ATTACHMENT E

6124 N. County Rd. 29C
Bellvue, CO 80512
27 November 2019

Mr. Rob Helmick
Senior Planner
Larimer County Planning Department
Larimer County, Colorado

Dear Mr. Helmick:

I am writing to emphatically state that I oppose the Conceptual Glade Recreation Facilities Plan proposed by NISP. Although I consider the entire Glade Reservoir project a losing endeavor, I will focus this letter on reasons I believe the recreational plan is bad for both nearby residents and for Larimer County in general.

The proposed recreational facilities will adversely affect the property value and the quality of life of residents owning property along the west side Highway 287. These residents will be in close proximity to the reservoir and its access roads, parking lots (cars and trailers), boat ramps, and camping grounds. Construction of these roads and sites will destroy the natural beauty surrounding our properties by turning untouched hillsides and gorgeous vistas into unsightly roads, parking lots, and expanses of tents and RVs. The proposed recreational facilities will result in nearby residents having to endure noise pollution (radios, voices, motor boats, generators, vehicles), air pollution (road dust, vehicle/boat exhaust, campfire smoke, etc.), and light pollution. Perhaps most important, presence of new roads, parking lots, and camp grounds will significantly increase the risk of wildfire - a HUGE concern in our already vulnerable area.

The recreational facilities proposed will be visited by an estimated 379,000 visitors per year, more than 1,000 people per day. This presents a huge burden on Larimer County. The proposed facilities including roads, trails, parking areas, campgrounds, restrooms, entry station, visitor center will require significant county resources for patrol, management, and maintenance. In addition, the already overburdened emergency responders in the area will undoubtedly see calls for services increase greatly. Standing water in the proposed reservoir (particularly since Glade will have fluctuating water levels) along with presence of human food and waste, will undoubtedly result in increased spread of insect borne infectious diseases such as West Nile Virus, Pigeon Fever, and Vesicular Stomatitis Virus.

We residents of Larimer County depend on our Planners and Commissioners to protect our interests; yet most County residents will not receive water benefits from the Glade Reservoir. Nor are the proposed recreational facilities likely to offer enjoyable water

related activities since water quality and water levels are likely to be often inadequate. The proposed recreational benefits definitely do not outweigh the disadvantages.

I implore you to reject the Glade Recreational Facilities Plan proposed by NISP, and, in fact, to work toward rejection of Glade Reservoir entirely in favor of a more up to date and efficient water use/storage plan that will not destroy the natural resources of our lovely County.

Thank you for giving my thoughts and concerns your serious consideration.

Sincerely,
Janice. M. Bright

28Nov2019

Rob Helmick
hemicrp@co.larimer.co.us

Dear Mr. Helmick,
I am currently a resident living on N County Road 29 C and have so for approximately 11 years. My wife and I have worked and played here and bought this house/land because of the pristine nature of our surroundings and the peace and quiet this area brings into our lives. We are both retired and in love with the slow and quiet nature this valley brings to our golden years.

I am writing to vehemently oppose any development (Glade Reservoir and proposed recreational facilities) that would bring environmental chaos to our area including many of our neighbors here on N 29 C, our neighbors in Bellvue and Laporte, and our neighbors to the north living in beautiful and bucolic Bonner Peak Ranch.

What upsets me the most about this Glade proposal is that most of the people "benefiting" from this structure are living outside Larimer County while those living adjacent to the proposed reservoir will be bearing the personal costs and sacrificing our peaceful style of life that we hoped would last well into the future. There is a strong degree of social injustice that accompanies this entire proposal.

I am concerned about the impact this project will have on the noise level of our valley (noise pollution), air pollution, the detrimental environmental effects on wildlife biodiversity, light pollution (the loss of our dark skies devoid of light so we can see starlit skies and constellations), possible contribution to wildfires by increased traffic in our surrounding hills and forests, the potential for trespassers straying away from the reservoir and on to contiguous private property, and the potential contribution to new development to this region and overcrowding. I am also concerned about the incredible pressure that will come to bear on our emergency response personnel who are already stretched to the limit in providing adequate coverage to our neighbors. As mentioned earlier, perhaps the most undesirable consequence is the noise pollution we can expect from this project not only during its 4-5 years period of construction, but from the traffic to and from the recreational facilities that are proposed. I don't want to think about the incredible disturbance to our peaceful valley motorboats and their occupants will bring.

Most of my neighbors are older retirees and some suffer from heart and lung disease. The dust from the area and air pollution from fossil fueled engines of all kinds will likely trigger some difficult breathing issues for them.

Building a reservoir for the purposes intended seems technologically 'old school'. Surely through better and more stringent conservation measures and access to aquifers through more advanced engineering techniques will better serve the needs of development far into the future with minimal impact to surrounding homes and villages.

Please SCRAP this entire GLADE proposal and work on a more environmentally and personally satisfying solution for our future. Please do not let 'corporate America" once again shove their agenda in our lives! Greed and power are pushing this development which is SOP these days!

Thank you for your time and consideration.

Sincerely,

Ronald M Bright, DVM MS DACVS
Resident on N CR 29 C

Subject: Suspend Hearings - Save Lives

To the Larimer County Commissioners:

Please correct any misconceptions, but it appears that Larimer County refuses to suspend the public hearings on the huge Northern Integrated Supply Project (NISP) application during a national pandemic, that already poses dangerous health risks for your constituents.

Despite the fact that NISP has been in the works for 17+ years, you are unwilling to alter the hearing schedule, in order for affected and concerned citizens to participate in the public process to the fullest extent possible once the pandemic eases. It seems all too easy for the Board to say, “Our hands are tied”—the public be damned.

Furthermore, it appears you will senselessly put the nine citizen members of the Planning Commission, nonessential county staff, numerous representatives of the applicant, yourselves and your families at risk to conduct hearings, while limiting the full participation of the general public.

Is that the plan, when Jefferson, Adams, Arapahoe, Douglas, Boulder and Denver Counties are issuing orders to stay at home, as is the Larimer County Health Director?

Apparently being term-limited gives some commissioners free reign to demean citizens and local organizations (in the Board’s public emails,) when they express understandable frustration with the NISP hearing schedule. As elected officials, you should be more skilled in controlling your contempt.

Criticizing constituents shows your clear bias, makes the Board look petty and reflects poorly on your obligation to represent all of Larimer County. Be grateful that your constituents care how greatly NISP will impact the character and natural environment of the county they call home.

Will it be your legacy to push through a monstrous project that is unlikely to even be built during the current recession/coming depression, due to the fact that the NISP partners will no longer have the financial stability to move forward?

What’s the rush to stick taxpayers with an empty pipeline to a dry reservoir that requires rerouting a federal highway and permanently disrupting the lives of Larimer County residents?

Do the right thing for your constituents. Suspend public hearings until the pandemic is over.

Karen Wagner

PROTECTING THE WEST'S LAND, AIR, AND WATER

Sent via email to Larimer County Planning Commission and Board of County Commissioners

March 27, 2020

Larimer County Planning Commission and
Board of County Commissioners
Larimer County Offices
200 West Oak, Suite 2200
Fort Collins, CO 80521

RE: Request to Postpone Upcoming NISP Planning Commission and Board of County Commissioner Hearings Due to Coronavirus and Extensive Materials to Review

Dear Planning Board and County Commissioners:

Western Resource Advocates supports the opportunity for public input on the Northern Integrated Supply Project (NISP). You recently announced an upcoming May 6 Planning Commission Hearing and June 8 Board of County Commissioners Hearing.

Due to unique current circumstances—the Coronavirus outbreak; recent county, state and national Declarations of Emergency; the extensive amount of material provided with Northern Water's First NISP permitting submittal (62 individual files, many of which are highly technical); and the complex and controversial nature of this project—we request that the County postpone scheduling these public hearings.

This unprecedented moment in time is impacting and complicating daily life for all of us. We believe insuring the public is provided adequate opportunity to review and comment on NISP permitting materials is a high priority and but will be extremely challenging under the current schedule. In addition to many citizens being largely absorbed in just getting through each day, some members of the community may not be accustomed to using and/or may not have access to computers and the internet. Thus the ability to comment online or otherwise likely isn't equitable across all citizens, particularly during these trying times when public computers and internet are inaccessible.

In-person attendance at public hearings provides a critical opportunity for community members to provide their comments and to hear from others. Given that we do not know when such in-person public hearings will be able to take place, we urge the County to delay any public hearings regarding NISP until this can occur. As an example, hundreds of individuals attended recent public hearings held by the County on the proposed Thornton Pipeline. We ask that you do not deny citizens a similar opportunity to provide you with their comments about NISP.

Salt Lake City, UT 84101

Postponing these hearings seems appropriate given the timescale of this project proposal. The Army Corps of Engineers first issued a notice of intent to prepare an EIS for the NISP project in August of 2004, nearly 16 years ago. Re-scheduling County public processes related to permitting will undoubtedly support public engagement and is a minimal inconvenience in light of the overall project timeline.

Thank you for considering our request to postpone any public hearings, to protect and support public health and provide adequate opportunity for public review and comment on the voluminous permitting materials recently provided by the Northern Integrated Supply Project Water Activity Enterprise.

Sincerely,

Bart Miller
Healthy Rivers Program Director

Dear Commissioners,
I know you are meeting to discuss the Thornton project tomorrow. Given we are all in this together I would hope any further discussion will be postponed until the public can also attend and participate. This pipeline effects us all just as much as the virus. We are all in this together on both issues. To proceed at this time of crisis with out the public~ who's lives will be directly impacted~ would be wrong on so many levels. Please wait until such time we can all participate. That is the right thing to do!
Thank you for listening

Dear Commissioners Donnelly, Johnson and Kefalas,

As residents of Larimer County that may be directly affected by this project, we ask for the delay of these hearings while we are still being instructed to stay home. We know that it's possible to participate in these kind of proceedings online, but frankly, we seem to be spending in an inordinate amount of time just figuring out how to decontaminate our purchases from the grocery store. We can't imagine plowing through the pages of this current 1041 and coming up with a coherent statement that would adequately express our opinion on this proposed project. We don't believe we are alone. A delay will give us all a chance to reset, use our frontal lobes for more than survival during this pandemic, to address issues that affect our happiness here and now on this big whirling dirt ball we call earth.

We hope you, your families and friends stay Covid-19 free. We look forward to seeing you all in person.
Thanks much.

By email
Larimer County Board of County Commissioners [bocc@larimer.org]
Commissioner Steve Johnson [swjohnson@larimer.org]
Commissioner John Kefalas [jkefalas@larimer.org]
Commissioner Tom Donnelly [tdonnelly@larimer.org]

Re: Citizen Petition for Indefinite Postponement of all Larimer County Land Use Hearings involving the Areas and Activities of State Interest Act ("AASIA"), Larimer County 1041 Land Use Code, Section 14.

Dear Commissioners:

On behalf of Save the Poudre and its approximately 600 Larimer County members, we hereby formally petition the Larimer County Board of County Commissioners to use its legal authority and/or emergency powers to indefinitely postpone all land use hearings under the County's 1041 regulations and pause in scheduling any future 1041 hearings until the current COVID 19 crisis is under control and would allow in person hearings. This Petition applies to, but is not limited to, any public meetings related to Northern Water's 1041 application for the Northern Integrated Supply Project ("NISP").

As you know, on Wednesday March 25, 2020 the Larimer County Health Department issued a "stay at home" order for all Larimer County residents.[1] Shortly thereafter, Governor Polis issued a "stay at home" order for the entire state of Colorado.[2] Neither order contains a provision allowing in person participation in a government sponsored land use hearing.

Despite the well-known COVID 19 crisis and various "stay at home" orders, Larimer County has scheduled 1041 land use hearings before both the Larimer County Planning Commission and Board of County Commissioners. By means of example, on March 18, 2020 Leslie Ellis of the Larimer County Community Development Department "scheduled a public hearing with the Larimer County Planning Commission in April 29 at 6:30 p.m.…[and] a public hearing with the Larimer County Board of County Commissioners on Monday June 8, 2020…" related to the NISP. We hereby petition the Board to overturn this decision by Ms. Ellis, indefinitely postpone all 1041 hearings, and pause in the scheduling of future hearings until the

[1] https://www.larimer.org/spotlights/2020/03/25/larimer-county-public-health-director-issues-stay-home-order-slow-spread-covid
[2] www.covid19.colorado.gov

current COVID 19 crisis is under control and would allow for in person hearings.

As the name implies, AASIA 1041 applications involve areas and activities of State interest. As such, they are some of the largest and most impactful construction projects occurring in the state. Such projects can often impact wide swaths of Larimer County, significantly impacting residents, including loss of property rights, interrupting traffic, causing congestion in emergency access routes, and other significant issues. Therefore, it is vitally important that the Larimer County citizens have adequate time and opportunity to both prepare for such land use hearings and present in person testimony at such hearings.

In recent days, Commissioner Johnson has received numerous emails from Larimer County residents asking the Board to use its legal authority and/or emergency powers to indefinitely postpone scheduled 1041 land use hearings. In response, Commissioner Johnson has taken the preliminary public position that the Board may not legally postpone any 1041 land use hearings. We disagree with Commissioner Johnson's interpretation of the law and hereby formally petition the full Board to override Commissioner Johnson's preliminary interpretation and indefinitely postpone all scheduled 1041 public hearings and pause the scheduling of any further 1041 hearings until the current COVID 19 crisis is under control and would allow for such in person hearings.

In Commissioner's Johnson's correspondence with Larimer County citizens, he indicated that he would confirm his preliminary interpretation with the Larimer County attorney. On March 25, 2020, Deputy Larimer County Attorney William Ressue stated that the county has flexibility in conducting its business, especially during a declared emergency.[3] We agree with your attorney and believe this flexibility allows an indefinite postponement of all 1041 public hearings until the present crisis is under control.

First, the Board has a legal duty to "be receptive to other policy initiatives from citizens…" Larimer County Land Use Code ("LUC") Section 2-67(4)(4). The Board also has a legal duty "to identify the needs of the citizens as they relate to the county's activities and scope of influence, and shall translate such knowledge into the articulation of board objectives policies." LUC 2-69(b). Further, one of the Board's strategic goals is to "proactively deal with threats from natural and human-caused hazards within and around the county." LUC 2-144(c). "In the event of an emergency, the county manager shall not fail to take appropriate action immediately to ensure the safety of the public and public and private assets, including authorizing specific actions by county staff and facilitating the declaration of an emergency by the board of county commissioners…" LUC 2-118(3). As confirmed by your attorney, these and other provisions of County and State law confer broad legal authority and/or emergency power to the Commissioners, which would include the indefinite postponement of 1041 public hearings during a nationwide public health crisis.

Given the State and County "stay at home" orders, conducting "virtual" public meetings

[3] https://www.coloradoan.com/story/news/2020/03/25/larimer-county-sets-public-hearings-nisp-water-project/5078944002/

instead of in person public meetings would not resolve our concerns. The "stay at home" orders prevent Larimer County citizens from meeting in person and coordinating effective preparation for both the Planning Commission and Board public hearings. While the County government may have access to expensive and sophisticated video conferencing, your Larimer County citizens have no such access.

Further, to date there has been no practical explanation why 1041 public hearings must be conducted in such a compressed time frame. For example, the Northern Integrated Supply Project has been in planning for years, is dependent on several additional state and federal permits that have yet to be finalized, and thus will not be poised to commence construction in the year 2020. As such, the only emergency is the COVID 19 emergency—there is no emergency to process any 1041 applications.

Finally, the Board has set a precedent by previously postponing public hearings on the Thornton Pipeline 1041 permit for a period of 4 months. More specifically, on August 1, 2018 the Board postponed the Thornton Pipeline 1041 hearing in order "to involve the public in the information-gathering process through public meetings or open houses."[4]

Unfortunately, time is of the essence. A 1041 Planning Commission meeting is one month away and a Board 1041 hearing is shortly thereafter. Accordingly, we request that the Board respond in writing to this Petition no later than Friday April 3, 2020 at 5pm MTN.

In the event the Board denies this request, we ask that the Board provide a written record of the motion presented to the Board, how each member of the Board voted on the motion, and complete legal rationale for the Board's denial of this Petition.

Thank you for your consideration of this Petition.

Sincerely

s/ John Barth

Dear Commissioners,
I would like you to take note that I feel it is unfair to continue permitting that affects our community without hearing that communities input. Please suspend the NISP permitting process during the coronavirus pandemic to ensure that all of our voices are heard. During this pandemic our elected officials should be an advocate of keeping their public safe and abiding of the governors shelter in place order without worrying about permitting being pushed through without their voice being heard. Please wait until the quarantine is lifted and we can resume attending normal public meetings/ hearings.
Thank you,
McAlpine

Please Suspend NISP Permitting During COVID-19 Pandemic

1 message

Courtney Blackmer-Raynolds <courtkbr@everyactioncustom.com> Mon, Mar 30, 2020 at 12:21 AM
Reply-To: courtkbr@gmail.com
To: rhelmick@larimer.org

Dear Community Development Rob Helmick,

To whom it may concern,

I am getting in touch to ask you to please suspend the permitting process for NISP until after the coronavirus outbreak has ended. It is not fair to move forward with a public permitting process at a time when the public is unable to participate in the process. This is unjust and manipulative. The free flowing Poudre River is a shared community resource of tremendous value. Do not degrade it without consulting with the public. Allow us to speak for our river.

Thank you for reading my request. Please don't hesitate to reach out if you have any questions.

All the best,
Courtney

Sincerely,
Courtney Blackmer-Raynolds

Subject: Please suspend NISP permitting process
To: <bocc@larimer.org>

Dear Commissioners,
My husband and I have written you once before on this topic via a link provided at the Save the Poudre site. We'd like to reiterate our request once again via these words from the No Pipe Dream site:

We strongly urge you to suspend the NISP permitting process during the coronavirus pandemic to ensure that all of our voices are heard. Please do not push this through during a time of crisis. Please wait until business is back to normal when we can adequately review the materials on NISP and attend open public hearings.

Thank you,
Susan Marshall

To: rhelmick@larimer.org

Dear Community Development Rob Helmick,

Colorado is in the midst of a "State of Emergency" and one of the greatest public health crises this nation has ever seen. The COVID-19 pandemic has already had wide sweeping repercussions, paralyzing the economy and government, shutting down countless businesses, and prohibiting public gatherings of any sort. Experts from around the world have made it abundantly clear that this crisis is not going away and will likely continue to worsen over the next several weeks to months. Is now really the time to initiate the 1041 permitting process for the Northern Integrated Supply Project, one of the most controversial developments in the history of Larimer County?

The Northern Integrated Supply Project is incredibly controversial and is expected to generate thousands of comments and have hundreds of people who want to speak at public hearings. However, with the State of Emergency and stay-at-home orders in effect for the foreseeable future, a lot of public input will not be heard. As parents loose access to child care, countless individuals experience incredible financial hardship, and more and more of us find ourselves caring for sick loved ones or falling ill ourselves, we will see a drastic reduction in the public's ability to comment on the 1041 permit. In addition, the inability to hold public gatherings during this time will silence the many voices who would otherwise be heard at public hearings.

With this, I ask you to please consider suspending the Northern Integrated Supply Project permitting process until a full, transparent, and meaningful public permit process can occur. Regardless of what the outcome of this permit process ends up being, the public deserves the opportunity to consider the options during a time when they don't feel like their own lives are at risk and to provide in person testimony if they so choose. I believe that the Governor's declaration of an official "State of Emergency," as well as the County's own emergency powers, gives you broad discretion to suspend the permitting process, and I encourage you to take this action as soon as possible. The public deserves a real and meaningful review process and that simply cannot occur in the midst of a global emergency.

Sincerely,
Lisa Blackmer-Raynolds

Subject: Fwd: Johnson & Donnelly Blocking Email
To: Linda Hoffmann <hoffmalc@co.larimer.co.us>

Ms, Hoffmann,

I was hoping that the email I sent an hour ago might be posted in a timely manner, since public comment is not permissible during the work session about to begin. Although that has not happened, please post and include in the NISP 1041 packet.

Perhaps you might have some success in convincing the commissioners that publically denigrating constituents and blocking citizen emails is injurious to the Board's reputation and defies their responsibility to represent all of Larimer County.

Regards,

Karen Wagner
Larimer County

Begin forwarded message:

From: "K.A. Wagner" <kaswagner@me.com>
Date: March 30, 2020 at 12:26:19 PM MDT
To: bocc@larimer.org, Lesli Ellis <ellislk@co.larimer.co.us>, Matthew Lafferty <laffermn@co.larimer.co.us>
Subject: Johnson & Donnelly Blocking Email

Commissioner Johnson was quoted this weekend as saying that "Save The Poudre just wants to make the county look bad." As he well knows, the organization is comprised of 600+ Larimer County constituents, who value the county's only wild and scenic river. Exactly how do those taxpayers make the county look bad in their attempts to communicate with the Board?

I was stunned to see that Commissioner Johnson, soon followed by Commissioner Donnelly, informed the County Manager to stop forwarding citizen emails (requesting suspension of the NISP hearings during the pandemic) to their inboxes, because they were duplicates or "form" letters. As a result of those requests, recent emails from citizens

requesting a suspension of the NISP 1041 hearings during the national pandemic were apparently only downloaded to Commissioner Kefalas.

The emails Johnson and Donnelly blocked were originals—not duplicates—and included concerns expressed by everyday citizens, No Pipe Dream supporters and members of Save Rural NoCo, just to name a few. Sadly, residents who thought the majority of the board would listen, now know two commissioners just don't want to be bothered.

So just who is making the county "look bad?" It appears that Johnson and Donnelly have excelled in damaging the reputation of the Board in their petty dismissal of taxpayer emails and their public contempt for constituents who pay their salaries. Unfortunately, lame duck commissioners must have the luxury of tuning out in a national pandemic.

Reply-To: bluewoo23@msn.com
To: rhelmick@larimer.org

Dear Community Development Rob Helmick,

I am writing in objection to Larimer County's triggering of the 1041 permitting process for the Northern Integrated Supply Project (NISP). It is incredible that despite Larimer County itself declaring a formal emergency and stay-at-home order and the Governor of Colorado declaring a "State of Emergency" due to the COVID-19 pandemic, that the County is choosing to move forward with this permit on a normal timeline. NISP is by far the most controversial project in the history of Larimer County, and it will likely generate thousands of comments and hundreds of people wanting to appear at public hearings that cannot be held at this time. The NISP project has been in some form of the Federal, State, and County permitting process for 17 years and the public deserves a full, transparent, and normal permit process that is not rushed and unduly affected by the current COVID-19 pandemic.

I believe that the Governor's declaration of an official "State of Emergency," as well as the County's own emergency powers, gives you broad discretion to suspend the permitting process, and I encourage you to take this action as soon as possible. Attempting to hold a public permitting process during this pandemic, when the citizens of Larimer County and state of Colorado are under a stay-at-home order and a formally declared emergency is not only one of the most tone-deaf actions this County has taken in its history, it is most likely illegal. No meaningful public process could be completed under these conditions and if County citizens are to believe that its government is acting in good faith, this permit process must be suspended.

This project would significantly affect the Poudre River and it is actively being opposed by river-protection and river-recreation groups, and there is broad opposition to NISP from homeowners around the proposed reservoir, neighbors along Highway 287, and homeowners along proposed pipeline routes. I respectfully request that you "suspend" the 1041 permitting process for NISP during this COVID-19 pandemic and that you conduct a real and meaningful public process once the pandemic has abated.

Sincerely,
Bob Vogler

Mike Vogler <mvogler0@everyactioncustom.com> Tue, Mar 31, 2020 at 8:48 AM
Reply-To: mvogler0@hotmail.com
To: rhelmick@larimer.org

Dear Community Development Rob Helmick,

I am writing to say that Larimer County's decision to continue with 1041 permitting process for the Northern Integrated Supply Project (NISP) is unwarranted at this time. Now is not the time to hear public opinion due to the fact that Larimer County itself has declared a formal emergency and stay-at-home order and the Governor of Colorado has declared a "State of Emergency" due to the COVID-19 pandemic. The fact that the County is choosing to move forward with this permit on a normal timeline to me is completely inappropriate. NISP has been the most controversial project in the County for the last 17 years, and it will likely generate thousands of comments and hundreds of people wanting to appear at public hearings that cannot be held at this time. Personally I am caring for my parents in Montrose during this lock down and will not be able to appear in person to voice my opinion. Due to the state order I know that I am not the only person in a similar position. The public deserves a full, transparent, and normal permit process that is not rushed and unduly affected by the current COVID-19 pandemic. This project would significantly affect the Poudre River and it is actively being opposed by river-protection and river-recreation groups, and there is broad opposition to NISP from homeowners around the proposed reservoir, neighbors along Highway 287, and homeowners along proposed pipeline routes. I respectfully request that you "suspend" the 1041 permitting process for NISP during this COVID-19 pandemic and that you conduct a real and meaningful public process once the pandemic has abated. Thank you for your time.

Sincerely,

Good morning Mr. Helmick and Ms. Ellis:

Thank you for your recent attention to the request for an extension of the hearing dates for the NISP 1041 permit application, we appreciate it.

I represent a group of landowners who are interested in submitting written comment on the NISP project and 1041 permit application. Can the county please provide specific guidance on how the public may submit written comments so as to ensure they become part of the record for this important public process.

Thanks, Karyn Coppinger

Cc: Lesli Ellis <ellislk@larimer.org>, Don Threewitt <threewdl@co.larimer.co.us>

Karyn,
There is not a good way to create a list you can use since the process is mostly e now. If you go to the citizen portal and enter the file # in the land use application tab you can get to the file then scroll down to the attachments tab and I think it is the last document there is a copy of an email with all the email addresses of who we referred to. When I get to the point of preparing a staff report I will have a list as a part of tht report.

Morning Rob:

I'm not sure how to find the"citizen portal". I searched for it on the county web but couldn't find it.

We would please like a list of the referring departments and agencies, surely the county must keep close track of this so you have records of which departments and agencies have been consulted. Especially for such a huge project?!

Thanks, Karyn

Karyn,
I am attaching a copy of the email cover that was the referral letter for NISP. As far as the executive session goes I have copies Bill Ressue in the County Attorney's office. You need to work with him on that question.

referral letter below

You are receiving this notice as a followup to the referral you received recently regarding the 1041 permit application made for the NISP project.
Because of the timing of the process and the current guidance from the Health Department, as well as the various emergency declarations, we want to be sure that you let us know as soon as possible if your agency anticipates a delay or inability in responding or commenting on the referral within the time period and will need to request an extension.

We understand that you may have competing priorities and or are devoting resources to addressing this current situation.

Plan #: 20-ZONE2657

Request:

Northern Integrated Supply Project (NISP) is a 1041 Permit under the Larimer County Land Use Code Secon 14.4.J,

approval for Northern Tier, Poudre Delivery/Intake And County Line raw water lines, and Secon 14.4.K water

storage reservoir (Glade Reservoir) including recreaon f acilies and other appurt enant facilies t o both the pipelines and reservoir.

Pipelines -- From northwest of Fort Collins east to the Weld County line and from the Poudre River at Hwy 14 in Fort

Collins then east roughly following CR40/Prospect to the Weld County Line then south to the south county line at

Johnstown.

Link to view Documents: https://onlineportal.larimer.org/EnerGov_Prod/CitizenAccess/Site/Plan/View/ByPlanNumber/20-ZONE2657

If you will need more time to comment or respond so that we may take appropriate steps regarding the processing of this application please advise, Rob Helmick, Senior Planner, by phone at (970) 498-7682 or by email at, rhelmick@larimer.org.

Kind regards,

Rob Helmick
Larimer County Senior Planner

Dear Mr. Helmick:

I am writing to you to express my absolute opposition to the NISP/Glade Reservoir project. I live in Bonner Peak Ranch and I am appalled that this project is even being considered. I can see no benefit for the City of Fort Collins, Larimer County or Colorado.

This project would result in years of disruptive construction activity for all of us living north of Fort Collins. This construction activity will result in blinding dust, traffic congestion, noise pollution, air pollution and an eyesore on our beautiful valley.

Let's be realistic and admit that Glade Reservoir will never be a beautiful lake for us to enjoy. NISP does not have enough water to fill the reservoir and their junior rights will only add water in abundant years. Whatever water it collects will be sucked out and sent away faster than it will fill up. Glade Reservoir will be an ugly mud pit cursed by residents of Larimer County.

Please let me know that you understand and share my concerns and plan to stop the NISP/Glade project with all of your power.

Thank you,
Gary Scott Geurin

Thanks Rob:

I appreciate this, but the email is apparently a *follow-up to a referral,* so I'd like the actual referral: I'm interested in what the county has asked the referral agencies to do. While I've looked at the 1041 regulations and the land use code section that discusses referrals, there's nothing that I can find that explains what information you seek from the referral agencies. I'm trying very hard to find this information on my own, but it doesn't seem to be publicly available on-line. Specifically what has the county requested from the referral agencies?

I'm also interested in what was discussed regarding referrals during the BOCC executive session.

Thanks, Karyn

Karyn,
There is not anything substantially different between the two except to note in the first is notes that we are asking for their comments. We work with these referral agencies regularly and they know what they do and how a project may affect them. We do not give guidance on what to comment on.

Question about NISP-1041

4 messages

John Mayfield <John@jmayfield.com> Wed, Apr 22, 2020 at 6:10 PM
To: "rhelmick@larimer.org" <rhelmick@larimer.org>

Good Afternoon Mr. Helmick-
I am a homeowner on CR-13 south of US392 and received a noce about NISP -1041 hearing coming up in June. Looking at the project, I am trying to determine if the pipeline going from Glade Reservoir to Johnstown is an above-ground pipeline or a buried pipeline. I'm having some trouble finding this detail in the project documents at: https://www.larimer.org/planning/NISP-1041.

Could you please clarify whether this is an above ground pipeline or a below-ground pipeline or point me to the document that contains that detail?

Thank you,

John Mayfield

John Mayfield <John@jmayfield.com> Wed, Apr 22, 2020 at 6:57 PM
To: "rhelmick@larimer.org" <rhelmick@larimer.org>

Hello again-
I realized about 5min a. er I sent this that it could easily be interpreted as a stupid queson due t o the fact that the project is in northern colorado where above-ground water could freeze. :) However, I wanted to ask the queson an yway as I have very lile kno wledge about water projects like this and don't know if piping material uliz ed would be resistant to freezing (I've seen other above ground pipes). So I thought I would ask instead of making an assumpon.

Thank you,
John

To: John Mayfield <John@jmayfield.com>

Mr. Mayfield,

All of the pipelines will be underground. I believe there is a "representational" cross section in the project description document on the web site.

NISP

1 message

Kay Mikesky <factualfitness@yahoo.com> Thu, Apr 23, 2020 at 10:41 AM
To: "rhelmick@larimer.org" <rhelmick@larimer.org>

Dear Mr. Helmick,
I am writing to you as a concerned citizen regarding NISP. Full information outlining the proposed Glade Reservoir has been incomplete and more than a little scarce for those citizens living close to the proposed site. My husband and I moved to Bellvue in March 2016 and reside approximately one mile west of the projected site. We had never heard about this proposed dam until a concerned neighbor held a meeting at her home in November 2019 where she shared the troubling news of the potential dam. As the nearby Poudre River would provide the water for this project, a small but growing group of neighbors has subsequently researched the many destructive environmental impacts of this outdated and costly "solution" for water scarcity.

NISP began presenting information to various groups in 2007, yet there has been only ONE informational presentation to the neighboring properties that would be affected by the Glade Reservoir. It wasn't until last December that NISP mailed postcards inviting "Neighbors of Glade Reservoir" to an informational meeting at the Livermore Community Center on December 18, 2019. Many of us attended the December NISP Open House and were stunned at the attempt to sell this as the optimal answer to water scarcity in towns along the I-25 corridor as well as "recreational opportunities" for the public. If this proposed dam/reservoir held such true benefits to those of us residing in the northern portion of Larimer County, wouldn't our realtor back in 2016 have touted the wonderful possibilities of living this close to such "amenities"? Guess what? Absolutely no mention of the proposed reservoir and recreational plans was made. Perhaps realtors simply avoid the subject, being aware of the many drawbacks of the project that would be foisted upon wildlife and the residents, both during and following construction of the nearly 28-story dam.

We are frankly amazed that any government official would consider manipulating the Poudre River, the sole Wild and Scenic River in the state of Colorado. The various governmental agencies charged with evaluating the environmental effects of the NISP proposed dam have revealed conflicting data. EPA and Army Corps of Engineers conclusions are still to be determined.

On the bright side, my fellow concerned citizens for responsible water use are realistic regarding the dilemma of water scarcity along the Front Range. We have been pleased to discover some strikingly simple, common-sense, updated techniques that will cost far less than this outdated 20th century behemoth called a dam. Most notably, AQUIFER STORAGE AND RECOVERY is not a new concept, yet is seems to have been ignored by decision-makers for years.

Let's explore less ruinous, less costly, and more modern yet simple solutions to a potentially destructive dinosaur. Our small group of neighbors who have experienced the seemingly sudden push to get this project to be a "done deal" are working strenuously to research viable options. The facts are quite easy to see when brought to light. While we appreciate the opportunity to present our viewpoints and offer alternative solutions at the Public Hearing on June 24, it seems that the 2-minute limit for expressions is restrictive. It may actually increase the length of the hearing if more speakers are required to present the information instead of a concise 3-minute presentation.

Thank you for your consideration in these extremely important matters,
Kay Mikesky

Northern Integrated Supply Project (NISP) 1041; Plan Number 20-ZONE2657

1 message

Patrick Mooney <pbmooney@me.com> Fri, Apr 24, 2020 at 2:53 PM
To: rhelmick@larimer.org

I am the owner of a fifty acre parcel at 5611 Kremers Lane, La Porte, CO 80535, Larimer County Parcel Number 9818000011. I received a notice of the above-referenced land use application, which invites me to submit comments on the application to you.

I wish to state my support for the project, which will both meet anticipated water needs in the area and be a valuable community amenity. The location takes advantage of natural features to create needed water storage with minimal new infrastructure development and should have less environmental impact than many other water storage projects. The project should be approved.

April 21, 2020

Commissioner John Kefalas
Larimer County Board of County Commissioners
200 West Oak Street
Fort Collins, CO 80521

Dear Commissioner Kefalas,

I am writing to ask you to very carefully consider the NISP 1041 permit application; Project No. 20-ZONE 2657. I am a retired wildlife ecologist who lives quite close to the proposed site of the Glade Reservoir dam. I spent my career conducting habitat assessments and trapping surveys for the Preble's Meadow Jumping Mouse, a federally-threatened species of mouse that occurs only in Colorado and Wyoming. I worked as an independent contractor for the City of Fort Collins and also for Larimer County for 13 years.

Although I would, of course, prefer not to have a dam built in my back yard, that is not why I'm writing. Instead, I'm asking you to please think long and hard about all the possible ramifications this project will have on some of the amazing natural resources in our county - public resources that you, as a county commissioner, have been elected to protect.

I understand that many people lack the background needed to appreciate the importance of all individual species, especially mice, even threatened ones like the Preble's mouse. However, as an ecologist, I understand the delicate balance between every animal species, both large and small, and their relation to their habitat. **We are all interconnected and interdependent.** And when one species gets shoved aside, or removed all together from a particular environment, the entire ecosystem can start to collapse, **which is detrimental to all of us!**

The black-tailed prairie dog, which inhabits the north end of the Glade reservoir site, is a good example. Prairie dogs are known as a 'keystone' or 'foundation' species. What this means is that many other birds and animals are dependent on them: they serve as prey for many species of predators, their burrows

provide shelter for many other species of birds, mammals, and reptiles, and they create open habitats preferred by many grassland species of birds. Burrowing owls, which are a state-listed threatened species, use their burrows for nesting and Black-footed ferrets, one of the most endangered mammals in North America, are almost entirely dependent on them.

Many people, especially those working in agriculture, tend to view prairie dogs as pests or vermin. Prairie dogs have been poisoned, used as target practice, and generally eliminated as quickly as possible to make more room for human beings. About 200 years ago, the number of prairie dogs living in North America probably exceeded 5 billion. The current number is less than 2% of the number described by Meriwether Lewis as "infinite", some 200 years ago.

Black-tailed prairie dogs, which are now a state-listed species, exist on the northeastern side of the proposed Glade Reservoir site and also in numerous areas along the proposed conveyance system. In their 1041 permit application, NISP claims they will, if possible, relocate any prairie dogs that will be potentially impacted by the project. However, if they are unable to do that, they will just euthanize (or poison) them. So what? Who cares?

It's imperative for all of us to start caring, now! If we keep pushing wildlife, such as mule deer, white-tailed deer, pronghorn antelope, elk, bald eagles, golden eagles, burrowing owls, coyotes, mountain lions, prairie dogs, and the federally-threatened Preble's mice aside and destroying their habitat because of huge projects like Glade Reservoir, we will be the losers. No amount of "mitigation" will make up for the losses we will all suffer. No amount of well-designed 'recreation' around a man-made reservoir with a visitor center, campgrounds, man-made hiking trails, and parking lots will ever be able to compete with having truly wild places in our midst, where we can occasionally catch a glimpse of wildlife in their native habitats.

What makes the proposed impacts to wildlife even more upsetting is that they are completely unnecessary. There are viable alternatives to NISP that are more sustainable, far less expensive, faster to build, and more in line with protecting our public natural resources.

Please make the right choice for the future of all of us, including our grandchildren and their progeny. Glade Reservoir is the wrong choice. Please deny NISP's 1041 permit for Glade Reservoir.

Thank you for considering my request, for your public service, and for your courage and foresight.

Respectfully,

Jan Peterson Rothe

Please Suspend NISP Permitting During COVID-19 Pandemic

1 message

Hunter Kerr <nhk@everyactioncustom.com> Sat, Apr 25, 2020 at 11:00 PM
Reply-To: nhk@standingupright.com
To: rhelmick@larimer.org

Dear Community Development Rob Helmick,

I am writing in objection to Larimer County's triggering of the 1041 permitting process for the Northern Integrated Supply Project (NISP). It is incredible that despite Larimer County itself declaring a formal emergency and stay-at-home order and the Governor of Colorado declaring a "State of Emergency" due to the COVID-19 pandemic, that the County is choosing to move forward with this permit on a normal timeline. NISP is by far the most controversial project in the history of Larimer County, and it will likely generate thousands of comments and hundreds of people wanting to appear at public hearings that cannot be held at this time. The NISP project has been in some form of the Federal, State, and County permitting process for 17 years and the public deserves a full, transparent, and normal permit process that is not rushed and unduly affected by the current COVID-19 pandemic.

I believe that the Governor's declaration of an official "State of Emergency," as well as the County's own emergency powers, gives you broad discretion to suspend the permitting process, and I encourage you to take this action as soon as possible. Attempting to hold a public permitting process during this pandemic, when the citizens of Larimer County and state of Colorado are under a stay-at-home order and a formally declared emergency is not only one of the most tone-deaf actions this County has taken in its history, it is most likely illegal. No meaningful public process could be completed under these conditions and if County citizens are to believe that its government is acting in good faith, this permit process must be suspended.

This project would significantly affect the Poudre River and it is actively being opposed by river-protection and river-recreation groups, and there is broad opposition to NISP from homeowners around the proposed reservoir, neighbors along Highway 287, and homeowners along proposed pipeline routes. I respectfully request that you "suspend" the 1041 permitting process for NISP during this COVID-19 pandemic and that you conduct a real and meaningful public process once the pandemic has abated.

Sincerely,
Hunter Kerr

To: rhelmick@larimer.org

Rob, Read through the study fairly close today. I noticed the preferred route is n-2.1. On page 24; the segment 1 description doesn't make sense to me. Also, for what it's worth I would go along with n-2.2 as that works best for us. The other angle to put in front of these guys is if they went with n-2.2, I would be open to renting a staging area on my property along Hwy.1

The other thing I want to bring up is if the Thornton pipeline is still in the works, I'd like to see them go In at the same time as we previously discussed.

I'd be happy to meet with you or talk on the phone to see what can get worked out.

Thanks and stay well

Subject: NISP
To: jkefalas@larimer.org <jkefalas@larimer.org>

Dear Mr. Kefalas,
I am writing to you as a concerned citizen regarding NISP. Full information outlining the proposed Glade Reservoir has been incomplete and more than a little scarce for those citizens living close to the proposed site. My husband and I moved to Bellvue in March 2016 and reside approximately one mile west of the projected site. We had never heard about this proposed dam until a concerned neighbor held a meeting at her home in November 2019 where she shared the troubling news of the potential dam. As the nearby Poudre River would provide the water for this project, a small but growing group of neighbors has subsequently researched the many destructive environmental impacts of this outdated and costly "solution" for water scarcity.

NISP began presenting information to various groups in 2007, yet there has been only ONE informational presentation to the neighboring properties that would be affected by the Glade Reservoir. It wasn't until last December that NISP mailed postcards inviting "Neighbors of Glade Reservoir" to an informational meeting at the Livermore Community Center on December 18, 2019. Many of us attended the December NISP Open House and were stunned at the attempt to sell this as the optimal answer to water scarcity in towns along the I-25 corridor as well as "recreational opportunities" for the public. If this proposed dam/reservoir held such true benefits to those of us residing in the northern portion of Larimer County, wouldn't our realtor back in 2016 have touted the wonderful possibilities of living this close to such "amenities"? Guess what? Absolutely no mention of the proposed reservoir and recreational plans was made. Perhaps realtors simply avoid the subject, being aware of the many drawbacks of the project that would be foisted upon wildlife and the residents, both during and following construction of the nearly 28-story dam.

We are frankly amazed that any government official would consider manipulating the Poudre River, the sole Wild and Scenic River in the state of Colorado. The various governmental agencies charged with evaluating the environmental effects of the NISP proposed dam have revealed conflicting data. EPA and Army Corps of Engineers conclusions are still to be determined.

On the bright side, my fellow concerned citizens for responsible water use are realistic regarding the dilemma of water scarcity along the Front Range. We have been pleased to discover some strikingly simple, common-sense, updated techniques that will cost far less than this outdated 20th century behemoth called a dam. Most notably, AQUIFER STORAGE AND RECOVERY is not a new concept, yet is seems to have been ignored by decision-makers for years.

Let's explore less ruinous, less costly, and more modern yet simple solutions to a potentially destructive dinosaur. Our small group of neighbors who have experienced the seemingly sudden push to get this project to be a "done deal" are working strenuously to research viable options. The facts are quite easy to see when brought to light. While we appreciate the opportunity to present our viewpoints and offer alternative solutions at the Public Hearing on June 24, it seems that the 2-minute limit for expressions is restrictive. It may actually increase the length of the hearing if more speakers are required to present the information instead of a concise 3-minute presentation.

Thank you for your consideration in these extremely important matters,
Kay Mikesky

Saturday, April 25, 2020

Dear Mr. Johnson,

I am writing to you as a concerned citizen regarding NISP. Full information outlining the proposed Glade Reservoir has been incomplete and more than a little scarce for those citizens living close to the proposed site. My husband and I moved to Bellvue in March 2016 and reside approximately one mile west of the projected site. LARIMER COUNTY

Public Referral & Hearing Notice

PROJECT NAME:
Northern Integrated Supply Project (NISP) 1041

APPLICANT: Carl Brouwer, Northern Integrated Supply Project Water Activity Enterprise

PLAN NUMBER: 20-ZONE2657
PLANNER: Rob Helmick
PLANNER EMAIL: rhelmick@larimer.org

Submit any comments to the planner above. For more information and to view the Full Project File and Map of Location, go to:
https://www.larimer.org/planning/NISP-1041

LOCATION OF PROPOSAL:
Reservoir – Northwest of Fort Collins along Hwy 287 north of Hwy 14

REQUEST:
Northern Integrated Supply Project (NISP) is a 1041 Permit under the Larimer County Land Use Code Section 14.4.J, approval for Northern Tier, Poudre Delivery/Intake And County Line raw water lines, and Section 14.4.K water storage reservoir (Glade Reservoir) including recreation facilities and other appurtenant facilities to both the pipelines and reservoir.
Pipelines – From northwest of Fort Collins east to the Weld County line and from the Poudre River at Hwy 14 in Fort Collins then east roughly following CR40/Prospect to the Weld County Line then south to the south county line at Johnstown.

NOTICE INFORMATION:
Records from the Larimer County Assessor's Office indicate that you are an owner of property adjacent to or near a proposed planning application. This postcard is being sent to inform you of the proposed project and public hearing. **Please submit any comments to the planner by May 29, 2020. The June 24th Hearing will only allow time for presentations, public comment will begin July 8th.**

Per the Americans with Disabilities Act (ADA), Larimer County will provide a reasonable accommodation to qualified individuals with a disability who need assistance. Services can be arranged with at least seven business days' notice. Please email us at beilbykm@larimer.org or by calling 970-498-7719 or Relay Colorado 711. "Walk-in" requests for auxiliary aids and services will be honored to the extent possible but may be unavailable if advance notice is not provided.

Hi Rob:

I just received this postcard. It looks like the amended pipeline plan has it coming directly through my property. I would like to educate myself on my options. Sure seems like the south side of the road, where there are no houses close or improvements yet would be a better options. Could we have time to speak about the plan? Thanks.

Nicole Staudinger

Hello Rob Helmic, John Kefalas, Steve Johnson and Tom Donnelly:

In my rush to meet the postal date for submitting comments on the NISP 1041, I failed to check all of the PDF converted figures. I just realized the PDF sent on 4/29/20 is missing:

- Figure 9 - Required peak power...
- Figure 10 - Power lines required ... and
- Text in Text in Figure 11 - Local subsurface water storage...

Please see a revised PDF with all figures.

Your short schedule was a challenge. These are busy times for me.

If convenient, an acknowledgement receipt of my comments would be greatly appreciated.

Best Regards, Tom Sale

Regarding: Comments on Northern Integrated Supply Project (NISP) 1041 Permit

Overview

The following is provided in response to postal notification received on 4/24/20 regarding an opportunity to provide comments on the Northern Integrated Supply Project (NISP) 1041 no later than May 29, 2020. I appreciate the opportunity to participate in the NISP 1041 and everyone's efforts to advance sustainable communities in Larimer County.

Given all our busy schedules I'm endeavoring to be as brief as possible. Herein I'm advancing questions that you might pose to Northern. My hope is that you will find my input helpful in reaching a decision on the NISP 1041.

My current position is Full Professor, Civil and Environmental Engineering, Colorado State University, Fort Collins, CO. My qualifications include BA degrees in Chemistry and Geology, an MS degree in Watershed Hydrology, and a PhD degree in Agricultural Engineering. I'm a registered professional Geologist (+25 years WY-1954). My employment history includes 20 years of water resource consulting engineering and 20 years of experience in academia including in excess of $30 million in research funding. I live 1 mile west of the proposed site of the Glade Reservoir and have intimate knowledge of the space associated with Glade. Furthermore, I have been an active kayaker on the Cache La Poudre River for the last quarter century. Given my education, professional experience, and knowledge of the NISP space, I feel uniquely qualified to support you in your decision on NISP 1041. Please feel free to contact me at any time if I can be of assistance.

Tom Sale

Siting

The following describes adverse aspects of the site selected for NISP's Glade Reservoir.

Faults

Two large faults pass under the proposed Glade Dam site as shown oin the USGS map below (Figure 1). This includes the North Fork Fault with over a 1-mile of E-W displacement and the Bellvue Fault with +100s of feet of vertical displacement. As 1) the faults represent vertical intervals of broken rock and 2) that they pass directly under the proposed dam site (that will have up to 400 feet of differential water level) it seems highly likely that leakage under the dam along the faults will be severe. This leakage would be far more severe than what Northern has already experienced at the North Dam on Horsetooth Reservoir. Gypsum and limestone beds in the formations that underlie the Glade site are widely recognized as being prone to dissolution and wash out as identified in annual North Poudre Irrigating Company meetings, experience with the North Dam on Horsetooth, and random anomalous high capacity wells in the Glade Area.

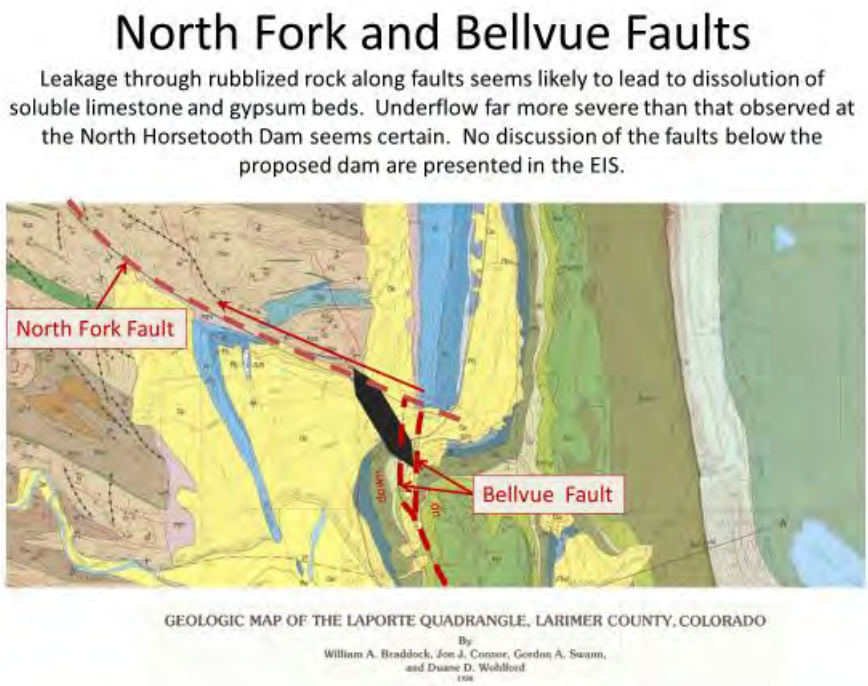

Figure 1 – North Fork and Bellvue Faults

Fault Questions:

- Why is it that neither the North Fork or Bellvue Faults have ever been mentioned in public NISP documents to date?

