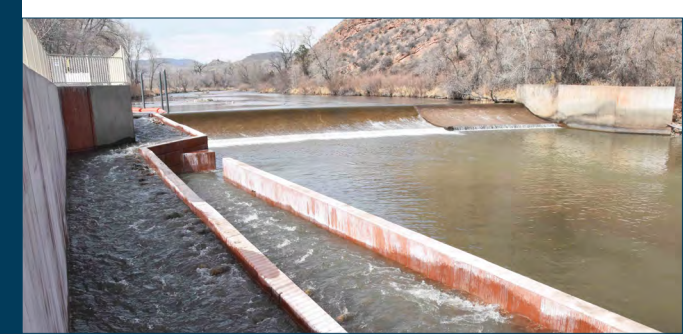


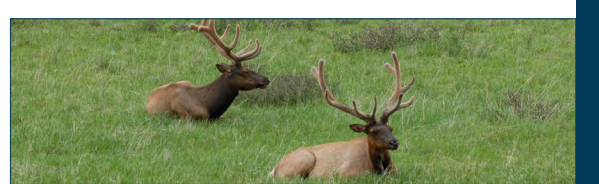
Flushing Flow Commitments

- Commitments in which Glade Reservoir won't divert Poudre River water during peak flows in 2/3 of years, and will bypass diversions for up to three days – equivalent to as much as 6,000 acre-feet in most years.
- The project's streamflow commitments will result in little to no diversions during peak flow conditions in 90 percent of years.

Stream Channel Commitments

- Building bypass/fish passage structures at four diversion dams through Fort Collins and at the Poudre Valley Canal diversion at the canyon mouth.
- Stream channel improvements on two reaches that cover 2.4 miles.
- Commitments of nearly $8 million for channel and riparian vegetation improvements.





Other Commitments

- Wildlife habitat conservation covering about 1,400 acres around Glade Reservoir.
- Wetlands and endangered species mitigation.
- Recreation/fishery benefits at Glade Reservoir.

NISP Endorsements

With NISP bringing so many benefits to the region, the project has earned support from numerous entities and individuals.