- What contingency plans are available to address fault-controlled leakage under the dams, what are the associated costs (e.g. following work on the North Dam on Horsetooth), and are the related costs being shared with participants and lending agencies?
- In your recent multiple year (undocumented?) drilling programs were “subsurface voids” encountered that could lead to severe seepage losses and/or washout under the Glade Dam? Have the results from recent subsurface investigations been shared with the public?

Seepage losses

Per the USGS report on geology in the vicinity of Glade, the principle rock type underlying the Glade Reservoir is porous sandstone (Figure 2). Much of the sandstone and other rock has been broken by deformation associated with uplift of the Rocky Mountains. Resulting from deformation, the underlying rock also conducts water along networks of joints and fractures (Figure 3).

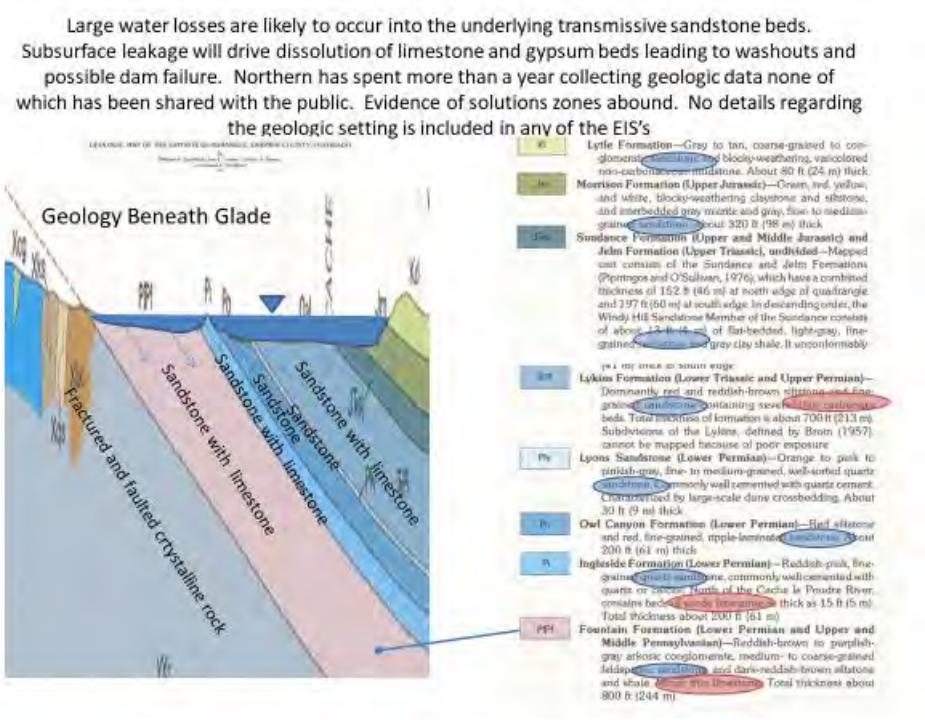

Figure 2- Excerpt from USGS report documenting sandstone below Glade

Figure 3 - Joints and Fractures in the Ingleside Formation near Glade

Seepage Loss Questions:

- Given up to 400 feet of water over the conductive sandstone beds, and the likelihood of large seepage losses, how can you advocate that Glade is a suitable site for a reservoir?
- The county requires groundwater models for projects where groundwater issues exist. What types of groundwater modeling has been conducted for Glade and have the results been shared with the public?
- Per Northern's recent public open house on NISP, there are NO plans to place a seepage control liner in Glade (as was ultimately required at the North Dam on Horsetooth). If a liner were required how would it effect the costs for NISP and are the parties that will cover the cost aware of the associated risks?
- Given effective subsurface water storage alternatives how much money could be saved by eliminating seepage losses?

Munroe Ditch

The Munroe Ditch (North Poudre Irrigation Company (NPIC) – Primary share holder Northern annually conducts tens of thousands of acre feet of water to extensive agricultural lands in eastern Larimer County. The Munroe Ditch passes through Glade including two unlined rock tunnels (Figure 4 - Figure 6). At Northern's recent NISP open house it was explained that a large +100 inch submerged steel pipeline would run through Glade and that the pipeline would be plugged into the unlined tunnels (Figure 5). Water would flow through the submerged pipeline at atmospheric pressure by gravity. Recognizing that this wouldn't work, because at atmospheric pressure the pipeline would float, Northern added cement to the pipeline in their recent submittals to Larimer County. Unfortunately, the most recent plan is still an implausible design due to:

- Dynamic loading on the concrete-weighted steel pipe will require unplanned submerged massive foundations that are likely to fail given the stresses
- There will be no practical way to remove the sediment that accumulates annually in the Munroe Ditch. NPIC spent months removing sediment from the Munroe ditch in 2014. Routine

sediment removal is a standard practice due to high spring sediment load on the Cache La Poudre.

- Problematic seepage losses from Glade will result in 1) raised water levels in the rock above the conveyance tunnels, 2) the tunnels becoming unstoppable submerged drains, and 3) the tunnels ultimately collapsing as the soluble beds fail.

As planned Northern does not have a viable plan for the Munroe Ditch or any idea what it will ultimately take to route the Munroe Ditch through Glade. Having been assured by two people from Northern at a recent NISP open house that Northern "owns" NPIC, I'm left wondering if Northern might have other plans for the water in the Munroe Ditch that they aren't quite ready to talk about.

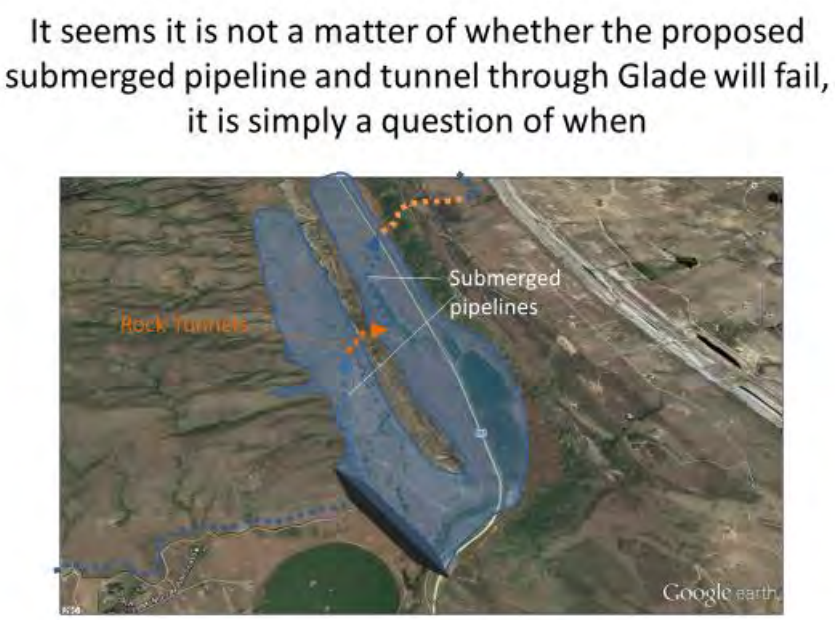

Figure 4 NISP plan for Munroe Ditch transmission through Glade

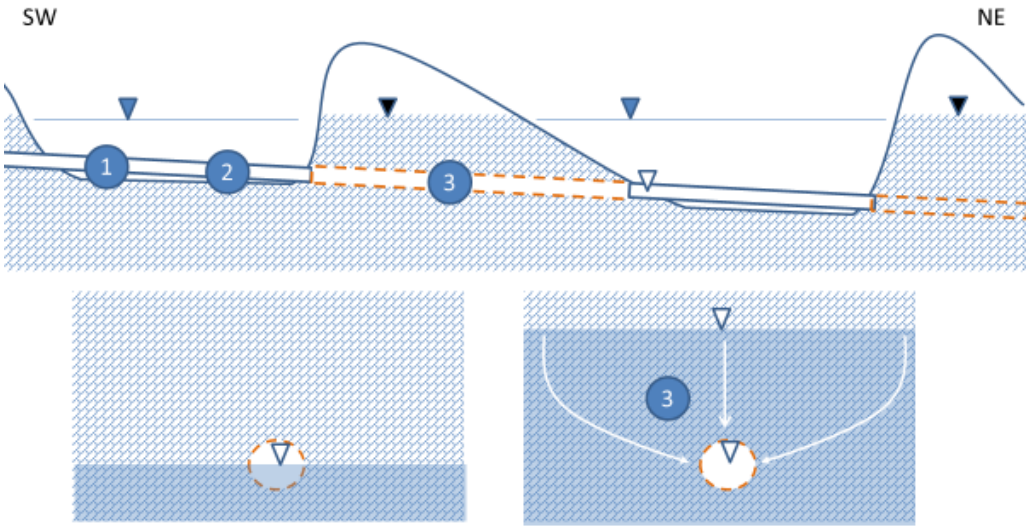

1) Per 2012 fire and 2013 flood, sediments will fill the submerged pipeline – Removal of sediment from a submerged pipeline may be impractical simply due to safety alone.
2) Sooner of later the submerged pipeline will fail (corrosion or earth movements) and the entire lake will want to drain through the pipe with the only potential solution being plugging the tunnels.
3) The unlined tunnel sections will be like a submerged drain potentially collecting 1-10 gpm/foot. In time soluble limestone and gypsum beds will dissolve and the tunnels will collapse.
4) It is not a matter of if the submerged pipeline or unlined tunnels through glade will fail, it is simply a question of how long it will take for the submerged pipeline and/or unlined tunnels through Glade to fail.

Figure 5- Transformation of Munroe conveyance tunnel into submerged drain that will collapse

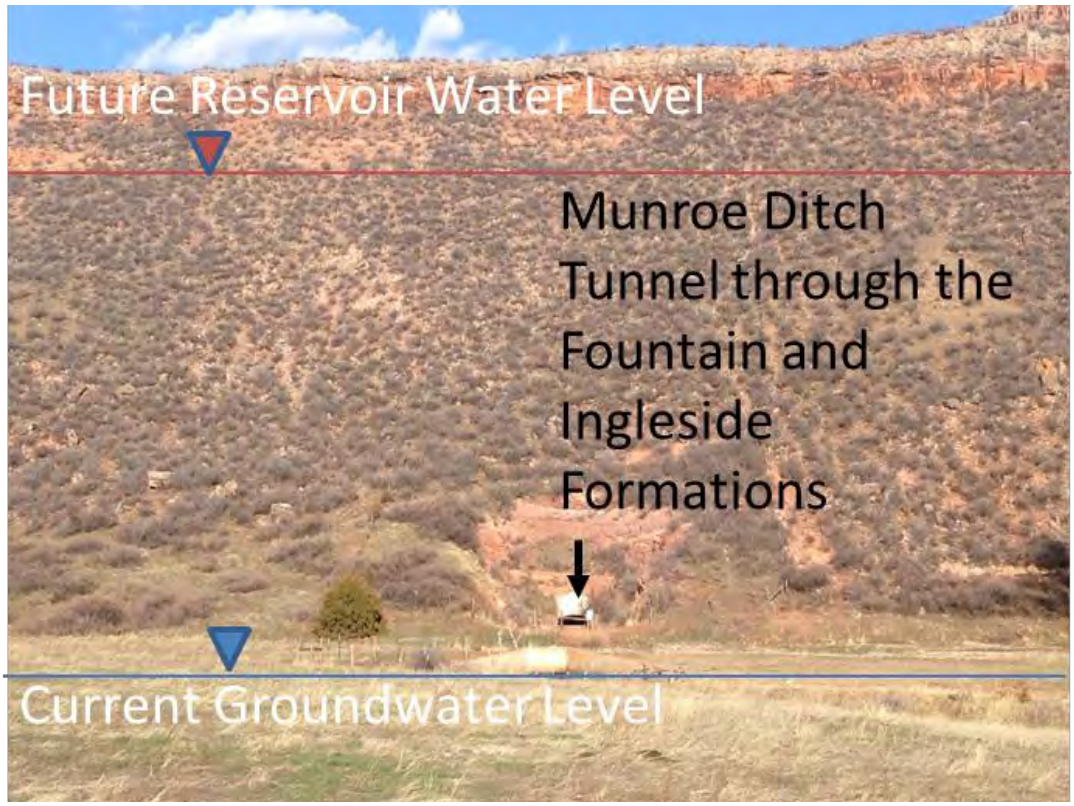

Figure 6 -Reservoir submergence of the Munroe Ditch tunnels leading to collapse

Questions: Munroe Ditch

- The proposed steel pipeline in cement will see dynamic vertical stresses. What kind of foundations are required, what are the costs for the submerged conveyance, are the costs currently included in the estimates provided to the participants?
- How do you plan on dealing with large volumes of water flowing into the submerged tunnels when they become submerged drains?
- Given prior experience with collapsing formations due to exposure to fresh water in the vicinity of Glade, why would the Munroe Ditch Tunnels not collapse when they become submerged drains?
- Are there any successful engineering precedents for the proposed submerged conveyance of the Munroe Ditch through Glade?
- How will you safely remove sediments that will inevitably fill the submerged pipeline?
- What are the anticipated costs of the submerged conveyance, its maintenance, and its periodic replacement?
- Are the costs for the submerged Munroe Ditch conveyance through Glade included in current estimates of the cost for NISP and are the related cost/concerns being shared with participants and lending agencies?
- What is Northern's contingency plan given the likelihood of the Munroe Ditch conveyance failing?

Pushing the Missile Site Chlorinated Solvent Plume into Domestic Drinking Water Wells

Historical operations at a DoD Nuclear Missile Site at the base of the Glade Dam created a large plume of carcinogenic chlorinated solvents in groundwater that currently passes out beneath the proposed forebay for Glade. Plumes of this nature last many lifetimes and it is implausible that site specific efforts to clean up the plume have been effective. It is odd and concerning that public documents do not identify critical wells and show implausibly short time intervals between when wells were sampled. Even odder is that based on Colorado Division of Natural Resources permit records (Figure 7), Northern installed more than 20 monitoring wells in 2019 located through the plume, but no public records are available regarding data from the Northern 2019 monitoring well network.

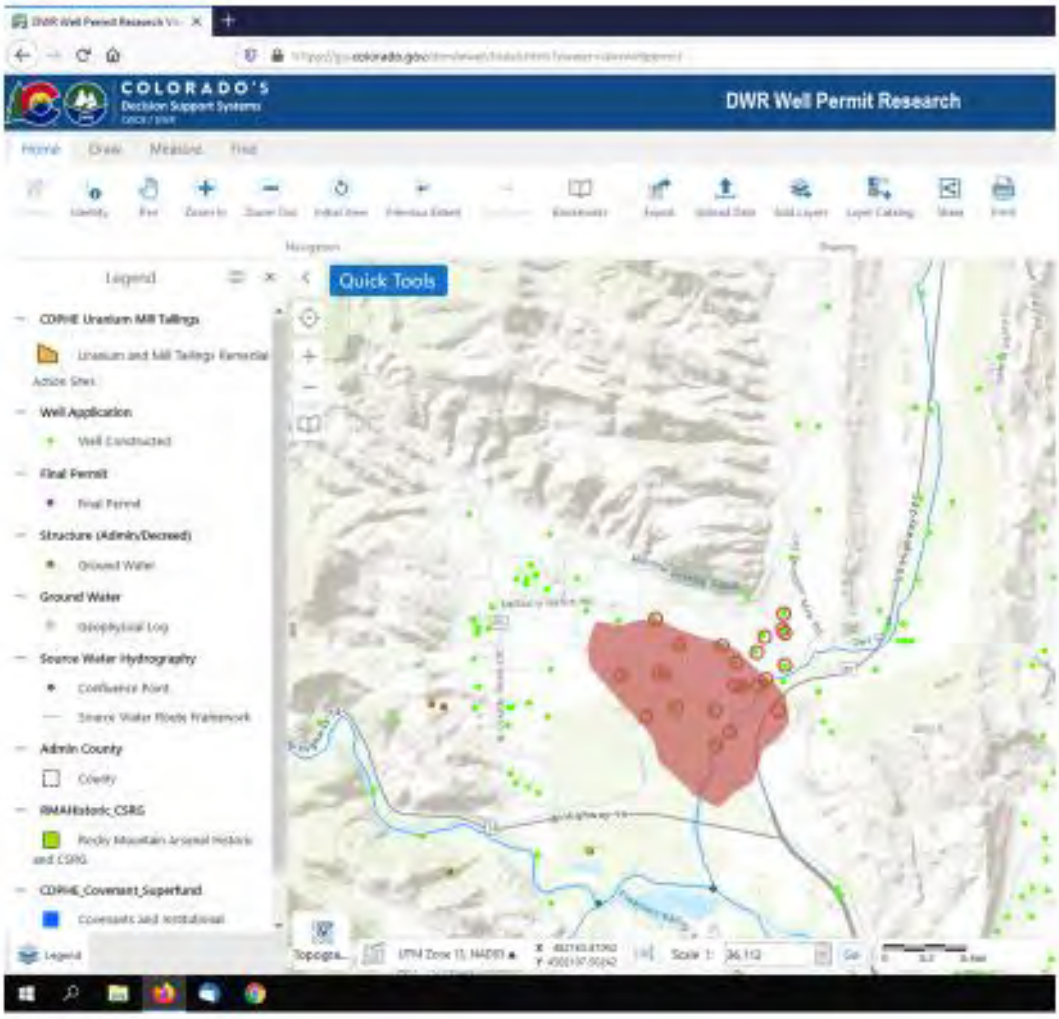

Figure 7 -Permitted wells in the vicinity of Glade. Brown circles are 2019 Northern monitoring wells for which no monitoring data has been reported. Red area is the potential extent of chlorinated solvent in groundwater based on information prior to 2019.

With leakage of water beneath the proposed dam and from the forebay, is seems likely the chlorinated solvent plume will be pushed into domestic water supply wells along County Road 29C as shown in Figure 8. Furthermore, it is anticipated that select portions of the material in the forebay may be hazardous, creating numerous issues including air quality impact and appropriate disposal of excavated materials.

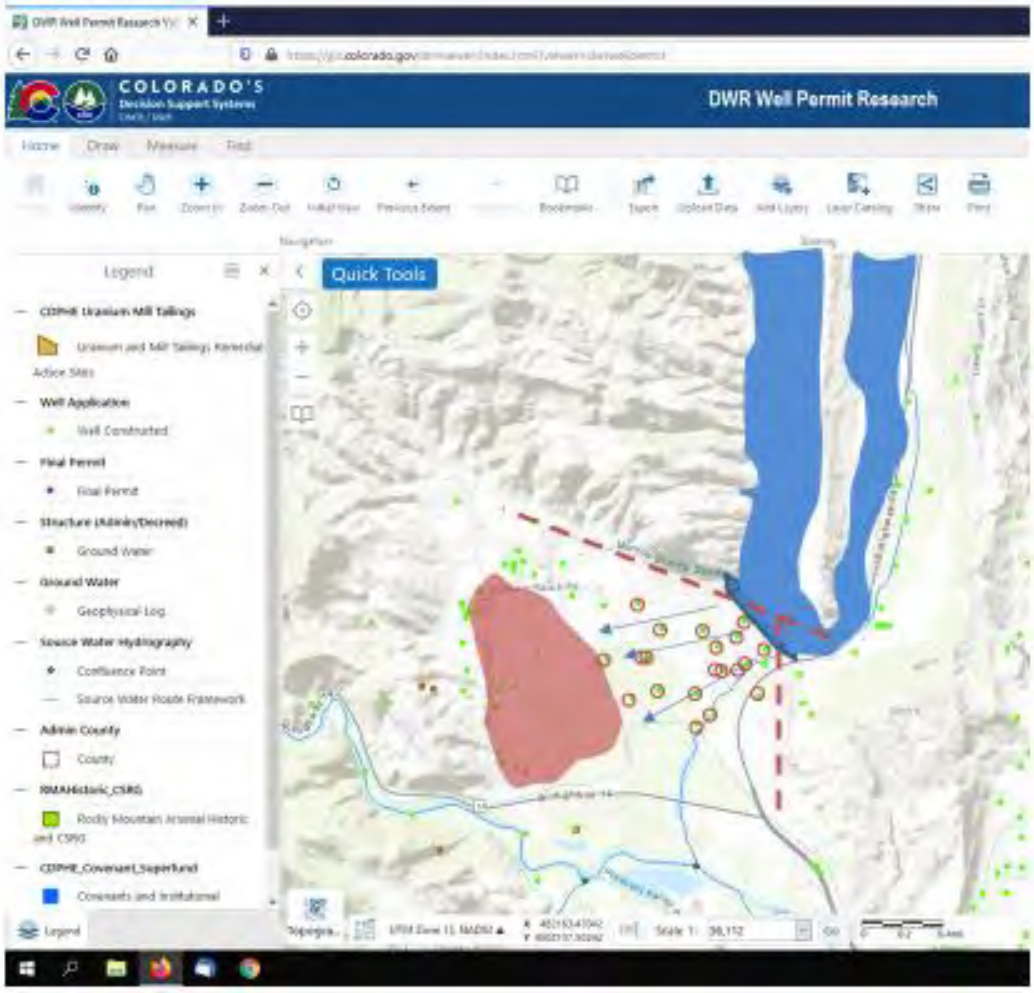

Figure 8 Anticipated movement of the chlorinated solvent plume to domestic water supply wells.

Question - Pushing the Missile Site Chlorinated Solvent Plume into Domestic Drinking Water Wells

- Why did Northern install 20 plus monitor wells in the missile site plume?

- Were water samples collected from the wells?
    - If yes, when will the data be made available? One might think that if the news was good, we would already know the results.
    - If no, isn't it in the best interest of protection to human health and to the environment, to accurately sample the wells and share the results prior to any approval of the NISP 1041 Permit?

- What are the contingency plans for adverse impact to domestic water supplies?

- Is it appropriate to proceed with a decision on the NISP 1041 Permit absent public documentation of the water quality in Northern's 20+ monitoring wells in the vicinity of the missile plume?

Located Off the Main Stem of the Cache La Poudre

The selected site for Glade Reservoir is off the main stems of the Cache La Poudre River. The implications are profound including:

- The maximum rates of diversion off the Cache La Poudre River will be limited by the capacity of diversion ditch (100s vs 1000s of CFS?). NISP will be incapable of consequentially capturing "peak flows" as claimed. Capturing unclaimed peak flows on the Cache La Poudre River with NISP (e.g. September 2013) is a **myth**.

- The proposed peak pumping rate in Northern's application to Larimer County, from the forebay, is 1,200 cubic feet per second. Water will be pumped upwards 400 feet. Following the calculations in **Error! Reference source not found.**, 81 MW (megawatt) of power will be required. To put 81 MW in context, it is equivalent to the power required by Fort Collins' approximately 62,000 residences and 90% of the reported generation capacity of Glen Canyon Dam. The power lines associated with Glen Canyon's 90 MW output are massive and presented in Figure 10.

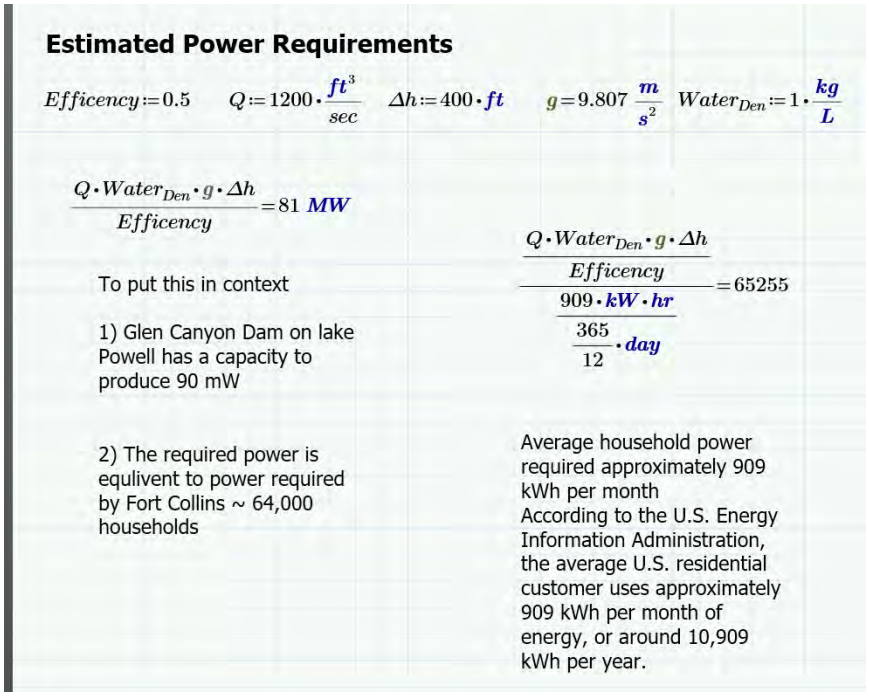

Figure 9 - Required peak power based on Northern's reported 1200 cfs and 400 foot lift.

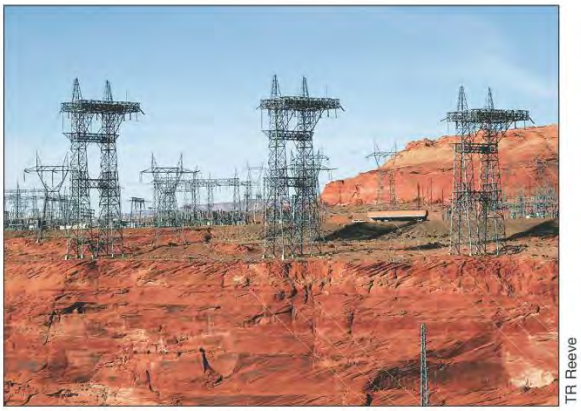


Transmission towers and switchyard on canyon rim

Figure 10 - Power lines required for 90 MW at Glen Canyon Dam

Notably, competing main stem surface water storage projects on the North Fork of the Poudre River (Seaman and Halligan) **have zero electrical inputs**, have far lower costs (in addition to no electrical power, they had no need to move a federal highway or run a large water conveyance through a reservoir), and have dramatically reduced carbon footprints. While Seaman and Halligan are far better projects than Glade, there also other noteworthy alternatives involving harvesting vast water losses off antiquated water transmission and storage systems, Subsurface Water Storage, and conservation. The label "Northern Integrated Supply" is an erroneous misnomer… if NISP were an integrated project, interested parties would work together to find the best project(s) with NISP almost certainly at the bottom of their list.

Questions - Off the Main Stem of the Cache La Poudre

- How will NISP capture peak flows if the diversion from the Cache La Poudre River is constrained by the hydraulic capacity of the diversion?
- Why should NISP be approved if there are lower cost/less harmful alternatives for surface water storage projects that the project proponents can participate in?
- How will NISP get the required electrical power to the pumps at the forebay?
- Has Northern provided the required information for approval of an 80 MW power line?
- How will required power lines impact the aesthetic of the views in Pleasant Valley and the new recreational facilities?
- Will the campers and residents of Pleasant Valley appreciate the crackle of power lines and/or the drone of nighttime boaters when they drift off to sleep?
- Is NISP OUR vision of the future?

Alternatives

The driving vision of the NEPA process is to find the Least Damaging Alternative that is Practical (LDAP). This vision is reflected in Larimer County Rules and Guidelines that form the basis for approving or disapproving the NISP 1041 Permit.

A most distressing aspect of NISP is the coarse dismissal of alternatives that are far less harmful, lower cost, and faster than NISP. It seems that Northern is unable to fairly consider alternatives that compete with their last century toolbox and commitments to see NISP through regardless of the cost. It seems the participants are being told that NISP is their only option which is so far from the truth. It seems the participants are being told to stick to the process or else… all the while that the participants are struggling with a future of staggering taps fee, enormous monthly water bills, and debt in times of unprecedented economic uncertainty.

The proof of the viability of alternatives to momentum water driven project like NISP is the Two Forks Dam on the South Platte River. Two Forks was not approved and the communities of Highlands Ranch, Castlerock, Parker, … have managed to grow, dramatically. The south metro communities found better ways that were less damaging, lower costs, and faster.

The bottom line is the consequential damages associated with NISP are avoidable given an openness to do things that are lower cost and faster. Who's against less damage, lower cost and sooner? Who is for more damage, higher cost, and decades to delivery?

Mining Water Losses from Antiquated Water Storage and Transmission Infrastructure

The majority of the water in Colorado's Front Range is diverted into gravity flow ditches and unlined reservoirs via systems that are often 100 years old. Given the economics of agriculture, little money has been invested in modernization of the Front Range's water conveyance and water storage reservoirs. The North Poudre Irrigation Company (NPIC), with Northern as a primary share holder, is a useful example. In 2019 NPIC, doing a remarkable job with annual charges of $180 per share (10,000 shares = $1.8M) lost 40,000 acre feet of water to "shrinkage" (primarily seepage and evaporation losses).

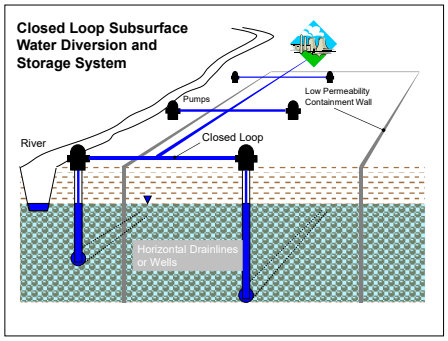
NPIC's losses beg the question of how much of the lost 40,000 acre feet could be saved by investments that are a fraction of the cost of NISP. For example, giving NPIC a tenth of the assumed $2B cost for NISP, one can envision lining ditches and locally storing water in alluvium. Figure 11 advances the concept of subsurface water storage. Per ongoing projects, it is easy to think that investing $200M in NPIC could yield savings on the order of 20,000 acre feet of water, AND, there are hundreds of similar water conveyance storage systems throughout the project participants' domains. In fact, it is easy to argue that all the water that Colorado needs for the next 50 years can be found in the modernization of Colorado's antiquated systems of surface water conveyances and storage systems.

The potential is huge for all (WIN-WIN):

- The costs are likely to be small relative to NISP
- The potential for mining losses can be proven in short order via demonstration projects funded by project participants at costs that are a fraction of what is being spent on Glade.
- The alternative could be implemented modularly through time as warranted by the economy (just in time delivery)
- You can start today and provide water in a year
- The investments would meet the need of NISP project participants and strengthen Colorado's agricultural backbone
- No additional water would need to be diverted from the Cache La Poudre or any of Colorado's already over allocated streams

- The tragic destruction of the truly remarkable wild spaces that is Glade would be averted
- And so much more…

Closed Loop Subsurface Water Diversion, Storage, and Recovery System



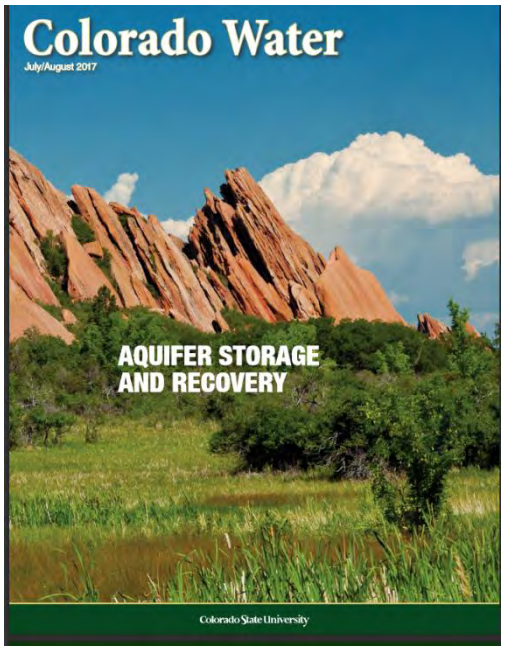
1. The source of water is diverted from a surface water body wherein the porous media between the surface water body and the wells or drainlines provides filtration.
2. Recharge source water is produced from a subsurface well or drain line yielding water with low Total Suspended Solids (TSS) that has similar geochemical conditions as that of the subsurface water storage body.
3. Produced water is conveyed into an isolated subsurface water storage body via closed conveyance with limited contact with atmospheric air or other agents that would altering the geochemical attributes of the recharge water.
4. Recharge water is introduced into the subsurface water body via wells or drain lines that minimize exposure of delivered water to agents that would altering the geochemical attributes of the recharge water.
5. In combination, 1-4 provides a system for subsurface water storage with minimal potential for adverse plugging of the recharge drainlines or wells.

Figure 11- Local Subsurface water storage walls horizontal drains installed with continuous trencher

Question: Mining Water Losses from Antiquated Water Storage and Transmission Infrastructure

- Given a viable alternative that is less damaging, low risk and suited to uncertain times – why should the (NISP) 1041 Permit be approved if it is, in contrast, severe in its impacts, more costly, and poorly suited to the State's current conditions?

Subsurface Water Storage



Subsurface water storage projects offer the promise of minimal seepage and evaporation losses, greater resiliency in times of drought, costs that are 10 to 50% of surface water storage, and synergistic complementary to Colorado's existing surface water storage systems. The basis for the preceding statement is outlined in the Colorado Water Center 2017 publication on Aquifer Storage and Recovery and Colorado State University's 2016 Subsurface Water Storage Symposium.

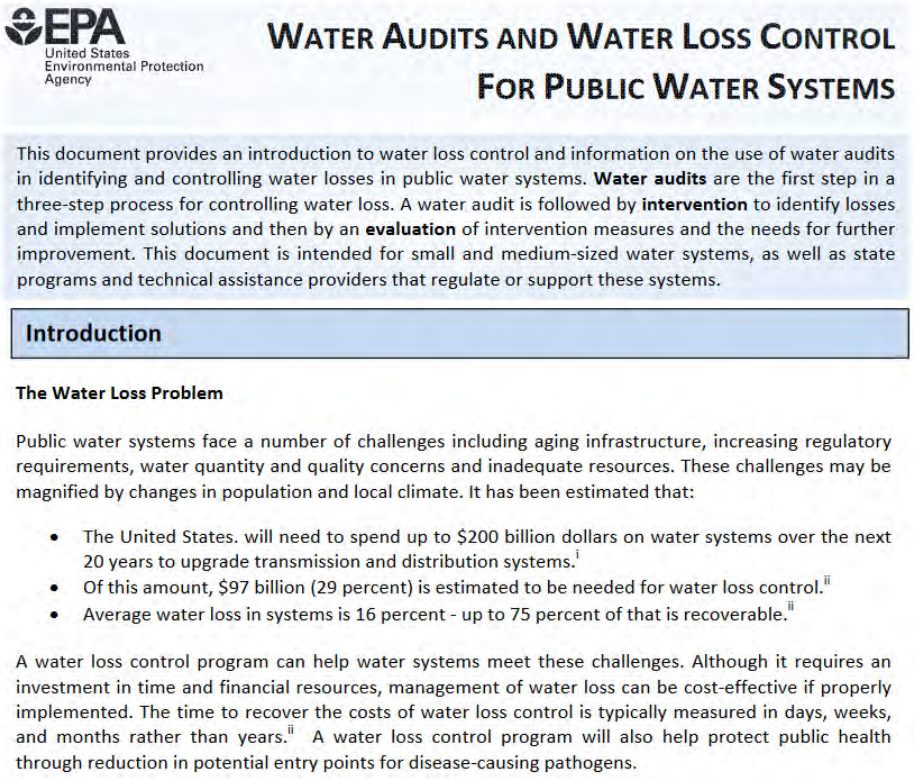
Since 2016, CSU has held a second Subsurface Water Storage Symposium. In 2016 there were 5 Subsurface Water Storage projects in Colorado. Today the number of Water Storage projects in Colorado is approaching 20 including the City of Morgan, a NISP participant. Dr. Sale's comments on the Final NISP EIS are attached for the record. Notably, responses to Dr. Sale's comments on the Subsurface Water Storage as an alternative have been dismissed by terse, false statements that only illustrate the NISP proponent's belief that they are not bound to consider NEPA's and County's commitments pursuing the Least Damaging Alternative that is Practical.

Question: Subsurface Water Storage

- Given all that is happening with Subsurface Water Storage in Colorado, and Dr. Sale's comments, why would you dismiss Subsurface Water Storage?

Conservations

So much of the water that is used by communities is wasted. One of the biggest found alternatives for Two Forks was conservation. And yet conservation has been missed by many of the project participants. As an example, one of the participants forbids xeriscaping by ordinance as an alternative to conventional lawns. Going further, municipal water conveyance can lose up to a third of source water through leaks. Long before communities spend vast sums on NISP they should invest in water loss control programs as outlined in Figure 12.



EPA United States Environmental Protection Agency

WATER AUDITS AND WATER LOSS CONTROL FOR PUBLIC WATER SYSTEMS

This document provides an introduction to water loss control and information on the use of water audits in identifying and controlling water losses in public water systems. **Water audits** are the first step in a three-step process for controlling water loss. A water audit is followed by **intervention** to identify losses and implement solutions and then by an **evaluation** of intervention measures and the needs for further improvement. This document is intended for small and medium-sized water systems, as well as state programs and technical assistance providers that regulate or support these systems.

Introduction

The Water Loss Problem

Public water systems face a number of challenges including aging infrastructure, increasing regulatory requirements, water quantity and quality concerns and inadequate resources. These challenges may be magnified by changes in population and local climate. It has been estimated that:

- The United States. will need to spend up to $200 billion dollars on water systems over the next 20 years to upgrade transmission and distribution systems.[i]
- Of this amount, $97 billion (29 percent) is estimated to be needed for water loss control.[ii]
- Average water loss in systems is 16 percent - up to 75 percent of that is recoverable.[ii]

A water loss control program can help water systems meet these challenges. Although it requires an investment in time and financial resources, management of water loss can be cost-effective if properly implemented. The time to recover the costs of water loss control is typically measured in days, weeks, and months rather than years.[ii] A water loss control program will also help protect public health through reduction in potential entry points for disease-causing pathogens.

Figure 12- EPA Guidance on water audits and water loss controls

Question on Conservation

- How can Northern justify requesting further surface water diversions, billions of dollars from Colorado's residents, and destruction of Larimer's County's limited wild lands when so much can still be done with conservation?

RE: NISP - Comments on NISP Final Environmental Impact Statement

Attention: John Urbanic, NISP EIS Project Manager

The following comments are offered in support of the U.S. Army Corps of Engineers review of the Northern Integrated Supply Project (NISP) Final Environmental Impact Statement (FEIS).

My current position is Professor, Civil and Environmental Engineering, Colorado State University, Fort Collins, CO. My comments are my own. My qualifications include BA degrees in Chemistry and Geology (1980), an MS degree in Watershed Hydrology (1995), and a PhD degree in Agricultural Engineering (1998). My employment history includes experience in consulting engineering and academia spanning 38 year. The focus of my career has been groundwater. Currently, I have over 60 groundwater-related publications.

Comment

Subsurface water storage, specifically Aquifer Storage and Recovery (ASR), is a viable alternative that has not received adequate consideration in the Northern Integrated Supply Project (NISP) Final Environmental Impact Statement (FEIS). Evaluations of ASR in the DEIS, SEIS, and FEIS are inaccurate, and important new public information has not been considered. The significance of inadequate consideration of ASR as an alternative are highlighted by the likelihood that ASR can achieve the participant's needs:

- At significantly lower costs
- Without the non-beneficial consumptive water loses through evaporation and seepage
- With far lessened environmental impacts
- With enhanced resiliency with respect to drought, climate change, and water security

Based on the following factors, the NISP FES should not be approved:

- Failure to comply with the NEPA regulatory requirements that require an EIS to rigorously explore and objectively evaluate all reasonable alternatives
- Existence of a viable alternative that avoids many of the damaging aspect of NISP advanced in extensive comments by others

The following information provides the basis for the above arguments for not approving the NISP FEIS position including:

- Comments on flaws in the applicant's response to my subsurface water storage comments relating to the DEIS and SEIS
- Relevant public information that has not been considered
- A pragmatic path forward exists for adequate consideration of ASR

Comments on flaws in the applicant's response

Prior comment on DEIS and SDEIS

My primary prior comment on the DEIS and SDEIS was that "The DEIS and SDEIS fail to accurately recognize alternatives based on subsurface water storage…" My complete comment is provided in Attachment A. As argued in the following text, the applicant's response to my comment fails to meet the standard of rigorously exploring and objectively evaluating ASR – a reasonable alternative. Based on failure to rigorously explore and objectively a reasonable alternative, I stand by the position that the FEIS is not in compliance with NEPA regulations and cannot be approved.

Response to my comments

Response to my above comments on the on the DEIS and SDEIS are provided in FEIS Vol 4 of 4 Appendix A under the header of Comment 2007, 2304, 2305, and 5007. For convenience the noted responses are provided in Attachment B.

Issues with the applicant's response

1) I appreciate the applicant's acknowledgment that subsurface water storage is a proven technology with successful projects in Colorado. A complete list of Denver Basin ASR projects based on (CDM Smith (2017) is provided in the slide below. Impressively, interest in ASR in Colorado continues to grow.

Table ES-2 Overview of Existing and Planned ASR Systems in SMWSA

Member	Status	Source Water	Number of ASR Wells
CWSD	existing system	South Platte River	33
East Cherry Creek Valley Water and Sanitation District (W&SD)	existing pilot system and planned expansion	Northern Water Supply Project	1 (pilot)
Rangeview	existing pilot system and planned expansion	WISE	1 (pilot)
Town of Castle Rock	existing pilot system and planned expansion	WISE, Plum Creek surface water and alluvial water, treated reuse water	2 (pilot)
Cottonwood W&SD	Permitting for ASR	Cherry Creek, WISE, and Denver Basin groundwater	3
Dominion W&SD	Planning for ASR and partnering with Castle Rock	WISE	Currently unknown
Inverness W&SD	Permitting for ASR	Denver Water, Denver Basin groundwater, WISE, and Cherry Creek (when developed)	4
Meridian Metropolitan District	Permitting for ASR	Denver Basin groundwater and WISE	1 to 2
Pinery Water and Wastewater District	Planning for ASR	WISE and Cherry Creek alluvial well water	Up to 9

2) A primary component of the applicant's response to my comment is, "**The Denver Basin aquifers do not extend into Larimer County**." For the following reasons, the extent of the Denver Basin Aquifer has little bearing on the viability of ASR in northern Colorado:

   a. ASR has been conducted around the world in many places where the Denver Basin Aquifers are not present. Being able to work in the Denver Basin Aquifer is not prerequisite for ASR. FYI, per 3) below, there are many bedrock aquifers that are well-suited for ASR in Northern Colorado.
   b. Passage of **HB17-1076 -** Artificial Recharge Nontributary Aquifer Rules has created a legal frame work for ASR in non-tributary aquifers outside of the Denver Basin Aquifers (concerning rule-making by the state engineer regarding permits for the use of water artificially recharged into non-tributary groundwater aquifers. LAST ACTION: 03/30/2017 | Governor Signed SPONSORS: Rep. J. Arndt.
   c. NISP participants south of Greeley are in fact underlain by the Denver Basin Aquifers. Local ASR systems could be deployed to store water at the points of use in the Denver Basin Aquifers.

3) An additional component of the responses to my comments is, "**The primary groundwater resources in the NISP study area are alluvial aquifers which are shallow and heavily used for agriculture**." This response leads to dismissal of the bedrock

aquifer as an opportunity for ASR. As demonstrated by public documents, described in the following text, the applicant's dismissal of bedrock aquifers in Northern Colorado is invalid. Specifically:

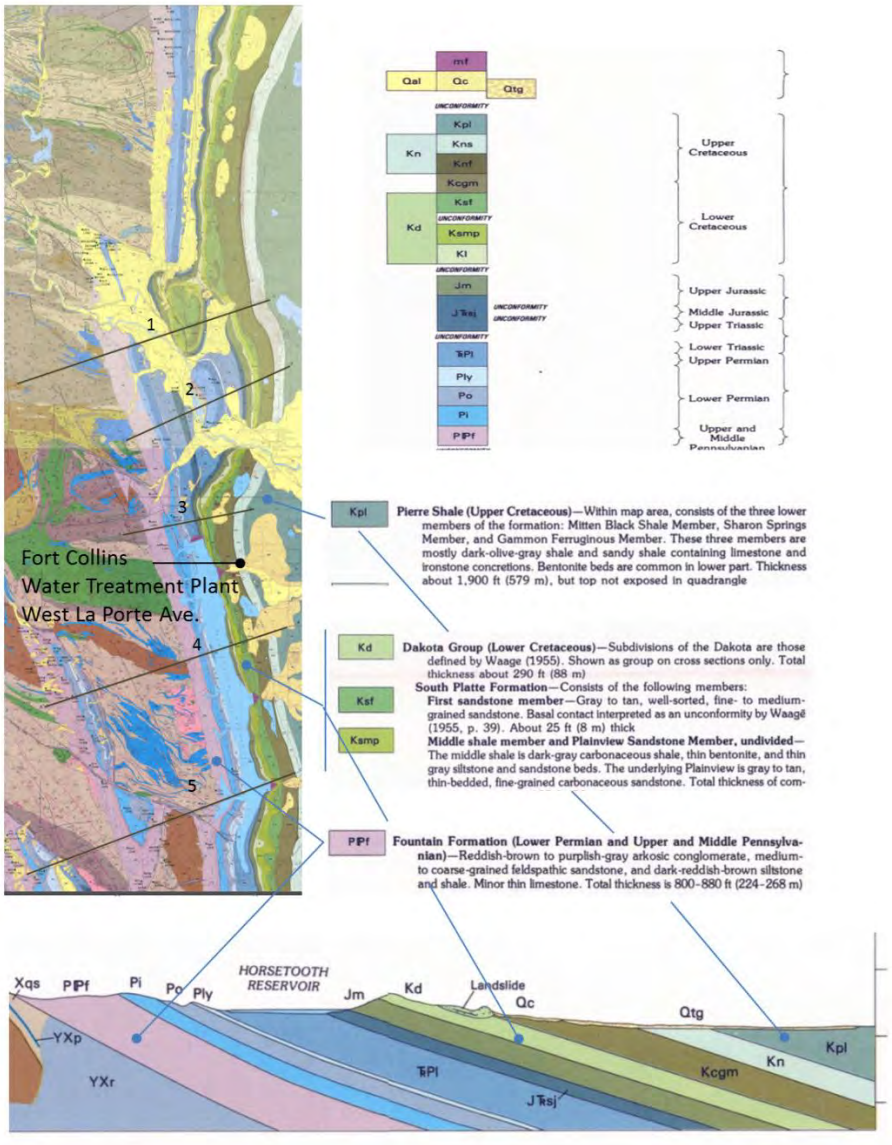
a) As outlined in Waskom and Sale (2017) , Sutton et al. (2017), Adam (2017), Hemenway and Sale (2017), and Collazo (2018) bedrock aquifers are widely used in northern Colorado for domestic water supply (thousands of wells). In addition, bedrock aquifers in northern Colorado are occasionally used in higher capacity applications. Limited use of bedrock aquifers in Northern Colorado for high-capacity applications reflects the availability of surface water but not the potential of bedrock aquifer. Following Sutton et al. (2017), Adam (2017), Hemenway and Sale (2017), and Collazo (2018), promising bedrock aquifers in Northern Colorado include the Fountain, Ingleside, Dakota, and Pierre Sand Formations, to name a few. Furthermore, unique structural features of the bedrock aquifers in Northern Colorado create promising opportunities to store water in non-tributary settings, where damage to others would not be significant.

b) Over much the past year, the applicants have been drilling bedrock aquifer and collecting cores below the proposed Glade Reservoir site. As the applicant must know by now, the western bay of the proposed reservoir is underlain by the Fountain Formation. The Fountain Formation consists of ~800 feet of interbedded sandstone and shales. The formation dips to the east providing a unique opportunity to store water in a non-tributary setting that is largely unused. Interestingly, with 400 feet of head in Glade Reservoir, seepage losses through the Fountain Formation are likely to be significant. To my knowledge, none of the data from drilling at the proposed Glade Reservoir site has been made available to the public. Public information addressing the feasibility of ASR in the Fountain Formation includes:

    a. Alqahtani (2015) presents a comprehensive analysis of ASR in the Glade Reservoir including designs and estimates of cost. Cost estimates indicate the opportunity to store water at a fraction of the costs of NISP without the consumptive water demand associated with evaporation and seepage loses. As footnotes:
        i. Given potential storage in Northern Colorado Aquifer, described in Topper et al. (2004), ASR can be scaled up for any reasonable future water storage volume.
        ii. Alqahtani (2015) was provided with my comments on the SEIS but was not acknowledged.

    b. Sutton et al. (2017) and Collazo (2018) provide extensive descriptions of the Fountain Formation with the expressed intent of resolving the potential of

the Fountain Formation for ASR. Both reports conclude that the Fountain Formation is a promising candidate for ASR in Northern Colorado.



Hemenway and Sale (2017)- Potential Fort Collins aquifers that can be used for ASR (Braddock et al. 1988 and Braddock et al. 1989).

Relevant public information that has not been considered

Building on concerns regarding roadblocks to advancing ASR as a synergistic complement to existing water supplies in Northern Colorado, extensive work has gone into 1) collecting and disseminating information relevant to ASR in Northern Colorado. The following synopsis provides critical information that is **not** considered in the NISP FEIS.

Colorado Water Conservation Board

Sutton, S.J., Collazo, D., and Sale, T., 2017. Fountain Formation: Potential for Subsurface Water Storage, report for Colorado Water Conservation Board.

Overview

"*Water storage capacity along the Colorado Front Range may be augmented by increased utilization of Aquifer Storage Recovery (ASR) projects in which excess water pumped into an aquifer for temporary storage and then pumped back to the surface when needed. One key aspect of successful ASR is selection of a suitable target aquifer and another is the geographic location of the ASR wells. The Pennsylvanian Fountain Formation, part of the sedimentary succession filling the Denver-Julesburg Basin and cropping out along the Front Range, has properties that suggest that it may be a suitable target aquifer. The geographic extent of near-surface occurrence of the Fountain Formation along the urban corridor of the Front Range may enable it to contribute to water storage needs as the population of this area continues to grow.*

Previous work on the Fountain (e.g. Howard, 1966; Maple and Suttner, 1990; Sweet and Soreghan, 2010; Hogan and Sutton, 2014) has shown that much of the formation comprises ancient braided stream deposits, including now lithified gravels, sands, silts, and clay-rich ancient soil horizons (paleosols). Some of this work has shown that these deposits may be compartmentalized, with zones of high permeability isolated from one another by low permeability horizons (e.g. Hogan and Sutton, 2014). The floodplain paleosols, now preserved as mudrock layers within the rock strata, appear to provide low permeability barriers that separate permeable zones. Similarly, the natural lateral discontinuities and variable permeability of the ancient river channel deposits likely provide additional barriers to flow between compartments. Anecdotal information about highly variable yields from neighboring domestic water wells further suggests that the Fountain Formation is compartmentalized. The probable permeability

compartments within the formation may form excellent targets for ASR. The structural dip of the Fountain Formation beds suggests that dipping permeable compartments could generate high yields because of the potential for applying large drawdowns or mounding. The proximity of the belt in which the Fountain Formation is found at depths suitable for ASR to existing infrastructure and to Front Range cities further supports consideration of the Fountain Formation as an ASR target. The goal of this work is to utilize existing hydrogeologic data to better evaluate the overall potential of the Fountain Formation as an ASR target and to evaluate the geographic variability of the formation's hydrogeologic and geochemical properties along the Colorado Front Range."

CDM Smith (2018). South Metro Water Supply Authority Aquifer Storage and Recovery Feasibility Study Final Report, Prepared for the Colorado Water Conservation Board.

This report documents the feasibility assessment of aquifer storage and recovery (ASR) at both local and regional scale of implementation in the Denver Basin as a water management strategy to meet the South Metro Water Supply Authority (SMWSA) member's future demands. This report was prepared through a Water Supply Reserve Account grant from the Colorado Water Conservation Board (CWCB) via the Metro Basin Roundtable. Inclusive to this report are tools developed by Colorado State University for evaluation of hydrogeologic setting for ASR wellfields, hydraulic modeling tools for ASR programs, and tools to estimate capital and operational accost associated with ASR programs.

City of Fort Collins

Hemenway, C. and T. Sale (2017), Final Draft Assessment of Fort Collins Aquifer Storage and Recovery (ASR) Opportunities, Project Report to the City of Fort Collins, Colorado.

Executive Summary

"This report explores the feasibility of storing water in bedrock aquifers through Aquifer Storage and Recovery (ASR) for the City of Fort Collins. ASR provides a promising complement to the City of Fort Collins' current water supply systems. Potential benefits include simplifying permitting of new storage, providing an economical alternative to surface storage, conserving water through reduction in seepage and evaporative losses,

and enhancing the resiliency of the City's water supply during fire, drought, or other periods requiring emergency water supplies.

Herein, the Fountain Formation, Dakota Group, and Pierre Formation are identified as promising options for subsurface water storage. Building on these options, a conceptual design for an ASR well field located at the City's Foothill Water Treatment Plant (WTP) is advanced. A total of 27 Aquifer Storage and Recovery (ASR) wells would be developed and used to store water over a 50-year planning period. The ASR well field would provide 15,000 acre-feet of new water storage and have a capacity to produce up to 30 cubic feet per second (cfs) or 13,465 gallons per minute (gpm).

Preliminary present-value cost estimates of $31 to $38 million are developed. Approximately one third of the estimated ASR cost could be covered by funds currently committed to adding new storage for treated water at the City's WTP. Our estimates of cost are qualified by the statements that:

- *This is only a screening-level study*
- *The capacities of wells (a key cost driver) is unproven*
- *Absent test data from the aquifers of interest, permitting, and water-rights issues cannot be rigorously resolved at this time*

Given the potential of ASR and critical data gaps advanced in this report, a sequential test well program is advanced. Phase 1 ($500k) involves drilling a test hole at the City's WTP on West Laporte Avenue. Formation capacities and water quality would be resolved in the Dakota Group and Fountain Formation. Phase 2 ($700k), if warranted would involve completion of a fully-equipped ASR well at the test location. The completed ASR well would be tested, and results would provide the basis for more rigorous analysis of ASR as an option and refinement of the design of future ASR wells. In addition, the test well could serve as the first well in the City's ASR well field. Phase 3 ($400k), if warranted, would involve drilling an additional test hole to resolve the performance of wells located east of the WTP.

In summary, this report indicates that ASR is a promising option for the City of Fort Collins. Costs are similar to current alternatives, a broad set of benefits can be achieved, and no critical impediments have been identified. The biggest challenge is that

proceeding with development of ASR will require a phased test well program that would require up to one year to complete and would cost up to $1.6M."

The CGS has completed an analysis of storing water underground through "artificial recharge." Artificial recharge is defined as any engineered system designed to introduce water to, and

store water in, underlying aquifers. The study, titled "EG-13 Artificial Recharge of Ground Water in Colorado: A Statewide Analysis," explores various geological and technical aspects of artificial recharge in Colorado.

Adam (2017) provides a comprehensive review of groundwater usage in Northern Colorado in aquifers other than the Fountain Formation in support of evaluating ASR.

Collazo, D. (2018). Hydrogeologic characterization of the Fountain Formation: prospective aquifer storage and recovery targets in Front Range Colorado. MS Thesis Department of Geosciences (Order No. 10690375). Available from Dissertations & Theses @ Colorado State University.

Collazo (2018) provides a comprehensive review of groundwater usage in the Fountain Formation (including Northern Colorado) in support of evaluating ASR.

A pragmatic path forward for adequate consideration of ASR

The next step forward for ASR in Northern Colorado would be a test well program following the form of ongoing ASR test program in the Denver metropolitan area (e.g., Castle, Rock, East Cherry Creek, Meridian, etc. See page 30 of 20.). The table below advances costs for an ASR test program developed for the City of Fort Collins in Hemenway and Sale (2017). Given interest from multiple parties, the cost of an ASR test program could be supported by multiple participants, and funds from state agencies could be solicited. The test well program proposed to the City of Fort Collins is presented in Attachment C.

Item	Estimated Cost ($)
Phase 1: Initial Test Boring	$500,000
Phase 2: Well Completion	$700,000
Phase 3: Second Test Boring	$400,000
Total Phase 1, 2, and 3 Drilling Costs	**$1,600,000**

FYI, the cost of evaluating ASR is likely far less than the cost of advancing a design for the NISP project. As such, there is little basis for rejecting a test program for ASR in Northern Colorado based on cost.

RE: NISP - Comments on NISP Supplemental Draft Environmental Impact Statement

Attention John Urbanic, NISP EIS Project Manager

The following comments are offered in support of the Crops review of the environmental effects of the proposed NISP. My comments are my own. My current position is Associate Professor, Civil and Environmental Engineering, Colorado State University, Fort Collins CO. My qualifications include BA degrees in Chemistry and Geology, an MS degree in Watershed Hydrology, and a PhD degree in Agricultural Engineering. My employment history includes 19 years of experience in consulting engineering and 15 year of experience in academia. The primary focus of my career has been groundwater.

Comment 1 – The DEIS and SDEIS fail to accurately recognize alternatives based on subsurface water storage

General

My primary comment is that the DEIS, April 2008, and the SDEIS, June 2015, fail to recognize accurately alternatives based on subsurface water storage that:

1) Have dramatically reduced impacts to the environment,
2) Dramatically lower costs, and
3) Cannot be dismissed as unproven technology.

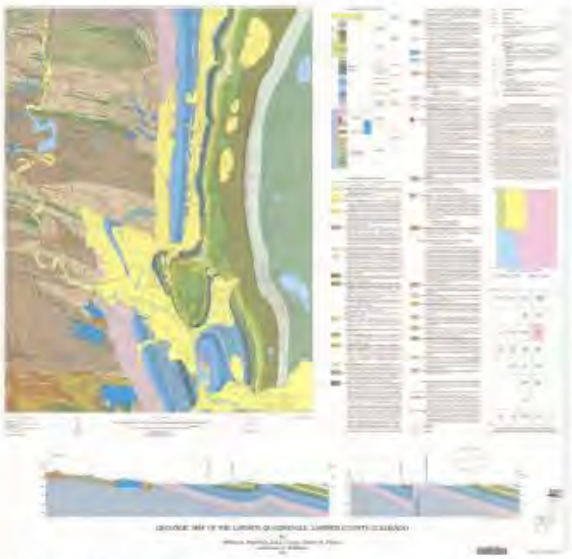
As observed in the SDEIS (page S-16):

> "Regulations implementing NEPA require that an EIS rigorously explore and objectively evaluate all reasonable alternatives."

The primary basis for my comment stems from Abdulaziz A. Alqahtani's 2015 Colorado State University Master of Science (MS) thesis titled "SUBSURFACE WATER STORAGE ASSESSMENT MODEL." Mr. Alqahtani's thesis is included as an attachment in the email transmitted with this letter.

In More Detail

Mr. Alqahtani's MS thesis research was conducted under my supervision as his major advisor over a two-year period. Mr. Alqahtani's research was motivated largely by my concern that the April 2008 DEIS failed to consider fairly subsurface water storage as a viable alternative.



Our explorations of subsurface water-storage opportunities in northern Colorado lead us to the Fountain Formation below Glade. Per the adjacent geologic map (LaPorte Quadrangle), the Fountain Formation (pink) is an approximately 800-foot-thick sandstone layer that dips to the east along the hog backs adjacent to the foothills. The Fountain Formation below Glade is separated from southern portions of the Fountain Formation by the North Fork Fault. Given sparse development and geologic structure, historical use of the Fountain Formation has been limited and the Formation is, in large part, hydraulically isolated.

Mr. Alqahtani's MS thesis advances tools to develop estimates of capital and operation costs for subsurface water storage projects. The model is demonstrated by considering:

- Subsurface water storage in the Fountain Formation beneath Glade
- A system that delivers 6,400 acre feet of water in an average year and up to 12,700 acre feet of water in a drought year. Note: given the extent of the Fountain Formation in

Northern Colorado, systems with larger capacities are feasible with similar costs on a per acre foot of water basis.

The associated present values costs for capital cost and 30 years of operations and maintenance is $23 million. Given these numbers, cost per acre foot for subsurface water storage is on the order of $3,500 and $1,800 per acre of foot yield. These costs are on the order of 1/10th the cost of the current NISP preferred alternative. Estimated cost for subsurface water storage are even lower if one recognizes the values of water that can be saved by effectively eliminating consumptive evaporation and seepage losses from the proposed Glade Reservoirs, which would be on the order of thousands of acre-feet per year.

In addition to reduced cost and water savings, local benefits of subsurface water storage include:

- Eliminating the need to move Highway 287 and the Munroe Ditch.
- An ability to build system capacity in modules to meet future water demands on an as-needed basis, which also provides much greater economic flexibility for the development of water storage over time. Development of large surface water storage projects, such as Glade, require the commitment of large capital resources at the onset of the project. With the modular, as-needed development of subsurface water storage, capital investments may be spread out over time or deferred as economic conditions and water demands vary in the future.
- Preservation of open space and wildlife habitat that would be destroyed by reservoirs.
- An ability to maintain greater streamflow through the Cache La Poudre River by eliminating water consumption due to evaporation and seepage losses.
- Elimination water quality impacts that can occur in the proposed Glade Reservoir due to evaporation driven concentration of salts, biological fouling of water by decaying organic material, and potential anthropogenic releases including release of fuels from recreational motor boats.
- Advancing low-cost water storage in a community that is desperate for new storage, especially as demonstrated in the current year where well over one million acre-feet of water available for use in Colorado flowed downstream to other states.
- Moving forward with new technology that is less hindered by complex permitting processes. Permitting of subsurface water storage in Colorado is simple, quick, and inexpensive through the Colorado State Engineer's Office and the Underground Injection Control Branch of the United States Environmental Protection Agency.
- Elimination of air-quality impact and traffic associated with constructing a large dam.

- Advancing systems that will have far greater resiliency in the face of future drought and climate change.
- Reduction of the debt burden placed on the current and future populace of Northern Colorado.

An anticipated response proposing subsurface water storage as an alternative is an argument that subsurface water storage is an unproven technology. The only basis for voicing this opinion would be based on the lack of knowledge of existing subsurface water storage projects developed nationally since 1980 and in Colorado since the 1990's. Successful bedrock subsurface water storage projects have been implemented in Colorado, including:

- Highlands Ranch with the Centennial Water and Sanitation District since 1991,
- Consolidated Mutual Water District in Lakewood since 2004, and
- Colorado Springs Utilities since 2005.

To enable these projects, the Colorado State Engineer's Office promulgated Rules and Regulations (Artificial Recharge Extraction Rules; 2CCR 402-11) for the Denver Basin in 1995, providing the necessary water-rights framework for subsurface water storage in Colorado.

Further proof of the viability of subsurface water storage projects, including resolution of water-rights issues, can be found for subsurface water storage projects that have been ongoing for decades in Arizona, Southern California, Utah, Florida, and around the world.

Lastly, Colorado is home to a cadre of engineers, scientists, contractors, water-rights attorneys and regulators with the local knowledge and skills needed to deliver subsurface water storage projects. To get a fair assessment of a remarkable opportunity, Northern Colorado simply needs to ask the right people how to do it. Conversely, disregarding subsurface water storage as an option, based on the work of individuals that are obviously unknowledgeable of the technology of subsurface water stoarge, as demonstrated in the DEIS and SDEIS, violates the specified requirement to "rigorously explore and objectively evaluate all reasonable alternatives".

In closing, the time has come for Northern Colorado to embrace modern technology that can responsibly meet the diverse challenges before us, as expressed in the Corps public hearings. The time has come for Coloradans to once again be bold innovators in water storage and the modern corollary of sustainable living.

Attachment B – Applicant response to T. Sale Comment -

… fail to accurately recognize alternatives based on subsurface water storage…

Dr. Tom Sale

2007, 2304, 2305, 5007

Comment 2007: Concern about other screening criteria

Subsurface water storage is a proven technology. *There are several successful bedrock subsurface water storage projects in Colorado*. The Corps considered and screened subsurface storage (6 elements) as part of the evaluation of 215 storage elements (DEIS Section 2.1.4, SDEIS Section 2.2.4 and FEIS Section 2.2.4). The examples cited by the commenter to demonstrate that subsurface storage is a proven technology (Highlands Ranch, Centennial, Lakewood, Colorado Springs) are all locations over thicker portions of the Denver Basin Aquifer. The Denver Basin bedrock aquifers are thinnest in northern Colorado, with the northernmost extent of the aquifers near Kersey. **The Denver Basin aquifers to not extend into Larimer County. The primary groundwater resources in the NISP study area are alluvial aquifers which are shallow and heavily used for agriculture**.

Comment 2304: Suggests an alternative to storage

Commenter(s) expressed concern that the EIS failed to consider subsurface storage. The Corps considered and screened subsurface storage (6 elements) as part of the evaluation of 215 storage elements (DEIS Section 2.1.4, SDEIS Section 2.2.4 and FEIS Section 2.2.4). The examples cited by the commenter to demonstrate that subsurface storage is a proven technology (Highlands Ranch, Centennial, Lakewood, Colorado Springs) are all locations over thicker portions of the Denver Basin Aquifer. The Denver Basin bedrock aquifers are thinnest in northern Colorado, with the northernmost extent of the aquifers near Kersey. **The Denver Basin aquifers do not extend into Larimer County. The primary groundwater resources in the NISP study area are alluvial aquifers that are shallow and heavily used for agriculture.**

Comment 2305: Suggests alternative reservoir site

Commenter(s) expressed concern that the EIS failed to consider subsurface storage. The Corps considered and screened subsurface storage (6 elements) as part of the evaluation of 215 storage elements (DEIS Section 2.1.4, SDEIS Section 2.2.4 and FEIS Section 2.2.4). Six groundwater storage sites, also known as aquifers, within the Poudre River Basin were evaluated and screened. Groundwater storage is the location where surface water rights are captured and stored in subsurface aquifers for later withdrawal. **All six groundwater storage sites were eliminated due to capacity.**

Comment 5007: Concern about NEPA regulations

Commenter(s) expressed concern that disregarding subsurface storage as an option violates the specified requirements to "rigorously explore and objectively evaluate all reasonable alternatives". **The Corps considered and evaluated subsurface storage.** See responses to Comments 2304 and 2305.

Attachment C – Excerpt from Hemenway and Sale 2017 – Test Well Program from Draft Report to the City of Fort Collins

The preceding feasibility analysis indicates that ASR is a promising option for the City of Fort Collins. The primary data gaps in the analyses are:

- Well recovery and storage flow rates that are needed to fully resolve costs
- Formation water quality and mineralogy
- Aquifer properties (T and S) that are needed to:
    - Predict water levels associated with the proposed ASR program
    - Evaluate dominion and control of stored water

The following outlines a test well program that would address data gaps.

Location

Figure 8 shows the location of the proposed ASR well field with Well #1 designated as the proposed test well location. The location of this well is based on proximity to the Fort Collins WTP, treated water storage facilities, and geologic considerations. The proposed location is within the current WTP property boundaries, eliminating any property or easement issues. Locating the well in close proximity to the WTP will minimize the length of pipelines and associated costs with delivering water to and recovering water from the test well. For testing purposes, temporary above-ground piping may be used that would further reduce testing costs. The proposed location would provide reasonable depths of completion for any of the geologic formations considered for testing (**Error! Reference source not found.**).

Drilling and Sampling

The proposed drilling program will be conducted in three phases. The first phase will identify and hydraulically characterize all potential water-bearing intervals from the ground surface through full penetration of the Fountain Formation. The second phase, pending success in the first phase, will develop a fully-functional ASR test well in the formation determined in the first phase to be the best hydraulically capable (pumping and injection) for ASR operations. The third phase includes the drilling of an additional test bore (no well completion) to define the areal extent and hydraulic properties of the aquifer formation selected for the test well in phase 2.

During the first phase of the test well program, a pilot hole with a nominal 9-inch diameter will be drilled to a total depth that fully penetrates the Fountain Formation. A total depth of approximately 3,000 feet is expected to reach the base of the Fountain Formation at the proposed test well location. Drill cuttings will be collected at 10-foot intervals and lithologically logged by a professional geologist. Due to the steep dip in the formations at the test well location, a declinometer in the drill assembly will be used to determine the straightness of the boring during drilling. The borehole direction will be controlled by the speed of the drilling and the weight on the drill bit. If the directional control cannot be maintained, mud motors will be used to control the direction of the drilling to maintain a straight borehole.

Following the completion of the drilling, the borehole will be geophysically logged. The geophysical logs will include natural gamma ray, shallow and deep resistivity, induction, spontaneous potential (SP), caliper, compensated density, and porosity logs. The geophysical logs will delineate the various formations and potential water-bearing zones. Following a review of the geophysical logs, up to 25 sidewall cores will be collected in several potential water-bearing intervals. The sidewall cores will be used to characterize the formations (lithology and mineralogy) and to test the specific yield of the formation. Specific yield is the drainable porosity of the material, or the percentage of water that drains by gravity from the formation material.

Following the side wall coring, up to three drill stem tests (DSTs) will be conducted in the open borehole. The DSTs will be used to hydraulically characterize individual zones within the borehole. The DST will isolate individual zones in the borehole using two inflatable packers. The DSTs will provide information on static water levels, potential water production rates, and water quality in the targeted formations.

Following the completion of the test borehole (phase 1) and review of all the information collected, a formation will be selected to be used for ASR testing (phase 2). The pilot test borehole will be reamed out to a diameter of 20 inches, and 12-inch diameter well casing and screens will be installed in the borehole. The well screen will be stainless steel, continuous wire-wrapped, V-wire screen with a slot size based on the formation materials. The annular space in the screened interval will be gravel packed with specific silica sand that is sized for the selected well screen slot size. The borehole annular space above the screened interval will be grouted with cement to the ground surface, as per Colorado Water Well Construction Rules. Following the grouting, the well will be developed using airlift methods and pumping using a submersible pump. The development will remove drilling fluids and accumulated sediments from the well.

Hydraulic Testing

As part of phase 2, aquifer testing will be conducted at the conclusion of the drilling and development work at the pilot test well and will consist of two tests: (1) a variable-rate drawdown test, and (2) a 72-hour constant-rate pumping test. Water levels and pumping rates will be measured during the pumping and recovery periods of the tests. From the aquifer test information, transmissivity, specific capacity at 72 hours, and when possible, the well efficiency and aquifer storage coefficient at the well will be calculated. Estimates of the long-term production and peaking rates for the well will be provided from the aquifer test results, as well as recommended injection rates for ASR operations.

Following the well installation and hydraulic testing conducted in phases 1 and 2, subsequent equipping of the test well and pilot ASR testing will need to be conducted. Three injection/storage/recovery cycle tests will be completed during the pilot ASR testing. The first of the three cycle tests is usually of a short duration. Typically, the first injection is continuous for three days, and then the water is immediately recovered with little storage time in the aquifer. This test provides for a simple confirmation of the water-quality compatibility assessments made prior to the testing. The second test usually runs for seven days of injection followed by seven days of storage in the aquifer prior to recovery. This test is used to further confirm the water compatibility issues related to ASR operations, as well as to identify the effects of storing the injected water in the aquifer. If the first two tests indicate that ASR operations are feasible at the site, an extended-duration test will be conducted to determine the actual operating criteria for long-term ASR operations in the well. This test usually runs injections for up to 45 days continuously with storage in the aquifer for 30 to 60 days prior to recovery. All of the proposed testing is predicated on the availability and delivery schedule for the injection water to be used in the ASR testing.

Water Quality

Near the conclusion of the 72-hour test conducted in phase 2, a water-quality sample will be collected from the well. This sample will be used to assess the water-quality conditions at the well. The water-

quality sample will be analyzed according to the list of parameters shown in Table 5. The water-quality sample can be used for both the Colorado Department of Public Health and Environment (CDPHE) Public Water System compliance testing and the EPA for amending the Rule Authorization for ASR operations.

Table 5 – Water Quality Parameter List

Total Alkalinity	Oil and Grease
Total Organic Carbon (TOC)	Total Plate Count
Total Coliform	PH
Fecal Coliform	Orthophosphate
Chloride	Total Phosphorus
Chemical Oxygen Demand (COD)	Total Dissolved Solids (TDS)
Color	Sulfate
Cyanide	Sulfide
Fluoride	Surfactants
Fecal Streptococcus	Turbidity
Total Organic Halide (TOX)	Total and Dissolved Metals
Calcium Hardness	Regulated Volatile Organic Compounds (VOCs)
Total Hardness	Nonregulated VOCs
Langelier Saturation Index	Pesticides
Ammonia, Nitrogen	Herbicides
Total Kjeldahl Nitrogen	Gross Alpha
Nitrate, Nitrogen	Gross Beta
Nitrite, Nitrogen	Radium 226
Odor	Radium 228
	Radon

In subsequent ASR testing conducted after phases 1 and 2, eight laboratory water-quality samples will be collected during the three proposed ASR test cycles. HGE will notify Fort Collins water treatment staff prior to each sampling event to coordinate any split sample requirements during the ASR testing.

The preliminary list of water-quality constituents required for analysis during the testing is shown in Table 5. Additional samples for analyses of major cations and anions might be collected on a variable basis if the preliminary test results indicate additional test data are required. Samples collected by HGE will be analyzed by a certified water-quality test laboratory.

During the first ASR cycle test, one water-quality sample will be collected for laboratory analysis during the recovery pumping. For the second ASR cycle test, two laboratory water-quality samples will be collected during the recovery phase at approximately 50 and 90 percent of the injected volume recovered. During the third and final ASR cycle test, four laboratory water-quality samples will be collected during the recovery pumping at 50, 75, 90, and 125 percent of the injected volume recovered. One additional sample will be collected at the wellhead during the injection phase of the cycle test to evaluate any changes to the injection water quality from the first two injection cycle tests.

Estimated Cost

The estimated cost to complete the three phases of the test well program was obtained from Hydro Resources located in Fort Lupton, Colorado. Hydro Resources is a highly-qualified drilling and pump installation contractor who has drilled and completed numerous deep bedrock aquifer wells within Colorado and the western United States. HGE developed general technical specifications for completing the Fort Collins ASR test well program. HGE reviewed the specifications with Hydro Resources and developed a basic cost estimate bid for the project.

The estimated drilling and well installation cost to complete the proposed test well program (phases 1 through 3) is $1.6 million. The cost estimate assumes that the initial test borehole will be completed to a depth of 3,000 feet for an estimated cost of $500,000, including a 25-percent contingency. If the base of the Fountain Formation is determined to be at a shallower depth, the phase 1 cost would be reduced. Similarly, if the base of the Fountain Formation is less than 3,000 feet or a shallow formation is selected for the final pilot well installation, the phase 2 well completion cost of $700,000 would be reduced. The cost to complete phase 3 (supplemental test hole) is estimated to be $400,000. The cost to complete the second test could be reduced if the depth is limited to be the base of the Pierre Formation or Dakota Group.

A 25-percent contingency is included in the budget for phase 1 of the project (test hole drilling) due to various uncertainties and risks associated with a deep test borehole with sidewall coring and DSTs. In addition, if the dip of the formations cannot be controlled using normal drilling techniques and directional drilling controls are required, the drilling costs would increase from the projected $500,000.

At the conclusion of the phase 1 and 2 drilling and installation programs, the pilot well would be installed in accordance with Colorado Water Well Construction Standards. The well would then be ready for installation of permanent equipment for the proposed pilot ASR testing. HGE also requested budget level cost estimates from Hydro Resources for two types of final well equipment designs. The first assumes that a shallow formation would be selected, such as the Dakota Group, and the pumping rate would be limited to 500 gpm. The second scenario assumed a deep well completion into the Fountain Formation with an estimated pumping rate of 1,000 gpm. The cost estimates for each scenario included installing and providing all the downhole equipment (submersible pump and motor, column pipe, electrical cable, downhole Flow Control Valve (FCV), check valves, etc.), well vault with all necessary piping and metering equipment (flow meters, valves, etc.), and all surface facilities (Variable Frequency Drive (VFD), step-up transformers, monitoring equipment, equipment panels and enclosures, etc.). The estimated cost for the shallow-well completion is $618,000, and the deep- well completion is $1 million.

The engineering cost to complete the three-phase drilling and test well installation program is estimated to range from $60,000 to $70,000. The engineering cost to complete the three-cycle ASR testing program is estimated to range from $65,000 to $85,000, including the laboratory cost for sampling during the ASR pilot testing ($32,000 - eight samples at $4,000 per sample). The ASR pilot testing costs could be reduced if some laboratory work was conducted by the Fort Collins WTP laboratory.

A summary of all estimated costs for the project are included in Table 6.

Table 6 – Estimated Test Program Costs

Item	Estimated Cost ($)
Phase 1: Initial Test Boring	$500,000
Phase 2: Well Completion	$700,000
Phase 3: Second Test Boring	$400,000
Total Phase 1, 2, and 3 Drilling Costs	**$1,600,000**
Engineering Cost – Phases 1 - 3	$60,000 to $70,000
Additional Future Costs	
Final Well Equipping Cost Range	$618,000 to $1,000,000
Pilot ASR Testing Engineering Cost Range	$65,000 to $85,000

NISP 1041 Permit Application; 20-ZONE2657

2 messages

Jan Rothe <lemmule@gmail.com> Thu, May 7, 2020 at 10:04 AM
To: rhelmick@larimer.org

Dear Mr. Helmick,

I am a retired wildlife ecologist who is writing to ask the planning commissioners to very carefully consider the NISP 1041 permit application; Project No. 20-ZONE 2657. It does not comply with many of the applicable criteria set forth in Section 14 of the Larimer County Land Use Code.

Specifically, Glade Reservoir will have many significant adverse affects on the natural resources on which the proposed reservoir is situated, as well as on lands adjacent to the proposal. The construction of Glade Reservoir will result in roughly 1600 acres of habitat being destroyed for many species of wildlife, not only in Larimer County, but as far away as Nebraska, due to a decrease in river flows. Any loss of habitat will, of course, impose certain limitations to wildlife populations, but we can't just consider loss of habitat in thinking about this proposal. **We MUST consider the cumulative effects of these losses**. How many different species of wildlife will be affected, how many individuals will die, how long will the results last, how much will population numbers be reduced. The habitat loss associated with building Glade Reservoir will result in losses of at least 18% of winter habitat for elk, 16% loss of mule deer winter range, 80 acres of habitat loss for the federally-threatened Preble's meadow jumping mouse, and 11 acres of habitat loss for the state-listed black-tailed prairie dog and burrowing owl, just to name a few. It will also further endanger the already federally-endangered Whooping Crane in Nebraska. Wildlife will have fewer migration routes, less food and water, and fewer places to nest, burrow, or den to hide from predators. If we keep pushing wildlife, such as mule deer, elk, pronghorn antelope, bald eagles, golden eagles, burrowing owls, prairie dogs, and the federally threatened Preble's mice aside and destroying their habitat because of huge projects like Glade Reservoir, we will be the losers. **No amount of mitigation will EVER make up for the losses we will all suffer**. No amount of well-designed 'recreation' around a man-made reservoir with a visitor center, campgrounds, man-made hiking trails, and parking lots can ever compare with having magnificent wild places in our midst, where we can occasionally catch a glimpse of wildlife in their native habitats.

The NISP proposal will **DEFINITELY NOT** protect critical environmental resources - most notably the Wild and Scenic Cache la Poudre River. It will negatively affect wetlands, forever change riparian corridors because of decreased river flow, and wipe out important wildlife habitat, as mentioned above. It will also negatively affect some special places in Larimer County, such as the Cache la Poudre River National Heritage Area, which includes 45 miles of the lower Poudre River. This National Heritage Area is one of only 55 such sites in the country and was established by the U.S. Congress in 2009. This heritage area commemorates the river's significant contribution to the development of water law in the western U.S., the evolution of the river's complex water delivery systems, and its cultural heritage.

Glade Reservoir will also **NOT** prevent or decrease danger to life and property from flooding, wildfire, and geologic hazards. The proposed dam will be constructed on a geologic fault, and there will always be risk for wildfire from careless campers in the surrounding recreation area. Additionally, there are potentially significant hazards to local wells in the area adjacent to the dam, from the missile silo site toxic plume, which lies adjacent to the project's proposed forebay.

What makes all of the proposed negative impacts from this project truly upsetting is the fact that they are completely unnecessary. There are many viable alternatives to NISP that are more sustainable, far less expensive, faster to build, and more in line with protecting our natural resources. Not one viable alternative has even been considered!

Please make the right choice for the future of all of us, including our grandchildren and their progeny. Glade Reservoir is the wrong choice. Please advise the County Commissioners to deny NISP's 1041 Permit for Glade Reservoir.

Also, please consider allowing the public 3 minutes in which they may voice their concerns at the public hearing. Two minutes is hardly enough time to state your name and address, let alone make a persuasive argument for or against anything! I feel certain that the NISP project proponents had much more time than this to make their case.

Thank you for your time and consideration.

Respectfully,
Jan Rothe, Ph.D.

May 1, 2020

Dear Commissioner Donnelly,

I am writing today in regards to the planned Glade Reservoir. Having been a resident of Larimer County for fifty plus years I am fully aware of the need for water on the front range. To be perfectly honest I'm not sure how I feel about Glade changing how and where I live. I do, however, have some very strong feelings about the waste of taxpayer dollars for this project. Dollars are already being spent and Northern Water doesn't have enough water shares to fill a pond much less a huge reservoir. That isn't the biggest issue for me. It's just not good sense and seems a bit old fashioned to not look into alternative water storage methods. When Northern Water was asked about this at a public meeting they didn't have an answer.

The city of Centennial is already doing aquifer storage successfully. We have experts in this field right here at CSU. The waste of storing and moving water above ground is huge.

Why is the planned moving of US 287 left out of NISP's 1040 permit?

Finally, it seems strange that I hear nothing about these outside communities cooperating to lessen the impact of all these requested water projects on Larimer County.

In conclusion I urge you to deny the "NISP's 1041permit, Project No. 20-ZONE 2657" before you and tell Northern Water to go back to the drawing board.

Respectfully,

Carolyn Stienmier

To: rhelmick@larimer.org

Hi Rob,

My name is Jim Hauan. I own 4300 Eagle Lake Drive as my personal residence.

I also own the majority of the ditch road which is part of my property.

This is also known as Hood Lane.

A friend of mine just shared this document with me. It was the first I have seen or heard of it. Apparently one plan for the pipeline is to use Hood Lane as an access for construction.

I'm shocked that I have not been contacted by anyone or asked for permission for this? I have owned my property for the past 16 years and am the only person that ever maintained that road until recently when Charlie Meserlian has built his home behind me and now he has done some improvement to the road as well.

The road is in no means capable of handling construction traffic for this project. But most importantly nobody has contacted me to gain any type of permission.

So I thought it might be something that you should be aware of.

It is a private road and there is no access for the public.

Feel free to call me if you have any questions.

Thanks,

Jim Hauan

Construction Approach for Pipeline Segment between Travis Road and Highway 1

In performing the route analysis the engineering team noted the gated entrances to the Eagle Lake Subdivision. The presence of these restricted entrances spurred the team to develop a preliminary approach to construction access and estimated construction duration so that the impacts to these gated entrances could be better understood. The limits of the preliminary plan are depicted in figure P-7 below.

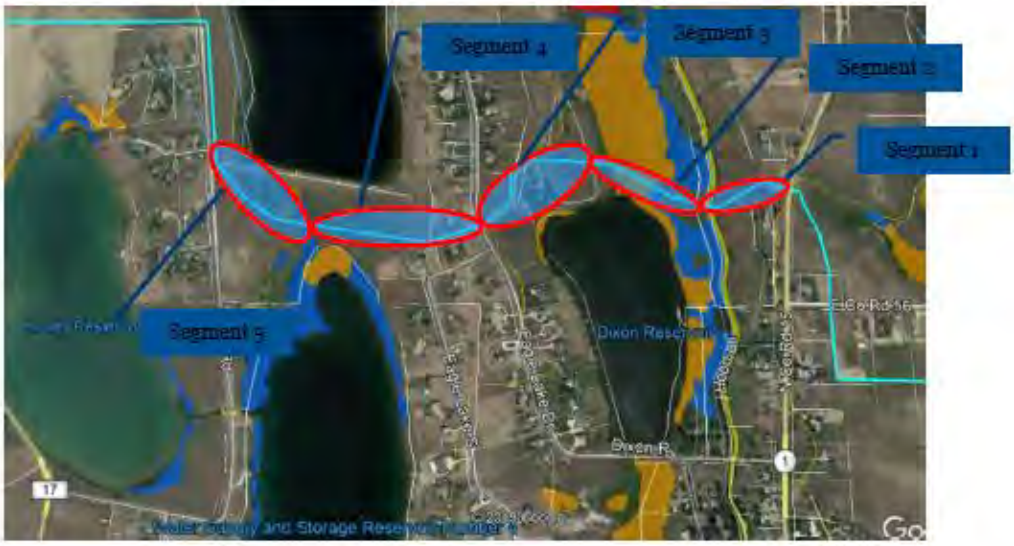

Figure P.9

Construction Access and Duration.

Segment 1 – Highway 1 to Hood Lane. Construction and material delivery vehicles will access the alignment via the alignment as it connects to Highway 1 and Hood Lane. In most cases entering via Highway one and exiting via Hood Lane. This segment is approximately 800 feet in length and is estimated to require approximately 5 to 8 work days for active excavation/pipe installation with activity beginning approximately 1 month prior for clearing, grubbing and site preparation. Following pipe installation, restoration of the disturbed area is anticipated to require approximately another 6 weeks. In total it is anticipated that this area will be impacted for approximately 12 weeks. The pipeline across Highway 1 will be crossed using trenchless methods so traffic on that roadway will not be restricted by construction activity.

Segment 2 – Wetlands North of Dixon Reservoir. Construction and material delivery vehicles will access the alignment via Hood Lane and Eagle Lake Drive. In most cases entering via Hood Lane and Exiting via Eagle Lake Drive. This will require access to the Eagle Lake Subdivision via the gated entrance at Eagle Lake Drive and Highway 1. This segment is approximately 1,100 feet in length and is estimated to require approximately 7 to 11 working days for active excavation/pipe installation with activity beginning approximately 1 month prior to that for clearing, grubbing and site preparation. Following pipe installation, restoration of the disturbed area is anticipated to require approximately another 6 weeks. In total it is anticipated that this area will be impacted for approximately 13 weeks. Because of the presence of wetlands in this segment, construction traffic will not access the alignment via Hood Lane once construction and restoration of this segment is completed. Unless otherwise requested by the County, it is proposed that the contractor not be allowed to use Eagle Lake Court for construction access.

Segment 3 – Private Property East of Eagle Lake Drive (TIPS COREY ALLEN/KAREN KRISTIN). Construction and material delivery vehicles will access the alignment via the Eagle Lake Drive both for construction traffic entering and exiting the site. This will require access to the Eagle Lake Subdivision via the gated entrance at Eagle Lake Drive and Highway 1. It is anticipated that sufficient temporary easement will be obtained from TIPS COREY ALLEN/KAREN KRISTIN to allow construction vehicles to turn around at the eastern end of this segment and exit the same way they came in. This segment is approximately 1,400 feet in length and is estimated to require approximately 9 to 14 working days for active excavation/pipe installation with activity beginning approximately six weeks prior for clearing, grubbing and site preparation. Following pipe installation, restoration of the disturbed area is anticipated to require approximately another 8 weeks. In total it is anticipated that this area will be impacted for approximately 17 weeks. Unless otherwise requested by the County, it is proposed that the contractor not be allowed to use Eagle Lake Court for construction access. The pipeline across Eagle Lake Drive will be crossed using trenchless methods so residential traffic using Eagle Lake Drive will not be restricted.

Segment 4 – Private Property west of Eagle Lake Drive to drainage between Water Supply and Storage Reservoirs 3 and 4. Construction and material delivery vehicles will access the alignment via the Eagle Lake Drive both for construction traffic entering and exiting the site. This will require access to the Eagle Lake Subdivision via the gated entrance at Eagle Lake Drive and Highway 1. It is anticipated that sufficient temporary easement will be obtained from the Water Supply and Storage Company to allow construction vehicles to turn around at the eastern end of the wetland that connects the two reservoirs. This segment is approximately 1,500 feet in length and is estimated to require approximately 9 to 14 working days for active excavation/pipe installation with activity beginning approximately six weeks prior for clearing, grubbing and site preparation. Following pipe installation, restoration of the disturbed area is anticipated to require approximately another 8 weeks. In total it is anticipated that this area will be impacted for approximately 17 weeks. Unless otherwise requested by the County, it is proposed that the contractor not be allowed to use Eagle Lake Court for construction access. Because of the presence of wetlands in this segment, construction traffic will not access the alignment via Eagle Lake Drive once construction and restoration of this segment is completed.

Segment 5 – Private Property east of Travis Road to drainage between Water Supply and Storage Reservoirs 3 and 4. Construction and material delivery vehicles will access the alignment via Travis Road both for construction traffic entering and exiting the site. It is anticipated that sufficient temporary easement will be obtained from the Water Supply and Storage Company to allow construction vehicles to turn around at the western end of the wetland that connects the two reservoirs. This segment is approximately 1,100 feet in length and is estimated to require approximately 8 to 12 working days for active excavation/pipe installation with activity beginning approximately six weeks prior for clearing, grubbing and site preparation. Following pipe installation, restoration of the disturbed area is anticipated to require approximately another 7 weeks. In total it is anticipated that this area will be impacted for approximately 16 weeks.

Space Availability for Other Pipeline in Preferred Corridor.

NISP WAE has not identified a need for an additional pipe in this corridor for its conveyance needs. Should another entity petition the County for a permit to construct a pipeline in parallel to NISP WAE's pipeline, adequate space exists to accommodate that pipeline. NISP WAE will acquire 40 feet of permanent easement plus an additional 60 feet of temporary easement for this project. If another pipeline were to be approved by the County, its permanent easement could abut NISP WAE's easement any they could use NISP WAE's permanent easement as their temporary easement.

LARIMER COUNTY

Larimer County Should Not Approve the NISP 1041 Permit Project No. 20-ZONE 2657

1 message

Weldon Barker <weldonb2@att.net> Fri, May 15, 2020 at 2:45 PM
To: rhelmick@larimer.org, tdonnelly@larimer.org, swjohnson@larimer.org, jkafalas@larimer.org

Dear Commissioners and Planning Commission:

Commissioner Johnson
Commissioner Kefalas
Commissioner Donnelly
Rob Helmick

I'm a retired resident in northern Larimer County, near the proposed location of Glade Reservoir, its massive dam, forebay, pumps, pipelines, campgrounds, parking lots, boat ramps, and other facilities. We strongly urge the Board of County Commissioners to deny the 1041 permit for the Northern Integrated Supply Project because it would forever impact the fundamental nature of the rural landscape in which we live and harm our quality of life.

We choose to live in northern Colorado for its beautiful natural landscapes, its wild and scenic rivers, its clean air and quiet surroundings, its wildlife, its opportunities for outdoor recreation on the abundant state and federal lands in the area. These are key pieces to our quality of life; key pieces that would be lost if this project is constructed and operated as proposed. Our land, water, and communities would be harmed by this project, and any benefits of the project would accrue to communities mostly outside Larimer County.

It is unacceptable that our rural northern Colorado communities must bear the impacts and un-mitigatable risks of this massive and ill-conceived project, the biggest ever proposed for Larimer County.

If construction is executed as planned, there would be seven years of heavy construction impacting our communities. We would be subjected to lots of heavy truck traffic, since the main artery to and from the reservoir site is Highway 287, which is also our main route; 6-days-a-week heavy traffic and heavy machinery operations, and the unwelcome, intrusive, and obnoxious presence of widespread and large-scale construction activity, noise, dust, and danger, over a long period of time. The intrusion would turn the hundreds of acres of the landscape into a construction zone, and take away the attractiveness, the clean air, the quiet – the things we depend on for health and happiness.

Northern Water is currently buying farms in northern Colorado to make up a more than 50% shortfall in the water rights needed for a successful project. In addition, recent prolonged droughts, which are becoming more common, have affected the amount of water that would be available from the Poudre River and other sources. For us, this means that we would endure the years and years of construction, and the irreparable loss of the unique landscape in which we live, all for an unfulfilled promise that "if they build it, the water would come" which is by no means guaranteed. The water shortage will only get worse as the climate dries, so Larimer County should deny this project, which will likely fail to meet its objectives. Less expensive, less destructive alternatives to water supply should be seriously considered.

Encouraging almost 400,000 visitors per year to this area would alter it from the quiet, rural and sparsely populated landscape we sought and invested in, to a busy recreational area with noise, dust, traffic, activity, accidents, and fires. Noise from motorboats on Glade would exceed state standards, would be heard miles away, and would significantly disrupt our lives. For some owners, the noise would cause property values to decline.

That's if the reservoir fills. The photographs Northern Water shows of a beautiful full reservoir are misleading at best, because the reservoir would rarely, if ever, look like that. It would generally look like an abandoned industrial facility marring the area's aesthetics.

Since the reservoir would not fill, and likely would not be full during much of its life, the project would look like an abandoned muddy puddle much of the time, and the recreational facilities would be mostly empty. Who would pay for the upkeep of the unused recreational facilities, Larimer County taxpayers? The project ruins the aesthetics of the valley and hogbacks – a unique and beautiful landscape – for a project that would provide little or no benefit to Larimer County and in fact would negatively impact its residents and its coffers.

The project would also contribute to climate change. Over 30,000 tons per year of CO2 would be emitted by engines to pump water into Glade. Other greenhouse gases would also be produced, both during construction and operation. Air

pollution would also occur due to the project, including gases that form ozone, a severe health hazard.

Dust blown from the barren shorelines would be swept up the valley on the area's strong winds and seep into our homes and further degrade our lives. The EIS states that it would take an 80-mph wind to generate any fugitive dust from the shorelines of the operating reservoir, an assertion that doesn't pass the laugh test for anyone living in this rural landscape. What else has have they got wrong? Are we to be the guinea pigs for some ill-conceived experiment?

We are very concerned about the potential for fire. We live in a high fire hazard, and we take many precautions with our homes and properties to protect against fires. Many visitors, who would be visiting in summer when the land is hottest and driest, would not be aware of how easy it is to cause a wildfire in this landscape. Some would be careless with campfires, with cigarettes, with illegal fireworks, or with firearms, and wildfires would be inadvertently ignited. Their vehicles can start fires. Unfortunately, arson is possible. Our climate is getting drier. Larimer County must recognize the seriousness of this issue and deny this permit. The county cannot simply hope for the best because our homes, our property, our animals would all be put at unacceptable risk of wildfire due to construction, high visitation, and incomplete understanding. These increased risks would also cause increased demands on local emergency services, especially fire, medical, and law enforcement.

No project this big can be undertaken without significant and irreparable impacts. We ask Larimer County to be a good steward and deny this permit PERMANENTLY and prevent the loss of open space and wildlife habitat, increased risk of wildfires and other public safety hazards, increased demands on local volunteer emergency services, noise, light pollution where now there is little, increased development and traffic in ever-widening circles around the reservoir, reduced air quality, climate change, increased illegal activities such as trespass on adjacent private land, decreased property values, and the loss of unique visual and aesthetic values. The natural and rural quality of this land is very important to our lives and communities.

For all the foregoing reasons, this project is a shocking affront to the residents of Larimer County and cannot be ethically--or environmentally--justified! It is only an attempt to reward residents of other counties who wish to usurp a disproportionate share of the limited waters of the Poudre River and to enrich the commercial interests who refuse to let this unconscionable die the death it wholly deserves!

Sincerely,

--

NISP Pipeline - Eagle Lake subdivision.pdf
1114K

May 15, 2020

Rob Helmick, Senior Planner

Larimer County Community Development Division

200 W. Oak Street

Fort Collins, CO 80521

email to: rhelmick@larimer.org

Dear Rob,

As a resident of the Eagle Lake neighborhood, I am writing you to ask that Larimer County not approve the 1041 Application that is before you for a pipeline through the county by Northern Water (NISP). The issues revolving around this application and the reasons it should be denied closely mirror that of the City of Thornton 1041 pipeline application that was rejected by the Board of County Commissioners.

Specifically, here are some of the reasons the County rejected the Thornton application and should do so as well with the NISP application:

1) According to the Land Use Code criteria quoted by the Board of Commissioners, the proposal is inconsistent with the county Master Plan affecting land use and development, specifically that the route will be traversing through significant amounts of private property and through yards in the Eagle Lake neighborhood. Private easements will have to be obtained through eminent domain. Affected residents will not be permitted to construct permanent structures or plant landscape material with deep roots (trees, wind blocks, etc) on their property due to the pipeline easement and maintenance requirements. Affected

925-525-8795
Karen@2wellers.com
4554 Eagle Lake S, Fort Collins CO 80524

residents will be subject to continual intrusion on their land by maintenance crews checking on the pipeline in perpetuity. This is a gross infringement of their right to a peaceful existence on their property and our right to restrict non-resident traffic on our privately owned roads.

2) In addition, according to Northern Water's Construction Approach document, they are anticipating using HOA owned private roads for construction traffic throughout the five segments of construction on the pipeline near and through our neighborhood. **The timeline of the cumulative impact to us is anticipated to be 59 weeks from start to finish for all the segments!** They are asking to use our narrow, non-public grade roads for heavy truck traffic and daily construction crew traffic on our private roads dozens of residents use daily to enter and exit our subdivision. This is an unacceptable burden on us and again is a gross infringement on our neighborhood and our rights to a peaceful existence that is inconsistent with the Master Plan's stated goal of "maintaining and enhancing our county's quality of life and to be fundamentally fair to all our citizens and to respect their individual rights." A quiet residential neighborhood with children playing, residents coming and going, and retirees enjoying the peaceful time they've earned is not a place for construction staging for a project that has no benefit for its residents and even minimal benefit to Larimer County as a whole. The concept and thought of using our roads for this purpose is untenable.

3) The NISP 1041 application negatively impacts public health and safety in our neighborhood. Our private roads are narrow roads and not constructed to handle large, semi-tractor trailer traffic loaded with pipe sections and construction materials for pipeline construction. The roads were not built to handle the volume of traffic or the load. Having these vehicles on our roads creates a safety hazard for children, bicyclists, walkers and resident traffic entering and leaving driveways. In addition, some of our older residents with health issues are at risk due to the constant coming and going of non-resident truck traffic. Noise levels, pollution from diesel vehicles, and anxiety from interruptions to our peaceful existence can all lead to increased health problems for all residents.

4) In the Land Use Code criteria for consideration by the County, Criteria C states its purpose is to "Promote the economic stability of existing land uses that are

925-525-8795
Karen@2wellers.com
4554 Eagle Lake S, Fort Collins CO 80524

consistent with the Master Plan and protect them by incompatible or harmful land uses." The proposed pipeline is certainly an incompatible and harmful use of the land in our neighborhood.

We recently annexed three parcels to our HOA (the TIPS Development) whose owner was required by the County to development certain aspects of the land (drainage, roads, etc) to be approved by the County before being allowed to offer the plots for sale and final residential development. The owner has spent thousands of dollars to prepare this land, yet the proposed pipeline path crosses near or on some of the new parcels rendering them virtually unsellable until the pipeline is built and completed. No buyer will pay a premium price for a parcel with the amount of disruption, uncertainty of building site and septic placement, and ongoing nuisance this project will cause to these three parcels for well over a year. The County is in effect killing the owner's ability to sell his parcels and recoup his already substantial investment that the County has made him invest to get the land ready for development. This is not "promoting the economic stability of existing land uses" (ie. Residential development) or "protecting incompatible and harmful land uses".

Other residents in our neighborhood who may be contemplating or are in the process of listing their property are also economically negatively impacted by the proposed pipeline. Buyers will use every reason to lower the price on a sale and a year or more of construction traffic, noise, dirt and dust flying in the neighborhood are good leverage points for them to either not buy at all, or attempt to attain a lower selling price than normal. The County is truly hurting the economic stability of the whole neighborhood with this proposal and hundreds of thousands of dollars in values may be lost if the application is approved.

5) Northern Water has presented other reasonable siting and design alternatives that do not include bisecting resident's property or cutting through our neighborhood that they have dismissed due to cost or more difficult construction conditions like their N2.4 (north of Reservoir #3) and N2.5 routes (Douglas Road). The Board of County Commissioners rejected reasoning that expense or difficulty of construction were disqualifying reasons for rejecting routes over ones that impacted private property owners and individual rights in the Thornton pipeline application. Northern's preferred

925-525-8795
Karen@2wellers.com
4554 Eagle Lake S, Fort Collins CO 80524

N2.1 route severely impacts our rights as property owners and citizens and should similarly be dismissed by the Commissioners when there are viable alternate routing options.

6) Another issue of grave concern to the Commissioners in the Thornton application was the construction and pipeline proximity to occupied dwellings. Proximity of construction and construction impact along with the long-term detriment to property owners was a primary concern. The Northern Water proposal includes a 100' easement – a 40' construction easement and a 60' permanent easement. If the pipeline were to be placed on the property line between the two residences the proposed N2.1 routing prefers, that will put the easement only 30 feet or less from one of the residences. The disruption and imposition on private property this close to an occupied dwelling is unacceptable when there are route alternatives that do not cross private property between two dwellings.
7) The other major point that should either cause the county to reject the application or defer a decision until later is the Thornton pipeline issue now pending before the courts. The proposed routing of their pipeline has almost identical routing alternatives to Northerns. Both entities are in the review process at the same time with construction timelines that are similar. Multiple times in the record for Larimer County in the proceedings with Thornton, both Thornton, Northern Water, and the County mentioned or agreed that co-location of the two pipelines along their nearly identical paths made sense and should be pursued. It has been discussed between all three parties on numerous occasions and should be part of the discussion now.
   In fact, one of the objections the Board of County Commissioners expressed to deny the Thornton pipeline by only submitting an application for one of their proposed pipelines in isolation from their planned future ones was that, **"Thornton deprives the Board and public of the opportunity to consider cumulative impacts and the effectiveness of mitigation. A route that may be appropriate for a single pipeline may be inappropriate for additional pipelines. If this information is not considered now, future pipelines may not be able to co-locate which would result in the disorderly development of Thornton's project and compound the impacts on Larimer County through multiple different pipelines in separate locations."**

   How is this not the case with the proposed Northern pipeline and Thornton's pipeline, both of which are looking at nearly identical routing alternatives? This is not just an issue of "disorderly development and compounding of the impacts" on Larimer County – it is the disorderly development and compounding of the impacts

925-525-8795
Karen@2wellers.com
4554 Eagle Lake S, Fort Collins CO 80524

on Eagle Lake in a much shorter timeframe than the proposed build out of the future Thornton pipelines. And how is the reverse not true – that a route that may be inappropriate for a single pipeline due to cost and difficulty of construction may be entirely appropriate for the combined resources of two pipelines from two well-funded entities with capable engineering that will minimize the impacts not only on Larimer County but the Eagle Lake neighborhood that is the target of two separate pipelines?

The precedent for this is Section A.2 of the Land Use Code itself that says the Code is intended to:

"A. Provide for the physical development of the county in order to:

1. Preserve the character and quality of rural and urban areas;

2. Foster convenient, harmonious and workable relationships among land uses; and

3. Achieve the principles and strategies described in the master plan."

This alone should allow the County to consider co-location as part of the process in both the Thornton and Northern Water 1041 applications. In addition, the Colorado Supreme Court noted that the purpose of the 1041 statute is to allow state and local governments to "supervise land use which may have an impact on the people of this state beyond the immediate scope of the project." Colorado Land Use Commission v. Board of County Comm'rs of Larimer County, 604 P.2d 32, 34 (Colo. 1979). The reference to impacts "beyond the immediate scope of the project" suggests that the Commissioners can and should consider the relationship between the project under consideration and other projects. Such sensitivity would definitely further the statute's apparent purpose of "protection of the utility, value, and future" of land, which the statute states is in the public interest. C.R.S. § 24-65.1-101(1)(a).

For these reasons, I ask the Planning Commission and the Board of County Commissioners reject the Northern Water 1041 application until such time that

925-525-8795
Karen@2wellers.com
4554 Eagle Lake S, Fort Collins CO 80524

there is resolution to the Thornton 1041 application so that both pipelines can apply for a co-location routing option where both entities can share costs and choose routes they might not otherwise consider around residential areas. Our specific properties and the Eagle Lake neighborhood should not have to shoulder the burden of these two projects for the sake of Larimer County.

Kind Regards,

Tom and Karen Weller

Do Not Approve NISP 1041 Project No. 20-ZONE 2- Save Our Rural Northern Colorado

1 message

Pamela Cruse <pjody@lpbroadband.net> Fri, May 15, 2020 at 5:25 PM
To: rhelmick@larimer.org, tdonnelly@larimer.org, swjohnson@larimer.org, jkefalas@larimer.org

Dear Commissioners and Planning Commission:

Commissioner Johnson
Commissioner Kefalas
Commissioner Donnelly
Rob Helmick

We are landowners residing in the area of the proposed Glade reservoir that have concerns with the proposed Glade Project and the negative impacts that would occur if the project moves forward.

The primary benefits of this proposed reservoir would be enjoyed by the 15 subscriber towns or agencies that receive the proposed Glade water. Most of these towns and agencies are outside Larimer County. The most obvious and intense costs would be borne by local and other surrounding communities.

In general, our concerns are that the scope and scale of this proposed project, if approved, would have significant, detrimental, and permanent impact on our rural community, environment, and lifestyle we enjoy today and desire to have in the future.

Specifically, our rural environment we believe would be negatively impacted in the following ways:

1) Noise - The rerouted highway over the most eastern hogback would have an unobstructed view from residences in the foothills, there would be no middle hogback to block truck and auto noise. The NISP publications suggest that recreation would include motorboats and jet skis. Boats and skis are loud, they would likely be louder than current road traffic.

2) Light Pollution – This rural area enjoys fairly dark skies. The proposed recreational activities would generate significant exterior lighting for boats, facilities, camping, pumping facilities, traffic, etc. and headlights from traffic coming down the hogback on the rerouted 287 would shine into the adjacent private property. This could destroy the enjoyment of our night skies.

3) New development - We do not know what sort of development would occur near and north of proposed Glade. The rerouted highway 287 would invite more residential development on the plains. The reservoir would invite more development in the adjacent foothills and valleys. It's not inconceivable that more commercial development catering to visitors would encroach into currently uncommercialized lands, forever altering the rural nature of the area.

4) Trespass – Plans for proposed Glade project almost 400,000 visitors per year. This would include boaters, campers, fishers and hikers and bikers, among others. There is every reason to believe that not all these visitors would stay within the confines of designated recreational areas. Some visitors are likely to explore the inviting foothills that border the reservoir and trespass, however inadvertently, on our private property.

5) Wildlife – Proposed Glade would become a significant barrier to the permanent and migratory herds of deer and elk that reside in our area and would be disruptive to other wildlife. In a world where wildlife and nature are under stress, and is diminishing generally owing to human activities, should we be contributing to those activities for unnecessary purposes? We encourage the county to find alternatives that don't result in the significant loss of open space and wildlife habitat that this project would cause.

6) Wildfires – In this century three major wildfires burned over 100,000 acres on and around Glade. Two of the three forest fires were caused by careless people. Can we rely on the >1000 daily visitors to proposed Glade to be careful?

7) Emergency response – The recreation on the proposed reservoir is projected to be almost 400,000 visitors per year. Such a large increase in recreationalists would likely increase the number of emergency calls thereby further stretching emergency response agency resources. Costs would be borne by Larimer County taxpayers, and emergency services

that are diverted to Glade would not be readily available to serve the local communities.

8) Air quality – Because Glade would have junior water rights, the water level of the proposed reservoir would be highly variable, unlike Horsetooth. The water level frequently would drop precipitously, often changing proposed Glade Reservoir to Glade Mudflats, and could stay that way for years. The large “bathtub ring” that would materialize around the reservoir would become dry soil that would blow in our strong winds causing air quality and visual concerns. The hundreds or thousands of vehicles that would travel to the area emit gases, particulates, and ozone precursors (i.e., health hazards).

9) Climate change – the pumps, the construction vehicles, the recreational vehicles: the project would result in considerable burning of fossil fuels, forever, and the emission of greenhouse gases. The pumping stations alone would emit the equivalent of adding 7000 GHG emitting cars at a time when Colorado is implementing zero emissions vehicle standards.

10) State Land Usage - The large area of state land west of the proposed reservoir is devoted to hunting and cattle grazing. The state and federal lands in this region of northern Colorado provide abundant and easily accessible opportunities for recreation, which we gratefully utilize. Impacts to use of or access to the state land is a negative impact to our communities.

11) Aesthetic - The drive from Livermore to Laporte would no longer be through the heritage rangeland and the familiar hogbacks. Since the proposed reservoir would likely be only partially filled much of the time, instead of beautiful hogbacks and grassy foothills, our viewshed would be marred by the barren sides (bathtub ring) and murky surface of a partially filled reservoir.

12) Lack of combined Project evaluation/coordination - There is no apparent coordination of the NISP or the proposed Seaman’s expansion or the Halligan expansion. All these projects surround our properties and would leave us on a peninsula of land cut from the rural environment we now enjoy. We met with the City of Greeley in August 2018 and learned that they are not planning to cooperate with other cities due to “challenges” and are proceeding on an expansion of Seamen’s reservoir from 5,000 to 80,000 acre-feet. In the 21st century, surface storage just doesn’t make sense; this is a semi-arid climate that is getting drier. Alternatives are available and should be seriously considered.

13) Social justice - While the benefits of proposed Glade would be enjoyed by people who live and work far from the reservoir site, the costs would be borne by those whose quality of life would be severely lessened.

14) Conservation and Alternatives – Conservation is not begin adequately considered. While the Colorado Front Range is land-rich for development, it is semi-arid and thus water-limited. About 2/3 of the Poudre is already taken out, and Glade would take another 40% of what’s left. Yet another reservoir is nothing but a temporary fix for a small portion of the state’s water needs; but one with permanent, destructive impacts on a large part of rural northern Colorado. The time is way past due for developing long-term solutions based on state-of-the-art technologies and widespread education on the absolute necessity to conserve water, and to stop relying on 19th century solutions for 21st century challenges.

The Larimer County Commissioners must save our rural communities and be good stewards of our natural resources by saying no Glade Reservoir!

Sincerely,

--

Rob Helmick <helmicrp@co.larimer.co.us>

Larimer County Should Not Approve the NISP 1041 Permit Project No. 20-ZONE 2657

1 message

Pamela Cruse <pjody@lpbroadband.net> Fri, May 15, 2020 at 5:08 PM
To: rhelmick@larimer.org, tdonnelly@larimer.org, swjohnson@larimer.org, jkefalas@larimer.org

Dear Commissioners and Planning Commission:

Commissioner Johnson
Commissioner Kefalas
Commissioner Donnelly
Rob Helmick

I'm a landowner residing in northern Larimer County, near the proposed location of Glade Reservoir, it's massive dam, forebay, pumps, pipelines, campgrounds, parking lots, boat ramps, and other facilities. We strongly urge the Board of County Commissioners to deny the 1041 permit for the Northern Integrated Supply Project because it would forever impact the fundamental nature of the rural landscape in which we live and harm our quality of life.

We choose to live in northern Colorado for its beautiful natural landscapes, its wild and scenic rivers, it's clean air and quiet surroundings, its wildlife, its opportunities for outdoor recreation on the abundant state and federal lands in the area. These are key pieces to our quality of life; key pieces that would be lost if this project is constructed and operated as proposed. Our land, water, and communities would be harmed by this project, and any benefits of the project would accrue to communities mostly outside Larimer County.

It is unacceptable that our rural northern Colorado communities must bear the impacts and unmitigable risks of this massive and ill-conceived project, the biggest ever proposed for Larimer County.

If construction is executed as planned, there would be seven years of heavy construction impacting our communities. We would be subjected to lots of heavy truck traffic, since the main artery to and from the reservoir site is Highway 287, which is also our main route; 6-days-a-week heavy traffic and heavy machinery operations, and the unwelcome, intrusive, and obnoxious presence of widespread and large-scale construction activity, noise, dust, and danger, over a long period of time. The intrusion would turn the hundreds of acres of the landscape into a construction zone, and take away the attractiveness, the clean air, the quiet – the things we depend on for health and happiness.

Northern Water is currently buying farms in northern Colorado to make up a more than 50% shortfall in the water rights needed for a successful project. In addition, recent prolonged droughts, which are becoming more common, have affected the amount of water that would be available from the Poudre River and other sources. For us, this means that we would endure the years and years of construction, and the irreparable loss of the unique landscape in which we live, all for an unfulfilled promise that "if they build it, the water would come" which is by no means guaranteed. The water shortage will only get worse as the climate dries, so Larimer County should deny this project, which will likely fail to meet its objectives. Less expensive, less destructive alternatives to water supply should be seriously considered.

Encouraging almost 400,000 visitors per year to this area would alter it from the quiet, rural and sparsely populated landscape we sought and invested in, to a busy recreational area with noise, dust, traffic, activity, accidents, and fires. Noise from motorboats on Glade would exceed state standards, would be heard miles away, and would significantly disrupt our lives. For some owners, the noise would cause property values to decline.

That's if the reservoir fills. The photographs Northern Water shows of a beautiful full reservoir are misleading at best, because the reservoir would rarely, if ever, look like that. It would generally look like an abandoned industrial facility marring the area's aesthetics.

Since the reservoir would not fill, and likely would not be full during much of its life, the project would look like an abandoned muddy puddle much of the time, and the recreational facilities would be mostly empty. Who would pay for the upkeep of the unused recreational facilities, Larimer County taxpayers? The project ruins the aesthetics of the valley and hogbacks – a unique and beautiful landscape – for a project that would provide little or no benefit to Larimer County and in fact would negatively impact its residents and its coffers.

The project would also contribute to climate change. Over 30,000 tons per year of CO2 would be emitted by engines to pump water into Glade. Other greenhouse gases would also be produced, both during construction and operation. Air

pollution would also occur due to the project, including gases that form ozone, a severe health hazard.

Dust blown from the barren shorelines would be swept up the valley on the area's strong winds and seep into our homes and further degrade our lives. The EIS states that it would take an 80-mph wind to generate any fugitive dust from the shorelines of the operating reservoir, an assertion that doesn't pass the laugh test for anyone living in this rural landscape. What else has have they got wrong? Are we to be the guinea pigs for some ill-conceived experiment?

We are very concerned about the potential for fire. We live in a high fire hazard, and we take many precautions with our homes and properties to protect against fires. Many visitors, who would be visiting in summer when the land is hottest and driest, would not be aware of how easy it is to cause a wildfire in this landscape. Some would be careless with campfires, with cigarettes, with illegal fireworks, or with firearms, and wildfires would be inadvertently ignited. Their vehicles can start fires. Unfortunately, arson is possible. Our climate is getting drier. Larimer County must recognize the seriousness of this issue and deny this permit. The county cannot simply hope for the best because our homes, our property, our animals would all be put at unacceptable risk of wildfire due to construction, high visitation, and incomplete understanding. These increased risks would also cause increased demands on local emergency services, especially fire, medical, and law enforcement.

No project this big can be undertaken without significant and irreparable impacts. We ask Larimer County to be a good steward and deny this permit and prevent the loss of open space and wildlife habitat, increased risk of wildfires and other public safety hazards, increased demands on local volunteer emergency services, noise, light pollution where now there is little, increased development and traffic in ever-widening circles around the reservoir, reduced air quality, climate change, increased illegal activities such as trespass on adjacent private land, decreased property values, and the loss of unique visual and aesthetic values. The natural and rural quality of this land is very important to our lives and communities.

Sincerely,

--

Rob Helmick, Senior Planner
Larimer County Community Development Division
200 W. Oak Street
Suite 3100
PO Box 1190
Fort Collins, CO 80521

Dear Rob,

As residents of the Eagle Lake neighborhood, my wife and I are wring y ou to ask that Larimer County not approve the 1041 Applicaon tha t is before you for a pipeline through the county by Northern Water (NISP). The issues revolving around this applicaon and the r easons it should be denied closely mirror that of the City of Thornton 1041 pipeline applicaon tha t was rejected by the Board of County Commissioners. We are a. aching the list of 7 reasons as listed by our HOA that led the county Commissioners to reject the Thornton 1041 pipeline applicaon. It seems t o us that these reasons are more than applicable to this new 1041 applicaon and should lead t o its rejecon. Further more, it certainly seems to us that their applicaon is pr emature as we wait for the Thornton court case to be decided.

Sincerely,

Gerald and Carolyn Taylor
412 Eagle Watch
Lot 76 Eagle Lake Estates
Fort Collins, CO 80524

Attachment:
Specifically, here are some of the reasons the County rejected the Thornton applicaon and should do so as w ell with the NISP applicaon:

1) According to the Land Use Code criteria quoted by the Board of Commissioners, the proposal is inconsistent with the county Master Plan affecng land use and de velopment, specifically that the route will be traversing through significant amounts of private property and through yards in the Eagle Lake neighborhood. Private easements will have to be obtained through eminent domain. Affected residents will not be permi ed to construct permanent structures or plant landscape material with deep roots (trees, wind blocks, etc) on their property due to the pipeline easement and maintenance requirements. Affected residents will be subject to connual in trusion on their land by maintenance crews checking on the pipeline in perpetuity. This is a gross infringement of their right to a peaceful existence on their property and our right to restrict non-resident traffic on our privately owned roads.
2) In addion, acc ording to Northern Water's Construcon Appr oach document, they are ancipa ng using HO A owned private roads for construcon tr affic throughout the five segments of construcon on the pipeline near and thr ough our neighborhood.
The meline of the cumula v e impact to us is ancipa ted to be 59 weeks from start to finish for all the segments! They are asking to use our narrow, non-public grade roads for heavy truck traffic and

daily construcon cr ew traffic on our private roads dozens of residents use daily to enter and exit our subdivision. This is an unacceptable burden on us and again is a gross infringement on our neighborhood and our rights to a peaceful existence that is inconsistent with the Master Plan's stated goal of "maintaining and enhancing our county's quality of life and to be fundamentally fair to all our ciz ens and to respect their individual rights." A quiet residenal neighborhood with childr en playing, residents coming and going, and rer ees enjoying the peaceful me the y've earned is not a place for construcon s taging for a project that has no benefit for its residents and even minimal benefit to Larimer County as a whole. The concept and thought of using our roads for this purpose is untenable.

3) The NISP 1041 applicaon neg av ely impacts public health and safety in our neighborhood. Our private roads are narrow roads and not constructed to handle large, semi-tractor trailer traffic loaded with pipe secons and c onstrucon ma terials for pipeline construcon. The r oads were not built to handle the volume of traffic or the load. Having these vehicles on our roads creates a safety hazard for children, bicyclists, walkers and resident traffic entering and leaving driveways. In addion, some of our older residents with health issues are at risk due to the constant coming and going of non-resident truck traffic. Noise levels, polluon fr om diesel vehicles, and anxiety from interrupons t o our peaceful existence can all lead to increased health problems for all residents.

4) In the Land Use Code criteria for consideraon b y the County, Criteria C states its purpose is to "Promote the economic stability of exisng land uses tha t are consistent with the Master Plan and protect them by incompable or harm ful land uses." The proposed pipeline is certainly an incompable and harm ful use of the land in our neighborhood.

We recently annexed three parcels to our HOA (the TIPS Development) whose owner was required by the County to development certain aspects of the land (drainage, roads, etc) to be approved by the County before being allowed to offer the plots for sale and final residenal de velopment. The owner has spent thousands of dollars to prepare this land, yet the proposed pipeline path crosses near or on some of the new parcels rendering them virtually unsellable unl the pipeline is built and c ompleted. No buyer will pay a premium price for a parcel with the amount of disrupon, uncert ainty of building site and sepc placemen t, and ongoing nuisance this project will cause to these three parcels for well over a year. The County is in effect killing the owner's ability to sell his parcels and recoup his already substanal in vestment that the County has made him invest to get the land ready for development. This is not "promong the ec onomic stability of exisng land uses" (ie. R esidenal de velopment) or "protecng inc ompable and harm ful land uses".

Other residents in our neighborhood who may be contemplang or ar e in the process of lisng their property are also economically negav ely impacted by the proposed pipeline. Buyers will use every reason to lower the price on a sale and a year or more of construcon tr affic, noise, dirt and dust flying in the neighborhood are good leverage points for them to either not buy at all, or attempt to attain a lower selling price than normal. The County is truly hurng the ec onomic stability of the whole neighborhood with this proposal and hundreds of thousands of dollars in values may be lost if the applicaon is appr oved.

5) Northern Water has presented other reasonable sing and design alt ernav es that do not include bisecng r esident's property or cung thr ough our neighborhood that they have dismissed due to cost or more difficult construcon c ondions lik e their N2.4 (north of Reservoir #3) and N2.5 routes (Douglas Road). The Board of County Commissioners rejected reasoning that expense or difficulty of construcon w ere disqualifying reasons for rejecng r outes over ones that impacted private property owners and individual rights in the Thornton pipeline applicaon. Northern' s preferred N2.1 route severely impacts our rights as property owners and ciz ens and should similarly be dismissed by the Commissioners when there are viable alternate roung op ons.

6) Another issue of grave concern to the Commissioners in the Thornton applicaon w as the construcon and pipeline pr oximity to occupied dwellings. Proximity of construcon and construcon impact along with the long-t erm detriment to property owners was a primary concern. The Northern Water proposal includes a 100' easement – a 40' construcon easemen t and a 60' permanent easement. If the pipeline were to be placed on the property line between the two residences the proposed N2.1 roung pr efers, that will put the easement only 30 feet or less from one of the residences. The disrupon and imposion on priv ate property this close to an occupied

dwelling is unacceptable when there are route alternav es that do not cross private property between two dwellings.

7) The other major point that should either cause the county to reject the applicaon or de fer a decision unl la ter is the Thornton pipeline issue now pending before the courts. The proposed roung of their pipeline has almos t idenc al roung alt ernav es to Northerns. Both enes ar e in the review process at the same me with c onstrucon me lines tha t are similar. Mulple mes in the record for Larimer County in the proceedings with Thornton, both Thornton, Northern Water, and the County menoned or agr eed that co-locaon of the tw o pipelines along their nearly idenc al paths made sense and should be pursued. It has been discussed between all three pares on numerous occasions and should be part of the discussion now.

In fact, one of the objecons the Boar d of County Commissioners expressed to deny the Thornton pipeline by only subming an applic aon f or one of their proposed pipelines in isolaon fr om their planned future ones was that, **"Thornton deprives the Board and public of the opportunity to consider cumulav e impacts and the effecv eness of mig aon. A r oute that may be appropriate for a single pipeline may be inappropriate for addional pipelines. If this in formaon is not considered now, future pipelines may not be able to co-locate which would result in the disorderly development of Thornton's project and compound the impacts on Larimer County through mulple different pipelines in separate locaons. "**

How is this not the case with the proposed Northern pipeline and Thornton's pipeline, both of which are looking at nearly idenc al roung alt ernav es? This is not just an issue of "disorderly development and compounding of the impacts" on Larimer County – it is the disorderly development and compounding of the impacts on Eagle Lake in a much shorter me fr ame than the proposed build out of the future Thornton pipelines. And how is the reverse not true – that a route that may be inappropriate for a single pipeline due to cost and difficulty of construcon ma y be enr ely appropriate for the combined resources of two pipelines from two well-funded enes with c apable engineering that will minimize the impacts not only on Larimer County but the Eagle Lake neighborhood that is the target of two separate pipelines?

The precedent for this is Secon A .2 of the Land Use Code itself that says the Code is intended to:

"A. Provide for the physical development of the county in order to:
1. Preserve the character and quality of rural and urban areas;
2. Foster convenient, harmonious and workable relaonship s among land uses; and
3. Achieve the principles and strategies described in the master plan."

This alone should allow the County to consider co-locaon as part of the pr ocess in both the Thornton and Northern Water 1041 applicaons. In addion, the Color ado Supreme Court noted that the purpose of the 1041 statute is to allow state and local governments to "supervise land use which may have an impact on the people of this state beyond the immediate scope of the project." Colorado Land Use Commission v. Board of County Comm'rs of Larimer County, 604 P.2d 32, 34 (Colo. 1979). The reference to impacts "beyond the immediate scope of the project" suggests that the Commissioners can and should consider the relaonship be tween the project under consideraon and other projects. Such sensivity w ould definitely further the statute's apparent purpose of "protecon of the ulity , value, and future" of land, which the statute states is in the public interest. C.R.S. § 24-65.1-101(1)(a).

For these reasons, I ask the Planning Commission and the Board of County Commissioners reject the Northern Water 1041 applicaon un l such me tha t there is resoluon t o the Thornton 1041 applicaon so tha t both pipelines can apply for a co-locaon r oung op on wher e both enes c an share costs and choose routes they might not otherwise consider around residenal ar eas. Our specific properes and the E agle Lake neighborhood should not have to shoulder the burden of these two projects for the sake of Larimer County.

On behalf of members of Save Rural NoCo, we are submitting a signed petition from 168 of our members that stand united against the NISP 1041 Permit Application; Project No. 20-ZONE 2657. These signatures represent a significant number of county citizens that will be directly affected if this project were to be approved.

We ask that this petition be included in the public record of the 1041 process for this project, and be made available to both the Planning Commission and the County Commissioners for their deliberations.

May 15, 2020

Dear Larimer County Commissioner,

Save Rural NoCo - Don't Support Glade Reservoir (Project No. 20-ZONE 2657)

We join the citizen's group "Save Rural NoCo" in asking the Larimer County Commissioners to deny the Northern Water's 1041 permit application for the Northern Integrated Supply Project and Glade Reservoir. The damage to communities, land, and water from this project will be widespread and permanent.

We encourage the Larimer County Commissioners to be proactive in supporting, not only the citizens they represent, but also the Poudre River, which struggles to support communities like the City of Fort Collins, and the rural lands of northern Colorado.

A number of communities and rural landowners lie near the proposed Glade Reservoir with its huge dam, forebay, and pumping station. Many more lie between the Glade Reservoir and the cities miles to the south that are slated to receive Poudre River water via 85 miles of pipeline. Still more lie along the reroute of Highway 287, a major federal highway that would tear through what is now rural open land.

Communities throughout northern Colorado will be harmed by 1) air, noise, light, and possibly water pollution; 2) loss of open space and wildlife habitat; 3) risk of wildfires and over-burdening of local emergency services; 4) increased development and traffic in relatively undeveloped areas, 5) loss of property access, 6) decreased property values, 7) loss of farmland, and 8) permanent damage to the aesthetics and character of northern Colorado, to name a few. The list of negative impacts is long, as is the list of affected communities.

In denying the NISP/Glade Reservoir project, the Larimer County Commissioners will avoid disturbing ecosystems—from the river and its riparian zone to the foothills, prairies, and farmlands; avoid permanently harming rural land uses; and avoid disrupting the communities residing in and around the sprawling pieces of this massive project.

We strongly urge the Larimer County Commissioners to reject Northern Water's 1041 permit application and, in doing so, join the citizens of Larimer County in supporting the health, vitality, and survival of rural northern Colorado communities, land, and water. It's never too late to do the right thing.

Respectfully,

Ms	Lynn	Utzman-Nichols	lynn.healthwrite@gmail.com
Ms	daniel	vigil	dnlvigil@mac.com
Mr	Weldon	Barker	weldonb2@att.net

Larimer County Should Not Approve the NISP 1041 Permit Project No. 20-ZONE 2657

1 message

Robert Hufziger <rhufziger@gmail.com> Fri, May 15, 2020 at 3:20 PM
To: rhelmick@larimer.org, tdonnelly@larimer.org, swjohnson@larimer.org, jkafalas@larimer.org

Dear Commissioners and Planning Commission:

Commissioner Johnson
Commissioner Kefalas
Commissioner Donnelly
Rob Helmick

I'm a landowner residing in northern Larimer County, near the proposed location of Glade Reservoir, it's massive dam, forebay, pumps, pipelines, campgrounds, parking lots, boat ramps, and other facilities. We strongly urge the Board of County Commissioners to deny the 1041 permit for the Northern Integrated Supply Project because it would forever impact the fundamental nature of the rural landscape in which we live and harm our quality of life.

We choose to live in northern Colorado for its beautiful natural landscapes, its wild and scenic rivers, it's clean air and quiet surroundings, its wildlife, its opportunities for outdoor recreation on the abundant state and federal lands in the area. These are key pieces to our quality of life; key pieces that would be lost if this project is constructed and operated as proposed. Our land, water, and communities would be harmed by this project, and any benefits of the project would accrue to communities mostly outside Larimer County.

It is unacceptable that our rural northern Colorado communities must bear the impacts and unmitigable risks of this massive and ill-conceived project, the biggest ever proposed for Larimer County.

If construction is executed as planned, there would be seven years of heavy construction impacting our communities. We would be subjected to lots of heavy truck traffic, since the main artery to and from the reservoir site is Highway 287, which is also our main route; 6-days-a-week heavy traffic and heavy machinery operations, and the unwelcome, intrusive, and obnoxious presence of widespread and large-scale construction activity, noise, dust, and danger, over a long period of time. The intrusion would turn the hundreds of acres of the landscape into a construction zone, and take away the attractiveness, the clean air, the quiet – the things we depend on for health and happiness.

Northern Water is currently buying farms in northern Colorado to make up a more than 50% shortfall in the water rights needed for a successful project. In addition, recent prolonged droughts, which are becoming more common, have affected the amount of water that would be available from the Poudre River and other sources. For us, this means that we would endure the years and years of construction, and the irreparable loss of the unique landscape in which we live, all for an unfulfilled promise that "if they build it, the water would come" which is by no means guaranteed. The water shortage will only get worse as the climate dries, so Larimer County should deny this project, which will likely fail to meet its objectives. Less expensive, less destructive alternatives to water supply should be seriously considered.

Encouraging almost 400,000 visitors per year to this area would alter it from the quiet, rural and sparsely populated landscape we sought and invested in, to a busy recreational area with noise, dust, traffic, activity, accidents, and fires. Noise from motorboats on Glade would exceed state standards, would be heard miles away, and would significantly disrupt our lives. For some owners, the noise would cause property values to decline.

That's if the reservoir fills. The photographs Northern Water shows of a beautiful full reservoir are misleading at best, because the reservoir would rarely, if ever, look like that. It would generally look like an abandoned industrial facility marring the area's aesthetics.

Since the reservoir would not fill, and likely would not be full during much of its life, the project would look like an abandoned muddy puddle much of the time, and the recreational facilities would be mostly empty. Who would pay for the upkeep of the unused recreational facilities, Larimer County taxpayers? The project ruins the aesthetics of the valley and hogbacks – a unique and beautiful landscape – for a project that would provide little or no benefit to Larimer County and in fact would negatively impact its residents and its coffers.

The project would also contribute to climate change. Over 30,000 tons per year of CO2 would be emitted by engines to pump water into Glade. Other greenhouse gases would also be produced, both during construction and operation. Air

pollution would also occur due to the project, including gases that form ozone, a severe health hazard.

Dust blown from the barren shorelines would be swept up the valley on the area's strong winds and seep into our homes and further degrade our lives. The EIS states that it would take an 80-mph wind to generate any fugitive dust from the shorelines of the operating reservoir, an assertion that doesn't pass the laugh test for anyone living in this rural landscape. What else has have they got wrong? Are we to be the guinea pigs for some ill-conceived experiment?

We are very concerned about the potential for fire. We live in a high fire hazard, and we take many precautions with our homes and properties to protect against fires. Many visitors, who would be visiting in summer when the land is hottest and driest, would not be aware of how easy it is to cause a wildfire in this landscape. Some would be careless with campfires, with cigarettes, with illegal fireworks, or with firearms, and wildfires would be inadvertently ignited. Their vehicles can start fires. Unfortunately, arson is possible. Our climate is getting drier. Larimer County must recognize the seriousness of this issue and deny this permit. The county cannot simply hope for the best because our homes, our property, our animals would all be put at unacceptable risk of wildfire due to construction, high visitation, and incomplete understanding. These increased risks would also cause increased demands on local emergency services, especially fire, medical, and law enforcement.

No project this big can be undertaken without significant and irreparable impacts. We ask Larimer County to be a good steward and deny this permit and prevent the loss of open space and wildlife habitat, increased risk of wildfires and other public safety hazards, increased demands on local volunteer emergency services, noise, light pollution where now there is little, increased development and traffic in ever-widening circles around the reservoir, reduced air quality, climate change, increased illegal activities such as trespass on adjacent private land, decreased property values, and the loss of unique visual and aesthetic values. The natural and rural quality of this land is very important to our lives and communities.

Sincerely,

--

Do Not Approve NISP 1041 Project No. 20-ZONE 2- Save Our Rural Northern Colorado

1 message

Stefan Ellis <Stellis99@gmail.com> Mon, May 18, 2020 at 9:03 PM
To: rhelmick@larimer.org, tdonnelly@larimer.org, swjohnson@larimer.org, jkefalas@larimer.org

Dear Commissioners and Planning Commission:

Commissioner Johnson
Commissioner Kefalas
Commissioner Donnelly
Rob Helmick

We are landowners residing in the area of the proposed Glade reservoir that have concerns with the proposed Glade Project and the negative impacts that would occur if the project moves forward.

The primary benefits of this proposed reservoir would be enjoyed by the 15 subscriber towns or agencies that receive the proposed Glade water. Most of these towns and agencies are outside Larimer County. The most obvious and intense costs would be borne by local and other surrounding communities.

In general, our concerns are that the scope and scale of this proposed project, if approved, would have significant, detrimental, and permanent impact on our rural community, environment, and lifestyle we enjoy today and desire to have in the future.

Specifically, our rural environment we believe would be negatively impacted in the following ways:

New development - We do not know what sort of development would occur near and north of proposed Glade. The rerouted highway 287 would invite more residential development on the plains. The reservoir would invite more development in the adjacent foothills and valleys. It's not inconceivable that more commercial development catering to visitors would encroach into currently uncommercialized lands, forever altering the rural nature of the area.

Wildlife – Proposed Glade would become a significant barrier to the permanent and migratory herds of deer and elk that reside in our area and would be disruptive to other wildlife. In a world where wildlife and nature are under stress, and is diminishing generally owing to human activities, should we be contributing to those activities for unnecessary purposes? We encourage the county to find alternatives that don't result in the significant loss of open space and wildlife habitat that this project would cause.

Wildfires – In this century three major wildfires burned over 100,000 acres on and around Glade. Two of the three forest fires were caused by careless people. Can we rely on the >1000 daily visitors to proposed Glade to be careful?

7) Emergency response – The recreation on the proposed reservoir is projected to be almost 400,000 visitors per year. Such a large increase in recreationalists would likely increase the number of emergency calls thereby further stretching emergency response agency resources. Costs would be borne by Larimer County taxpayers, and emergency services that are diverted to Glade would not be readily available to serve the local communities.

8) Air quality – Because Glade would have junior water rights, the water level of the proposed reservoir would be highly variable, unlike Horsetooth. The water level frequently would drop precipitously, often changing proposed Glade Reservoir to Glade Mudflats, and could stay that way for years. The large "bathtub ring" that would materialize around the reservoir would become dry soil that would blow in our strong winds causing air quality and visual concerns. The hundreds or thousands of vehicles that would travel to the area emit gases, particulates, and ozone precursors (i.e., health hazards).

9) Climate change – the pumps, the construction vehicles, the recreational vehicles: the project would result in considerable burning of fossil fuels, forever, and the emission of greenhouse gases. The pumping stations alone would emit the equivalent of adding 7000 GHG emitting cars at a time when Colorado is implementing zero emissions vehicle

standards.

10) State Land Usage - The large area of state land west of the proposed reservoir is devoted to hunting and cattle grazing. The state and federal lands in this region of northern Colorado provide abundant and easily accessible opportunities for recreation, which we gratefully utilize. Impacts to use of or access to the state land is a negative impact to our communities.

11) Aesthetic - The drive from Livermore to Laporte would no longer be through the heritage rangeland and the familiar hogbacks. Since the proposed reservoir would likely be only partially filled much of the time, instead of beautiful hogbacks and grassy foothills, our viewshed would be marred by the barren sides (bathtub ring) and murky surface of a partially filled reservoir.

12) Lack of combined Project evaluation/coordination - There is no apparent coordination of the NISP or the proposed Seaman's expansion or the Halligan expansion. All these projects surround our properties and would leave us on a peninsula of land cut from the rural environment we now enjoy. We met with the City of Greeley in August 2018 and learned that they are not planning to cooperate with other cities due to "challenges" and are proceeding on an expansion of Seamen's reservoir from 5,000 to 80,000 acre-feet. In the 21st century, surface storage just doesn't make sense; this is a semi-arid climate that is getting drier. Alternatives are available and should be seriously considered.

13) Social justice - While the benefits of proposed Glade would be enjoyed by people who live and work far from the reservoir site, the costs would be borne by those whose quality of life would be severely lessened.

14) Conservation and Alternatives – Conservation is not begin adequately considered. While the Colorado Front Range is land-rich for development, it is semi-arid and thus water-limited. About 2/3 of the Poudre is already taken out, and Glade would take another 40% of what's left. Yet another reservoir is nothing but a temporary fix for a small portion of the state's water needs; but one with permanent, destructive impacts on a large part of rural northern Colorado. The time is way past due for developing long-term solutions based on state-of-the-art technologies and widespread education on the absolute necessity to conserve water, and to stop relying on 19th century solutions for 21st century challenges.

The Larimer County Commissioners must save our rural communities and be good stewards of our natural resources by saying no Glade Reservoir!

Sincerely,

--

The water shortage will only get worse as the climate dries, so Larimer County should deny this project, which will likely fail to meet its objectives. Less expensive, less destructive alternatives to water supply should be seriously considered.

Encouraging almost 400,000 visitors per year to this area would alter it from the quiet, rural and sparsely populated landscape we sought and invested in, to a busy recreational area with noise, dust, traffic, activity, accidents, and fires. Noise from motorboats on Glade would exceed state standards, would be heard miles away, and would significantly disrupt our lives. For some owners, the noise would cause property values to decline.

That's if the reservoir fills. The photographs Northern Water shows of a beautiful full reservoir are misleading at best, because the reservoir would rarely, if ever, look like that. It would generally look like an abandoned industrial facility marring the area's aesthetics.

Since the reservoir would not fill, and likely would not be full during much of its life, the project would look like an abandoned muddy puddle much of the time, and the recreational facilities would be mostly empty. Who would pay for the upkeep of the unused recreational facilities, Larimer County taxpayers? The project ruins the aesthetics of the valley and hogbacks – a unique and beautiful landscape – for a project that would provide little or no benefit to Larimer County and in fact would negatively impact its residents and its coffers.

The project would also contribute to climate change. Over 30,000 tons per year of CO2 would be emitted by engines to pump water into Glade. Other greenhouse gases would also be produced, both during construction and operation. Air

pollution would also occur due to the project, including gases that form ozone, a severe health hazard.

Dust blown from the barren shorelines would be swept up the valley on the area's strong winds and seep into our homes and further degrade our lives. The EIS states that it would take an 80-mph wind to generate any fugitive dust from the shorelines of the operating reservoir, an assertion that doesn't pass the laugh test for anyone living in this rural landscape. What else has have they got wrong? Are we to be the guinea pigs for some ill-conceived experiment?

We are very concerned about the potential for fire. We live in a high fire hazard, and we take many precautions with our homes and properties to protect against fires. Many visitors, who would be visiting in summer when the land is hottest and driest, would not be aware of how easy it is to cause a wildfire in this landscape. Some would be careless with campfires, with cigarettes, with illegal fireworks, or with firearms, and wildfires would be inadvertently ignited. Their vehicles can start fires. Unfortunately, arson is possible. Our climate is getting drier. Larimer County must recognize the seriousness of this issue and deny this permit. The county cannot simply hope for the best because our homes, our property, our animals would all be put at unacceptable risk of wildfire due to construction, high visitation, and incomplete understanding. These increased risks would also cause increased demands on local emergency services, especially fire, medical, and law enforcement.

No project this big can be undertaken without significant and irreparable impacts. We ask Larimer County to be a good steward and deny this permit and prevent the loss of open space and wildlife habitat, increased risk of wildfires and other public safety hazards, increased demands on local volunteer emergency services, noise, light pollution where now there is little, increased development and traffic in ever-widening circles around the reservoir, reduced air quality, climate change, increased illegal activities such as trespass on adjacent private land, decreased property values, and the loss of unique visual and aesthetic values. The natural and rural quality of this land is very important to our lives and communities.
The impact of this project on the extremely important, extremely beautiful Poudre River would break my heart and make me angry. As a master naturalist I know the value of this wildlife corridor and Important Bird Area. Please do not jeopardize our natural environment.

Sincerely,

--

To: "rhelmick@larimer.org" <rhelmick@larimer.org>

Rob,
I wanted to share my family's thoughts on the NISP project and proposal.

We live in Bonner Peak Ranch, and I am a native resident who is old enough to remember the dirt roads and weekend parties at Horsetooth. Likewise I have witnessed the tremendous growth over the years in our northern front range.

I work in the construction and infrastructure space, and like to think I take a balanced common sense approach to development and infrastructure planning. I also come from a ranching family who have valued water resources as a premium resource to conserve.

We look forward to the new reservoir in our community, and likewise understand the huge benefits the pipeline will bring to our downstream neighbors. The firm I work for (HDR) has supported various aspects of the NISP including the design of the new pipeline facilities. It is important to note that our relationship with NCWCD in no way affects my personal views on the benefits of the project.

We look forward to a more public setting to further engage with the County and our neighbors regarding the NISP.

Please consider our household as being firmly supportive of the current proposals for developing the NISP.

MICHAEL D. NOONAN

COMMISSIONERS' OFFICE

Dear Larimer County Commissioner,

Save Rural NoCo - Don't Support Glade Reservoir (Project No. 20-ZONE-2667)

We join the citizen's group "Save Rural NoCo" in asking the Larimer County Commissioners to deny the Northern Water's 1041 permit application for the Northern Integrated Supply Project and Glade Reservoir. The damage to communities, land, and water from this project will be widespread and permanent.

We encourage the Larimer County Commissioners to be proactive in supporting, not only the citizens they represent, but also the Poudre River, which struggles to support communities like the City of Fort Collins, and the rural lands of northern Colorado.

A number of communities and rural landowners lie near the proposed Glade Reservoir with its huge dam, forebay, and pumping station. Many more lie between the Glade Reservoir and the cities miles to the south that are slated to receive Poudre River water via 85 miles of pipeline. Still more lie along the reroute of Highway 287, a major federal highway that would tear through what is now rural open land.

Communities throughout northern Colorado will be harmed by 1) air, noise, light, and possibly water pollution; 2) loss of open space and wildlife habitat; 3) risk of wildfires and over-burdening of local emergency services; 4) increased development and traffic in relatively undeveloped areas, 5) loss of property access, 6) decreased property values, 7) loss of farmland, and 8) permanent damage to the aesthetics and character of northern Colorado, to name a few. The list of negative impacts is long, as is the list of affected communities.

In denying the NISP/Glade Reservoir project, the Larimer County Commissioners will avoid disturbing ecosystems—from the river and its riparian zone to the foothills, prairies, and farmlands; avoid permanently harming rural land uses; and avoid disrupting the communities residing in and around the sprawling pieces of this massive project.

We strongly urge the Larimer County Commissioners to reject Northern Water's 1041 permit application and, in doing so, join the citizens of Larimer County in supporting the health, vitality, and survival of rural northern Colorado communities, land, and water. It's never too late to do the right thing.

LARIMER COUNTY

Rob Helmick <helmicrp@co.larimer.co.us>

Do Not Approve NISP 1041 Project No. 20-ZONE 2- Save Our Rural Northern Colorado

1 message

Renatta Griego <griegorenatta@gmail.com> Sun, May 17, 2020 at 2:30 PM
To: rhelmick@larimer.org, tdonnelly@larimer.org, swjohnson@larimer.org, jkefalas@larimer.org

Dear Commissioners and Planning Commission:

Commissioner Johnson
Commissioner Kefalas
Commissioner Donnelly
Rob Helmick

Hello,

I live on County Road 29C with my three young children and have MAJOR concerns with the proposed Glade Project and the negative impacts that would occur to my family if the project moves forward.

In general, my concern is that the scope and scale of this proposed project, if approved, would have significant, detrimental, and permanent impact on this rural community, environment, and the lifestyle we enjoy today and desire to have in the future.

The primary benefits of this proposed reservoir would be enjoyed by the 15 subscriber towns or agencies that receive the proposed Glade water. Most of these towns and agencies are outside Larimer County. The most obvious and intense costs would be borne by local and other surrounding communities.

Specifically, our rural environment we believe would be negatively impacted in the following ways:

1) Noise - The rerouted highway over the most eastern hogback would have an unobstructed view from residences in the foothills, there would be no middle hogback to block truck and auto noise. The NISP publications suggest that recreation would include motorboats and jet skis. Boats and skis are loud, they would likely be louder than current road traffic.

2) Light Pollution – This rural area enjoys fairly dark skies. The proposed recreational activities would generate significant exterior lighting for boats, facilities, camping, pumping facilities, traffic, etc. and headlights from traffic coming down the hogback on the rerouted 287 would shine into the adjacent private property. This could destroy the enjoyment of our night skies.

3) New development - We do not know what sort of development would occur near and north of proposed Glade. The rerouted highway 287 would invite more residential development on the plains. The reservoir would invite more development in the adjacent foothills and valleys. It's not inconceivable that more commercial development catering to visitors would encroach into currently uncommercialized lands, forever altering the rural nature of the area.

4) Trespass – Plans for proposed Glade project almost 400,000 visitors per year. This would include boaters, campers, fishers and hikers and bikers, among others. There is every reason to believe that not all these visitors would stay within the confines of designated recreational areas. Some visitors are likely to explore the inviting foothills that border the reservoir and trespass, however inadvertently, on our private property.

5) Wildlife – Proposed Glade would become a significant barrier to the permanent and migratory herds of deer and elk that reside in our area and would be disruptive to other wildlife. In a world where wildlife and nature are under stress, and is diminishing generally owing to human activities, should we be contributing to those activities for unnecessary purposes? We encourage the county to find alternatives that don't result in the significant loss of open space and wildlife habitat that this project would cause.

6) Wildfires – In this century three major wildfires burned over 100,000 acres on and around Glade. Two of the three forest fires were caused by careless people. Can we rely on the >1000 daily visitors to proposed Glade to be careful?

7) Emergency response – The recreation on the proposed reservoir is projected to be almost 400,000 visitors per year.

Such a large increase in recreationalists would likely increase the number of emergency calls thereby further stretching emergency response agency resources. Costs would be borne by Larimer County taxpayers, and emergency services that are diverted to Glade would not be readily available to serve the local communities.

8) Air quality – Because Glade would have junior water rights, the water level of the proposed reservoir would be highly variable, unlike Horsetooth. The water level frequently would drop precipitously, often changing proposed Glade Reservoir to Glade Mudflats, and could stay that way for years. The large “bathtub ring” that would materialize around the reservoir would become dry soil that would blow in our strong winds causing air quality and visual concerns. The hundreds or thousands of vehicles that would travel to the area emit gases, particulates, and ozone precursors (i.e., health hazards).

9) Climate change – the pumps, the construction vehicles, the recreational vehicles: the project would result in considerable burning of fossil fuels, forever, and the emission of greenhouse gases. The pumping stations alone would emit the equivalent of adding 7000 GHG emitting cars at a time when Colorado is implementing zero emissions vehicle standards.

10) State Land Usage - The large area of state land west of the proposed reservoir is devoted to hunting and cattle grazing. The state and federal lands in this region of northern Colorado provide abundant and easily accessible opportunities for recreation, which we gratefully utilize. Impacts to use of or access to the state land is a negative impact to our communities.

11) Aesthetic - The drive from Livermore to Laporte would no longer be through the heritage rangeland and the familiar hogbacks. Since the proposed reservoir would likely be only partially filled much of the time, instead of beautiful hogbacks and grassy foothills, our viewshed would be marred by the barren sides (bathtub ring) and murky surface of a partially filled reservoir.

12) Lack of combined Project evaluation/coordination - There is no apparent coordination of the NISP or the proposed Seaman’s expansion or the Halligan expansion. All these projects surround our properties and would leave us on a peninsula of land cut from the rural environment we now enjoy. We met with the City of Greeley in August 2018 and learned that they are not planning to cooperate with other cities due to “challenges” and are proceeding on an expansion of Seamen’s reservoir from 5,000 to 80,000 acre-feet. In the 21st century, surface storage just doesn’t make sense; this is a semi-arid climate that is getting drier. Alternatives are available and should be seriously considered.

13) Social justice - While the benefits of proposed Glade would be enjoyed by people who live and work far from the reservoir site, the costs would be borne by those whose quality of life would be severely lessened.

14) Conservation and Alternatives – Conservation is not begin adequately considered. While the Colorado Front Range is land-rich for development, it is semi-arid and thus water-limited. About 2/3 of the Poudre is already taken out, and Glade would take another 40% of what’s left. Yet another reservoir is nothing but a temporary fix for a small portion of the state’s water needs; but one with permanent, destructive impacts on a large part of rural northern Colorado. The time is way past due for developing long-term solutions based on state-of-the-art technologies and widespread education on the absolute necessity to conserve water, and to stop relying on 19th century solutions for 21st century challenges.

PLEASE...the Larimer County Commissioners must save our rural communities and be good stewards of our natural resources by saying no Glade Reservoir!

Sincerely,

--

Larimer County Should Not Approve the NISP 1041 Permit Project No. 20-ZONE 2657

1 message

Lucas Griego <lgriego04@gmail.com> Sun, May 17, 2020 at 2:08 PM
To: rhelmick@larimer.org, tdonnelly@larimer.org, swjohnson@larimer.org, jkefalas@larimer.org

Dear Commissioners and Planning Commission:

Commissioner Johnson
Commissioner Kefalas
Commissioner Donnelly
Rob Helmick
Hello,

I am a landowner residing in northern Larimer County - unfortunately, on County Road 29C next to the proposed location of Glade Reservoir, it's massive dam, forebay, pumps, pipelines, campgrounds, parking lots, boat ramps, and other facilities. I STRONGLY urge the Board of County Commissioners to deny the 1041 permit for the Northern Integrated Supply Project because it would forever impact the fundamental nature of the rural landscape in which I live and will harm my quality of life and those neighbors in this neighborhood.

I chose to live in northern Colorado for its beautiful natural landscapes, its wild and scenic rivers, it's clean air and quiet surroundings, its wildlife, its opportunities for outdoor recreation on the abundant state and federal lands in the area. These are key pieces to the quality of life; key pieces that would be lost if this project is constructed and operated as proposed. This land, the water, and the communities would be harmed by this project, and any benefits of the project would accrue to communities mostly outside Larimer County.

It is unacceptable that our rural northern Colorado communities must bear the impacts and unmitigable risks of this massive and ill-conceived project, the biggest ever proposed for Larimer County.

If construction is executed as planned, there would be seven years of heavy construction impacting our communities. We would be subjected to lots of heavy truck traffic, since the main artery to and from the reservoir site is Highway 287, which is also our main route; 6-days-a-week heavy traffic and heavy machinery operations, and the unwelcome, intrusive, and obnoxious presence of widespread and large-scale construction activity, noise, dust, and danger, over a long period of time. The intrusion would turn the hundreds of acres of the landscape into a construction zone, and take away the attractiveness, the clean air, the quiet – the things we depend on for health and happiness.

Encouraging almost 400,000 visitors per year to this area would alter it from the quiet, rural and sparsely populated landscape we sought and invested in, to a busy recreational area with noise, dust, traffic, activity, accidents, and fires. Noise from motorboats on Glade would exceed state standards, would be heard miles away, and would significantly disrupt our lives. There is no doubt that the noise would cause my property value to decline.

That is if the reservoir fills. The photographs Northern Water shows of a beautiful full reservoir are misleading at best, because the reservoir would rarely, if ever, look like that. It would generally look like an abandoned industrial facility marring the area's aesthetics.

Since the reservoir would not fill, and likely would not be full during much of its life, the project would look like an abandoned muddy puddle much of the time, and the recreational facilities would be mostly empty. Who would pay for the upkeep of the unused recreational facilities, Larimer County taxpayers? The project ruins the aesthetics of the valley and hogbacks – a unique and beautiful landscape – for a project that would provide little or no benefit to Larimer County and in fact would negatively impact its residents and its coffers.

Dust blown from the barren shorelines would be swept up the valley on the area's strong winds and seep into our homes and further degrade our lives. The EIS states that it would take an 80-mph wind to generate any fugitive dust from the shorelines of the operating reservoir, an assertion that doesn't pass the laugh test for anyone living in this rural landscape. And worse, they plan on using fly ash to build much of the concrete structures, which can do major health harm to many of the mostly retired folks living on County Road 29C, who have been diagnosed with medical breathing difficulties of one kind or another. Are we to be the guinea pigs for some ill-conceived experiment and will this open up Larimer County to a class action lawsuit?

My neighborhood is very concerned about the potential for fire. We live in a high fire hazard, and we take many precautions with our homes and properties to protect against fires. Many visitors would be careless with campfires, cigarettes, with illegal fireworks, or with firearms, and wildfires would be inadvertently ignited. Their vehicles can start fires. Unfortunately, arson is possible. Our climate is getting drier. Larimer County must recognize the seriousness of this issue and deny this permit. The county cannot simply hope for the best because our homes, our property, our animals would all be put at unacceptable risk of wildfire due to construction, high visitation, and incomplete understanding. These increased risks would also cause increased demands on local emergency services, especially fire, medical, and law enforcement.

No project this big can be undertaken without significant and irreparable impacts. I am asking Larimer County to be a good steward and deny this permit and prevent the loss of open space and wildlife habitat, increased risk of wildfires and other public safety hazards, increased demands on local volunteer emergency services, noise, light pollution where now there is little, increased development and traffic in ever-widening circles around the reservoir, reduced air quality, climate change, increased illegal activities such as trespass on adjacent private land, decreased property values, and the loss of unique visual and aesthetic values. The natural and rural quality of this land is very important to our lives and communities.

Sincerely,

--

Commissioner Donnelly
Rob Helmick

NOT BLIND OPPOSITION TO PROGRESS, BUT OPPOSITION TO BLIND PROGRESS.

This is an incredibly poorly-thought project from its very beginning. It is UNACCEPTABLE that our rural northern Colorado communities must bear the impacts and risks of this massive and ill-conceived project, the biggest ever proposed for Larimer County.

I'm a landowner residing in northern Larimer County, near the proposed location of Glade Reservoir, its massive dam, forebay, pumps, pipelines, campgrounds, parking lots, boat ramps, and other facilities. We strongly urge the Board of County Commissioners to DENY the 1041 permit for the Northern Integrated Supply Project because it would forever impact the fundamental nature of the rural landscape in which we live and harm our quality of life.

We choose to live in northern Colorado for its beautiful natural landscapes, its wild and scenic rivers, its clean air and quiet surroundings, its wildlife, its opportunities for outdoor recreation on the abundant state and federal lands in the area. These are key pieces to our quality of life; key pieces that would be lost if this project is constructed and operated as proposed. Our land, water, and communities would be harmed by this project, and any benefits of the project would accrue to communities mostly outside Larimer County.

If construction is executed as planned, there would be seven years of heavy construction impacting our communities. We would be subjected to unbearable heavy truck traffic, since the main artery to and from the reservoir site is Highway 287, our main route; 6-days-a-week heavy traffic and heavy machinery operations, and the unwelcome, intrusive, and obnoxious presence of widespread and large-scale construction activity, noise, dust, and danger, over a long period of time. The intrusion would turn the hundreds of acres of the landscape into a construction zone, and take away the attractiveness, the clean air, the quiet – the things we depend on for health and happiness.

Northern Water is currently buying farms in northern Colorado to make up a more than 50% shortfall in the water rights needed for a successful project. In addition, recent prolonged droughts, which are becoming more common, have affected the amount of water that would be available from the Poudre River and other sources. For us, this means that we would endure the years and years of construction, and the IRREPARABLE LOSS of the unique landscape in which we live, all for an unfulfilled promise that "if they build it, the water would come" which is NOT guaranteed. The water shortage will only get worse as the climate dries. Larimer County should DENY this project, which will likely fail to meet its objectives.

Encouraging almost 400,000 visitors per year to this area would FOREVER ALTER it from the quiet, rural and sparsely populated landscape we sought and invested in, to a busy recreational area with noise, dust, traffic, activity, accidents, and fires. Noise from motorboats on Glade would exceed state standards, would be heard miles away, and would significantly disrupt our lives. For some owners, the noise would cause property values to decline.

That's if the reservoir fills. The photographs Northern Water shows of a beautiful full reservoir are misleading because the reservoir would rarely, if ever, look like that. The project ruins the aesthetics of the valley and hogbacks – a unique and beautiful landscape – for a project that would provide little or no benefit to Larimer County, and in fact would negatively impact its residents and its coffers.

The project would also contribute to climate change and increase air pollution. Over 30,000 tons per year of CO_2 would be emitted by engines to pump water into Glade. High levels of greenhouse gases would be produced, both during construction and daily operation.
We are very concerned about the potential for fire, having endured the disastrous High Park Fire of 2012. We live in a

high fire hazard area, and we take many precautions with our homes and properties to protect against wildfires. Many visitors, who would be visiting in summer when the land is hottest and driest, would not be aware of how easy it is to cause a wildfire in this landscape. Some would be careless with campfires, cigarettes, illegal fireworks, or firearms, and wildfires could easily ignite. Their vehicles can start fires. Unfortunately, arson is possible. Our climate is getting drier. Larimer County must recognize the seriousness of this issue and DENY this permit. These increased risks would also cause increased demands on local emergency services, especially fire, medical, and law enforcement.

No project this big can be undertaken without significant and irreparable impacts. We ask Larimer County to be a good steward and deny this permit and prevent the loss of open space and wildlife habitat, increased risk of wildfires and other public safety hazards, increased demands on local volunteer emergency services, noise, light pollution where now there is little, increased development and traffic in ever-widening circles around the reservoir, reduced air quality, climate change, increased illegal activities such as trespass on adjacent private land, decreased property values, and the loss of unique visual and aesthetic values.

The natural and rural quality of this land is very important to our lives and communities.

VOTE NO ON THIS ILL-CONCEIVED PLAN THAT WILL FOREVER DESTROY OUR LAND.

Sincerely,

--

Do Not Approve NISP 1041 Project No. 20-ZONE 2- Save Our Rural Northern Colorado

1 message

Vincent Fayad <fayadcattle@gmail.com> Mon, May 18, 2020 at 6:39 PM
To: rhelmick@larimer.org, tdonnelly@larimer.org, swjohnson@larimer.org, jkefalas@larimer.org

Dear Commissioners and Planning Commission:

Commissioner Johnson
Commissioner Kefalas
Commissioner Donnelly
Rob Helmick

We are landowners residing in the area of the proposed Glade reservoir that have concerns with the proposed Glade Project and the negative impacts that would occur if the project moves forward.

The primary benefits of this proposed reservoir would be enjoyed by the 15 subscriber towns or agencies that receive the proposed Glade water. Most of these towns and agencies are outside Larimer County. The most obvious and intense costs would be borne by local and other surrounding communities.

In general, our concerns are that the scope and scale of this proposed project, if approved, would have significant, detrimental, and permanent impact on our rural community, environment, and lifestyle we enjoy today and desire to have in the future.

Specifically, our rural environment we believe would be negatively impacted in the following ways:

1) Noise - The rerouted highway over the most eastern hogback would have an unobstructed view from residences in the foothills, there would be no middle hogback to block truck and auto noise. The NISP publications suggest that recreation would include motorboats and jet skis. Boats and skis are loud, they would likely be louder than current road traffic.

2) Light Pollution – This rural area enjoys fairly dark skies. The proposed recreational activities would generate significant exterior lighting for boats, facilities, camping, pumping facilities, traffic, etc. and headlights from traffic coming down the hogback on the rerouted 287 would shine into the adjacent private property. This could destroy the enjoyment of our night skies.

3) New development - We do not know what sort of development would occur near and north of proposed Glade. The rerouted highway 287 would invite more residential development on the plains. The reservoir would invite more development in the adjacent foothills and valleys. It's not inconceivable that more commercial development catering to visitors would encroach into currently uncommercialized lands, forever altering the rural nature of the area.

4) Trespass – Plans for proposed Glade project almost 400,000 visitors per year. This would include boaters, campers, fishers and hikers and bikers, among others. There is every reason to believe that not all these visitors would stay within the confines of designated recreational areas. Some visitors are likely to explore the inviting foothills that border the reservoir and trespass, however inadvertently, on our private property.

5) Wildlife – Proposed Glade would become a significant barrier to the permanent and migratory herds of deer and elk that reside in our area and would be disruptive to other wildlife. In a world where wildlife and nature are under stress, and is diminishing generally owing to human activities, should we be contributing to those activities for unnecessary purposes? We encourage the county to find alternatives that don't result in the significant loss of open space and wildlife habitat that this project would cause.

6) Wildfires – In this century three major wildfires burned over 100,000 acres on and around Glade. Two of the three forest fires were caused by careless people. Can we rely on the >1000 daily visitors to proposed Glade to be careful?

7) Emergency response – The recreation on the proposed reservoir is projected to be almost 400,000 visitors per year. Such a large increase in recreationalists would likely increase the number of emergency calls thereby further stretching emergency response agency resources. Costs would be borne by Larimer County taxpayers, and emergency services

that are diverted to Glade would not be readily available to serve the local communities.

8) Air quality – Because Glade would have junior water rights, the water level of the proposed reservoir would be highly variable, unlike Horsetooth. The water level frequently would drop precipitously, often changing proposed Glade Reservoir to Glade Mudflats, and could stay that way for years. The large “bathtub ring” that would materialize around the reservoir would become dry soil that would blow in our strong winds causing air quality and visual concerns. The hundreds or thousands of vehicles that would travel to the area emit gases, particulates, and ozone precursors (i.e., health hazards).

9) Climate change – the pumps, the construction vehicles, the recreational vehicles: the project would result in considerable burning of fossil fuels, forever, and the emission of greenhouse gases. The pumping stations alone would emit the equivalent of adding 7000 GHG emitting cars at a time when Colorado is implementing zero emissions vehicle standards.

10) State Land Usage - The large area of state land west of the proposed reservoir is devoted to hunting and cattle grazing. The state and federal lands in this region of northern Colorado provide abundant and easily accessible opportunities for recreation, which we gratefully utilize. Impacts to use of or access to the state land is a negative impact to our communities.

11) Aesthetic - The drive from Livermore to Laporte would no longer be through the heritage rangeland and the familiar hogbacks. Since the proposed reservoir would likely be only partially filled much of the time, instead of beautiful hogbacks and grassy foothills, our viewshed would be marred by the barren sides (bathtub ring) and murky surface of a partially filled reservoir.

12) Lack of combined Project evaluation/coordination - There is no apparent coordination of the NISP or the proposed Seaman’s expansion or the Halligan expansion. All these projects surround our properties and would leave us on a peninsula of land cut from the rural environment we now enjoy. We met with the City of Greeley in August 2018 and learned that they are not planning to cooperate with other cities due to “challenges” and are proceeding on an expansion of Seamen’s reservoir from 5,000 to 80,000 acre-feet. In the 21st century, surface storage just doesn’t make sense; this is a semi-arid climate that is getting drier. Alternatives are available and should be seriously considered.

13) Social justice - While the benefits of proposed Glade would be enjoyed by people who live and work far from the reservoir site, the costs would be borne by those whose quality of life would be severely lessened.

14) Conservation and Alternatives – Conservation is not begin adequately considered. While the Colorado Front Range is land-rich for development, it is semi-arid and thus water-limited. About 2/3 of the Poudre is already taken out, and Glade would take another 40% of what’s left. Yet another reservoir is nothing but a temporary fix for a small portion of the state’s water needs; but one with permanent, destructive impacts on a large part of rural northern Colorado. The time is way past due for developing long-term solutions based on state-of-the-art technologies and widespread education on the absolute necessity to conserve water, and to stop relying on 19th century solutions for 21st century challenges.

The Larimer County Commissioners must save our rural communities and be good stewards of our natural resources by saying no Glade Reservoir!

Sincerely,

NISP Pipeline

1 message

Essay, Isaac I <Isaac.Essay@gs.com> Mon, May 18, 2020 at 10:50 AM
To: "rhelmick@larimer.org" <rhelmick@larimer.org>

Hi Rob,

I am sending you a brief email today regarding the proposal to run the NISP pipeline through Eagle Lake Subdivision. Please don't do that.

It is unnecessary and unfair to cause so much disruption to one neighborhood when there are alternatives. Finally, I believe a decision on NISP should be done after we know what Thornton is going to do. It sure makes sense to me that there should be some coordination there.

Thanks for taking the time to read this email.

We are losing our way of life on a daily basis up here. This is an awful idea. This river is our home. My great, great grandparents settled on this river in the 1800's and the water loss is going to ruin the habitat. I am not a NIMBY and believe development is important, but this is a terrible thing that could happen to our community.
Please vote against this.

NISP, Thornton Pipeline and other 19th-century infrastructure ideas...

We are in the 21st century, not the 19th or 20th century. We need to plan for environmentally - friendly "green infrastructure", not environmentally-destructive 19th and 20th century infrastructure.

Bulldozing ecosystems and installing pipes to transport water and construct new dams is old century stuff.

Let's start using our heads and good design, and move water from existing waterways from into places in a cost-effective and environmentally effective way. Use the existing rivers to transport water....that is what they are there for and they are already there!

Also, let's respect the nature and the environment that brought us all here in the first place, not convert Colorado's front-range into a high-density version of New York City or L.A.

Let's keep Colorado being Colorado! Stop the high density and environmental nonsense. Please use earth-friendly and sensible design and implementation practices!

Thanks,
Karen

Please Suspend NISP Permitting During COVID-19 Pandemic

1 message

Will Becker <will.becker84111@everyactioncustom.com> Tue, May 19, 2020 at 1:14 PM
Reply-To: will.becker84111@gmail.com
To: rhelmick@larimer.org

Dear Community Development Rob Helmick,

I am writing in objection to Larimer County's triggering of the 1041 permitting process for the Northern Integrated Supply Project (NISP). It is incredible that despite Larimer County itself declaring a formal emergency and stay-at-home order and the Governor of Colorado declaring a "State of Emergency" due to the COVID-19 pandemic, that the County is choosing to move forward with this permit on a normal timeline. NISP is by far the most controversial project in the history of Larimer County, and it will likely generate thousands of comments and hundreds of people wanting to appear at public hearings that cannot be held at this time. The NISP project has been in some form of the Federal, State, and County permitting process for 17 years and the public deserves a full, transparent, and normal permit process that is not rushed and unduly affected by the current COVID-19 pandemic.

I believe that the Governor's declaration of an official "State of Emergency," as well as the County's own emergency powers, gives you broad discretion to suspend the permitting process, and I encourage you to take this action as soon as possible. Attempting to hold a public permitting process during this pandemic, when the citizens of Larimer County and state of Colorado are under a stay-at-home order and a formally declared emergency is not only one of the most tone-deaf actions this County has taken in its history, it is most likely illegal. No meaningful public process could be completed under these conditions and if County citizens are to believe that its government is acting in good faith, this permit process must be suspended.

This project would significantly affect the Poudre River and it is actively being opposed by river-protection and river-recreation groups, and there is broad opposition to NISP from homeowners around the proposed reservoir, neighbors along Highway 287, and homeowners along proposed pipeline routes. I respectfully request that you "suspend" the 1041 permitting process for NISP during this COVID-19 pandemic and that you conduct a real and meaningful public process once the pandemic has abated.

Sincerely,
Will Becker

NISP Objection Letter to Rob Helmick.pdf

Rob Helmick, Senior Planner
Larimer County Community Development Division
200 W. Oak Street
Suite 3100
PO Box 1190
Fort Collins, CO 80521

May 21, 2020

Dear Rob,

As president of the Eagle Lake Association, I have a unique perspective on Northern Water's 1041 application and their proposed pipeline through Eagle Lake. I have been working on both this and the Thornton pipeline projects for the HOA for the better part of three years and see many similarities in the process that is unfolding before the County. I am writing you to ask that the Planning Commission, and ultimately the Board of County Commissioners for Larimer County, not approve the 1041 Application that is before you for a pipeline through the county by Northern Water (NISP).

The issues revolving around this application and the reasons it should be denied closely mirror that of the City of Thornton 1041 pipeline application that was rejected by the Board of County Commissioners.

Specifically, here are some of the reasons the County rejected the Thornton application and should do so as well with the NISP application:

1) According to the Land Use Code criteria quoted by the Board of Commissioners, the proposal is inconsistent with the county Master Plan affecting land use and development, specifically that the route will be traversing through significant amounts of private property and through yards in the Eagle Lake neighborhood. Private easements will have to be obtained through eminent domain. Affected residents will not be permitted to construct permanent structures or plant landscape material with deep roots (trees, wind blocks, etc) on their property due to the pipeline easement and maintenance requirements. Affected residents will be subject to continual intrusion on their land by maintenance crews checking on the pipeline in perpetuity. This is a gross infringement of their right to a peaceful existence on their property and our right to restrict non-resident traffic on our privately owned roads.
2) In addition, according to Northern Water's Construction Approach document, they are anticipating using HOA owned private roads for construction traffic throughout the five segments of construction on the pipeline near and through our neighborhood. **The timeline of the cumulative impact to us is anticipated to be 59 weeks from start to finish for all the segments!** They are asking to use our narrow, non-public grade roads for heavy truck traffic and daily construction crew traffic on our private roads dozens of residents use daily to enter and exit our subdivision. This is an unacceptable burden on us and again is a gross infringement on our neighborhood and our rights to a peaceful existence that is inconsistent with the Master Plan's stated goal of "maintaining and enhancing our county's quality of life and to be fundamentally fair to all our citizens and to respect their individual rights." A quiet residential neighborhood with children playing, residents coming and going, and retirees enjoying the peaceful time they've

earned is not a place for construction staging for a project that has no benefit for its residents and even minimal benefit to Larimer County as a whole. The concept and thought of using our roads for this purpose is untenable.

3) Lack of transparency and communication with affected properties were a large negative for the Board of Commissioners during the Thornton hearings and should be as well for the NISP application. Although they have held numerous public information events, they have not reached out to the affected property owners in Eagle Lake whose land will be crossed by the proposed pipeline. They have not held any discussions with the HOA about the use of our roads and what that may look like. They have not contacted any of the 24 Eagle Lake residents plus adjacent non-resident households who will be impacted by the use of our private roads during construction for over a year.
4) Importantly from a construction traffic standpoint, they have not contacted the three owners of the properties that Hood Lane crosses about the viability of that dirt road for construction traffic – all three of whom tell us that it is not designed or built for heavy truck traffic and will probably collapse into the adjacent water canal if used for that purpose. Erosion from the canal on the road bed and underlying bank make this a dangerous proposition at best. Not to mention the fact that no truck longer than about 20 feet can make the turn from Eagle Lake Drive onto Hood Lane which is a backward angle turn past the HOA owned and maintained bridge. It seems no one from Northern Water has done their due diligence on this path for the purposes they propose.
5) The NISP 1041 application negatively impacts public health and safety in our neighborhood. Our private roads are narrow roads and not constructed to handle large, semi-tractor trailer traffic loaded with pipe sections and construction materials for pipeline construction. The roads were not built to handle the volume of traffic or the load. Having these vehicles on our roads creates a safety hazard for children, bicyclists, walkers and resident traffic entering and leaving driveways. In addition, some of our older residents with health issues are at risk due to the constant coming and going of non-resident truck traffic. Noise levels, pollution from diesel vehicles, and anxiety from interruptions to our peaceful existence can all lead to increased health problems for all residents.
6) In the Land Use Code criteria for consideration by the County, Criteria C states its purpose is to “Promote the economic stability of existing land uses that are consistent with the Master Plan and protect them by incompatible or harmful land uses.” The proposed pipeline is certainly an incompatible and harmful use of the land in our neighborhood.

   We recently annexed three parcels to our HOA (the TIPS Development) whose owner was required by the County to development certain aspects of the land (drainage, roads, etc) to be approved by the County before being allowed to offer the plots for sale and final residential development. The owner has spent thousands of dollars to prepare this land, yet the proposed pipeline path crosses near or on some of the new parcels rendering them virtually unsellable until the pipeline is built and completed. No buyer will pay a premium price for a parcel with the amount of disruption, uncertainty of building site and septic placement, and ongoing nuisance this project will cause to these three parcels for well over a year. The County is in effect killing the owner’s ability to sell his parcels and recoup his already substantial investment that the County has made him invest to get the land ready for development. This is not “promoting the economic stability of existing land uses” (ie. Residential development) or “protecting incompatible and harmful land uses”.

Other residents in our neighborhood who may be contemplating or are in the process of listing their property are also economically negatively impacted by the proposed pipeline. Buyers will use every reason to lower the price on a sale and a year or more of construction traffic, noise, dirt and dust flying in the neighborhood are good leverage points for them to either not buy at all, or attempt to attain a lower selling price than normal. The County is truly hurting the economic stability of the whole neighborhood with this proposal and hundreds of thousands of dollars in values may be lost if the application is approved.

7) Northern Water has presented other reasonable siting and design alternatives that do not include bisecting resident's property or cutting through our neighborhood that they have dismissed due to cost or more difficult construction conditions like their N2.4 (north of Reservoir #3) and N2.5 routes (Douglas Road). The Board of County Commissioners rejected reasoning that expense or difficulty of construction were disqualifying reasons for rejecting routes over ones that impacted private property owners and individual rights in the Thornton pipeline application. Northern's preferred N2.1 route severely impacts our rights as property owners and citizens and should similarly be dismissed by the Commissioners when there are viable alternate routing options.
8) Another issue of grave concern to the Commissioners in the Thornton application was the construction and pipeline proximity to occupied dwellings. Proximity of construction and construction impact along with the long-term detriment to property owners was a primary concern. The Northern Water proposal includes a 100' easement – a 40' construction easement and a 60' permanent easement. If the pipeline were to be placed on the property line between the two residences the proposed N2.1 routing prefers, that will put the easement only 30 feet or less from one of the residences. The disruption and imposition on private property this close to an occupied dwelling is unacceptable when there are route alternatives that do not cross private property between two dwellings.
9) The other major point that should either cause the county to reject the application or defer a decision until later is the Thornton pipeline issue now pending before the courts. The proposed routing of their pipeline has almost identical routing alternatives to Northerns. Both entities are in the review process at the same time with construction timelines that are similar. Multiple times in the record for Larimer County in the proceedings with Thornton, both Thornton, Northern Water, and the County mentioned or agreed that co-location of the two pipelines along their nearly identical paths made sense and should be pursued. It has been discussed between all three parties on numerous occasions and should be part of the discussion now.
   In fact, one of the objections the Board of County Commissioners expressed to deny the Thornton pipeline by only submitting an application for one of their proposed pipelines in isolation from their planned future ones was that, **"Thornton deprives the Board and public of the opportunity to consider cumulative impacts and the effectiveness of mitigation. A route that may be appropriate for a single pipeline may be inappropriate for additional pipelines. If this information is not considered now, future pipelines may not be able to co-locate which would result in the disorderly development of Thornton's project and compound the impacts on Larimer County through multiple different pipelines in separate locations."**
   How is this not the case with the proposed Northern pipeline and Thornton's pipeline, both of which are looking at nearly identical routing alternatives? This is not just an

issue of "disorderly development and compounding of the impacts" on Larimer County – it is the disorderly development and compounding of the impacts on Eagle Lake in a much shorter timeframe than the proposed build out of the future Thornton pipelines. And how is the reverse not true – that a route that may be inappropriate for a single pipeline due to cost and difficulty of construction may be entirely appropriate for the combined resources of two pipelines from two well-funded entities with capable engineering that will minimize the impacts not only on Larimer County but the Eagle Lake neighborhood that is the target of two separate pipelines?
The precedent for this is Section A.2 of the Land Use Code itself that says the Code is intended to:

"A. Provide for the physical development of the county in order to:
1. Preserve the character and quality of rural and urban areas;
2. Foster convenient, harmonious and workable relationships among land uses; and
3. Achieve the principles and strategies described in the master plan."

This alone should allow the County to consider co-location as part of the process in both the Thornton and Northern Water 1041 applications. In addition, the Colorado Supreme Court noted that the purpose of the 1041 statute is to allow state and local governments to "supervise land use which may have an impact on the people of this state beyond the immediate scope of the project." Colorado Land Use Commission v. Board of County Comm'rs of Larimer County, 604 P.2d 32, 34 (Colo. 1979). The reference to impacts "beyond the immediate scope of the project" suggests that the Commissioners can and should consider the relationship between the project under consideration and other projects. Such sensitivity would definitely further the statute's apparent purpose of "protection of the utility, value, and future" of land, which the statute states is in the public interest. C.R.S. § 24-65.1-101(1)(a).

For these reasons, I ask the Planning Commission and the Board of County Commissioners reject the Northern Water 1041 application until such time that there is resolution to the Thornton 1041 application so that both pipelines can apply for a co-location routing option where both entities can share costs and choose routes they might not otherwise consider around residential areas. Our specific properties and the Eagle Lake neighborhood should not have to shoulder the burden of these two projects for the sake of Larimer County.

Thank you for consideration of our points and position.

Respectfully submitted,

Mark Heiden, President and Affected Homeowner

HI Rob:

I wanted to reach out to you again prior to the hearing. I personally am very supportive of the NISP project but I would like to understand what this means for our property. We have a large concrete driveway, mature trees and landscaping that runs towards the front of our property. The County does not have an easement. How do you intend to handle this? Where exactly will the pipeline run? Why did you choose the north side of the road versus the south side (where there are no houses)? When will this project start?

Thanks. I look forward to hearing from you.

Nicole

To: Rob Helmick <helmicrp@co.larimer.co.us>

Great.
Thanks.
I just want to be sure that they contact me in the future if they expect to go thru my property for construction.
I own the ditch road and its not fit for heavy construction traffic anyway.

Dear Rob,

Please review my letter of objection, and the detailed reasons provided, to NISP's proposal for alternative N2.1.

Have a great weekend.

Stay safe!

Sincerely,

Tom.

NISP Objection Letter - Tom Mackenzie.docx
21K

Rob Helmick, Senior Planner
Larimer County Community Development Division
200 W. Oak Street
Suite 3100
PO Box 1190
Fort Collins, CO 80521

Dear Rob,

As a resident of the Eagle Lake neighborhood, I am writing you to ask that Larimer County not approve the 1041 Application that is before you for a pipeline through the county by Northern Water (NISP).

NISP conducted criteria assessments on only three of five alternatives. Alternatives N2.1, N2.2 and N2.3 all entail going through the Eagle Lake neighborhood. No assessment was conducted on N2.4 [north of reservoir 3] and N2.5 [Douglas Road]. Neither of these two alternatives entail the level of neighborhood disruption or environmental impact [no wet lands] compared to N2.1, N2.2 or N2.3. I am against N2.1 because it affects the neighborhood I live in. Although not proposed by NISP, I would be against N2.2 and N2.3 since I would be directly impacted because I live in one of the eight properties affected on the east side of reservoir 3. I ask that Larimer County request NISP to look at the N2.4 or the N2.5 alternatives.

The issues revolving around this application and the reasons it should be denied closely mirror that of the City of Thornton 1041 pipeline application that was rejected by the Board of County Commissioners. Specifically, here are some of the reasons the County rejected the Thornton application and should do so as well with the NISP application:

1) According to the Land Use Code criteria quoted by the Board of Commissioners, the proposal is inconsistent with the county Master Plan affecting land use and development, specifically that the route will be traversing through significant amounts of private property and through yards in the Eagle Lake neighborhood. Private easements will have to be obtained through eminent domain. Affected residents will not be permitted to construct permanent structures or plant landscape material with deep roots (trees, wind blocks, etc) on their property due to the pipeline easement and maintenance requirements. Affected residents will be subject to continual intrusion on their land by maintenance crews checking on the pipeline in perpetuity. This is a gross infringement of their right to a peaceful existence on their property and our right to restrict non-resident traffic on our privately owned roads.
2) In addition, according to Northern Water's Construction Approach document, they are anticipating using HOA owned private roads for construction traffic throughout the five segments of construction on the pipeline near and through our neighborhood. **The timeline of the cumulative impact to us is anticipated to be 59 weeks from start to finish for all the segments!** They are asking to use our narrow, non-public grade roads for heavy truck traffic and daily construction crew traffic on our private roads dozens of residents use daily to enter and exit our subdivision. This is an unacceptable burden on us and again is a gross infringement on our neighborhood and our rights to a peaceful existence that is inconsistent with the Master Plan's stated goal of "maintaining and enhancing our county's quality of life and to be fundamentally fair to all our citizens and

to respect their individual rights." A quiet residential neighborhood with children playing, residents coming and going, and retirees enjoying the peaceful time they've earned is not a place for construction staging for a project that has no benefit for its residents and even minimal benefit to Larimer County as a whole. The concept and thought of using our roads for this purpose is untenable.

3) The NISP 1041 application negatively impacts public health and safety in our neighborhood. Our private roads are narrow roads and not constructed to handle large, semi-tractor trailer traffic loaded with pipe sections and construction materials for pipeline construction. The roads were not built to handle the volume of traffic or the load. Having these vehicles on our roads creates a safety hazard for children, bicyclists, walkers and resident traffic entering and leaving driveways. In addition, some of our older residents with health issues are at risk due to the constant coming and going of non-resident truck traffic. Noise levels, pollution from diesel vehicles, and anxiety from interruptions to our peaceful existence can all lead to increased health problems for all residents.
4) In the Land Use Code criteria for consideration by the County, Criteria C states its purpose is to "Promote the economic stability of existing land uses that are consistent with the Master Plan and protect them by incompatible or harmful land uses." The proposed pipeline is certainly an incompatible and harmful use of the land in our neighborhood.

   We recently annexed three parcels to our HOA (the TIPS Development) whose owner was required by the County to development certain aspects of the land (drainage, roads, etc) to be approved by the County before being allowed to offer the plots for sale and final residential development. The owner has spent thousands of dollars to prepare this land, yet the proposed pipeline path crosses near or on some of the new parcels rendering them virtually unsellable until the pipeline is built and completed. No buyer will pay a premium price for a parcel with the amount of disruption, uncertainty of building site and septic placement, and ongoing nuisance this project will cause to these three parcels for well over a year. The County is in effect killing the owner's ability to sell his parcels and recoup his already substantial investment that the County has made him invest to get the land ready for development. This is not "promoting the economic stability of existing land uses" (ie. Residential development) or "protecting incompatible and harmful land uses".

   Other residents in our neighborhood who may be contemplating or are in the process of listing their property are also economically negatively impacted by the proposed pipeline. Buyers will use every reason to lower the price on a sale and a year or more of construction traffic, noise, dirt and dust flying in the neighborhood are good leverage points for them to either not buy at all, or attempt to attain a lower selling price than normal. The County is truly hurting the economic stability of the whole neighborhood with this proposal and hundreds of thousands of dollars in values may be lost if the application is approved.
5) Northern Water has presented other reasonable siting and design alternatives that do not include bisecting resident's property or cutting through our neighborhood that they have dismissed due to cost or more difficult construction conditions like their N2.4 (north of Reservoir #3) and N2.5 routes (Douglas Road). The Board of County Commissioners rejected reasoning that expense or difficulty of construction were disqualifying reasons for rejecting routes over ones that impacted private property owners and individual rights in the Thornton pipeline application. Northern's preferred

N2.1 route severely impacts our rights as property owners and citizens and should similarly be dismissed by the Commissioners when there are viable alternate routing options.

6) Another issue of grave concern to the Commissioners in the Thornton application was the construction and pipeline proximity to occupied dwellings. Proximity of construction and construction impact along with the long-term detriment to property owners was a primary concern. The Northern Water proposal includes a 100' easement – a 40' construction easement and a 60' permanent easement. If the pipeline were to be placed on the property line between the two residences the proposed N2.1 routing prefers, that will put the easement only 30 feet or less from one of the residences. The disruption and imposition on private property this close to an occupied dwelling is unacceptable when there are route alternatives that do not cross private property between two dwellings.
7) The other major point that should either cause the county to reject the application or defer a decision until later is the Thornton pipeline issue now pending before the courts. The proposed routing of their pipeline has almost identical routing alternatives to Northern's. Both entities are in the review process at the same time with construction timelines that are similar. Multiple times in the record for Larimer County in the proceedings with Thornton, both Thornton, Northern Water, and the County mentioned or agreed that co-location of the two pipelines along their nearly identical paths made sense and should be pursued. It has been discussed between all three parties on numerous occasions and should be part of the discussion now.
   In fact, one of the objections the Board of County Commissioners expressed to deny the Thornton pipeline by only submitting an application for one of their proposed pipelines in isolation from their planned future ones was that, "Thornton deprives the Board and public of the opportunity to consider cumulative impacts and the effectiveness of mitigation. A route that may be appropriate for a single pipeline may be inappropriate for additional pipelines. If this information is not considered now, future pipelines may not be able to co-locate which would result in the disorderly development of Thornton's project and compound the impacts on Larimer County through multiple different pipelines in separate locations."
   How is this not the case with the proposed Northern pipeline and Thornton's pipeline, both of which are looking at nearly identical routing alternatives? This is not just an issue of "disorderly development and compounding of the impacts" on Larimer County – it is the disorderly development and compounding of the impacts on Eagle Lake in a much shorter timeframe than the proposed build out of the future Thornton pipelines. And how is the reverse not true – that a route that may be inappropriate for a single pipeline due to cost and difficulty of construction may be entirely appropriate for the combined resources of two pipelines from two well-funded entities with capable engineering that will minimize the impacts not only on Larimer County but the Eagle Lake neighborhood that is the target of two separate pipelines?
   The precedent for this is Section A.2 of the Land Use Code itself that says the Code is intended to:

   "A. Provide for the physical development of the county in order to:
   1. Preserve the character and quality of rural and urban areas;
   2. Foster convenient, harmonious and workable relationships among land uses; and
   3. Achieve the principles and strategies described in the master plan."

This alone should allow the County to consider co-location as part of the process in both the Thornton and Northern Water 1041 applications. In addition, the Colorado Supreme Court noted that the purpose of the 1041 statute is to allow state and local governments to "supervise land use which may have an impact on the people of this state beyond the immediate scope of the project." Colorado Land Use Commission v. Board of County Comm'rs of Larimer County, 604 P.2d 32, 34 (Colo. 1979). The reference to impacts "beyond the immediate scope of the project" suggests that the Commissioners can and should consider the relationship between the project under consideration and other projects. Such sensitivity would definitely further the statute's apparent purpose of "protection of the utility, value, and future" of land, which the statute states is in the public interest. C.R.S. § 24-65.1-101(1)(a).

For these reasons, I ask the Planning Commission and the Board of County Commissioners reject the Northern Water 1041 application until such time that there is resolution to the Thornton 1041 application so that both pipelines can apply for a co-location routing option where both entities can share costs and choose routes they might not otherwise consider around residential areas. Our specific properties and the Eagle Lake neighborhood should not have to shoulder the burden of these two projects for the sake of Larimer County.

Sincerely,

Tom Mackenzie

Dear Mr. Helmick, County Commissions, and Planning Commission,

I am submitting a letter to be included in the County's review of the proposed NISP project. As a life-long alfalfa farmer in Larimer County, I feel honored to represent the agricultural community in opposing this project.

Please see attached my letter directed to the Larimer County Commissioners, Planning Commission, and Planning Staff regarding the 1041 permitting process for the NISP project.

Please include this letter in the official notes for the meeting agendas going forward. If you have any questions, please let me know.

Thank you,

Ken McCullough

RE: NISP 1041 Permit Application; Project No. 20-ZONE 2657

Dear Planning Commision, Commissioner Johnson, Commissioner Kefalas, Commissioner Donnelly, and Planning Staff:

My name is Ken McCullough, I am a life-long resident of Larimer County and a third-generation alfalfa farmer. My 45-acre farm is irrigated with water diverted directly out of the Cache la Poudre River via a canal operated by the Larimer and Weld Irrigation Company. This canal is located just east of Taft Hill Road and is downstream of the diversion point for the proposed Glade Reservoir. As someone with deep ties to the agricultural economy and rural culture of the Fort Collins area, I am opposed to the Northern Integrated Supply Project (NISP) being pushed by the Northern CO. Water District. For many reasons, I urge you as Commissioners and County Staff to oppose this God-awful project. Let me explain why I am so strongly opposed to this project and believe you should be too.

My farm diverts about 30-acre feet of water from the river annually, primarily June through September. This is a reliable water right, although my water rights are not senior to many upstream and down-stream users, I have never suffered from an inadequate supply when I needed it most. There have been many years when I don't get my full 30-acre feet, but my alfalfa operation has always received enough water, even in the driest years of 2000-2006, to get a reliable crop and stay in the black. After review of the NISP project and discussions with others in the agricultural economy, including leadership Larimer and Weld Irrigation Company, the NISP project will not benefit me at all, in fact, it could make me lose my farm.

The NISP project does not supply any new additional water to irrigators, agricultural users, or farmers in Larimer County. However, the water diverted into Glade Reservoir would be water that is *already* allo-cated and exists in paper water rights with farms in Larimer and Weld Counties. A major problem with NISP is that the water to be stored in Glade would need to be purchased in order to be allocated to the project, which it isn't, and unless Northern Water and NISP customers purchase thousands of acres of farmland, that water will never make it to Glade except for years with incredibly exceptional runoff. Since most of the water NISP is hoping to capture is already allocated for downstream users, NISP would need to purchase the farmland where the water rights are held in order to divert and eventually sell that water to customers. This issue was pointed out in the 2018 Final Environmental Impact Statement for the NISP project produced by the United States Army Corps of Engineers. Despite this incredibly prob-lematic detail, Northern Water thinks they can purchase these farms eventually over the next 30-40 years. Frankly, that is unrealistic, this is a billion-dollar pipe dream that won't likely operate at full capac-ity unless billions of more dollars are sourced to purchase farmland.

The issue I fear most that could jeopardize my farm is if Northern Water begins purchasing farmland and water rights in Larimer and Weld Counties. If farms are purchased for their water rights, the value of the

farmland will skyrocket because the water rights associated with the land will be “developed” and stored behind a dam and made available for urban users instead of kept in the river. This would result in a major *negative* economic incentive for farmers to sell their land and water rights to NISP in order to “cash out”. Farmers would of course have to sell their land willingly but imagine if a big fat “green carrot” was dangled in front of a working-class family? We all know what will happen, the pressure to sell the land for cash would be too overwhelming for most, and the multi-generation farms will be turned over for a quick buck.

Developers would then be able to buy the land from NISP and turn the land into homes and subdivisions, knowing that the farmland being paved over and has fed the Country for generations and will forever be lost.

My biggest fear about NISP is that if it were successful, which is unlikely, it would incentivize the development of Larimer and Weld Counties rich farmlands and rural charters, resulting in appalling urban sprawl and will contribute to the loss of a stable and reliable agricultural economy. At best NISP would waste billions of dollars and never become operational, but at worst, it would turn our beautiful rich agricultural lands into cement cul-de-sacs and parking lots.

My family and I have weathered through many years of drought, lost revenue, pest diseases, broken equipment, labor disputes, and market swings, but we’ve always kept our heads above water. However, I see NISP as the grim reaper, a sign of danger coming to turn my farm and our neighbors’ farms into lawns and asphalt driveways, forever destroying the traditions we have established in Larimer County.

This is not the future I want to leave my daughter, who will inherit the farm and be the first woman in the family to run it. I want her to have the same lifestyle and traditions that my grandfather had when he came to Larimer County in 1910 to farm alfalfa and corn. As someone who is trying to find their way in this chaotic world and walk tall as a steady and honorable person, I find myself feeling helpless and in utter despair if NISP were built. That’s why I am writing, to urge you to hear my story and see my perspective as a farmer who wishes the best for his home. Please stand with me and do not issue a 1041 permit for the Northern Integrated Supply Project.

Sincerely,

Ken McCullough

NISP 1041

1 message

Dori Aravis <dori.aravis@gmail.com> Sun, May 24, 2020 at 3:35 PM
To: rhelmick@larimer.org

Hi, my name is Dori Aravis and I am a long time resident of Fort Collins/Larimer County, and I simply cannot believe that we are still having to save the Poudre River from those who would exploit it. I am talking about the Glade Reservoir and the NISP plan to run pipeline from this ill-conceived reservoir across private property (mine included) to give this water to others. This damn is totally unnecessary and the citizens of Larimer County will not benefit from it in any way.

The Poudre is one of the last free-running rivers in the area. It is a treasure not only to Fort Collins, Larimer County, and the State of Colorado, but to the whole country. Taking water from it to serve the needs of a few with vested interests is not only a crime, but is morally wrong. We have fought against the Glade for many, many years; please don't let this happen, but preserve the natural world from this travesty!

And don't think for one moment that all the "recreational" benefits of Glade, would make up for the loss of the same recreational benefits of having a beautiful free-flowing river. Dams are 19 Century technology: We are living in the 21 Century and need to find better ways to meet our needs while at the same time saving the natural world.

And finally on a personal level— the route that is proposed that goes through my property is by no means the best choice. A route that was proposed by my neighbor, Karl Swenson, one that you have in the record, is much better with far less stress and disruption to the neighbors all along its pathway. It goes between the irrigation lakes and runs over mostly open sagebrush and would be so much better. Please look at it and consider this option if this terrible pipeline must be built at all.

Mr. Robert Helmick, Senior Planner

Larimer County Community Development Division

200 W. Oak Street

Suite 3100

P.O. Box 1190

Ft. Collins, CO 80521

Mr. Helmick:

On behalf of the people of Ft. Collins and Larimer County, my wife and I would like to voice our opinions regarding the routing of water lines for NISP and Thornton. Both interests are so much alike that it seems redundant and inefficient to deal with one and not the other simultaneously. Whatever the outcome of these debates, the answers should be pretty much the same for each water concern.

We live in the Eagle Lake Subdivision and can't even believe you would consider bringing one or both pipe lines through our area for all the disruption that it would cause for many months. Our housing area would be terribly abused to achieve these projects. Potential maintenance of these pipelines in the future would also be more of a problem if running through a residential neighborhood. From an aerial standpoint, water that needs to originate in the vicinity of Hwy 14 and 287 (Ted's Place) should be brought east in a more northernly location than Eagle Lake Subdivision. There exist plenty of open areas where two 40" pipelines can run side by side to the east side of I-25 and not have to impact as many people as it would running through Eagle Lake.

Thank You,

Lynn & Glenn Reiff

Do Not Approve NISP 1041 Project No. 20-ZONE 2- Save Our Rural Northern Colorado

1 message

Colleen Finnman <cfinnman1524@gmail.com> Sun, May 24, 2020 at 3:22 PM
To: rhelmick@larimer.org, tdonnelly@larimer.org, swjohnson@larimer.org, jkefalas@larimer.org

Dear Commissioners and Planning Commission:

Commissioner Johnson
Commissioner Kefalas
Commissioner Donnelly
Rob Helmick

I am a landowner residing in the area of the proposed Glade reservoir who has concerns with the proposed Glade Project and the negative impacts that would occur if the project moves forward.

My understanding is that the primary benefits of this proposed reservoir would be enjoyed by the 15 subscriber towns or agencies that receive the proposed Glade water. Most of these towns and agencies are outside Larimer County. The most obvious and intense costs would be borne by local and other surrounding communities. Furthermore, I am wholly opposed to capturing and piping precious water that originates in the Poudre water shed to other locales.

As landowners and residents, our concerns are that the scope and scale of this proposed project, if approved, would have significant, detrimental, and permanent impact on our rural community, environment, and lifestyle we enjoy today and desire to have for future generations.

Specifically, we believe our rural environment would be negatively impacted in the following ways:

1) Noise - The rerouted highway over the most eastern hogback would have an unobstructed view from residences in the foothills, there would be no middle hogback to block truck and auto noise. The NISP publications suggest that recreation would include motorboats and jet skis. Boats and skis are loud, they would likely be louder than current road traffic.

2) Light Pollution – This rural area now enjoys fairly dark skies. The proposed recreational activities would generate significant exterior lighting for boats, facilities, camping, pumping facilities, traffic, etc. and headlights from traffic coming down the hogback on the rerouted 287 would shine into the adjacent private property. This will undoubtedly destroy the enjoyment of our night skies.

3) New development - We do not know what sort of development would occur near and north of proposed Glade. The rerouted highway 287 would invite more residential development on the plains. The reservoir would invite more development in the adjacent foothills and valleys. It's not inconceivable that more commercial development catering to visitors would encroach into currently uncommercialized lands, forever altering the rural nature of the area. I would point out that this sort of development is clearly incompatible with the vision for the area articulated in the current Larimer County Comprehensive Land Use Plan.

4) Wildlife – Proposed Glade would become a significant barrier to the permanent and migratory herds of deer and elk that reside in our area and would be disruptive to other wildlife. There will also be negative impacts to the Poudre River as a viable coldwater fishery below the dam. In a world where wildlife and nature are under stress, and is diminishing generally owing to human activities, should we be contributing to those activities for unnecessary purposes? We encourage the county to find alternatives that don't result in the significant loss of open space and wildlife habitat that this project would cause.

5) Destruction of important historical and cultural sites -- Proposed Glade would obliterate the lower reaches of historic Hook and Moore Glade, along with a portion of the Overland Trail and many other sites of historical and cultural significance. Is this the way we want to treat these sites?

6) Wildfires – In this century three major wildfires burned over 100,000 acres on and around Glade. Two of the three forest fires were caused by careless people. Can we rely on the >1000 daily visitors to proposed Glade to be careful?

7) Emergency response – The recreation on the proposed reservoir is projected to be almost 400,000 visitors per year. Such a large increase in recreationalists would likely increase the number of emergency calls thereby further stretching emergency response agency resources. Costs would be borne by Larimer County taxpayers, and emergency services that are diverted to Glade would not be readily available to serve the local communities.

8) Air quality – Because Glade would have junior water rights, the water level of the proposed reservoir would be highly variable, unlike Horsetooth. The water level frequently would drop precipitously, often changing proposed Glade Reservoir to Glade Mudflats, and could stay that way for years. This us particularly true in an era of climate change. The large "bathtub ring" that would materialize around the reservoir would become dry soil that would blow in our strong winds causing air quality and visual concerns. The hundreds or thousands of vehicles that would travel to the area emit gases, particulates, and ozone precursors (i.e., health hazards).

9) Climate change – the pumps, the construction vehicles, the recreational vehicles: the project would result in considerable burning of fossil fuels, forever, and the emission of greenhouse gases. The pumping stations alone would emit the equivalent of adding 7000 GHG emitting cars at a time when Colorado is implementing zero emissions vehicle standards. Perhaps even more concerning is that with increasing droughts, it is unlikely that the proposed Glade Reservoir will be able to consistently reach the water levels projected for the project.

10) Aesthetic - The drive from Livermore to Laporte would no longer be through the heritage rangeland and the familiar hogbacks. Since the proposed reservoir would likely be only partially filled much of the time, instead of beautiful hogbacks and grassy foothills, our views would be marred by the barren sides (bathtub ring) and murky surface of a partially filled reservoir.

11) Conservation and Alternatives – Conservation is not being adequately considered. While the Colorado Front Range is land-rich for development, it is semi-arid and thus water-limited. About 2/3 of the Poudre is already taken out, and Glade would take another 40% of what's left. Yet another reservoir is nothing but a temporary fix for a small portion of the state's water needs; but one with permanent, destructive impacts on a large part of rural northern Colorado. In the 21st century, surface storage just doesn't make sense; this is a semi-arid climate that is getting drier.The time is way past due for developing long-term solutions based on state-of-the-art technologies and widespread education on the absolute necessity to conserve water, and to stop relying on 19th century solutions for 21st century challenges.

The Larimer County Commissioners must save our rural communities and be good stewards of our natural resources by saying no Glade Reservoir!

Sincerely,

--

NISP 1041 Application

1 message

Patrick Crotzer <patrick.crotzer@gmail.com> Mon, May 25, 2020 at 11:51 AM
To: rhelmick@larimer.org

Dear Mr. Helmick,
As you prepare for the upcoming Planning Commission Hearings and follow on County Commissioners' meetings I wanted to provide a couple of general observations and questions as well as questions more focused on the CR 56 area.

I don't believe limiting comments to two minutes per person will allow in-depth information to be exchanged with the Planning Commission and the County Commissioners. There should be a way for people to yield time to a larger group so that more detailed information than "not in my backyard" comments can be made. This would allow more reasonable discussions in the public input. It is worth noting that it was presentations from local grassroots groups like No Pipe Dream and Save the Poudre that brought to light the misinformation put forward by the City of Thornton in its 1041 application presentations, last year. I have attended NISP open houses and have noted a propensity to state opinion and preferences as hard unassailable facts. For this reason I recommend that all 1041 applicants provide their presentations and answers to questions from both the Planning Commission and County Commissioners under oath.

I believe that until the relocation of US Highway 287 has been firmly resolved including a reliable vetting of the ability of the NISP participants to pay for the relocation in full, especially given the strain of the current economic crisis, it is premature to approve either Glade Reservoir or the associated pipelines. In a similar vein it is premature to approve a reservoir for which NISP does not currently own enough water to fill it.

Even if Glade Reservoir is approved, there is no compelling reason to convey water through pipelines in Norther Larimer County. As the Board of County Commissioners have already made clear, water quality for municipal users is not the overarching concern of Larimer County. NISP assertion that there are no viable alternatives to pipelines is false. Water could be conveyed down the Poudre River or through the existing canal infrastructure. NISP already plans to flow water from Glade Reservoir to a point thirteen miles down river to the Poudre River Intake which if done properly would negate a Northern Tier pipeline altogether. Claims of diminished water quality while relatively true are overblown. The South Platt Regional Opportunities Water Group (SPROWG) is proposing to pipe water from near the Colorado Nebraska state lines all the way back to the Denver Metro area for treatment and reuse. Clearly, if that water is economically treatable then water taken from the Poudre River south of Fort Collins should be in even better condition.

Additionally, a survey of the 15 NISP participants websites and associated Water Quality Reports reveal that all but one receive some or all of their water in one way or another from local watersheds in conjunction with Northern Water and the Colorado Big Thompson project. This begs the question, could water from Glade be fed into Horsetooth Reservoir and then distributed via existing infrastructure to service all 15 participants?

NISP has long had a preference for traversing private property in lieu of utilizing existing easements to reduce the requirement to coordinate with other utilities and ditch companies. This puts a huge burden on private property owners who have no choice when faced with eminent domain. Full disclosure, my wife and I own property which is currently on the NISP route. The Northern Tier Pipeline route in the vicinity of CR56 would require easements from a dozen properties instead of just a few or none if it stayed in existing utility, county road and access road easements. Many of the properties already have ditch and utility easements and don't need to be further encumbered. If a pipeline is ultimately approved then we would appreciate Larimer County leadership stipulating use of existing easements along CR 56 until past Elder Lake to make the turn south to Douglas Road.

Thank You for your Time and Consideration

Best Wishes

Larimer County Should Not Approve the NISP 1041 Permit Project No. 20-ZONE 2657

1 message

John Dettenwanger <jjdettenwanger@gmail.com> Mon, May 25, 2020 at 9:09 AM
To: rhelmick@larimer.org, tdonnelly@larimer.org, swjohnson@larimer.org, jkefalas@larimer.org

Dear Commissioners and Planning Commission:

Commissioner Johnson
Commissioner Kefalas
Commissioner Donnelly
Rob Helmick

I'm a landowner and taxpayer residing in northern Larimer County, near the proposed location of Glade Reservoir. I strongly urge the Board of County Commissioners to deny the 1041 permit for the Northern Integrated Supply Project because it would forever impact the fundamental nature of the rural landscape in which we live, harm our quality of life and increase our taxes.

Northern Water's current application should be rejected on two significant points.

First, Northern Water is asking Larimer County to give them over 1200 acres of productive farm land and in exchange the only benefit they offer the county is the promise of "High Quality Recreation". Yet the county must invest 25% of the development cost and take on the liability of operating and maintaining the facilities.

It is a fact that Northern Water lacks almost 22,000 acre feet of water rights required to fill the reservoir before it could ever be used for "High Quality Recreation". On this fact alone, the application should be rejected until Northern Water has proven they have all the water rights to deliver on the projections. If the county was a bank, this would represent a high-risk unsecured loan. A bank would never make this kind of an agreement.

Secondly, even if Northern Water could guarantee they have the water rights to fill the reservoir, their modeling projections on water levels are significantly flawed.

Northern Water's hydrological modeling over a 56-year interval (1950-2005) reveals numerous multi-year periods where water levels at Glade would have been too low to provide access for motorized boating. During droughts (which are predicted to increase in frequency and duration in response to climate warming), boat access would be curtailed for multiple years. Northern's simulation indicates that Glade water levels would have been adequate for boating during the peak recreation season (May-August) in 41 (73%) of those years, and below the proposed boat ramp in the other 15 (27%) years.

Save Rural NoCo's hydrological modeling over a 70-year interval (1950-2019), starting with a lower initial volume, and using historic data to simulate post 2019 conditions, suggests that the initial fill could take many years, and decades could pass before Glade refilled to full capacity following extreme water drawdowns. Over this 70-year interval, we estimated that Glade water levels during the peak recreation season would have been adequate for boating in only 43 (62%) of those years, and below the proposed boat ramp in the other 27 (38%) years.

The extreme low water levels predicted in Northern Water's hydrological modeling correspond to the onset of what has recently been coined the "millennial drought". In the last year of Northern's simulation (2005), storage volumes dropped precipitously, resulting in water levels that would've been more than 160 feet below the high-water line! And they have not recovered yet.

The potential adverse impacts of extreme low water levels at Glade are enormous. However, such conditions are not acknowledged in the FEIS, despite being predicted by Northern's own hydrological modeling. The omission of recent streamflow data (previous 15 years) and the reliance on historical water supplies to predict storage volumes at Glade, denies the public and the County valuable information on refill characteristics at Glade following severe water drawdowns.

Since the reservoir would not fill, and likely would not be full during much of its life, the project would look like an abandoned muddy puddle much of the time, and the recreational facilities would be mostly empty. Larimer County taxpayers would pay for the upkeep of the unused recreational facilities. The project ruins the aesthetics of the valley and hogbacks – a unique and beautiful landscape – for a project that would provide little or no benefit to Larimer County and

in fact would negatively impact its residents and its coffers.

Because of the financial commitments the county would take on, the county should perform a critical analyses of the Northern Water assumptions and data before approving this application.

Sincerely,

--

Subject: Thornton and NISP, Oh My!
To: <jkefalas@larimer.org>

Dear Commissioner Kefalas,

Thank you for all the hard work you do on behalf of the citizens of Larimer County.

I am writing to express my views on two very large projects Larimer County will soon be facing: The Thornton water pipeline and the NISP project.

Regarding the Thornton pipeline, I would just like to reiterate my previous position that a pipeline through north Fort Collins will provide no benefits to its citizens and be very destructive and disruptive. Furthermore, it is not often that we get the chance to restore a badly damaged ecosystem so easily by just requiring Thornton to convey it's water through the Poudre River. If Thornton refuses to convey the water in the river, then I suggest they retrieve it where they bought it, on the farms. Municipalities all over the country deal with treating much "dirtier" water. Alternatively, perhaps Thornton should consider building a community where they have the water instead of the other way around. This concept would bring life back to the small towns they destroyed by buying the agricultural water and drying up the farms along with a sustainable way of life.

Concerning NISP: Please bear in mind (and keep bears in mind) the total environmental costs of this project. How many millions (billions?) of tons of carbon dioxide will be released into the atmosphere to construct the dams and pipelines? To what end? To encourage more residential development which will require more carbon, dams and pipelines to support the never ending cycle.

Horsetooth Reservoir was the right choice at the right time but times have changed and now is the time to adapt to the change. Somewhere, sometime, the old thinking must stop and new thinking must begin. Now may be the time and here the place. A small spark can start a massive change (a tipping point). A single county's decision to rethink "business as usual" and consider the long term sustainability of a community can encourage others to follow. I hope that is the spark Larimer County chooses to make, not one that creates another all consuming wildfire of rampant urban development.

Thank you for your time.

Respectfully,

Michael Anthony

NISP 1041 Application

1 message

Jeanne Strathman <jeannestrathman@aol.com> Tue, May 26, 2020 at 9:08 PM
To: rhelmick@larimer.org

Dear Rob,

As a resident of the Eagle Lake neighborhood, I am writing you to ask that Larimer County not approve the 1041 Application that is before you for a pipeline through the county by Northern Water (NISP). The issues revolving around this application and the reasons it should be denied closely mirror that of the City of Thornton 1041 pipeline application that was rejected by the Board of County Commissioners.

Specifically, here are some of the reasons the County rejected the Thornton application and should do so as well with the NISP application:

1) According to the Land Use Code criteria quoted by the Board of Commissioners, the proposal is inconsistent with the county Master Plan affecting land use and development, specifically that the route will be traversing through significant amounts of private property and through yards in the Eagle Lake neighborhood. Private easements will have to be obtained through eminent domain. Affected residents will not be permitted to construct permanent structures or plant landscape material with deep roots (trees, wind blocks, etc) on their property due to the pipeline easement and maintenance requirements. Affected residents will be subject to continual intrusion on their land by maintenance crews checking on the pipeline in perpetuity. This is a gross infringement of their right to a peaceful existence on their property and our right to restrict non-resident traffic on our privately owned roads.

2) In addition, according to Northern Water's Construction Approach document, they are anticipating using HOA owned private roads for construction traffic throughout the five segments of construction on the pipeline near and through our neighborhood.

The timeline of the cumulative impact to us is anticipated to be 59 weeks from start to finish for all the segments! They are asking to use our narrow, non-public grade roads for heavy truck traffic and daily construction crew traffic on our private roads dozens of residents use daily to enter and exit our subdivision. This is an unacceptable burden on us and again is a gross infringement on our neighborhood and our rights to a peaceful existence that is inconsistent with the Master Plan's stated goal of "maintaining and enhancing our county's quality of life and to be fundamentally fair to all our citizens and to respect their individual rights." A quiet residential neighborhood with children playing, residents coming and going, and retirees enjoying the peaceful time they've earned is not a place for construction staging for a project that has no benefit for its residents and even minimal benefit to Larimer County as a whole. The concept and thought of using our roads for this purpose is untenable.

3) The NISP 1041 application negatively impacts public health and safety in our neighborhood. Our private roads are narrow roads and not constructed to handle large, semi-tractor trailer traffic loaded with pipe sections and construction materials for pipeline construction. The roads were not built to handle the volume of traffic or the load. Having these vehicles on our roads creates a safety hazard for children, bicyclists, walkers and resident traffic entering and leaving driveways. In addition, some of our older residents with health issues are at risk due to the constant coming and going of non-resident truck traffic. Noise levels, pollution from diesel vehicles, and anxiety from interruptions to our peaceful existence can all lead to increased health problems for all residents.

4) In the Land Use Code criteria for consideration by the County, Criteria C states its purpose is to "Promote the economic stability of existing land uses that are consistent with the Master Plan and protect

them by incompatible or harmful land uses." The proposed pipeline is certainly an incompatible and harmful use of the land in our neighborhood.

We recently annexed three parcels to our HOA (the TIPS Development) whose owner was required by the County to development certain aspects of the land (drainage, roads, etc) to be approved by the County before being allowed to offer the plots for sale and final residential development. The owner has spent thousands of dollars to prepare this land, yet the proposed pipeline path crosses near or on some of the new parcels rendering them virtually unsellable until the pipeline is built and completed. No buyer will pay a premium price for a parcel with the amount of disruption, uncertainty of building site and septic placement, and ongoing nuisance this project will cause to these three parcels for well over a year. The County is in effect killing the owner's ability to sell his parcels and recoup his already substantial investment that the County has made him invest to get the land ready for development. This is not "promoting the economic stability of existing land uses" (ie. Residential development) or "protecting incompatible and harmful land uses".

Other residents in our neighborhood who may be contemplating or are in the process of listing their property are also economically negatively impacted by the proposed pipeline. Buyers will use every reason to lower the price on a sale and a year or more of construction traffic, noise, dirt and dust flying in the neighborhood are good leverage points for them to either not buy at all, or attempt to attain a lower selling price than normal. The County is truly hurting the economic stability of the whole neighborhood with this proposal and hundreds of thousands of dollars in values may be lost if the application is approved.

5) Northern Water has presented other reasonable siting and design alternatives that do not include bisecting resident's property or cutting through our neighborhood that they have dismissed due to cost or more difficult construction conditions like their N2.4 (north of Reservoir #3) and N2.5 routes (Douglas Road). The Board of County Commissioners rejected reasoning that expense or difficulty of construction were disqualifying reasons for rejecting routes over ones that impacted private property owners and individual rights in the Thornton pipeline application. Northern's preferred N2.1 route severely impacts our rights as property owners and citizens and should similarly be dismissed by the Commissioners when there are viable alternate routing options.

6) Another issue of grave concern to the Commissioners in the Thornton application was the construction and pipeline proximity to occupied dwellings. Proximity of construction and construction impact along with the long-term detriment to property owners was a primary concern. The Northern Water proposal includes a 100' easement – a 40' construction easement and a 60' permanent easement. If the pipeline were to be placed on the property line between the two residences the proposed N2.1 routing prefers, that will put the easement only 30 feet or less from one of the residences. The disruption and imposition on private property this close to an occupied dwelling is unacceptable when there are route alternatives that do not cross private property between two dwellings.

7) The other major point that should either cause the county to reject the application or defer a decision until later is the Thornton pipeline issue now pending before the courts. The proposed routing of their pipeline has almost identical routing alternatives to Northerns. Both entities are in the review process at the same time with construction timelines that are similar. Multiple times in the record for Larimer County in the proceedings with Thornton, both Thornton, Northern Water, and the County mentioned or agreed that co-location of the two pipelines along their nearly identical paths made sense and should be pursued. It has been discussed between all three parties on numerous occasions and should be part of the discussion now.

In fact, one of the objections the Board of County Commissioners expressed to deny the Thornton pipeline by only submitting an application for one of their proposed pipelines in isolation from their planned future ones was that, **"Thornton deprives the Board and public of the opportunity to consider cumulative impacts and the effectiveness of mitigation. A route that may be appropriate for a single pipeline may be inappropriate for additional pipelines. If this information is not considered now, future pipelines may not be able to co-locate which would result in the disorderly development of Thornton's project and compound the impacts on Larimer County through multiple different pipelines in separate locations."**

How is this not the case with the proposed Northern pipeline and Thornton's pipeline, both of which are looking at nearly identical routing alternatives? This is not just an issue of "disorderly development and compounding of the impacts" on Larimer County – it is the disorderly development and compounding of the impacts on Eagle Lake in a much shorter timeframe than the proposed build out of the future Thornton pipelines. And how is the reverse not true – that a route that may be inappropriate for a single pipeline due to cost and difficulty of construction may be entirely appropriate for the combined resources

of two pipelines from two well-funded entities with capable engineering that will minimize the impacts not only on Larimer County but the Eagle Lake neighborhood that is the target of two separate pipelines?

The precedent for this is Section A.2 of the Land Use Code itself that says the Code is intended to:

"A. Provide for the physical development of the county in order to:

1. Preserve the character and quality of rural and urban areas;

2. Foster convenient, harmonious and workable relationships among land uses; and

3. Achieve the principles and strategies described in the master plan."

This alone should allow the County to consider co-location as part of the process in both the Thornton and Northern Water 1041 applications. In addition, the Colorado Supreme Court noted that the purpose of the 1041 statute is to allow state and local governments to "supervise land use which may have an impact on the people of this state beyond the immediate scope of the project." Colorado Land Use Commission v. Board of County Comm'rs of Larimer County, 604 P.2d 32, 34 (Colo. 1979). The reference to impacts "beyond the immediate scope of the project" suggests that the Commissioners can and should consider the relationship between the project under consideration and other projects. Such sensitivity would definitely further the statute's apparent purpose of "protection of the utility, value, and future" of land, which the statute states is in the public interest. C.R.S. § 24-65.1-101(1)(a).

For these reasons, I ask the Planning Commission and the Board of County Commissioners reject the Northern Water 1041 application until such time that there is resolution to the Thornton 1041 application so that both pipelines can apply for a co-location routing option where both entities can share costs and choose routes they might not otherwise consider around residential areas. Our specific properties and the Eagle Lake neighborhood should not have to shoulder the burden of these two projects for the sake of Larimer County.

Stan and Jeanne Strathman

Comments: Northern Integrated Supply Project 1041

I started paying attention to this pipe situation about 3 years ago after my neighbor mentioned some people were on his property looking at possibly putting in a big pipe line. I ended up at a meeting about the Thornton pipe and realized the neighbor had been talking about another pipe project. Finally someone clarified that there were two pipes being proposed and I had heard about NISP. The pipe directly affects me and my property and yet I was not included in the notification process.

Since then I have attended meetings that I felt I needed to be at to look out for my interests. I am not part of any group; I will limit my comments to just that area of the Northern Tier Pipeline I have expertise, knowledge, and concerns about. My father was a water geologist with the federal government and would take me along when he was doing field work trying to solve water problems. A lot of the problems he showed me are similar to what I see in the report here.

I attended the public open house at the Drake Center several months ago and discussed with NISP personnel my concerns at that time. They urged me to fill out a card because what I was telling them had not been brought up before. I was told that it would be passed on to an engineer or someone with the project and I would be contacted. The company representatives at the meeting said they wanted to work with me.

Months later and I have heard from no one. They have submitted their plan and no changes that address my concerns were made. You would think that when they are trying. Clearly this is telling in terms of the response I/we will get after their plan has been approved.

Many years ago, when I was in high school science class, we were taught the final report/outcome of an investigation is only as good as the data collected and used to make a conclusion. I have looked at two reports: No. 12 Ground water modeling report, and just page 10 (of 32) of No. 10 Northern Tier Pipeline. The information in both reports, regarding the ½ mile section near my house, is seriously wrong. The

No. 12 report shows the proposed route for the pipe running along the south edge of Windsor #8 Annex reservoir. At the west point, ground water depth is stated to be at 10 feet. The proposed pipe heads south east to a point where it connects to the 900 block of Grey Rock. The ground water depth is shown at 15 feet and going to 30 feet deep by the time it crosses Co. Rd. 13.

This is absolutely incorrect. Three separate soils tests done in the Grey Rock area, done prior to building homes, show the ground water depth at 5 ft. 6 in. and running across the top of a layer of bedrock that sits at 8 feet.

We have determined during the 10 years we have lived at 989 Grey Rock that there is in fact a gravel bed on top of the bed rock that conveys water from beneath Annex #8 to the south east, *just where the NIPS pipe is slated to go.*

When we built our house, we raised the house foundation out of the ground and installed 2 sump pumps because of the water situation. Since moving in I have had to add three more large pumps to keep the water out of the area under our house. In the summer months when the reservoir is full, we have to pump 6000 gallons of water a day to keep the area semi dry.

The location and direction of the pipe line will make the situation much worse. This proposed location is not where the pipe line should be run.

Along Co. Rd. 56 would be a better choice. It would be more difficult running it between the two reservoirs but if something went wrong the water would be contained in the lower of the two reservoirs and not flood surrounding homes.

My second concern is information that I see in Report #10, page 10 out of 32. Again my concerns are just in my area, not other areas. There are issues with the accuracy of what is being reported. Other accuracy issues may be present throughout the report but I don't know that.

Issue 1: Grey Rock, west from Co. Road 13 is a self-maintained, narrow lane on a county road easement. The # 10 document shows the lane

going through to Colorado Route 1. *It does not go through;* there is a several hundred foot privately owned section that the owner will not allow others to use. When the pipe is being put in, both east and west from Co. Rd. 13, which will completely block access to all of those homes during the period of construction. Fire protection will also be blocked. There is no alternative access into these properties, as was discussed during the open house.

Issue 2: Our utilities for our homes, water, gas, electric, and phones which run in the street easement will all be destroyed with the present pipe location. A more rural pipe location would likely not affect near as many homes.

Issue 3. Ditches on the map are not accurately shown. The people doing the work did not spend the needed time checking their facts. In one case, a ditch I see marked as existing has not carried water for at least 40 years. It ran through the back corner of our old house in NE Fort Collins and had been filled in 40 years ago. Current North Poudre ditches, at least two, are not shown. Both would be affected by the proposed pipeline route. Piping was recently installed in one of those ditches two years ago; it would be destroyed by the installation of the new pipe. The second is a concrete ditch that would be expensive to replace after the construction equipment broke it up.

Third concern: Revegetation of the area where the pipe will be run. Looks good on paper with nice pictures to back up the idea. Real life is a whole different situation. I will use my own example from just a couple of years ago when some neighbors decided to show up on my property and put in a plastic pipe line on their small ditch.

They did not notify Larimer county government, apply for permits, or put it in correctly. They ran their pipe through the county culvert pipes under the roads that were there to handle run off water. They used our road material to back fill around the pipe and did not replace it. When the pipe laying was finished, they did not level out the back fill over the pipe and refused to pay to cover any of the revegetation cost. The

county was made aware of what was going on and in the end did nothing to help or correct the situation.

My neighbors and I were responsible for purchasing our own grass seed, leveling the ground, planting the seed, and watering it Since the county has a history of not helping in these situations, I envision a similar outcome with this pipe revegetation project, only on a much grander scale.

Where is the water coming from for all of the property owners whose land was destroyed? This is an arid climate and many years there is not enough rainfall to bring the seed up and keep it alive while the roots grow and spread to support it. Even if there is sufficient moisture, to get it started it will take years without some supplemental water to return the pastures back to the original condition. You will be looking at a 50 mile long, 100ft. wide weed patch, in violation of the County weed ordinances.

In conclusion you are making decisions that will greatly affect people's lives without accurate information about what conditions exists where the pipe line is being proposed. Here's a solution: run the pipe line along County Rd. 56 until just little past its junction with County Road 13 and then turn diagonally southeast through open fields.

Much of this land is under the control of Thornton and they should be willing to help make it happen. It would avoid several road crossing problems and wet land issues.

Thank you for your time and consideration of my comments.

Karl Swenson

NISP 1041 application

1 message

Nancy Terry <nterry@pmglending.com> Wed, May 27, 2020 at 9:50 PM
To: "rhelmick@larimer.org" <rhelmick@larimer.org>
Cc: Nancy Terry <nterry@pmglending.com>

Dear Rob,

I'm a resident of Eagle Lake. We bought our lot in 1991 and built in 1992.

This is not meant to be flip. it's a sincere question: Did people from NISP ever drive down Hood Lane (a/k/a "the ditch road") before they proposed it be used as a staging site for the pipeline installation? When I think of heavy machinery and materials rumbling down the ditch road – the same ditch road that is immediately next to *and higher than the residence below?* It simply is too dangerous. If a truck were to go off the road it would land on top of the Hauan residence. I know citizens' safety is of paramount concern to the County in approving any route!

That fact alone should make it a non-starter, but if more is needed any plan to access the ditch road from Eagle Lake Dr. is also unmanageable.

- the gate opening is too small. Trucks can't thread between the stone and wrought iron privacy gates and the stone center median. I've watched trucks try to squeeze between the gates too many times. The openings are too tight.

- the turn onto Hood Ln. from Eagle Lake Dr. is too sharp, greater than 90 degrees. And the bridge is immediately preceding. Trucks would necessarily need to jockey back and forth to get onto the ditch road.

- The ditch road itself is not safe for heavy equipment. Charlie Meserlian has obviously spent much material, labor and money on maintaining the ditch road. But it is an ongoing effort. The bank has eroded in several places under the road. A heavy truck just slightly right of center could cave in the entire road and land in the ditch.

- Eagle Lake has private roads. The County declined to accept the maintenance of the streets in Eagle Lake when the subdivision was developed. Eagle Lake's HOA has done an excellent job of maintaining our roads. Why should we accept allowing NISP to use our roads? Private roads should be respected by NISP and the County. *I can picture NISP's trucks instead choosing to use the Eagle Lake South entrance, as it is more negotiable. It also would mean trucks would drive though the entire neighborhood, on our private roads that we maintain with our money.*

The County should decline NISP's 1041 application for the same reason Thornton's 1041 was denied: County Commissioners first sent Thornton back to the drawing board because they (the County) said Thornton had not sufficiently researched other routes. The County denied the final 1041 application citing "the project's anticipated impact on private lands." Thornton's preferred route along Douglas Rd. was largely in the *public right-of-way or road easements.* NISP's 1041 application is *primarily through private land*: Hood Lane, owned by Hauan, Tips and Miserlian, Eagle Lake, owned by our neighborhood, through the Bieritz and Helgeson lots, across Tips' land, impacting his three

new lots, just north of Belcher's lot, etc. And the planned route presented by NISP now is the same route they identified 3 or 4 years ago when we first learned of NISP's plans. Where is their serious vetting of alternative routes?

NISP's 1041 should also be denied because the County should demand that NISP and Thornton co-locate if their pipelines are to run through Larimer County essentially during the same time and along similar paths. To not do so amounts to "planning malpractice." To require Larimer County residents in general, and Eagle Lake homeowners specifically, to shoulder the burden of other cities' and counties' desires for more growth is not acting in the interests of your own constituents: the people whom you are elected or hired to represent.

In this new age of Covid-19 perhaps we can learn that *more growth* should not be seen as inevitable and always desirable. People have a right to keep their communities "as they are".

NISP

1 message

Charmaine Stavedahl <stavedahlc@gmail.com> Wed, May 27, 2020 at 1:29 PM
To: Rob Helmick <helmicrp@co.larimer.co.us>, jkefalas@larimer.org, Steve Johnson <swjohnson@larimer.org>, Tom Donnelly <donnelt@co.larimer.co.us>, pcboard@larimer.org

I am writing this for inclusion in the review packet for NISP.
I am against the NISP 1041 proposal for multiple reasons, but I will speak to only one, my biggest concern.
I read the first proposal several years ago and was most alarmed at the fact that the Glade Reservoir site is situated over a toxic plume. I have seen very little further mention of this until Tom Sale sent in his 42 page review of NISP.
Page 7-9:
"Pushing the Missile Site Chlorinated Solvent Plume into Domestic Drinking Water Wells."
"...DoD Nuclear Missile Site at the base of the Glade Dam created a large plume of CARCINOGENIC CHLORINATED SOLVENTS in the ground water that currently passes out beneath the proposed fore bay for Glade."
Apparently NISP installed over 20 monitoring wells in 2019 located throughout the plume, but no public records exist sharing any data from these wells. Apparently, NISP has some concerns here.
The following pages show maps of the plume and the location of the wells within the plume.
Why would any municipality want to purchase water from such a tainted location? Is this the reason this information has been buried these last few years? I have seen no public comment on this issue until Mr. Sale sent his review.
I cannot understand why this project continues to progress and be considered viable. I consider this criminal behavior, putting the health of so many at such risk.
Do not allow NISP to become a reality.

NISP 1041 Permit Application; Project No. 20-ZONE 2657

1 message

Mikesky, Alan E <amikesky@iupui.edu> Wed, May 27, 2020 at 2:15 PM
To: "tdonnelly@larimer.org" <tdonnelly@larimer.org>, "jkefalas@larimer.org" <jkefalas@larimer.org>, "swjohnson@larimer.org" <swjohnson@larimer.org>, "rhelmick@larimer.org" <rhelmick@larimer.org>

Dear Commissioners Kefalas, Johnson, Donnelly and Senior Planner Helmick,

I write this le er to voice my opposion t o the NISP project. To be clear, I recognize the importance of water acquision and s torage to meet the growing needs of Colorado and its ciz ens. However, I am opposed to the NISP and its proposed outdated, shortsighted, inefficient, environmentally destrucv e and costly plan to address northern Colorado's present and future water needs. So as not to take too much of your valuable me, m y comments will be summav e and brief.

First and most importantly, NISP planners have not presented a thorough discussion of viable alternav es in their proposal. This is one of the key criteria that "must" be met for the approval of a 1041 permit. There is a reason why they have skirted doing a thorough review and assessment of alternav e plans. The reason is that there are be er opons f or meeng northern Color ado's present and future water needs. Building dams for reservoir water storage is outdated, infrastructurally costly (i.e., construcon and main tenance), inefficient (i.e., water evaporav e losses), and environmentally disrupv e. These are all reasons why dam projects are actually on the decline naonally and in ternaonally .

Second, I hope the polic al clout of Colorado's water organizaons and NISP 's historical longevity (i.e., 20+ years) and sizable monetary outlay to date (i.e, > $50 million) in no way cast biases that would influence anything other than very careful scrun y of the proposal. NISP's proposal is not the answer to our water needs and it is me t o abandon this outdated and inferior plan.

Third, the suggeson tha t there will be a recreaonal bene fit to Larimer county ciz ens as a reason for support is a thinly veiled distracon and ar guably not a benefit at all. First it will take years to complete the dam and then to actually fill Glade reservoir. Once in operaon, the Glade r eservoir will undergo large fluctuaons in w ater levels, potenally e ven greater than Horsetooth reservoir, to meet water needs. Water level fluctuaons neg av ely affect reservoir use and its offering as a consistent recreaonal and ec onomic asset to Larimer county and its residents. In addion, the support ser vices (i.e., operaonal, main tenance and emergency) of the proposed recreaon ar ea will be costly to Larimer county residents. As frequent boang user s of Horsetooth reservoir, my wife and I have experienced early closures or restricv e boang use of Satanka Cove due to budgetary issues. Addionally , similar to what occurs at Horsetooth, low water levels will make Glade reservoir narrow and dangerous. In fact, in Horsetooth reservoir we stop boang during low water levels because of the effect on the width of the reservoir and its effect on water use (boang , jet skis, paddle boarding, kayaking, etc.) density and safety. As a result, the economic and recreaonal bene fits of Glade reservoir to Larimer county residents will be years in the offing, operaonally expensive, and recreaonally inc onsistent.

In conclusion, a thorough discussion of viable alternav es has not been addressed and as a result, I urge you to vote to reject this applicaon. Ther e are significantly be er alternav es than what is proposed by NISP. Dam construcon has bec ome obsolete and the NISP 20+ years plan is now outdated. Please do not allow the inera of the NISP 's longevity and historical costs to play a role in your consideraon as t o its role

in meeng Color ado's present and future water needs.

Sincerely,
Alan Mikesky, Ph.D.

Northern Water Pipeline

1 message

Liz Spencer <lizrspencer@gmail.com> Thu, May 28, 2020 at 4:46 PM
To: rhelmick@larimer.org

Hi Mr Helmick,

I'm writing as a resident of Eagle Lake who is concerned about the proposed Northern Water pipeline route through my neighborhood. In my opinion, it does not make any sense to consider letting a company bulldoze through a private neighborhood when

1. there are routes just slightly north which would avoid much private property.
2. there is another pipeline in the works which may be routed down public roadways. This same routing could be used for both projects at the same time, minimizing disruption to the area and the use of private lands.
3. the access to the currently proposed route is not conducive to large trucks and construction equipment. In fact, it may not even be physically possible, which makes me wonder how much research Northern Water did into the proposed route. It is very doubtful that what they currently propose would work.

Please consider these things when reviewing Northern Pipeline's proposal. There are better ways to go about building this pipeline, it will just take a bit more work to figure out the best ways.

Thank you for your time,
Liz Spencer

Rob Helmick,
I am a resident at 4533 Eagle Lake South in the Eagle Lake subdivision and have been for twenty years. My residence is on the NE shore of reservoir #3. For the past two years, we have been involved in listening to the many different opinions offered for the placement of the Thornton pipeline whose water would be drawn from reservoir #3. No final decision has yet been made on this pipeline but regardless of which option is selected, our neighborhood is certain to suffer substantial financial and quality-of-life losses as a result.

The NISP pipeline is now contemplated to also pass through our neighborhood by going between reservoirs, under our streets, and through some of the home's private property. These two projects together stand to destroy our beautiful neighborhood. Many alternative ideas have been offered that involve different routes or pipeline co-locating. I would hope that the parties involved can use their great wisdom and come to a solution that does not cause such a hardship to one neighborhood.

Respectfully,

Pedro Lopez

Proposed NISP Pipeline Construction Plan through Eagle Lake Subdivision

1 message

Patrick Mcguigan <mcguigan62@yahoo.com> Thu, May 28, 2020 at 3:36 PM
To: Rob Helmick <rhelmick@larimer.org>
Cc: Patrick Mcguigan <mcguigan62@yahoo.com>

Dear Mr. Helmick,

I'm writing you today to express our strong opposition to the pipeline route being proposed by Northern Integrated Supply Projects through the Eagle Lake Sub Division where my wife and I have lived for the past 23 years.

Our objection to this proposed pipeline route is that it plows right through our Eagle Lake Subdivision and requires our neighbors to surrender easement construction and maintenance rights through their property. The second concern we have is the fact that NISP is seeking permission from Larimer County to utilize our privately maintained roads to accommodate what will clearly be an enormous amount of truck and trailer traffic moving up and down our streets for a very considerable amount of of time. Piecing together the estimated construction and restoration time frames for each segment of this project results in a total period of disruption to our neighborhood of 59 weeks. I think we can all safely assume the actual total time will be considerably longer than that if this project is approved.

We have a quiet community here in Eagle Lake where younger children can safely use their tricycles and bicycles and other non motorized devices on our roads. Our Seniors feel safe using these roads for their daily exercise walks. Many people who walk and/or cycle our streets are not even residents of Eagle Lake. We allow this kind of activity to take place in the spirit of good community relations. Our gates are open from 5:00 each morning until 11:00 each night. The amount of truck and trailer activity required to complete the portion of this project through our neighborhood presents a major safety issue to our seniors, our children, our guests, and to all other residents of Eagle Lake. There is no question as to the high probability of serious injury, or potentially worse, if this project is allowed to proceed as proposed. We add to that the environmental concerns we have with all the dust, the constant truck noise and emissions, and the obvious wear and tear on our roadways which are neither wide enough nor strong enough to withstand the impact of this much transport weight for such a prolonged period of time.

Along with most of our neighbors, we are both grateful and relieved that the second 1041 proposal from the City of Thornton which essentially followed this same path now being proposed by NISP, was unanimously rejected by the Larimer County Commissioners. At the same time, most of us were greatly disappointed with the rejection of the first 1041 application submitted by the City of Thornton which would have routed their pipeline entirely through public utility easement land as opposed to the utilization of any residential private property. Isn't the whole idea of county owned public easements adjacent to county owned roads intended to accommodate projects such as these?

Our understanding is that there is adequate existing easement width along the Douglas Road corridor to accommodate "both" the Thornton and NISP pipelines. Given that both projects will likely be approved someday in one fashion or another, it makes total sense to us for these two projects to be "viewed" by the Commissioners as a single impact project

with an eye toward identifying the least intrusive route available. In that vein, we're seriously hoping the county will take a strong second look at the previously proposed Douglas Road option, re-evaluate it's impacts compared to every other known option on the table, and subsequently encourage NISP to consider a coordinated effort with the City of Thornton to achieve their mutual needs and goals without forcing unnecessary, disruptive, and damaging intrusions through residential areas such as Eagle Lake.

Thank you for your time and attention.

Jim Keller <jfkellerdds@gmail.com> Thu, May 28, 2020 at 3:57 PM
To: "rhelmick@larimer.org" <rhelmick@larimer.org>

I reside at 5017 Eagle Lake Dr. I Purchased and moved to this property 2 1/2 years ago to enjoy the peaceful friendly and scenic neighborhood and enjoy reservoir three which this property abuts. I am very perturbed, disturbed and saddened by the prospect of Thorton and NISP pipeline project impacting this lifestyle that I expected in my early retirement years. There would be extreme negative affects on our neighborhood including pollution from noise,exhaust and visually. Also the property values would be hurt greatly. To realize that this process would take more than a year is horrible to say the least.
I hope very much that you will reject this project. I feel there are better alternative routes for the pipeline. First being the Douglas Road route or the route north of reservoir three out of our neighborhood.

Thank you for considering these remarks
James Keller

Rob Helmick, Senior Planner

Larimer County Community Development Division

200 W. Oak Street

Suite 3100

PO Box 1190

Fort Collins, CO 80521

Dear Mr. Helmick:

We wish to add our names to the other residents of Eagle Lake to ask that Larimer County not approve the 1041 Application that is before you for a pipeline through the county by Northern Water (NISP). The issues revolving around this application and the reasons it should be denied closely mirror that of the City of Thornton 1041 pipeline application that was rejected by the Board of County Commissioners. The information provided below was developed by the Eagle Lake HOA. We are in complete agreement with the points made in that document, which are reproduced below.

Specifically, here are some of the reasons the County rejected the Thornton application and should do so as well with the NISP application:

1. According to the Land Use Code criteria quoted by the Board of Commissioners, the proposal is inconsistent with the county Master Plan affecting land use and development, specifically that the route will be traversing through significant amounts of private property and through yards in the Eagle Lake neighborhood. Private easements will have to be obtained through eminent domain. Affected residents will not be permitted to construct permanent structures or plant landscape material with deep roots (trees, wind blocks, etc) on their property due to the pipeline easement and maintenance requirements. Affected residents will be subject to continual intrusion on their land by maintenance crews checking on the pipeline in perpetuity. This is a gross infringement of their right to a peaceful existence on their property and our right to restrict non-resident traffic on our privately owned roads.
2. In addition, according to Northern Water's Construction Approach document, they are anticipating using HOA owned private roads for construction traffic throughout the five segments of construction on the pipeline near and through our neighborhood.

The timeline of the cumulative impact to us is anticipated to be 59 weeks from start to finish for all the segments! They are asking to use our narrow, non-public grade roads for heavy truck traffic and daily construction crew traffic on our private roads dozens of residents use daily to enter and exit our subdivision. This is an unacceptable burden on us and again is a gross infringement on our neighborhood and our rights to a peaceful existence that is inconsistent with the Master Plan's stated goal of "maintaining and enhancing our county's quality of life and to be fundamentally fair to all our citizens and to respect their individual rights." A quiet residential neighborhood with children playing, residents coming and going, and retirees enjoying the peaceful time they've earned is not a place for construction staging for a project that has no benefit for its residents and even minimal benefit to Larimer County as a whole. The concept and thought of using our roads for this purpose is untenable.

3) The NISP 1041 application negatively impacts public health and safety in our neighborhood. Our private roads are narrow roads and not constructed to handle large, semi-tractor trailer traffic loaded with pipe sections and construction materials for pipeline construction. The roads were not built to handle the volume of traffic or the load. Having these vehicles on our roads creates a safety hazard for children, bicyclists, walkers and resident traffic entering and leaving driveways. In addition, some of our older residents with health issues are at risk due to the constant coming and going of non-resident truck traffic. Noise levels, pollution from diesel vehicles, and anxiety from interruptions to our peaceful existence can all lead to increased health problems for all residents.

4) In the Land Use Code criteria for consideration by the County, Criteria C states its purpose is to "Promote the economic stability of existing land uses that are consistent with the Master Plan and protect them by incompatible or harmful land uses." The proposed pipeline is certainly an incompatible and harmful use of the land in our neighborhood.

We recently annexed three parcels to our HOA (the TIPS Development) whose owner was required by the County to development certain aspects of the land (drainage, roads, etc) to be approved by the County before being allowed to offer the plots for sale and final residential development. The owner has spent thousands of dollars to prepare this land, yet the proposed pipeline path crosses near or on some of the new parcels rendering them virtually unsellable until the pipeline is built and completed. No buyer will pay a premium price for a parcel with the amount of disruption, uncertainty of building site and septic placement, and ongoing nuisance this project will cause to these three parcels for well over a year. The County is in effect killing the owner's ability to sell his parcels and recoup his already substantial investment that the County has made him invest to get the land ready for development. This is not "promoting the economic stability of existing land uses" (ie. Residential development) or "protecting incompatible and harmful land uses".

Other residents in our neighborhood who may be contemplating or are in the process of listing their property are also economically negatively impacted by the proposed pipeline. Buyers will use every reason to lower the price on a sale and a year or more of construction traffic, noise, dirt and dust flying in the neighborhood are good leverage points for them to either not buy at all, or attempt to attain a lower selling price than normal. The County is truly hurting the economic stability of the whole neighborhood with this proposal and hundreds of thousands of dollars in values may be lost if the application is approved.

5. Northern Water has presented other reasonable siting and design alternatives that do not include bisecting resident's property or cutting through our neighborhood that they have dismissed due to cost or more difficult construction conditions like their N2.4 (north of Reservoir #3) and N2.5 routes (Douglas Road). The Board of County Commissioners rejected reasoning that expense or difficulty of construction were disqualifying reasons for rejecting routes over ones that impacted private property owners and individual rights in the Thornton pipeline application. Northern's preferred N2.1 route severely impacts our rights as property owners and citizens and should similarly be dismissed by the Commissioners when there are viable alternate routing options.
6. Another issue of grave concern to the Commissioners in the Thornton application was the construction and pipeline proximity to occupied dwellings. Proximity of construction and construction impact along with the long-term detriment to property owners was a primary concern. The Northern Water proposal includes a 100' easement – a 40' construction easement and a 60' permanent easement. If the pipeline were to be placed on the property line between the two residences the proposed N2.1 routing prefers, that will put the easement only 30 feet or less from one of the residences. The disruption and imposition on private property this close to an occupied dwelling is unacceptable when there are route alternatives that do not cross private property between two dwellings.
7. The other major point that should either cause the county to reject the application or defer a decision until later is the Thornton pipeline issue now pending before the courts. The proposed routing of their pipeline has almost identical routing alternatives to Northerns. Both entities are in the review process at the same time with construction timelines that are similar. Multiple times in the record for Larimer County in the proceedings with Thornton, both Thornton, Northern Water, and the County mentioned or agreed that co-location of the two pipelines along their nearly identical paths made sense and should be pursued. It has been discussed between all three parties on numerous occasions and should be part of the discussion now.

In fact, one of the objections the Board of County Commissioners expressed to deny the Thornton pipeline by only submitting an application for one of their proposed pipelines in isolation from their planned future ones was that, **"Thornton deprives the Board and public of the opportunity to consider cumulative impacts and the effectiveness of mitigation. A route that may be appropriate for a single pipeline may be inappropriate for additional pipelines. If this information is not considered now, future pipelines may not be able to co-locate which would result in the disorderly development of Thornton's project and compound the impacts on Larimer County through multiple different pipelines in separate locations."**

How is this not the case with the proposed Northern pipeline and Thornton's pipeline, both of which are looking at nearly identical routing alternatives? This is not just an issue of "disorderly development and compounding of the impacts" on Larimer County – it is the disorderly development and compounding of the impacts on Eagle Lake in a much shorter timeframe than the proposed build out of the future Thornton pipelines. And how is the reverse not true – that a route that

may be inappropriate for a single pipeline due to cost and difficulty of construction may be entirely appropriate for the combined resources of two pipelines from two well-funded entities with capable engineering that will minimize the impacts not only on Larimer County but the Eagle Lake neighborhood that is the target of two separate pipelines?

The precedent for this is Section A.2 of the Land Use Code itself that says the Code is intended to:

“A. Provide for the physical development of the county in order to:

1. Preserve the character and quality of rural and urban areas;

2. Foster convenient, harmonious and workable relationships among land uses; and

3. Achieve the principles and strategies described in the master plan.”

This alone should allow the County to consider co-location as part of the process in both the Thornton and Northern Water 1041 applications. In addition, the Colorado Supreme Court noted that the purpose of the 1041 statute is to allow state and local governments to “supervise land use which may have an impact on the people of this state beyond the immediate scope of the project.” Colorado Land Use Commission v. Board of County Comm’rs of Larimer County, 604 P.2d 32, 34 (Colo. 1979). The reference to impacts “beyond the immediate scope of the project” suggests that the Commissioners can and should consider the relationship between the project under consideration and other projects. Such sensitivity would definitely further the statute’s apparent purpose of “protection of the utility, value, and future” of land, which the statute states is in the public interest. C.R.S. § 24-65.1-101(1)(a).

For these reasons, we ask the Planning Commission and the Board of County Commissioners reject the Northern Water 1041 application until such time that there is resolution to the Thornton 1041 application so that both pipelines can apply for a co-location routing option where both entities can share costs and choose routes they might not otherwise consider around residential areas. Our specific properties and the Eagle Lake neighborhood should not have to shoulder the burden of these two projects for the sake of Larimer County.

Sincerely,

John S. Reif, D.V.M.,

Kathleen D. Reif

Fort Collins, CO 80524

Rob Helmick, Senior Planner
Larimer County Community Development Division
200 W. Oak Street
Suite 3100
PO Box 1190
Fort Collins, CO 80521

Dear Rob,

As a resident of the Eagle Lake neighborhood, I am writing you to ask that Larimer County not approve the 1041 Application that is before you for a pipeline through the county by Northern Water (NISP). The issues revolving around this application and the reasons it should be denied closely mirror that of the City of Thornton 1041 pipeline application that was rejected by the Board of County Commissioners.

Specifically, here are some of the reasons the County rejected the Thornton application and should do so as well with the NISP application:

1) According to the Land Use Code criteria quoted by the Board of Commissioners, the proposal is inconsistent with the county Master Plan affecting land use and development, specifically that the route will be traversing through significant amounts of private property and through yards in the Eagle Lake neighborhood. Private easements will have to be obtained through eminent domain. Affected residents will not be permitted to construct permanent structures or plant landscape material with deep roots (trees, wind blocks, etc) on their property due to the pipeline easement and maintenance requirements. Affected residents will be subject to continual intrusion on their land by maintenance crews checking on the pipeline in perpetuity. This is a gross infringement of their right to a peaceful existence on their property and our right to restrict non-resident traffic on our privately owned roads.
2) In addition, according to Northern Water's Construction Approach document, they are anticipating using HOA owned private roads for construction traffic throughout the five segments of construction on the pipeline near and through our neighborhood. **The timeline of the cumulative impact to us is anticipated to be 59 weeks from start to finish for all the segments!** They are asking to use our narrow, non-public grade roads for heavy truck traffic and daily construction crew traffic on our private roads dozens of residents use daily to enter and exit our subdivision. This is an unacceptable burden on us and again is a gross infringement on our neighborhood and our rights to a peaceful existence that is inconsistent with the Master Plan's stated goal of "maintaining and enhancing our county's quality of life and to be fundamentally fair to all our citizens and to respect their individual rights." A quiet residential neighborhood with children playing, residents coming and going, and retirees enjoying the peaceful time they've earned is not a place for construction staging for a project that has no benefit for its residents and even minimal benefit to Larimer County as a whole. The concept and thought of using our roads for this purpose is untenable.
3) The NISP 1041 application negatively impacts public health and safety in our neighborhood. Our private roads are narrow roads and not constructed to handle large, semi-tractor trailer traffic loaded with pipe sections and construction materials for pipeline construction. The roads were not built to handle the volume of traffic or the load. Having these vehicles on our roads creates a safety hazard for children, bicyclists,

walkers and resident traffic entering and leaving driveways. In addition, some of our older residents with health issues are at risk due to the constant coming and going of non-resident truck traffic. Noise levels, pollution from diesel vehicles, and anxiety from interruptions to our peaceful existence can all lead to increased health problems for all residents.

4) In the Land Use Code criteria for consideration by the County, Criteria C states its purpose is to "Promote the economic stability of existing land uses that are consistent with the Master Plan and protect them by incompatible or harmful land uses." The proposed pipeline is certainly an incompatible and harmful use of the land in our neighborhood.

   We recently annexed three parcels to our HOA (the TIPS Development) whose owner was required by the County to development certain aspects of the land (drainage, roads, etc) to be approved by the County before being allowed to offer the plots for sale and final residential development. The owner has spent thousands of dollars to prepare this land, yet the proposed pipeline path crosses near or on some of the new parcels rendering them virtually unsellable until the pipeline is built and completed. No buyer will pay a premium price for a parcel with the amount of disruption, uncertainty of building site and septic placement, and ongoing nuisance this project will cause to these three parcels for well over a year. The County is in effect killing the owner's ability to sell his parcels and recoup his already substantial investment that the County has made him invest to get the land ready for development. This is not "promoting the economic stability of existing land uses" (ie. Residential development) or "protecting incompatible and harmful land uses".

   Other residents in our neighborhood who may be contemplating or are in the process of listing their property are also economically negatively impacted by the proposed pipeline. Buyers will use every reason to lower the price on a sale and a year or more of construction traffic, noise, dirt and dust flying in the neighborhood are good leverage points for them to either not buy at all, or attempt to attain a lower selling price than normal. The County is truly hurting the economic stability of the whole neighborhood with this proposal and hundreds of thousands of dollars in values may be lost if the application is approved.

5) Northern Water has presented other reasonable siting and design alternatives that do not include bisecting resident's property or cutting through our neighborhood that they have dismissed due to cost or more difficult construction conditions like their N2.4 (north of Reservoir #3) and N2.5 routes (Douglas Road). The Board of County Commissioners rejected reasoning that expense or difficulty of construction were disqualifying reasons for rejecting routes over ones that impacted private property owners and individual rights in the Thornton pipeline application. Northern's preferred N2.1 route severely impacts our rights as property owners and citizens and should similarly be dismissed by the Commissioners when there are viable alternate routing options.

6) Another issue of grave concern to the Commissioners in the Thornton application was the construction and pipeline proximity to occupied dwellings. Proximity of construction and construction impact along with the long-term detriment to property owners was a primary concern. The Northern Water proposal includes a 100' easement – a 40' construction easement and a 60' permanent easement. If the pipeline were to be placed on the property line between the two residences the proposed N2.1 routing prefers, that will put the easement only 30 feet or less from one of the residences. The

disruption and imposition on private property this close to an occupied dwelling is unacceptable when there are route alternatives that do not cross private property between two dwellings.

7) The other major point that should either cause the county to reject the application or defer a decision until later is the Thornton pipeline issue now pending before the courts. The proposed routing of their pipeline has almost identical routing alternatives to Northerns. Both entities are in the review process at the same time with construction timelines that are similar. Multiple times in the record for Larimer County in the proceedings with Thornton, both Thornton, Northern Water, and the County mentioned or agreed that co-location of the two pipelines along their nearly identical paths made sense and should be pursued. It has been discussed between all three parties on numerous occasions and should be part of the discussion now.
In fact, one of the objections the Board of County Commissioners expressed to deny the Thornton pipeline by only submitting an application for one of their proposed pipelines in isolation from their planned future ones was that, **"Thornton deprives the Board and public of the opportunity to consider cumulative impacts and the effectiveness of mitigation. A route that may be appropriate for a single pipeline may be inappropriate for additional pipelines. If this information is not considered now, future pipelines may not be able to co-locate which would result in the disorderly development of Thornton's project and compound the impacts on Larimer County through multiple different pipelines in separate locations."**
How is this not the case with the proposed Northern pipeline and Thornton's pipeline, both of which are looking at nearly identical routing alternatives? This is not just an issue of "disorderly development and compounding of the impacts" on Larimer County – it is the disorderly development and compounding of the impacts on Eagle Lake in a much shorter timeframe than the proposed build out of the future Thornton pipelines. And how is the reverse not true – that a route that may be inappropriate for a single pipeline due to cost and difficulty of construction may be entirely appropriate for the combined resources of two pipelines from two well-funded entities with capable engineering that will minimize the impacts not only on Larimer County but the Eagle Lake neighborhood that is the target of two separate pipelines?
The precedent for this is Section A.2 of the Land Use Code itself that says the Code is intended to:

"A. Provide for the physical development of the county in order to:
1. Preserve the character and quality of rural and urban areas;
2. Foster convenient, harmonious and workable relationships among land uses; and
3. Achieve the principles and strategies described in the master plan."

This alone should allow the County to consider co-location as part of the process in both the Thornton and Northern Water 1041 applications. In addition, the Colorado Supreme Court noted that the purpose of the 1041 statute is to allow state and local governments to "supervise land use which may have an impact on the people of this state beyond the immediate scope of the project." Colorado Land Use Commission v. Board of County Comm'rs of Larimer County, 604 P.2d 32, 34 (Colo. 1979). The reference to impacts "beyond the immediate scope of the project" suggests that the Commissioners can and should consider the relationship between the project under consideration and other projects. Such sensitivity would definitely further the statute's

apparent purpose of “protection of the utility, value, and future” of land, which the statute states is in the public interest. C.R.S. § 24-65.1-101(1)(a).

For these reasons, I ask the Planning Commission and the Board of County Commissioners reject the Northern Water 1041 application until such time that there is resolution to the Thornton 1041 application so that both pipelines can apply for a co-location routing option where both entities can share costs and choose routes they might not otherwise consider around residential areas. Our specific properties and the Eagle Lake neighborhood should not have to shoulder the burden of these two projects for the sake of Larimer County.

NISP Pipeline proposal

Dear Rob,

As a resident of Eagle Lake Subdivision, I am deeply concerned about the 1041 proposal which NISP has presented. NISP has tried to put this through at a time when our county, state, and country have been fighting a pandemic and a devastated economy. I believe they have taken advantage of a time when people are dealing with life and death and very serious concerns about what lies ahead. NISP is trying to squeeze this 1041 in between the pandemic and the election hoping we are so distracted they can get away with it without our input. This must not happen. The construction plan they added at the last minute to the 1041 (I am assuming the county staff recognized it was not there and it was added) is an unacceptable plan for Eagle Lake. No neighborhood should be expected to deal with the devastation of property, property values, roads, and the environment that this proposal would cause.
When NISP was present at the Thornton meetings, they talked about co-locating their pipeline with the Thornton pipeline. This could be done North of Eagle Lake on agricultural land and there is also the Douglas Road right of way which could work for co-location. These two locations must be studied and presented. The proposal before us is the first one they came up with before co-location was discussed. It was not acceptable then. It is not acceptable now.

Our way of life here in Eagle Lake is very special. All of us worked hard to be able to build here. The environment off of the lakes and behind our homes, is home to all types of wildlife. We want to protect and maintain our homes and land. The pipeline proposal would destroy our roads and our property values would come down. NISP must look at other places for this pipeline. Co-location is the answer for the NISP and Thornton pipelines.
I respectfully ask you to reject the NISP 1041.

Sincerely,

Rebecca Shelley

Fort Collins, CO 80521

Sent by email on May 28, 2020 to: rhelmick@larimer.org

Dear Rob,

We are Terry and Serena Bieritz.
We have lived at 4835 Eagle Lake Drive in Fort Collins 80524 for 10 years.
We are in our 70's and this is our retirement home.
We both worked full time for 50 years to save for a happy and peaceful retirement.
Our home is located in Segment 4 of the NISP "Construction Approach" document.
That document states they expect to interrupt our lives for 16 weeks of construction.
From the south wall of our home to the southern property line is 92.5 feet.
That south wall is where our master bedroom and office are located on the first floor.
That south wall is where two more bedrooms are located on the second floor.
That south wall is where the finished portion of our basement is located.
Another south wall on the first floor is our sunroom which is all glass on 3 sides.
These rooms constitute the majority of our daily living area.
From our south wall to our southern property line is 92.5 feet.
NISP proposes an easement of 100 feet running west to east along the ENTIRE south side of our property, from our back yard through our front yard to the street.
That path includes fruit trees, irrigation, our septic system, and underground utilities.
That is in essence ONE-THIRD of our 2.6 acre lot!!!
We would not be able to plant trees or build anything EVER AGAIN on that easement.
We are concerned about subsidence issues as a result of drilling so close to our home.
How would YOU feel if NISP was disrupting your parents' lives and taking their property?
NISP should not be allowed to plow through someone's yard in a private neighborhood. PERIOD
There are many empty lots of 10 to 100 acres North of our neighborhood, some of which are for sale right now. They can easily find another route with no improvements.
PLEASE do not allow NISP to ruin our retirement years and disrupt our neighborhood.

You are welcome to come and see our lot for yourself.... call us at 970.672.3772 ... leave a message and we will return your call.

And by the way, Northern Water has never contacted us to discuss their plans.

As a resident of the Eagle Lake neighborhood, I am writing you to ask that Larimer County not approve the 1041 Application that is before you for a pipeline through the county by Northern Water (NISP). The issues revolving around this application and the reasons it should be denied closely mirror that of the City of Thornton 1041 pipeline application that was rejected by the Board of County Commissioners.

Specifically, here are some of the reasons the County rejected the Thornton application and should do so as well with the NISP application:

• According to the Land Use Code criteria quoted by the Board of Commissioners, the proposal is inconsistent with the county Master Plan affecting land use and development, specifically that the route will be traversing through significant amounts of private property and through yards in the Eagle Lake neighborhood. Private easements will have to be obtained through eminent domain. Affected residents will not be permitted to construct permanent structures or plant landscape material with deep roots (trees, wind blocks, etc) on their property due to the pipeline easement and maintenance requirements. Affected residents will be subject to continual intrusion on their land by maintenance crews checking on the pipeline in perpetuity. This is a gross infringement of their right to a peaceful existence on their property and our right to restrict non-resident traffic on our privately owned roads.

• In addition, according to Northern Water's Construction Approach document, they are anticipating using HOA owned private roads for construction traffic throughout the five segments of construction on the pipeline near and through our neighborhood.

The timeline of the cumulative impact to us is anticipated to be 59 weeks from start to finish for all the segments! They are asking to use our narrow, non-public grade roads for heavy truck traffic and daily construction crew traffic on our private roads dozens of residents use daily to enter and exit our subdivision. This is an unacceptable burden on us and again is a gross infringement on our neighborhood and our rights to a peaceful existence that is inconsistent with the Master Plan's stated goal of "maintaining and enhancing our county's quality of life and to be fundamentally fair to all our citizens and to respect their individual rights." A quiet residential neighborhood with children playing, residents coming and going, and retirees enjoying the peaceful time they've earned is not a place for construction staging for a project that has no benefit for its residents and even minimal benefit to Larimer County as a whole. The concept and thought of using our roads for this purpose is untenable.

3) The NISP 1041 application negatively impacts public health and safety in our neighborhood. Our private roads are narrow roads and not constructed to handle large, semi-tractor trailer traffic loaded with pipe sections and construction materials for pipeline construction. The roads were not built to handle the volume of traffic or the load. Having these vehicles on our roads creates a safety hazard for children, bicyclists, walkers and resident traffic entering and leaving driveways. In addition, some of our older residents with health issues are at risk due to the constant coming and going of

non-resident truck traffic. Noise levels, pollution from diesel vehicles, and anxiety from interruptions to our peaceful existence can all lead to increased health problems for all residents.

4) In the Land Use Code criteria for consideration by the County, Criteria C states its purpose is to “Promote the economic stability of existing land uses that are consistent with the Master Plan and protect them by incompatible or harmful land uses.” The proposed pipeline is certainly an incompatible and harmful use of the land in our neighborhood.

We recently annexed three parcels to our HOA (the TIPS Development) whose owner was required by the County to development certain aspects of the land (drainage, roads, etc) to be approved by the County before being allowed to offer the plots for sale and final residential development. The owner has spent thousands of dollars to prepare this land, yet the proposed pipeline path crosses near or on some of the new parcels rendering them virtually unsellable until the pipeline is built and completed. No buyer will pay a premium price for a parcel with the amount of disruption, uncertainty of building site and septic placement, and ongoing nuisance this project will cause to these three parcels for well over a year. The County is in effect killing the owner’s ability to sell his parcels and recoup his already substantial investment that the County has made him invest to get the land ready for development. This is not “promoting the economic stability of existing land uses” (ie. Residential development) or “protecting incompatible and harmful land uses”.

Other residents in our neighborhood who may be contemplating or are in the process of listing their property are also economically negatively impacted by the proposed pipeline. Buyers will use every reason to lower the price on a sale and a year or more of construction traffic, noise, dirt and dust flying in the neighborhood are good leverage points for them to either not buy at all, or attempt to attain a lower selling price than normal. The County is truly hurting the economic stability of the whole neighborhood with this proposal and hundreds of thousands of dollars in values may be lost if the application is approved.

• Northern Water has presented other reasonable siting and design alternatives that do not include bisecting resident’s property or cutting through our neighborhood that they have dismissed due to cost or more difficult construction conditions like their N2.4 (north of Reservoir #3) and N2.5 routes (Douglas Road). The Board of County Commissioners rejected reasoning that expense or difficulty of construction were disqualifying reasons for rejecting routes over ones that impacted private property owners and individual rights in the Thornton pipeline application. Northern’s preferred N2.1 route severely impacts our rights as property owners and citizens and should similarly be dismissed by the Commissioners when there are viable alternate routing options.

• Another issue of grave concern to the Commissioners in the Thornton application was the construction and pipeline proximity to occupied dwellings. Proximity of construction and construction impact along with the long-term detriment to property owners was a primary concern. The Northern Water proposal includes a 100’ easement – a 40’ construction easement and a 60’ permanent easement. If the pipeline were to be placed on the property line between the two residences the proposed N2.1 routing prefers, that will put the easement only 30 feet or less from one of the residences. The disruption and imposition on private property this close to an occupied dwelling is unacceptable

when there are route alternatives that do not cross private property between two dwellings.

• The other major point that should either cause the county to reject the application or defer a decision until later is the Thornton pipeline issue now pending before the courts. The proposed routing of their pipeline has almost identical routing alternatives to Northerns. Both entities are in the review process at the same time with construction timelines that are similar. Multiple times in the record for Larimer County in the proceedings with Thornton, both Thornton, Northern Water, and the County mentioned or agreed that co-location of the two pipelines along their nearly identical paths made sense and should be pursued. It has been discussed between all three parties on numerous occasions and should be part of the discussion now.

In fact, one of the objections the Board of County Commissioners expressed to deny the Thornton pipeline by only submitting an application for one of their proposed pipelines in isolation from their planned future ones was that, ”Thornton deprives the Board and public of the opportunity to consider cumulative impacts and the effectiveness of mitigation. A route that may be appropriate for a single pipeline may be inappropriate for additional pipelines. If this information is not considered now, future pipelines may not be able to co-locate which would result in the disorderly development of Thornton’s project and compound the impacts on Larimer County through multiple different pipelines in separate locations.”

How is this not the case with the proposed Northern pipeline and Thornton’s pipeline, both of which are looking at nearly identical routing alternatives? This is not just an issue of “disorderly development and compounding of the impacts” on Larimer County – it is the disorderly development and compounding of the impacts on Eagle Lake in a much shorter timeframe than the proposed build out of the future Thornton pipelines. And how is the reverse not true – that a route that may be inappropriate for a single pipeline due to cost and difficulty of construction may be entirely appropriate for the combined resources of two pipelines from two well-funded entities with capable engineering that will minimize the impacts not only on Larimer County but the Eagle Lake neighborhood that is the target of two separate pipelines?

The precedent for this is Section A.2 of the Land Use Code itself that says the Code is intended to:

“A. Provide for the physical development of the county in order to:
1. Preserve the character and quality of rural and urban areas;
2. Foster convenient, harmonious and workable relationships among land uses; and
3. Achieve the principles and strategies described in the master plan.”

This alone should allow the County to consider co-location as part of the process in both the Thornton and Northern Water 1041 applications. In addition, the Colorado Supreme Court noted that the purpose of the 1041 statute is to allow state and local governments to “supervise land use which may have an impact on the people of this state beyond the immediate scope of the project.” Colorado Land Use Commission v. Board of County Comm’rs of Larimer County, 604 P.2d 32, 34 (Colo. 1979). The reference to impacts “beyond the immediate scope of the project” suggests that the Commissioners can and should consider the relationship between the project under

consideration and other projects. Such sensitivity would definitely further the statute's apparent purpose of “protection of the utility, value, and future” of land, which the statute states is in the public interest. C.R.S. § 24-65.1-101(1)(a).

For these reasons, we ask the Planning Commission and the Board of County Commissioners to reject the Northern Water 1041 application until such time that there is resolution to the Thornton 1041 application so that both pipelines can apply for a co-location routing option where both entities can share costs and choose routes they might not otherwise consider around residential areas. Our specific properties and the Eagle Lake neighborhood should not have to shoulder the burden of these two projects for the sake of Larimer County.

Dear Rob,

My wife Becky and I live at 4641 Eagle Lake South in the Eagle Lake Subdivision. Here are our objections to the 1041 application as it relates to our neighborhood:

1. 1.No route North or South of our subdivision was studied or presented in this application. There is agricultural land North of Reservoir 3 that would make it possible to co-locate both NISP and Thornton's pipeline and they could share the cost. There is also the possibility of the pipeline using the Douglas Road right of way. These two options should be studied and presented because what they have proposed, is the worst plan possible for our subdivision.
2. 2. No interaction or presentation meetings about NISP's construction have been presented to our neighborhood. When the Thornton pipeline application was going though the review process, the NISP Representatives made it clear to us that they would work with the county and would plan to co-locate their pipeline with Thornton's pipeline. The route they are proposing now is the same one they came up with before discussions of co-location. Therefore, they are planning to use our private roads with no concern whatsoever for the property values of our 92 homes or the safety of residents consisting of young families and retired families who walk and bike these private streets.

3. 3. NISP's construction plan is not feasible because they cannot access the property in the manner NISP's construction plan is presented. Our roads are private and they would have to be completely rebuilt after the construction of this pipeline. Hood Lane is not feasible because of stability and the inability to make turns with heavy equipment.

4. 4. NISP's plan calls for an easement of a hundred feet between two houses that are 135 feet apart. There could be damage to these homes from the vibrations and heavy equipment which will be used.

5. 5. No safety, environmental or private road access plan has been presented. JUST TRUST US is not a plan. If NISP is able to spend millions of dollars and decades of time getting permits from Washington and Denver, and plans to spend billions to build the project, they must be required to spend the necessary time with our neighborhood before a route is approved by the County.

The pipeline needs to go on a public right of way or agricultural land before tearing through neighborhoods. The construction plan was not put in the original application. It was added at the last minute. NISP knew the neighborhood would object so one has to assume that the construction plan was left out on purpose but the County Staff required them to add the construction plan. What else has NISP tried to hide to get approval for the 1041?
We respectfully ask that this application for the 1041 be rejected.

Sincerely,

Sean and Rebecca Shelley

Rob Helmick <helmicrp@co.larimer.co.us>

Northern Water pipeline proposed through Eagle Lake is completely unacceptable.The residents of Eagle Lake are ready to fight this untenable option for the pipeline.

NISP 1041 Permit application; Project No. 20-ZONE 2657

1 message

Brent Hawley <bhawleys@frii.com> Thu, May 28, 2020 at 2:21 PM
To: Rob Helmick <rhelmick@larimer.org>

From: Brent Hawley

6521 Placer Ct Bellvue, Colo 80512

970-213-5939 bhawley@frii.com

May 27, 2020

To: Larimer County Planning Commission

The purpose of this letter is to ask you to please consider better alternatives to the NISP 1041 permit application: Project No. 20-ZONE 2657. There is **one** reason that the NISP proposal exists, **WATER,** water for the future development of the northern Front Range. I am strongly against the current project plan. As it stands, there are better ways to provide the water at a fraction of the financial and environmental cost.

The Northern Colorado Water Conservancy District has been a key player in the development of water supply in the northern Front Range over the last 85 years. What we take for granted today would not exist if it weren't for their efforts, and I applaud them for that.

Historically, when water supply development plans were designed, usually a dam was at the heart of the plan. We know now that some dams haven't worked out as conceived. In the past 30 years, over 1000 dams have been destroyed in the United States due to high maintenance costs, public safety, and restoration of free flowing rivers. With the seemingly insurmountable barriers to dam building apparent these days, it would seem obvious that different ways of achieving the same goals would be welcome to the planning process. I believe that the right combination of alternatives could provide the water needed for the future population growth on the northern Front Range, done at a fraction of the financial and environmental cost of the proposed NISP project. Unfortunately, large players in the water planning process don't want to hear about cheaper and less damaging options. They have staked their claim on the old school methods, put years and untold millions of dollars into planning and land purchases, and don't want to give alternatives a fair consideration. They say they have – but I don't agree.

This letter is mostly focused on point D-2 of the Larimer County "General requirements for approval of 1041 permit application".

"The applicant has presented reasonable siting and design alternatives or explained why no reasonable alternatives are available".

WATER CONSERVATION

Water Conservation is much more than low flow shower heads, and xeriscaping. It is more about how to use less, and hopefully be a way of life for new growth in a semi-arid environment. Conservation is how to keep what you already have and make the wisest use of it. In my opinion, the northern front range of Colorado **already has** the developed water it will need for the future. It needs to be developed better and smarter, sometimes thinking outside the traditional "box".

Significant Water Losses in Agricultural Irrigation

There are several methods and technologies that when used together, can provide this water at minimal environmental impact, and at a fraction of the financial cost of Glade reservoir. One of the most obvious methods of achieving the water goals of the future is to capture the water lost in **agricultural water irrigation.**

I am a shareholder in North Poudre Irrigation Company (NPIC), a water delivery company that is comprised of hard working, dedicated employees. NPIC's 2019 annual report states that the percentage of water loss due to leaks and evaporation in their system (shrinkage) was calculated at 47%, equaling 39,272 acre feet. NPIC is no different than all of the other 100+ irrigation companies in northern Colorado. Most of the irrigation ditches were built 60 – 100 years ago, and they are all a source of significant water losses.

Ditch companies work tirelessly to improve their systems and reduce shrinkage, but none of them have adequate funds to sizably reduce their losses. Add it all up and there is a staggering amount of water that never gets delivered. What happens to this water? Essentially it escapes the system and goes back into the earth or evaporates.

How to reduce these losses and use the captured volume as part of the NISP goal?

I propose that a "win-win" relationship be established between irrigation companies and the NISP participants (11 towns and 4 water districts). Develop a program for giving financial grants to the irrigation companies to accurately study their water systems, quantify real percentage and volume losses, and design and build the repairs to tighten up shrinkage losses. This would require a water systems engineering association to manage. This program would be financed by the NISP participants. A financial balance is proposed between participating irrigation companies, NISP participants, grants awarded, and the resulting water conserved. A defined percentage of the captured water would go to the NISP partners, and the

remainder of the captured water to be retained by the participating ditch companies.

Summary: The stated goal in the NISP plan is to provide 40,000 acre feet of reliable water for their participating partners. The concept of reducing large water losses in irrigation could probably supply all of the water needed for the future growth of the northern Front Range at a significantly lower cost and environmental impact to building Glade Reservoir**.**

There are additional methods of water management that could add to water savings. They are summarized below.

Rotating Fallow Agreements

About 80% of water on the Front Range goes to agriculture, however this water generates only 20% of the economy. Using rotating fallow agreements, farmers with irrigation water rights could enter into an agreement with their water supplier and NISP to remove a portion of their farmable land from production for one year. That same portion of their water would be then available for NISP. The farmer is paid by NISP the financial value that the removed land would have generated from crop yield. This arrangement would be voluntary to the farmer. This practice would free up considerable water for future growth and doesn't cost the farmer.

Native water rights

New housing subdivisions would utilize existing untreated agricultural water for landscape needs. This does require a second plumbing system to be installed during the house construction process. There is no need to use treated potable water for landscaping. As a result, this practice would significantly reduce the load on water treatment plants. This practice is mentioned in the NISP proposal.

Aquifer Storage and Recovery (ASR)

About 98% of all fresh water on planet Earth is located underground. Because it is out of sight, this water is typically not recognized by most people. The technology of ASR is well developed and used around the world, at construction costs far below that of a new reservoir. Water stored underground is not subject to losses from evaporation like what occurs with reservoir storage. The evaporative losses on Horsetooth Reservoir, at 24" per year, equal 3800 acre feet per year. At current water market value of $40,000 per acre foot, this evaporative loss has a value of $150 million. Using ASR, through a network of subsurface wells, water is stored underground in the geologic strata, to be pumped out and recovered when called for. A large scale example of this application in Colorado is in South West Denver. The denial of the Two Forks Dam project in 1990 did not result in the doom of the towns of Centennial, Highlands Ranch, and Parker. A network of 54 deep water ASR wells was built and life goes on in these towns.

SITE LOCATION

Please refer to the paper written by Dr Tom Sale. He outlines in detail several reasons why the Glade Reservoir site location has major geologic problems that were never mentioned in the US Army Core design. A quick summary of those problems includes:

*** The actual dam construction site sits on top of 2 major geologic faults. The faults are stable but will consist of unconsolidated rubble that will act as a freeway for water loss. You might consider them as a “crack in the bath tub”.

*** The sedimentary strata that comprises the Glade valley is vertically oriented with many layers being very permeable to water flow. It is predicted that water losses due to seepage will be significant.

*** The existing Munroe gravity irrigation ditch currently runs through the Glade valley. The NISP plan puts the ditch in a large steel and concrete pipe secured to the existing ground. When the proposed reservoir is full, the pipe would be submerged by about 80 feet of water. As Dr Sale states: “It is not a matter of if – it’s just a matter of when the pipe fails”. One must consider the worst case scenario in reviewing any structural design. Failure of this pipe could result in all of the water above the pipe draining out of the reservoir, resulting in flooding the valley below. This is basic plumbing – simple as that – only on a giant scale.

*** Missile Silo Toxic Waste Site. The following is from the paper by Dr Tom Sale:

“Historical operations at a DoD Nuclear Missile Site at the base of the Glade Dam created a large plume of carcinogenic chlorinated solvents in groundwater that currently passes out beneath the proposed forebay for Glade. With leakage of water beneath the proposed dam and from the forebay, is seems likely the chlorinated solvent plume will be pushed into domestic water supply wells along County Road 29C . Furthermore, it is anticipated that select portions of the material in the forebay may be hazardous, creating numerous issues including air quality impact and appropriate disposal of excavated materials.”

This paper by Dr Sale is a must read.

The following comment is not part of site considerations or alternatives (point D-2)

Recreation

Northern Water is using the proposed Glade reservoir recreation to sell the project to the Larimer County decision makers. As I study the projected water dynamics of the design, the reservoir would rarely be full enough for quality boating experiences. From Save Rural NOCO website: “The NISP Final Environmental Impact Statement (FEIS) claims overall economic benefits from recreation at Glade will range from $13 to $30 million per year. For comparison, recreation at Horsetooth generated $2.5 million in 2019. Even by generous estimates, visitation at Glade will be roughly half of that at Horsetooth. The FEIS provides no evidence to support Northern’s overinflated recreation value at Glade”. Don’t be fooled by the smoke and mirror deception presented by Northern Water’s recreation sales pitch.

Summary

In conclusion, the topics discussed above can supply the water goals in the NISP plan without building Glade reservoir. The alternative components are truly an “integrated supply project”. They can be built in incremental stages and captured water can be available when any stage is complete. This approach does not put a huge financial load on the participants compared to the extreme cost of building Glade. The Glade approach would force the participating towns to fuel real estate development to pay for their share of Glade. This doesn’t make sense.

The proposed NISP/Glade project uses old methods and attitudes to steal water from a precious river and put it behind a new dam. NISP is asking Larimer County to sacrifice a truly unique and beautiful valley, enjoyed by all who drive through it. They say the benefit to Larimer County is recreation and water for some in south east Larimer County. I say the recreation is a smokescreen, and the water can be obtained in the conservation and wise technologies discussed above. This is too high a price for Larimer County to pay mostly for the benefit of Weld County.

I ask the Larimer County planning commission and county commissioners to vote NO on the 1041 permit for NISP.

Thank you for considering my request.

Respectfully,

Brent Hawley

Submitted on behalf of Save Rural Noco

This alone should allow the County to consider co-location as part of the process in both the Thornton and Northern Water 1041 applications. In addition, the Colorado Supreme Court noted that the purpose of the 1041 statute is to allow state and local governments to "supervise land use which may have an impact on the people of this state beyond the immediate scope of the project." Colorado Land Use Commission v. Board of County Comm'rs of Larimer County, 604 P.2d 32, 34 (Colo. 1979). The reference to impacts "beyond the immediate scope of the project" suggests that the Commissioners can and should consider the relationship between the project under consideration and other projects. Such sensitivity would definitely further the statute's apparent purpose of "protection of the utility, value, and future" of land, which the statute states is in the public interest. C.R.S. § 24-65.1-101(1)(a).

For these reasons, I ask the Planning Commission and the Board of County Commissioners reject the Northern Water 1041 application until such time that there is resolution to the Thornton 1041 application so that both pipelines can apply for a co-location routing option where both entities can share costs and choose routes they might not otherwise consider around residential areas. Our specific properties and the Eagle Lake neighborhood should not have to shoulder the burden of these two projects for the sake of Larimer County.

Rob Helmick, Senior Planner
Larimer County Community Development Division
200 W. Oak Street
Suite 3100
PO Box 1190
Fort Collins, CO 80521

Dear Rob,

As a resident of the Eagle Lake neighborhood, I am writing you to ask that Larimer County not approve the 1041 Application that is before you for a pipeline through the county by Northern Water (NISP). The issues revolving around this application and the reasons it should be denied closely mirror that of the City of Thornton 1041 pipeline application that was rejected by the Board of County Commissioners.

Specifically, here are some of the reasons the County rejected the Thornton application and should do so as well with the NISP application:

- According to the Land Use Code criteria quoted by the Board of Commissioners, the proposal is inconsistent with the county Master Plan affecting land use and development, specifically that the route will be traversing through significant amounts of private property and through yards in the Eagle Lake neighborhood. Private easements will have to be obtained through eminent domain. Affected residents will not be permitted to construct permanent structures or plant landscape material with deep roots (trees, wind blocks, etc) on their property due to the pipeline easement and maintenance requirements. Affected residents will be subject to continual intrusion on their land by maintenance crews checking on the pipeline in perpetuity. This is a gross infringement of their right to a peaceful existence on their property and our right to restrict non-resident traffic on our privately owned roads.
- In addition, according to Northern Water's Construction Approach document, they are anticipating using HOA owned private roads for construction traffic throughout the five segments of construction on the pipeline near and through our neighborhood.

  The timeline of the cumulative impact to us is anticipated to be 59 weeks from start to finish for all the segments! They are asking to use our narrow, non-public grade roads for heavy truck traffic and daily construction crew traffic on our private roads dozens of residents use daily to enter and exit our subdivision. This is an unacceptable burden on us and again is a gross infringement on our neighborhood and our rights to a peaceful existence that is inconsistent with the Master Plan's stated goal of "maintaining and enhancing our county's quality of life and to be fundamentally fair to all our citizens and to respect their individual rights." A quiet residential neighborhood with children playing, residents coming and going, and retirees enjoying the peaceful time they've earned is not a place for construction staging for a project that has no benefit for its residents and even minimal benefit to Larimer County as a whole. The concept and thought of using our roads for this purpose is untenable.

  3) The NISP 1041 application negatively impacts public health and safety in our neighborhood. Our private roads are narrow roads and not constructed to handle large, semi-tractor trailer traffic loaded with pipe sections and construction materials for pipeline construction. The roads were not built to handle the volume of traffic or the load. Having these vehicles on our roads creates a safety hazard for children, bicyclists, walkers and resident traffic entering and leaving driveways. In addition, some of our older residents with health issues are at risk due to the constant coming and going of non-resident truck traffic. Noise levels, pollution from diesel vehicles, and anxiety from interruptions to our peaceful existence can all lead to increased health problems for all residents.

  4) In the Land Use Code criteria for consideration by the County, Criteria C states its purpose is to "Promote the economic stability of existing land uses that are consistent with the Master Plan and protect them by incompatible or

harmful land uses." The proposed pipeline is certainly an incompatible and harmful use of the land in our neighborhood.

We recently annexed three parcels to our HOA (the TIPS Development) whose owner was required by the County to development certain aspects of the land (drainage, roads, etc) to be approved by the County before being allowed to offer the plots for sale and final residential development. The owner has spent thousands of dollars to prepare this land, yet the proposed pipeline path crosses near or on some of the new parcels rendering them virtually unsellable until the pipeline is built and completed. No buyer will pay a premium price for a parcel with the amount of disruption, uncertainty of building site and septic placement, and ongoing nuisance this project will cause to these three parcels for well over a year. The County is in effect killing the owner's ability to sell his parcels and recoup his already substantial investment that the County has made him invest to get the land ready for development. This is not "promoting the economic stability of existing land uses" (ie. Residential development) or "protecting incompatible and harmful land uses".

Other residents in our neighborhood who may be contemplating or are in the process of listing their property are also economically negatively impacted by the proposed pipeline. Buyers will use every reason to lower the price on a sale and a year or more of construction traffic, noise, dirt and dust flying in the neighborhood are good leverage points for them to either not buy at all, or attempt to attain a lower selling price than normal. The County is truly hurting the economic stability of the whole neighborhood with this proposal and hundreds of thousands of dollars in values may be lost if the application is approved.

- Northern Water has presented other reasonable siting and design alternatives that do not include bisecting resident's property or cutting through our neighborhood that they have dismissed due to cost or more difficult construction conditions like their N2.4 (north of Reservoir #3) and N2.5 routes (Douglas Road). The Board of County Commissioners rejected reasoning that expense or difficulty of construction were disqualifying reasons for rejecting routes over ones that impacted private property owners and individual rights in the Thornton pipeline application. Northern's preferred N2.1 route severely impacts our rights as property owners and citizens and should similarly be dismissed by the Commissioners when there are viable alternate routing options.
- Another issue of grave concern to the Commissioners in the Thornton application was the construction and pipeline proximity to occupied dwellings. Proximity of construction and construction impact along with the long-term detriment to property owners was a primary concern. The Northern Water proposal includes a 100' easement – a 40' construction easement and a 60' permanent easement. If the pipeline were to be placed on the property line between the two residences the proposed N2.1 routing prefers, that will put the easement only 30 feet or less from one of the residences. The disruption and imposition on private property this close to an occupied dwelling is unacceptable when there are route alternatives that do not cross private property between two dwellings.
- The other major point that should either cause the county to reject the application or defer a decision until later is the Thornton pipeline issue now pending before the courts. The proposed routing of their pipeline has almost identical routing alternatives to Northerns. Both entities are in the review process at the same time with construction timelines that are similar. Multiple times in the record for Larimer County in the proceedings with Thornton, both Thornton, Northern Water, and the County mentioned or agreed that co-location of the two pipelines along their nearly identical paths made sense and should be pursued. It has been discussed between all three parties on numerous occasions and should be part of the discussion now.

In fact, one of the objections the Board of County Commissioners expressed to deny the Thornton pipeline by only submitting an application for one of their proposed pipelines in isolation from their planned future ones was that, **"Thornton deprives the Board and public of the opportunity to consider cumulative impacts and the effectiveness of mitigation. A route that may be appropriate for a single pipeline may be inappropriate for additional pipelines. If this information is not considered now, future pipelines may not be able to co-locate which would result in the disorderly development of Thornton's project and compound the impacts on Larimer County through multiple different pipelines in separate locations."**

How is this not the case with the proposed Northern pipeline and Thornton's pipeline, both of which are looking at nearly identical routing alternatives? This is not just an issue of "disorderly development and compounding of the impacts" on Larimer County – it is the disorderly development and compounding of the impacts on Eagle Lake in a much shorter timeframe than the proposed build out of the future Thornton pipelines. And how is the reverse not true – that a route that may be inappropriate for a single pipeline due to cost and difficulty of construction may be entirely appropriate for the combined resources of two pipelines from two well-funded entities with capable engineering that will minimize the impacts not only on Larimer County but the Eagle Lake neighborhood that is the target of two separate pipelines?

The precedent for this is Section A.2 of the Land Use Code itself that says the Code is intended to:

"A. Provide for the physical development of the county in order to:

1. Preserve the character and quality of rural and urban areas;
2. Foster convenient, harmonious and workable relationships among land uses; and
3. Achieve the principles and strategies described in the master plan."

Dear Mr. Helmick,

Thank you very much for the opportunity to express our very strong objections to the NISP proposed route from Hwy 1 traversing west to Travis Road and beyond. Please share this information with the Commissioners for their consideration.

The proposed route appears to be the shortest and least expensive route for NISP. It is not, however, a route that offers the least impact to the northern neighborhoods and to the best of my knowledge, as a resident of Eagle Lake Subdivision, I have had no invitation to or involvement in working with them to select a route with the least residential impacts and their preferred route seems to indicate little thought with regard to the physical feasibility or the ramifications of the disruption to residents.

To be specific:

1. Any route through a subdivision that involves either the bed of a pipeline or construction vehicle access should patently be rejected when there are other less impactful solutions in this northern area. Just look at a map.
2. The proposed route proposes a pipeline bed that closely impacts several residences within one- hundred and fifty feet of it's path. That's too close.
3. The construction vehicle access utilizing the ditch road on the east side of Eagle Lake is physically very difficult, if not impossible and would also be disruptive to several residences and require extensive road improvements to even be physically possible.

Other possible options to mitigate residential impact:

1. Instead of staging east to west (Hwy 1 to Travis Rd), consider staging west to east (County Rd 19 toward Hwy 1) and then at Travis Rd head north around Rocky Ridge with construction traffic and pipeline bed in tandem. This offers the least impact to residences from both the construction of pipe bed itself to the logistics of construction vehicle access.
2. Consider other less dense and impactful northern routes.

The NISP Application requires much more thought toward residential impacts and their preferred route should be rejected at this time in favor of finding other less impactful solutions even if there additional costs involved to do so. Thank you for you consideration.

Eagle Lake Project

1 message

Lance Astrella <lance@astrellalaw.com> Fri, May 29, 2020 at 10:36 AM
To: "rhelmick@larimer.org" <rhelmick@larimer.org>

Mr. Helmick:

In the event that the County approves of NISP's plans to unnecessarily construct its project within the Eagle Lake Subdivision, including the use of private roads, NISP should be required to submit for approval reasonable and customary plans to the County for approval, including the following:

Fire Mitigation Plan

This is particularly important for the safety of the residents and protection of their property in light of the fact that construction will take place in dry grasslands and adjacent lands that contain vast amounts of dead and dry timber and brush. Strong winds in the area consistently blow toward the subdivision.

Emergency Response Plan

This is important due to the high fire danger.

Proof of Insurance

Adequate insurance coverage is essential in light of fire danger, construction traffic and attractive nuisance.

Security Plan

Security for equipment and materials which may attract thieves and result in theft of property and danger to the residents.

Noise Mitigation Plan

This should restrict the time of operations and noise mitigation devices on equipment.

Weed Control

Due to weeds in the area to be excavated and weed contamination on rolling stock, a comprehensive weed control program should be implemented.

Fencing

A plan to safely fence the excavation area when operations are not taking place, including nighttime.

Staging Area

No material shall be stored nor equipment placed in the subdivision.

Storm Water

Plan to control run off within the subdivision.

Worker ID

All contractors and subcontractors should be required to wear visible identification.

Traffic Plan

This should include traffic control from public access to Eagle Lake private roads. It should include 10 MPH speed limits for heavy equipment.

Reclamation Plan

A detailed reclamation plan should be provided for Eagle Lake Subdivision including reestablishing irrigation and natural vegetation to pre-existing condition and remediation of subsidence over time.

Employee Rules

No employees, contractors or subcontractors shall be permitted to have alcohol, marijuana, illegal drugs, firearms or pets on the property. No smoking will be permitted. There should be a liquidated damages payment for each violation.

Dust Control Plan

Due to high winds in the area, construction dust can accumulate on the exterior and in the interior of houses.

Compensation

NISP should be required to compensate affected residences for exterior dirt, duct cleaning and necessary interior cleaning of houses affected by construction dust and dirt.

Roads

Subdivision roads shall be used only when necessary. A road use plan should be submitted identifying time specific traffic volumes for each phase of construction.

NISP should repair roads after construction is completed, including placing a new top coat on the Eagle Lake roads used by NISP.

A road usage fee of $_____ per day of use should be imposed.

Room and Board

Compensation should be paid for room and board for residents and pets whose quiet enjoyment of their property is disrupted.

There appear to be several alternatives available to NISP. If NISP chooses to disrupt Eagle Lake Subdivision and use its private roads, the foregoing requirements are reasonable to protect the health and safety of the community and to compensate for use and damages of private property.

Respectfully submitted,

Lance Astrella

Rob Helmick, Senior Planner

Larimer County Community Development Division

200 W. Oak Street Suite 3100

Fort Collins CO 80521

rhelmick@larimer.org

Dear Mr. Helmick:

As a resident of the Eagle Lake neighborhood, we are writing you to ask that Larimer County not approve the NISP 1041 Application that would route a pipeline through our neighborhood. We strongly object to being held hostage by a few who object to minor inconvenience with installation of pipelines in the public right-of-way along Douglas Road. Contrast that minor inconvenience with years of disruption in our neighborhood and the loss of private property control and value in perpetuity. Would these people like a pipeline through their property? I suspect not.

The reasons for denying this application by NISP are the same for our objection to the City of Thornton application to route its pipeline through our neighborhood. These reasons include:

- Taking private property to route this pipeline is against Larimer County's own stated land use goals and runs contrary to every accepted legal position on private property rights as well as judicious governance and best development practices. Considering that legitimate alternatives that don't include confiscation of private property exist, these alternatives must be given exclusive consideration over all others.

- The home owners of Eagle Lake and Terry Lake did not purchase their properties for the convenience of either NISP or the City of Thornton. Neither did Larimer County plat these additions for the convenience of NISP or Thornton. Because these two entities failed to properly plan their future needs should not impose penalties on those that made and executed in a timely and appropriate manner.

    - For totally illogical and unsupportable reasons the NISP project proposes using privately owned property to build a pipeline instead of using the public right-of-way along Douglas Road, which they previously had agreed to do. That would be a wrong decision.

        - We expect Larimer County's professional staff and the Commissioners, our elected representatives, to defend our property rights as individuals and as a privately owned housing subdivision. The Eagle Lake developer followed all requirements and codes and invested considerable time and money to develop this neighborhood. My husband and I invested considerable time and money to buy property here and to build our house following every code and requirement of the HOA, the County and the State. This is our one and only home in which we have lived since 1993 and hope to enjoy for the remainder of our days.

        - All of our neighbors have the right to expect the County Commissioners, our elected representatives, to represent us, Larimer County property tax payers, not the NISP project and not the City of Thornton.

- The proposed route is contrary to the planning staff's recommendations and flies in the face of the reasoned arguments made by them. It is obvious that improvements will be made to Douglas road at some time. As staff pointed out, the cost of these improvements would be lessened by having the pipeline(s) use the existing right of way.

- This approach minimizes the time that Douglas Road users would be inconvenienced due to non-simultaneous road improvements and pipeline projects. This also begs the question of why Thornton and NISP can't use common right-of-way.

- This approach would completely eliminate any discussion of "eminent domain", which looms large over the existing proposal (and Thornton proposal).

- It eliminates disturbance to the "domestic tranquility" of the home owners in loss of Eagle Lake neighborhood property value, eliminates the continued interruption of property owner's privacy over the lifetime of the property and allows the owners the full use of their property concerning landscaping and recreational use.

- The disruption that this proposed NISP project brings will have significant effects on people being able to enjoy or even to sell their property and likely affect its value. Our neighbors, whose property is directly affected should not have to even be dealing with this disruption and neither should those of us who have had homes here for over 25 years. Many of us are retired and find it unconscionable that we are to lose 59 weeks (1 YEAR) of our retirement for the inappropriate confiscation of our property when better alternatives are available.

- Having these waterline routes proposed creates so much insecurity in fact and in feeling for our present and future wellbeing that faith is being lost in our governmental agencies.

    - Why are the NISP and Thornton proposals not required to be considered concurrently? It is unbelievable that two similar projects, along similar routes, with potential multiple year disruptions each are not required to plan and execute concurrently.

    - This is a waste of taxpayers' money and inconvenience, a misuse of NISP's and Thornton's resources and a perfect example of waste and poor planning wherein the individual once again loses their rights to the money.

- The impact on the Eagle Lake neighborhood would be extreme disruption from construction activities for an estimated 59 weeks, traffic disrupting access to our own homes, **not** just a little extra time accessing a public road. This acquisition of private property is unjustifiable when there are other, better options, including the public right-of-way along Douglas Road.

Respectfully,

Tom and Jean Grove

Hi Rob. Hope all is well with you and your family. All good here with our family in Eagle Lake. I am writing a short email (I am sure you received many from my neighbors) to remind you that using private property in Eagle Lake when so many other / better alternatives are available is not acceptable to me. Whether it is Douglas Road or land further north I hope that you will use good judgment and move this project so that it does not come through this beautiful area.

Pelloquin, Amy <Amy.Pelloquin@uchealth.org> Fri, May 29, 2020 at 3:34 PM
To: "rhelmick@larimer.org" <rhelmick@larimer.org>

Good afternoon.

My family and I moved to Fort Collins several years ago after looking at many communities around Colorado. We chose Fort Collins for many reasons, but one of those was the obvious foresight and planning that Larimer County and Fort Collins employed in developing this area. The bike lanes, neighborhoods and low impact commercial signage all indicated a well thought out plan emphasizing that quality of life for its citizens is paramount.

I have unfortunately been involved in the NISP and Thornton pipeline debacle for the past year as this has directly impacted my neighborhood and my house. While I do see the need for water delivery through the general area, the proposed route is almost ludicrous in terms of local impact on your citizens. The current proposal has this running directly by houses with possible plans for additional pipes if needed. These easements would take up large portions of individual lots and come unacceptably close to actual buildings. There are many undeveloped areas just north of our neighborhood that this pipeline could be run through that would cause little to no disruption (or dramatically less) to local citizens.

This has nothing to do with the “Save the Poudre” campaign as this is not about whether or not the reservoir will be placed, or whether the reservoir will be a benefit or hindrance to this community. This is only concerning where the pipeline will go. This is about putting the rights of the constituents that you serve as a first priority, and protecting these rights to not have our homes and neighborhoods disrupted for months, along with unnecessary easements to save an outside entity time and money.

Progress is important but not at the expense of the citizens who call Fort Collins and Larimer Country home. Disrupting residential homes and neighborhoods based solely on what is most convenient for NISP constitutes placing the welfare of your constituents far below the welfare of an outside entity. Please uphold the reasons that my family chose Fort Collins as our home.

Sincerely

Amy Fitzgerald Pelloquin
MD FACP

Do Not Approve NISP 1041 Project No. 20-ZONE 2- Save Our Rural Northern Colorado

1 message

Mary-Jo Briguglio <infinitelyoung60@gmail.com> Fri, May 29, 2020 at 3:33 PM
To: rhelmick@larimer.org, tdonnelly@larimer.org, swjohnson@larimer.org, jkefalas@larimer.org

Dear Commissioners and Planning Commission:

Commissioner Johnson
Commissioner Kefalas
Commissioner Donnelly
Rob Helmick

We are landowners residing in the area of the proposed Glade reservoir that have many concerns with the proposed Glade Project and the negative impacts that would occur if the project moves forward.

The primary benefits of this proposed reservoir would be enjoyed by the 15 subscriber towns or agencies that receive the proposed Glade water. Most of these towns and agencies are outside Larimer County. The most obvious and intense costs would be borne by local and other surrounding communities.

In general, our concerns are that the scope and scale of this proposed project, if approved, would have significant, detrimental, and permanent impact on our rural community, environment, and lifestyle we enjoy today and desire to have in the future. Additionally, do any of you live in the area that will be highly impacted by the development of this reservoir?

Specifically, our rural environment we believe would be negatively impacted in the following ways:

1) Noise - The rerouted highway over the most eastern hogback would have an unobstructed view from residences in the foothills, there would be no middle hogback to block truck and auto noise. The NISP publications suggest that recreation would include motorboats and jet skis. Boats and skis are loud, they would likely be louder than current road traffic.

2) Light Pollution – This rural area enjoys fairly dark skies. The proposed recreational activities would generate significant exterior lighting for boats, facilities, camping, pumping facilities, traffic, etc. and headlights from traffic coming down the hogback on the rerouted 287 would shine into the adjacent private property. This could destroy the enjoyment of our night skies. We already hear some noise from highway 287.

3) New development - We do not know what sort of development would occur near and north of proposed Glade. The rerouted highway 287 would invite more residential development on the plains. The reservoir would invite more development in the adjacent foothills and valleys. It's not inconceivable that more commercial development catering to visitors would encroach into currently uncommercialized lands, forever altering the rural nature of the area.

4) Trespass – Plans for proposed Glade project almost 400,000 visitors per year. This would include boaters, campers, fishers and hikers and bikers, among others. There is every reason to believe that not all these visitors would stay within the confines of designated recreational areas. Some visitors are likely to explore the inviting foothills that border the reservoir and trespass, however inadvertently, on our private property.

5) Wildlife – Proposed Glade would become a significant barrier to the permanent and migratory herds of deer and elk that reside in our area and would be disruptive to other wildlife. In a world where wildlife and nature are under stress, and is diminishing generally owing to human activities, should we be contributing to those activities for unnecessary purposes? We encourage the county to find alternatives that don't result in the significant loss of open space and wildlife habitat that this project would cause.

6) Wildfires – In this century three major wildfires burned over 100,000 acres on and around Glade. Two of the three forest fires were caused by careless people. Can we rely on the >1000 daily visitors to proposed Glade to be careful?

7) Emergency response – The recreation on the proposed reservoir is projected to be almost 400,000 visitors per year. Such a large increase in recreationalists would likely increase the number of emergency calls thereby further stretching emergency response agency resources. Costs would be borne by Larimer County taxpayers, and emergency services

that are diverted to Glade would not be readily available to serve the local communities.

8) Air quality – Because Glade would have junior water rights, the water level of the proposed reservoir would be highly variable, unlike Horsetooth. The water level frequently would drop precipitously, often changing proposed Glade Reservoir to Glade Mudflats, and could stay that way for years. The large “bathtub ring” that would materialize around the reservoir would become dry soil that would blow in our strong winds causing air quality and visual concerns. The hundreds or thousands of vehicles that would travel to the area emit gases, particulates, and ozone precursors (i.e., health hazards).

9) Climate change – the pumps, the construction vehicles, the recreational vehicles: the project would result in considerable burning of fossil fuels, forever, and the emission of greenhouse gases. The pumping stations alone would emit the equivalent of adding 7000 GHG emitting cars at a time when Colorado is implementing zero emissions vehicle standards.

10) State Land Usage - The large area of state land west of the proposed reservoir is devoted to hunting and cattle grazing. The state and federal lands in this region of northern Colorado provide abundant and easily accessible opportunities for recreation, which we gratefully utilize. Impacts to use of or access to the state land is a negative impact to our communities.

11) Aesthetic - The drive from Livermore to Laporte would no longer be through the heritage rangeland and the familiar hogbacks. Since the proposed reservoir would likely be only partially filled much of the time, instead of beautiful hogbacks and grassy foothills, our viewshed would be marred by the barren sides (bathtub ring) and murky surface of a partially filled reservoir.

12) Lack of combined Project evaluation/coordination - There is no apparent coordination of the NISP or the proposed Seaman’s expansion or the Halligan expansion. All these projects surround our properties and would leave us on a peninsula of land cut from the rural environment we now enjoy. We met with the City of Greeley in August 2018 and learned that they are not planning to cooperate with other cities due to “challenges” and are proceeding on an expansion of Seamen’s reservoir from 5,000 to 80,000 acre-feet. In the 21st century, surface storage just doesn’t make sense; this is a semi-arid climate that is getting drier. Alternatives are available and should be seriously considered.

13) Social justice - While the benefits of proposed Glade would be enjoyed by people who live and work far from the reservoir site, the costs would be borne by those whose quality of life would be severely lessened.

14) Conservation and Alternatives – Conservation is not begin adequately considered. While the Colorado Front Range is land-rich for development, it is semi-arid and thus water-limited. About 2/3 of the Poudre is already taken out, and Glade would take another 40% of what’s left. Yet another reservoir is nothing but a temporary fix for a small portion of the state’s water needs; but one with permanent, destructive impacts on a large part of rural northern Colorado. The time is way past due for developing long-term solutions based on state-of-the-art technologies and widespread education on the absolute necessity to conserve water, and to stop relying on 19th century solutions for 21st century challenges.

15) Small ranches and farms that provide food for our local community. There are many ranches that would be significantly impacted by this project. Additionally there are farms that supply food to local restaurants the pollution alone from rerouting 287 would substantially affect the quality of this food.

16) How many of you live in this area and realize the impact it has? It's bad enough that you all allowed the gravel pit to potentially be approved in Laporte when none of you live in that quaint town, now you want to destroy the surrounding lands.

The Larimer County Commissioners MUST save our rural communities and be GREAT stewards of our natural resources by saying NO Glade Reservoir!

Sincerely,
Mary-Jo Briguglio

Larimer County Should Not Approve the NISP 1041 Permit Project No. 20-ZONE 2657

1 message

Della Garelle <dgarelle@gmail.com> Fri, May 29, 2020 at 10:46 PM
To: rhelmick@larimer.org, tdonnelly@larimer.org, swjohnson@larimer.org, jkefalas@larimer.org

Dear Commissioners and Planning Commission:

Commissioner Johnson
Commissioner Kefalas
Commissioner Donnelly
Rob Helmick

I'm a land and home owner residing in northern Larimer County, near the proposed location of ill fated Glade Reservoir. It's massive dam, forebay, pumps, pipelines, campgrounds, parking lots, boat ramps, and other facilities are a huge mistake.. It is not needed, wasteful, and damaging not only to the Poudre river, but to many other habitats and a beautiful natural glade. We strongly urge the Board of County Commissioners to deny the 1041 permit for the Northern Integrated Supply Project because it would forever impact the fundamental nature of the rural landscape in which we live and harm our quality of life.

We choose to live in northern Colorado for its beautiful natural landscapes, its wild and scenic rivers, it's clean air and quiet surroundings, its wildlife, its opportunities for peacful enjoyment of this area.These are key to our quality of life; key pieces that would be lost if this project is constructed and operated as proposed. Our land, our water, and our communities would be harmed by this wrong-headed project.
Any benefits of the project would only be for monetary gain for developers and realtors outside Larimer County.

It is unacceptable that our rural northern Colorado communities shoukd bear the negative impacts and untold risks of this massive and ill-conceived project, the biggest ever proposed for Larimer County.

If construction is executed as planned, there would be at least seven years of heavy construction impacting our communities. The intrusion would turn the hundreds of acres of the landscape into a construction zone and permanently take away the attractiveness, the clean air, the quiet – the things we depend on for health and happiness and property values.

Northern Water is trying to buy up farms in northern Colorado to make up a more than 50% shortfall in the water rights needed for a successful project. In addition, recent and projected prolonged droughts have and will affect the amount of water available from the Poudre River and other sources. For us, this means that we would endure the years and years of construction, and the irreparable loss of the unique landscape in which we live, all for just a hope of excess water sometime in the future. Larimer County should deny this project, which is likely to fail to meet its obligations. Less expensive and less destructive alternatives to preserving water supply should be undertaken instead.

Encouraging almost 400,000 visitors per year to this area would alter it from the quiet, rural and sparsely populated landscape we sought and invested in, to a busy recreational area with noise, dust, traffic, trash, accidents, and fires. Noise from recreation on a potential reservoir would exceed state standards, would be heard miles away, and would significantly disrupt our community and wildlife. For most owners, this entire debacle would cause property values to decline.

That's if the reservoir ever fills for any reasonable amount of time before immediately being drained for money The photographs Northern Water shows of a beautiful full reservoir are misleading at best, because the reservoir would rarely, if ever, look like that. It would generally look like a stinking barren mud plain and abandoned industrial facility marring the landscape.

This project ruins the aesthetics of the valley and hogbacks – a unique and beautiful landscape – for a project that would provide little or no benefit to Larimer County and in fact would negatively impact its residents and its coffers.

The project would also contribute to climate change. Over 30,000 tons per year of CO2 would be emitted by engines to pump water from the Poudre into Glade. Other greenhouse gases would also be produced, both during construction and operation. Air pollution would also occur due to the project, including gases that form ozone, a severe health hazard.

Dust blown from the barren shorelines would be swept up the valley on the area's strong winds and seep into our homes and further degrade our lives. The EIS states that it would take an 80-mph wind to generate any fugitive dust from the shorelines of the operating reservoir, an assertion that doesn't pass the laugh test for anyone living in this rural landscape. What else have they got wrong?

We are very concerned about the potential for fire. We live in a high fire hazard zone and we take many precautions with our homes and properties to protect against fires. Many visitors, who would be visiting in summer when the land is hottest and driest, would not be aware of how easy it is to cause a wildfire in this landscape. Some would be careless with campfires, with cigarettes, with illegal fireworks, or with firearms, and wildfires would be inadvertently ignited. Their vehicles can also start fires. Unfortunately, arson is possible. Our climate is getting drier.

Larimer County must recognize the seriousness of all these issues and deny this permit. The county cannot put our homes, our property, our livestock and our way of life at an increased and unacceptable risk of wildfire These increased risks would also cause increased demands on local emergency services, especially fire, medical, and law enforcement.

No project this big can be undertaken without significant and irreparable negative impacts. We ask Larimer County commissioners to be good stewards and deny this permit and prevent the loss of open space and wildlife habitat, increased risk of wildfires and other public safety hazards, increased demands on local volunteer emergency services, noise, light pollution, increased development, trash and traffic in ever-widening circles around the reservoir, reduced air quality, climate change, increased illegal activities such as trespass on adjacent private land, decreased property values, and the loss of unique visual and aesthetic values. The natural and rural quality of this land is critical to our lives, property values and stable communities.

Sincerely,
Dr. Della Garelle

NISP OBJECTION LETTER

Rob Helmick, Senior Planner
Larimer County Community Development Division
200 W. Oak Street
Suite 3100
PO Box 1190
Fort Collins, CO 80521

Or email to: rhelmick@larimer.org

Dear Rob,

Below is a Talking Point letter that by now, I am sure you have seen many times. My family and I live at 351 Deerfield Circle in Eagle Lakes and feel compelled to strongly join in with our objection to this proposed pipe route. The points below capture the major reasons to reject this path for the pipeline but in addition to these points is the foundation of what is right and wrong. Many years ago my wife had her home taken away by the State of Wyoming by eminent domain so this something we feel strongly about.

If the route through Eagle Lakes is approved, you are placing dollars ahead of what is right and just. In my opinion, there is way too much of this antiquated politics in action in our country. I ask you to think more enlightened; consider, people's rights, values and moral obligations above dollars. I believe there are alternate routes that would serve our values better. I know you have to make hard decisions but this is the time to make a hard decision, and tell Norther Water they need to spend more money on an alternate route.

As a resident of the Eagle Lake neighborhood, I am writing you to ask that Larimer County not approve the 1041 Application that is before you for a pipeline through the county by Northern Water (NISP). The issues revolving around this application and the reasons it should be denied closely mirror that of the City of Thornton 1041 pipeline application that was rejected by the Board of County Commissioners.

Specifically, here are some of the reasons the County rejected the Thornton application and should do so as well with the NISP application:

1) According to the Land Use Code criteria quoted by the Board of Commissioners, the proposal is inconsistent with the county Master Plan affecting land use and development, specifically that the route will be traversing through significant amounts of private property and through yards in the Eagle Lake neighborhood. Private easements will have to be obtained through eminent domain. Affected residents will not be permitted to construct permanent structures or plant landscape material with deep roots (trees, wind blocks, etc) on their property due to the pipeline easement and maintenance requirements. Affected residents will be subject to continual intrusion on their land by maintenance crews checking on the pipeline in perpetuity. This is a gross

infringement of their right to a peaceful existence on their property and our right to restrict non-resident traffic on our privately owned roads.

2) In addition, according to Northern Water's Construction Approach document, they are anticipating using HOA owned private roads for construction traffic throughout the five segments of construction on the pipeline near and through our neighborhood. **The timeline of the cumulative impact to us is anticipated to be 59 weeks from start to finish for all the segments!** They are asking to use our narrow, non-public grade roads for heavy truck traffic and daily construction crew traffic on our private roads dozens of residents use daily to enter and exit our subdivision. This is an unacceptable burden on us and again is a gross infringement on our neighborhood and our rights to a peaceful existence that is inconsistent with the Master Plan's stated goal of "maintaining and enhancing our county's quality of life and to be fundamentally fair to all our citizens and to respect their individual rights." A quiet residential neighborhood with children playing, residents coming and going, and retirees enjoying the peaceful time they've earned is not a place for construction staging for a project that has no benefit for its residents and even minimal benefit to Larimer County as a whole. The concept and thought of using our roads for this purpose is untenable.
3) The NISP 1041 application negatively impacts public health and safety in our neighborhood. Our private roads are narrow roads and not constructed to handle large, semi-tractor trailer traffic loaded with pipe sections and construction materials for pipeline construction. The roads were not built to handle the volume of traffic or the load. Having these vehicles on our roads creates a safety hazard for children, bicyclists, walkers and resident traffic entering and leaving driveways. In addition, some of our older residents with health issues are at risk due to the constant coming and going of non-resident truck traffic. Noise levels, pollution from diesel vehicles, and anxiety from interruptions to our peaceful existence can all lead to increased health problems for all residents.
4) In the Land Use Code criteria for consideration by the County, Criteria C states its purpose is to "Promote the economic stability of existing land uses that are consistent with the Master Plan and protect them by incompatible or harmful land uses." The proposed pipeline is certainly an incompatible and harmful use of the land in our neighborhood.

   We recently annexed three parcels to our HOA (the TIPS Development) whose owner was required by the County to development certain aspects of the land (drainage, roads, etc) to be approved by the County before being allowed to offer the plots for sale and final residential development. The owner has spent thousands of dollars to prepare this land, yet the proposed pipeline path crosses near or on some of the new parcels rendering them virtually unsellable until the pipeline is built and completed. No buyer will pay a premium price for a parcel with the amount of disruption, uncertainty of building site and septic placement, and ongoing nuisance this project will cause to these three parcels for well over a year. The County is in effect killing the owner's ability to sell his parcels and recoup his already substantial investment that the County has made him invest to get the land ready for development. This is not "promoting the economic stability of existing land uses" (ie. Residential development) or "protecting incompatible and harmful land uses".

   Other residents in our neighborhood who may be contemplating or are in the process of listing their property are also economically negatively impacted by the proposed pipeline. Buyers will use every reason to lower the price on a sale and a year or more of

construction traffic, noise, dirt and dust flying in the neighborhood are good leverage points for them to either not buy at all, or attempt to attain a lower selling price than normal. The County is truly hurting the economic stability of the whole neighborhood with this proposal and hundreds of thousands of dollars in values may be lost if the application is approved.

5) Northern Water has presented other reasonable siting and design alternatives that do not include bisecting resident's property or cutting through our neighborhood that they have dismissed due to cost or more difficult construction conditions like their N2.4 (north of Reservoir #3) and N2.5 routes (Douglas Road). The Board of County Commissioners rejected reasoning that expense or difficulty of construction were disqualifying reasons for rejecting routes over ones that impacted private property owners and individual rights in the Thornton pipeline application. Northern's preferred N2.1 route severely impacts our rights as property owners and citizens and should similarly be dismissed by the Commissioners when there are viable alternate routing options.
6) Another issue of grave concern to the Commissioners in the Thornton application was the construction and pipeline proximity to occupied dwellings. Proximity of construction and construction impact along with the long-term detriment to property owners was a primary concern. The Northern Water proposal includes a 100' easement – a 40' construction easement and a 60' permanent easement. If the pipeline were to be placed on the property line between the two residences the proposed N2.1 routing prefers, that will put the easement only 30 feet or less from one of the residences. The disruption and imposition on private property this close to an occupied dwelling is unacceptable when there are route alternatives that do not cross private property between two dwellings.
7) The other major point that should either cause the county to reject the application or defer a decision until later is the Thornton pipeline issue now pending before the courts. The proposed routing of their pipeline has almost identical routing alternatives to Northerns. Both entities are in the review process at the same time with construction timelines that are similar. Multiple times in the record for Larimer County in the proceedings with Thornton, both Thornton, Northern Water, and the County mentioned or agreed that co-location of the two pipelines along their nearly identical paths made sense and should be pursued. It has been discussed between all three parties on numerous occasions and should be part of the discussion now.
   In fact, one of the objections the Board of County Commissioners expressed to deny the Thornton pipeline by only submitting an application for one of their proposed pipelines in isolation from their planned future ones was that, **"Thornton deprives the Board and public of the opportunity to consider cumulative impacts and the effectiveness of mitigation. A route that may be appropriate for a single pipeline may be inappropriate for additional pipelines. If this information is not considered now, future pipelines may not be able to co-locate which would result in the disorderly development of Thornton's project and compound the impacts on Larimer County through multiple different pipelines in separate locations."**
   How is this not the case with the proposed Northern pipeline and Thornton's pipeline, both of which are looking at nearly identical routing alternatives? This is not just an issue of "disorderly development and compounding of the impacts" on Larimer County – it is the disorderly development and compounding of the impacts on Eagle Lake in a much shorter timeframe than the proposed build out of the future Thornton pipelines.

And how is the reverse not true – that a route that may be inappropriate for a single pipeline due to cost and difficulty of construction may be entirely appropriate for the combined resources of two pipelines from two well-funded entities with capable engineering that will minimize the impacts not only on Larimer County but the Eagle Lake neighborhood that is the target of two separate pipelines?
The precedent for this is Section A.2 of the Land Use Code itself that says the Code is intended to:

"A. Provide for the physical development of the county in order to:
1. Preserve the character and quality of rural and urban areas;
2. Foster convenient, harmonious and workable relationships among land uses; and
3. Achieve the principles and strategies described in the master plan."

This alone should allow the County to consider co-location as part of the process in both the Thornton and Northern Water 1041 applications. In addition, the Colorado Supreme Court noted that the purpose of the 1041 statute is to allow state and local governments to "supervise land use which may have an impact on the people of this state beyond the immediate scope of the project." Colorado Land Use Commission v. Board of County Comm'rs of Larimer County, 604 P.2d 32, 34 (Colo. 1979). The reference to impacts "beyond the immediate scope of the project" suggests that the Commissioners can and should consider the relationship between the project under consideration and other projects. Such sensitivity would definitely further the statute's apparent purpose of "protection of the utility, value, and future" of land, which the statute states is in the public interest. C.R.S. § 24-65.1-101(1)(a).

For these reasons, I ask the Planning Commission and the Board of County Commissioners reject the Northern Water 1041 application until such time that there is resolution to the Thornton 1041 application so that both pipelines can apply for a co-location routing option where both entities can share costs and choose routes they might not otherwise consider around residential areas. Our specific properties and the Eagle Lake neighborhood should not have to shoulder the burden of these two projects for the sake of Larimer County.

Corey Tips <coreyatips@msn.com> Fri, May 29, 2020 at 7:08 PM
To: rhelmick@larimer.org

Hey Rob,
Hope you're doing well and staying healthy. I don't envy your position on this one. I'm sure I could find some common ground with NISP but that would put me at odds with pretty much all of my neighbors in Eagle Lake. So, I'll register my opposition to the proposed pipeline route through Eagle Lake in solidarity with the neighborhood.
Thanks,
Corey Tips

Objection to Northern Water 1041 Application

1 message

Evelyn pierro <evelynpierro@gmail.com> Fri, May 29, 2020 at 3:48 PM
To: rhelmick@larimer.org

Dear Mr. Helmick,

We are writing to express some concerns about the 1041 application by Northern Water (NISP) currently under consideration. Some of the concerns are as follows:

1. The Thornton pipeline case is pending before the courts. It doesn't make sense to decide on one proposal when another one hasn't been finalized yet. Since both Thornton and NISP have similar construction timelines, and in agreement with the county stated during the Thornton discussion that co-location of the two pipelines should be pursued, the idea needs to remain part of the current discussion as well.

2. The Proximity of construction and construction impact along with the long-term detriment to property owners was a primary concern mentioned by the county in regard to the Thornton Pipeline. The Northern Water proposal includes a 100' easement – a 40' construction easement and a 60' permanent easement. If the pipeline were to be placed on the property line between the two residences the proposed N2.1 routing prefers, that will put the easement only 30 feet or less from one of the residences. The disruption and imposition on private property this close to an occupied dwelling seems unacceptable when there are route alternatives that do not cross private property between two dwellings.

3. According to the Land Use Code criteria quoted by the Board of Commissioners, the proposal is inconsistent with the county Master Plan affecting land use and development, specifically that the route will be traversing through significant amounts of private property and through yards in the Eagle Lake neighborhood.

4. According to Northern Water's Construction Approach document, they are anticipating using HOA owned private roads for construction traffic throughout the five segments of construction on the pipeline near and through the Eagle Lake neighborhood, with an anticipated timeline of 59 weeks. Not only are the non-public grade roads NOT designed to handle such ongoing wear and tear, but the additional impact of affecting the physical health of Eagle Lake residents due to all the construction pollution needs to be taken into account as well.

5. When rejecting the Thornton application, county commissioners did not consider additional expense or more difficult construction as valid reasons for cutting through neighborhoods when other routes are available. These arguments should not be considered in this case either. Please consider the impact to private property when making this decision.

Thank you very much for allowing me to give input on this very important matter.

Sincerely,

Evelyn & Dennis Pierro, Eagle Lake residents

NISP pipeline

1 message

Edward Slavik <theslaviks@msn.com> Fri, May 29, 2020 at 10:14 PM
To: "rhelmick@larimer.org" <rhelmick@larimer.org>

Rob,

Once again the residents of Eagle Lake are faced with the prospect of a pipeline coming through our subdivision and disrupting our lives and properties. As with the Thornton pipeline, and for the same reasons, we are very opposed to the NISP plan. Two options were identified for Thornton that would not have such negative, long term impacts on our community. Either of those options were acceptable, especially the Douglas Road combined pipeline option that does not impact any private property, only causing short term inconvenience. NISP should be required to accept one of those options and respect the concerns of county homeowners.

Sincerely,

Ed and Donna Slavik

Larimer County Should Not Approve the NISP 1041 Permit Project No. 20-ZONE 2657

1 message

Pamela Scinto <pamscinto@hotmail.com> Fri, May 29, 2020 at 11:29 AM
To: rhelmick@larimer.org, tdonnelly@larimer.org, swjohnson@larimer.org, jkefalas@larimer.org

Dear Commissioners and Planning Commission:

Commissioner Johnson
Commissioner Kefalas
Commissioner Donnelly
Rob Helmick

I'm a landowner residing in Belllvue, CO. (Larimer County). I have lived here since 1993 and have endured the construction of 2 pipelines, and the expansion of Graves Dairy/Noosa among other things. I have to say that none of these things have enhanced my quality of life. In fact, just the opposite, it has been an infringement on my privacy. Between the stench from Noosa and the noise from large construction equipment, my quality of life has been degraded. This once quiet, rural community is now disturbed by loud motorcycles late at night and a constant parade of trucks and vehicles spewing exhaust and littering Watson Lake. I know because that is where we walk. The trash cans are always overflowing; my husband picks up the cans to recycle and often gets a large bag full just from the west side.
I am pleading with the Board of County Commissioners to deny the 1041 permit for the NISP as it would forever impact the fundamental nature of the rural landscape in which we live and harm our quality of life. The Cache la Poudre River is Colorado's only designated wild and scenic river! Please ask yourselves who this project is going to benefit? Not I, for sure, and I pay the taxes here. I also pay for water. When I first moved here there was an abundance of irrigation water with which to water my landscape, now that has dried up..or gone to Greeley. My yard is dry and cracked and my plants are dying.

We choose to live in northern Colorado for its beautiful natural landscapes, its wild and scenic rivers, it's clean air and quiet surroundings, its wildlife, its opportunities for outdoor recreation on the abundant state and federal lands in the area. These are key pieces to our quality of life; key pieces that would be lost if this project is constructed and operated as proposed. Our land, water, and communities would be harmed by this project, and any benefits of the project would accrue to communities mostly outside Larimer County.

It is unacceptable that our rural northern Colorado communities must bear the impacts and unmitigable risks of this massive and ill-conceived project, the biggest ever proposed for Larimer County.

If construction is executed as planned, there would be seven years of heavy construction impacting our communities. We would be subjected to lots of heavy truck traffic, since the main artery to and from the reservoir site is Highway 287, which is also our main route; 6-days-a-week heavy traffic and heavy machinery operations, and the unwelcome, intrusive, and obnoxious presence of widespread and large-scale construction activity, noise, dust, and danger, over a long period of time. The intrusion would turn the hundreds of acres of the landscape into a construction zone, and take away the attractiveness, the clean air, the quiet – the things we depend on for health and happiness.

Northern Water is currently buying farms in northern Colorado to make up a more than 50% shortfall in the water rights needed for a successful project. In addition, recent prolonged droughts, which are becoming more common, have affected the amount of water that would be available from the Poudre River and other sources. For us, this means that we would endure the years and years of construction, and the irreparable loss of the unique landscape in which we live, all for an unfulfilled promise that "if they build it, the water would come" which is by no means guaranteed. The water shortage will only get worse as the climate dries, so Larimer County should deny this project, which will likely fail to meet its objectives. Less expensive, less destructive alternatives to water supply should be seriously considered.

Encouraging almost 400,000 visitors per year to this area would alter it from the quiet, rural and sparsely populated landscape we sought and invested in, to a busy recreational area with noise, dust, traffic, activity, accidents, and fires. Noise from motorboats on Glade would exceed state standards, would be heard miles away, and would significantly disrupt our lives. For some owners, the noise would cause property values to decline.

That's if the reservoir fills. The photographs Northern Water shows of a beautiful full reservoir are misleading at best, because the reservoir would rarely, if ever, look like that. It would generally look like an abandoned industrial facility

marring the area's aesthetics.

Since the reservoir would not fill, and likely would not be full during much of its life, the project would look like an abandoned muddy puddle much of the time, and the recreational facilities would be mostly empty. Who would pay for the upkeep of the unused recreational facilities, Larimer County taxpayers? The project ruins the aesthetics of the valley and hogbacks – a unique and beautiful landscape – for a project that would provide little or no benefit to Larimer County and in fact would negatively impact its residents and its coffers.

The project would also contribute to climate change. Over 30,000 tons per year of CO2 would be emitted by engines to pump water into Glade. Other greenhouse gases would also be produced, both during construction and operation. Air pollution would also occur due to the project, including gases that form ozone, a severe health hazard.

Dust blown from the barren shorelines would be swept up the valley on the area's strong winds and seep into our homes and further degrade our lives. The EIS states that it would take an 80-mph wind to generate any fugitive dust from the shorelines of the operating reservoir, an assertion that doesn't pass the laugh test for anyone living in this rural landscape. What else has have they got wrong? Are we to be the guinea pigs for some ill-conceived experiment?

We are very concerned about the potential for fire. We live in a high fire hazard, and we take many precautions with our homes and properties to protect against fires. Many visitors, who would be visiting in summer when the land is hottest and driest, would not be aware of how easy it is to cause a wildfire in this landscape. Some would be careless with campfires, with cigarettes, with illegal fireworks, or with firearms, and wildfires would be inadvertently ignited. Their vehicles can start fires. Unfortunately, arson is possible. Our climate is getting drier. Larimer County must recognize the seriousness of this issue and deny this permit. The county cannot simply hope for the best because our homes, our property, our animals would all be put at unacceptable risk of wildfire due to construction, high visitation, and incomplete understanding. These increased risks would also cause increased demands on local emergency services, especially fire, medical, and law enforcement.

No project this big can be undertaken without significant and irreparable impacts. We ask Larimer County to be a good steward and deny this permit and prevent the loss of open space and wildlife habitat, increased risk of wildfires and other public safety hazards, increased demands on local volunteer emergency services, noise, light pollution where now there is little, increased development and traffic in ever-widening circles around the reservoir, reduced air quality, climate change, increased illegal activities such as trespass on adjacent private land, decreased property values, and the loss of unique visual and aesthetic values. The natural and rural quality of this land is very important to our lives and communities.

Sincerely,
Pamela S. Scinto

Request for NISP Application Rejection

1 message

Gary Salomon <gms6655@me.com> Fri, May 29, 2020 at 11:40 AM
To: rhelmick@larimer.org

Rob Helmick, Senior Planner

Larimer County Community Development Division

200 W. Oak Street

Suite 3100

PO Box 1190

Fort Collins, CO 80521

Dear Rob,

As a resident of the Eagle Lake neighborhood, I am writing you to ask that Larimer County **not** approve the 1041 Application that is before you for a pipeline through the county by Northern Water (NISP). The issues revolving around this application and the reasons it should be denied closely mirror that of the City of Thornton 1041 pipeline application that was rejected by the Board of County Commissioners.

Specifically, here are some of the reasons the County rejected the Thornton application and should do so as well with the NISP application:

1) According to the Land Use Code criteria quoted by the Board of Commissioners, the proposal is inconsistent with the county Master Plan affecting land use and development, specifically that the route will be traversing through significant amounts of private property and through yards in the Eagle Lake neighborhood. Private easements will have to be obtained through eminent domain. Affected residents will not be permitted to construct permanent structures or plant landscape material with deep roots (trees, wind blocks, etc) on their property due to the pipeline easement and maintenance requirements. Affected residents will be subject to continual intrusion on their land by maintenance crews checking on the pipeline in perpetuity. This is a gross infringement of their right to a peaceful existence on their property and our right to restrict non-resident traffic on our privately-owned roads.

2) In addition, according to Northern Water's Construction Approach document, they are anticipating using HOA owned private roads for construction traffic throughout the five segments of construction on the pipeline near and through our neighborhood.

The timeline of the cumulative impact to us is anticipated to be 59 weeks from start to finish for all the segments! They are asking to use our narrow, non-public grade roads for heavy truck traffic and daily construction crew traffic on our private roads dozens of residents use daily to enter and exit our subdivision. This is an unacceptable burden on us and again is a gross infringement on our neighborhood and our rights to a peaceful existence that is inconsistent with the Master Plan's stated goal of "maintaining and enhancing our county's quality of life and to be fundamentally fair to all our citizens and to respect their individual rights." A quiet residential neighborhood with children playing,

residents coming and going, and retirees enjoying the peaceful time they've earned is not a place for construction staging for a project that has no benefit for its residents and even minimal benefit to Larimer County as a whole. The concept and thought of using our roads for this purpose is untenable.

3) The NISP 1041 application negatively impacts public health and safety in our neighborhood. Our private roads are narrow roads and not constructed to handle large, semi-tractor trailer traffic loaded with pipe sections and construction materials for pipeline construction. The roads were not built to handle the volume of traffic or the load. Having these vehicles on our roads creates a safety hazard for children, bicyclists, walkers and resident traffic entering and leaving driveways. In addition, some of our older residents with health issues are at risk due to the constant coming and going of non-resident truck traffic. Noise levels, pollution from diesel vehicles, and anxiety from interruptions to our peaceful existence can all lead to increased health problems for all residents.

4) In the Land Use Code criteria for consideration by the County, Criteria C states its purpose is to "Promote the economic stability of existing land uses that are consistent with the Master Plan and protect them by incompatible or harmful land uses." The proposed pipeline is certainly an incompatible and harmful use of the land in our neighborhood.

We recently annexed three parcels to our HOA (the TIPS Development) whose owner was required by the County to development certain aspects of the land (drainage, roads, etc) to be approved by the County before being allowed to offer the plots for sale and final residential development. The owner has spent thousands of dollars to prepare this land, yet the proposed pipeline path crosses near or on some of the new parcels rendering them virtually unsellable until the pipeline is built and completed. No buyer will pay a premium price for a parcel with the amount of disruption, uncertainty of building site and septic placement, and ongoing nuisance this project will cause to these three parcels for well over a year. The County is in effect killing the owner's ability to sell his parcels and recoup his already substantial investment that the County has made him invest to get the land ready for development. This is not "promoting the economic stability of existing land uses" (ie. Residential development) or "protecting incompatible and harmful land uses".

Other residents in our neighborhood who may be contemplating or are in the process of listing their property are also economically negatively impacted by the proposed pipeline. Buyers will use every reason to lower the price on a sale and a year or more of construction traffic, noise, dirt and dust flying in the neighborhood are good leverage points for them to either not buy at all, or attempt to attain a lower selling price than normal. The County is truly hurting the economic stability of the whole neighborhood with this proposal and hundreds of thousands of dollars in values may be lost if the application is approved.

5) Northern Water has presented other reasonable siting and design alternatives that do not include bisecting resident's property or cutting through our neighborhood that they have dismissed due to cost or more difficult construction conditions like their N2.4 (north of Reservoir #3) and N2.5 routes (Douglas Road). The Board of County Commissioners rejected reasoning that expense or difficulty of construction were disqualifying reasons for rejecting routes over ones that impacted private property owners and individual rights in the Thornton pipeline application. Northern's preferred N2.1 route severely impacts our rights as property owners and citizens and should similarly be dismissed by the Commissioners when there are viable alternate routing options.

6) Another issue of grave concern to the Commissioners in the Thornton application was the construction and pipeline proximity to occupied dwellings. Proximity of construction and construction impact along with the long-term detriment to property owners was a primary concern. The Northern Water proposal includes a 100' easement – a 40' construction easement and a 60' permanent easement. If the pipeline were to be placed on the property line between the two residences the proposed N2.1 routing prefers, that will put the easement only 30 feet or less from one of the residences. The disruption and imposition on private property this close to an occupied dwelling is unacceptable when there are route alternatives that do not cross private property between two dwellings.

7) The other major point that should either cause the county to reject the application or defer a decision until later is the Thornton pipeline issue now pending before the courts. The proposed routing of their pipeline has almost identical routing alternatives to Northern's. Both entities are in the review process at the same time with construction timelines that are similar. Multiple times in the record for Larimer County in the proceedings with Thornton, both Thornton, Northern Water, and the County mentioned or agreed that co-location of the two pipelines along their nearly identical paths made sense and should be pursued. It has been discussed between all three parties on numerous occasions and should be part of the discussion now.

In fact, one of the objections the Board of County Commissioners expressed to deny the Thornton pipeline by only submitting an application for one of their proposed pipelines in isolation from their planned future ones was that, **"Thornton deprives the Board and public of the opportunity to consider cumulative impacts and the effectiveness of mitigation. A route that may be appropriate for a single pipeline may be inappropriate for additional pipelines. If this information is not considered now, future pipelines may not be able to co-locate which would result in the disorderly development of Thornton's project and compound the impacts on Larimer County through multiple different pipelines in separate locations."**

How is this not the case with the proposed Northern pipeline and Thornton's pipeline, both of which are looking at nearly identical routing alternatives? This is not just an issue of "disorderly development and compounding of the impacts" on Larimer County – it is the disorderly development and compounding of the impacts on Eagle Lake in a much shorter timeframe than the proposed build out of the future Thornton pipelines. And how is the reverse not true – that a route that may be inappropriate for a single pipeline due to cost and difficulty of construction may be entirely appropriate for the combined resources of two pipelines from two well-funded entities with capable engineering that will minimize the impacts not only on Larimer County but the Eagle Lake neighborhood that is the target of two separate pipelines?

The precedent for this is Section A.2 of the Land Use Code itself that says the Code is intended to:

"A. Provide for the physical development of the county in order to:

1. Preserve the character and quality of rural and urban areas;

2. **Foster convenient, harmonious and workable relationships among land uses; and**

3. Achieve the principles and strategies described in the master plan."

This alone should allow the County to consider co-location as part of the process in both the Thornton and Northern Water 1041 applications. In addition, the Colorado Supreme Court noted that the purpose of the 1041 statute is to allow state and local governments to "supervise land use which may have an impact on the people of this state beyond the immediate scope of the project." Colorado Land Use Commission v. Board of County Comm'rs of Larimer County, 604 P.2d 32, 34 (Colo. 1979). The reference to impacts "beyond the immediate scope of the project" suggests that the Commissioners can and should consider the relationship between the project under consideration and other projects. Such sensitivity would definitely further the statute's apparent purpose of "protection of the utility, value, and future" of land, which the statute states is in the public interest. C.R.S. § 24-65.1-101(1)(a).

For these reasons, I am asking the Planning Commission and the Board of County Commissioners to reject the Northern Water 1041 application until such time that there is resolution to the Thornton 1041 application so that both pipelines can apply for a co-location routing option where both entities can share costs and choose routes they might not otherwise consider around residential areas. Our specific properties and the Eagle Lake neighborhood should not have to shoulder the burden of these two projects for the sake of Larimer County.

Thank you for your time and consideration on the matter.

Respectfully,

Gary Salomon

Objections to NISP 1041 Pipeline Application

1 message

Dan K <Dan2x@msn.com> Fri, May 29, 2020 at 12:04 PM
To: "rhelmick@larimer.org" <rhelmick@larimer.org>

Dear Mr. Helmick,

As 20+ year residents of the Eagle Lake community, we want to express our strongest opposition to the approval of the NISP 1041 Pipeline application.

It is NOT reasonable or fair that our quiet community should shoulder the burden of the disruption and expense that the current proposed route of the NISP pipeline would cause**, so that the developers can access the least expensive route.**

In addition to the hardships of those land owners whose properties are directly affected,

a year-long construction project would not only cause harm to our lifestyle and environment but also create financial hardship for the entire Eagle Lake community due to immediate and permanently reduced property values.

We chose to move north and invest our retirement in the Eagle Lake community primarily to get away from the noise, congestion and pollution that was developing South of town. Now it appears that NIST wants to bring all of that to our doorstep! WHY? To save money at our expense and without any benefit to our community. NOT ACCEPTABLE!

It is our understanding:

That disrupting the serenity, financial stability and environmental quality of our neighborhood is inconsistent with the Larimer County Master Plan,

That there are other routes available that have significantly less impact on residential properties, and

That there is an opportunity to combine the NIST Pipeline project with the Thornton Pipeline to the benefit of both without having to cut through established neighborhoods.

For all of the above reasons we strongly object to the current route of the NIST 1041 proposal and request the proposal be denied.

Respectfully submitted,

Dan & Joyce Kiskis

The Northern Water pipeline project

1 message

Doug Gibson <dgibson66@gmail.com> Fri, May 29, 2020 at 12:07 AM
To: rhelmick@larimer.org

Rob,
As property owners of 4734 Eagle Lake Drive, we are vehemently opposed to the current plan to route the Northern Water pipeline through our neighborhood. There are other options that don't include tearing up our neighborhood, destroying our streets, and ruining the property values of our friends and neighbors. Please tell Northern Water that they need to find another solution.

NISP water project negative impact on Eagle Lake

1 message

Richard Nash <team.richard@gmail.com> Fri, May 29, 2020 at 5:27 AM
To: rhelmick@larimer.org

Hi Rob,

As a resident of Eagle Lake (address 4737 Eagle Lake Dr, Fort Collins, Co 80524) we are opposed to the NISP water project being routed through personal property in Eagle Lake subdivision. Utilities should use public right away such as roads etc. and not private land.

Regards,
Rich & Marylou Nash

Re: Eagle Lake Subdivision

Dear Rob:

This letter concerns the 1041 Application that is before you for a pipeline through the County by Northern Water (NISP). I am asking you not to approve this application. The reasons for denial closely mirror that of the City of Thornton 1041 pipeline application which was rejected by the Board of County Commissioners.

This 1041 application is inconsistent with the County Master Plan because the route will be cutting through significant private property including residential yards in our neighborhood and will restrict use of the land in these easements to the detriment of the homeowners.

Another reason I am requesting denial of the application is that during construction Northern Water is anticipating using our subdivision's private roads for construction traffic. This time period is estimated to be 59 weeks. Our roads will be severely impaired due to all the construction traffic, not to mention that our quiet neighborhood will be totally disrupted. We are not going to benefit from this 1041 application so why should be suffer for it.

The County would severely damage the economic stability of our entire neighborhood with this proposal and hundreds of thousands of dollars in value may be lost if the application is approved.

For the above reasons, and numerous other reasons which I am sure have already been brought to your attention, I request that you deny this application.

Sincerely yours,

Ron Young, CCIM, CSM

Ralph Shinn <shinncpa@hotmail.com> Fri, May 29, 2020 at 6:15 AM
To: "rhelmick@larimer.org" <rhelmick@larimer.org>, "shinncpa@yahoo.com" <shinncpa@yahoo.com>

Dear Mr. Helmick:

My name is Ralph Shinn. My wife and I are residents of Eagle Lake and proud homeowners of 5016 Eagle Lake Drive and have lived there for 6 years. When we moved to the neighborhood it was done with thoughts of retiring in this tranquil area close to town. We have saved for years to be able to acquire this home and were drawn to the area due to the many amenities provided, specifically Dixon Lake. We enjoy the wildlife, openness, and quietness of this neighborhood. With all due respect the proposed path of this pipeline will undoubtedly negatively affect our property values in and around the neighborhood and potentially impact our septic and bring about other known and unknown environmental hazards. What logical person or group with consider a path through a developed neighborhood when there are certainly more practical and preferable routes that would not create the negative impact that this route does? Running the pipeline north of our subdivision through open space areas with no development would be a much better, less disruptive, and a comparatively priced alternative.

When reviewing the tier Map and proposed line of the project this will run directly south and east of our property with excavation and other heavy equipment and will continue for a prolonged period of months. We understand eminent domain is a normal part of development but it must be contemplated and viewed from the shoes of the property owners whose lives, dreams, and hopes have been negatively impacted. This doesn't even mention the financial implications, mostly negative, to our and our neighbor's property value and resale potential.

We strongly urge you and the committee to consider alternative routes for this pipeline and put yourself in the place of us homeowners. Would you approve such a pipeline if it ran right through your back yard? I think not.

Respectfully submitted,

Ralph Shinn

Board Members;

I am respectfully requesting that you do not approve the NISP. I am especially concerned that a proposed pipeline will be constructed through my private property and the only surface access to my home. I do not believe this project will benefit the citizens of Larimer County and it certainly will not benefit my family. 20,000 acres additional buy-and-dry is a detriment to the entire Western US,all to benefit Weld and Boulder county developers. I am also shocked that there has been absolutely no information outreach or contact with the landowners in the path of the proposed development.
Please refuse support to this ill-conceived project.

These projects, such as NISP, the Thornton Pipeline, etc. are here to benefit ReMax, Lennar Homes and other real estate firms, not the people of Ft. Collins, or really, the people and environment of Colorado.

Stop the dams, stop the pipelines, stop the environmental damage, and most of all, stop the greedy nonsense!

Thanks,
Karen

Dear Mr. Helmick, County Commissions, and Planning Commission,

I am submitting a letter to be included in the County's review of the proposed NISP project. As a fluvial geomorpholigst and river hydrologist, I am opposed to this project from its detrimental effects to river health.

Please see attached a letter directed to the Larimer County Commissioners, Planning Commission, and Planning Staff regarding the 1041 permitting process for the NISP project.

Please include this letter in the official notes for the meeting agendas going forward.

RE: NISP 1041 Permit Application; Project No. 20-ZONE 2657

Dear Commissioner Johnson, Commissioner Kefalas, Commissioner Donnelly, and Planning Commission:

I am writing to express my opposition to the Northern Integrated Supply Project NISP and encourage the Larimer County Planning Commission and County Commissioners to reject the 1041 County permit for the project. Let me explain why I do not support this project and encourage you to reject the permit.

This annual spring "rise" on the Cache la Poudre River is a sacred event, a living pulse of water that lasts just about a month but refreshes and re-nourishes the entire river ecology. As the Poudre reaches Fort Collins these floodwaters spill the banks, filling secondary channels where frogs, birds, and fish rear and lay eggs. Fresh layers of sediments drop out over the floodplains, nourishing the deep, lush cottonwood forests and marshes.

Something unique about the Poudre is that despite roughly 2/3 of the flow already diverted out, there is still enough of a spring "rise" to flood the banks, clean out the river of lingering sediments, redeposit nutrients, and refresh the ecology. This is rare, nearly all of the rivers and creeks along Colorado's Front Range have been dammed or diverted where the natural rhythm of the spring "rise" is gone, turning the echoing drumbeat of the river into a muted whine.

The Poudre still has its spring heartbeat, but not for long if the Northern Colorado Water Conservancy District builds their gluttonous Northern Integrated Supply Project (NISP). If this project is built it will take 71% of the water out of the river during the spring "rise", flat-lining the river and putting it on life support.

My expertise is in river restoration and geomorphology, it's my job to know how river and stream mechanics respond to changes in flow. A major problem that NISP would have on the river is that by reducing the spring "rise", the river will not be able to redistribute and transport sediments out of the river channel where they can deposit onto floodplains and wetlands. By functionally limiting the peak flow and eliminating the annual flushing effect, those sediments will stack up in the channel year after year, eventually raising the channel higher and higher to a point that will create regular flooding problems. The annual flush is needed to improve hydraulic conveyance and move sediments downstream. Not allowing this annual pulse will create a clog, similar to a blood clot.

Additionally, if NISP were built and the sediments are not annually flushed out with large spring pulses, the water quality will greatly suffer. This will occur because the sediment and nutrients trapped in the channel will decompose and consume oxygen levels within the water, thereby decreasing dissolved oxygen available for fish and other wildlife. The annual spring "rise" is not "extra unused water", it's the force that cleans the river environment, flushing sediments and nutrients out and distributing them on floodplains.

Taking the last of the peak flow and storing it behind a dam to feed sprawling suburbs, while turning the river into a putrid algae-filled ditch, is not a good starting point.

This is not my vision for the Poudre River or the Northern Colorado region. Instead, my vision is to keep the wild character of the river, meet growing water needs, and retain the farmland and rustic character of the region. We don't need another river-destroying boondoggle like NISP that creates more urban sprawl. We need intelligent planning, water conservation, recycling, water sharing agreements between cities and farms, and water efficiency upgrades. These solutions have been done in places like Las Vegas where water use has gone down even through growth has skyrocketed. These methods are common and would be significantly cheaper than a billion-dollar dam, paid for by ratepayers.

Only 35 years ago, a 415 ft tall dam was proposed along highway 14 near the mouth of the Poudre Canyon. The Grey Mountain Reservoir proposal was pushed by Northern Water, the same agency pushing NISP. Thankfully Grey Mountain Dam was rejected by Larimer County, and I hope that NISP will be defeated too, but only with your help in rejecting the 1041 County Permit.

Please stand with the river and all the constituents in Larimer County that do not want to see our beloved river put on life support to feed the growth of cities in other Counties.

Thank you,

Preston Brown

Fort Collins, CO.

From: Barry Feldman

Date 6/4/2020

Re: NISP

Dear commissioners:

I know you are receiving numerous emails on the subject of NISP 1041 process so I will keep this brief.

My wife and I have several issues with both the permitting process and the project itself.

The biggest concern about the process is the proposed idea of only allowing 2 minutes per speaker with no group presentations. Though I, and dozens of others I know, am more than willing to get up to the microphone and speak quickly to cram in my perspective on this process I think that it is best served to have one representative from each concerned group to take 10 – 15 minutes to present a more succinct, fact filled, less emotional presentation.

I know we all believe in strength in numbers but think that goal can be achieved quite well by being present, supporting ideas presented without the need to each march up to the microphone to be sure to be heard.

As for the project itself, a few key concerns are as follows:

1. The water issue is little different than for the Thornton pipeline. All the water is to be used after passing past Fort Collins. The water used will diminish the Poudre from the point of take out along with its beauty and recreational use. If it is taken out before going through Fort Collins that will greatly effect one of the cities – and surrounding communities – greatest assets. This includes the new, costly white water park and may negate its use completely.

2. There is to be a pipeline put in near Mulberry and Lemay to take some of the water out of the river and pipe east to meet the main pipeline and piped south crossing the river. Why not run all the water from Glade to the river east of town and take it out where the main line is designed to cross the river. Basically what was being insisted for the Thornton pipeline.

3. The currently proposed pipeline route is virtually all through private property, purposely avoiding going through any existing easements. Thus all new easements when plenty of existing ones could be used with less permanent impact to homeowners. As a personal note the existing route will be run down our west property line and then across the south portion of our property from west to east. We already have an easement on the north along CR 56 and an access easement along our east property line. We will lose any practical use of a horse corral and a portion of our riding arena. Lots of others have similar issues.

Running the water back into the Poudre and taking the water out of the river after Fort Collins is a win/win.

Please consider, Barry Feldman, 401 ECR 56

1967

Your Upcoming NISP Decisions

2 messages

John M. Bartholow <john.m.bartholow@gmail.com> Fri, Jun 5, 2020 at 9:49 AM
To: pcboard@larimer.org
Cc: Board of County Commissioners <bocc@larimer.org>

Ladies and Gentlemen -

There are many, many angles to the decisions you must make regarding the Northern Integrated Supply Project. I only want to weigh in on one today, and that is the health effects of removing more water from the Cache la Poudre River. It is a very important angle indeed because we will pay the long term costs for years to come if NISP goes forward as planned.

I'm sure your "bias" is to make decisions based on sound science. Although there are umpteen pages of material in the myriad NISP documents, the pages that directly address the health effects of removing more water from the river are relatively few and, as the City of Fort Collins has clearly documented, are confusing at best and completely wrong at worst.

To the best of my knowledge, there are only two peer-reviewed articles directly addressing the science of how much water the Poudre River near Fort Collins actually needs to maintain some semblance of health. They are:

> Bartholow, J.M. 2010. Constructing an interdisciplinary flow regime recommendation. J. Am. Water Resources Association 1-15. DOI: 10.1111/j.1752-1688.2010.00461.x. Available online at http://onlinelibrary.wiley.com/doi/10.1111/j.1752-1688.2010.00461.x/abstract.
>
> Bestgen, K. & Poff, N. & Baker, D. & Bledsoe, B. & Merritt, D. & Lorie, M. & Auble, G. & Sanderson, J. & Kondratieff, B.. (2019). Designing flows to enhance ecosystem functioning in heavily altered rivers. Ecological Applications. 30. 10.1002/eap.2005. Available online at https://esajournals.onlinelibrary.wiley.com/doi/full/10.1002/eap.2005

Because I wrote the first article, I can speak most directly to its findings that clearly show that the Poudre is already badly depleted of water in every month of the year and actually needs more water (except during extreme flood events) to become sustainably healthy. We are fortunate that there are some efforts underway to supply more flows TO the river in critical times, but NISP would do just the opposite -- its net effect would be to take water FROM the river -- and the project, if implemented, would further compromise the struggling river we see today.

Thank you for your consideration. Stay safe!

John Bartholow

RE NISP 1041 Permit Application; Project No. 20-ZONE 2657

Dear Commissioners and Planning Commission:

Thank you for the opportunity to comment on the Northern Integrated Supply Project (NISP) and its 1041 permit application. My husband and I are landowners residing in northern Larimer County, near the proposed location of Glade Reservoir, it's massive dam, forebay, pumps, pipelines, campgrounds, parking lots, boat ramps, and other appurtenant facilities. We strongly urge the Board of County Commissioners to deny the 1041 permit for the NISP because it will irrevocably and irretrievably harm our quality of life and the fundamental nature of the rural landscape in which we live.

We choose to live in northern Colorado for its attractive natural landscapes, its wild and scenic rivers, it's clean air and quiet surroundings, its wildlife, its opportunities for outdoor recreation on the abundant existing public land in northern Colorado. These landscape attributes are key elements of our quality of life; elements that will be lost if this project is constructed and operated as proposed. We practice stewardship of our land, controlling weeds and maintaining the native vegetations, preventing fires, enabling wildlife use, preventing disturbance and pollution, to name a few. We grow vegetables. We work and recreate. We chose rural northern Colorado because it is unique and beautiful and relatively undisturbed.

Any benefits of the project would accrue to communities mostly outside Larimer County. We should not have to bear the impacts and unacceptable risks of this ill-conceived industrial and commercial complex. We have a clear, bleak picture of the project's far-reaching and permanent impacts to rural ways of life, but no explanation exists of why such impacts should ever occur.

Large portions of Colorado, including Larimer County and surrounds, are semi-arid, so while abundant land exists for development and growth, there is very limited water. NISP is a costly and wasteful approach to water supply. Alternatives, especially conservation (and public education about conservation) are paramount to insure viable long-term water supplies with less environmental harm.

NISP as its is currently planned is speculative and infeasible. In 2019 NISP announced that it was undertaking a farm-buying program to obtain 22,000 ac-ft of water from farm rights, over half of the water rights needed for the project, primarily in Weld County. Prior to 2019 NISP indicated they would not be buying farms to obtain water and the FEIS for the project stated that the buying alternative was not feasible because it could not meet the project purpose. But now they have switched to that very approach

for over half of the necessary water rights, without providing any additional environmental analysis or explanation of how it is now feasible. Since early 2019, the project has purchased about 160 acres. It is pure speculation that the remaining tens-of-thousands of acres would be purchased or purchased any time soon, nor has the additional cost been revealed. None of the infrastructure construction should be undertaken; the project likely would not be able to provide sufficient water to meet project goals, and certainly would not be able to provide water at the costs estimated for the project as proposed.

The purported recreation benefits also would not occur. Even if the water rights were somehow obtained in the near future, the hydrological modeling conducted by NISP failed to consider the effects of prolonged drought that occurred after 2005, the last year included in the applicant's modeling. Water levels in the reservoir would be well below the boat ramp in ~49% of years. And, droughts are becoming more severe, threatening water supplies. So, while the NISP propaganda, presented during public outreach, shows a full reservoir with happy sailboarders and fishermen, the facts are that the reservoir will frequently contain very little water and will be surrounded by an ugly, barren shorelines, and will be unsuitable for boating and unattractive for other types of recreation. Furthermore, the recreation proposal is financial folly, because not only would the county have to pay 25% of the recreational facility construction costs, it would be responsible for paying for the maintenance costs, and without sufficient entry fees, that burden will fall on the county, and likely the taxpayers.

The project is being piecemealed and the 1041 application lacks concrete mitigation commitments, so there is still high risk and many unknown effects, the consequences of which will irreparably harm the landscape we love. The application is rife with "to be determined" or "to be developed" and even states, in section 12, that the present project is "conceptual." The project may be conceptual, but the impacts would be real and shockingly harmful.

The relocation of over seven miles of a major federal highway was carved out of the application in mere months prior to the submittal of the 1041 application, whereas the applicant (and the county) had led the public to believe that it would be included. This smacks of slicing off the impacts of a huge construction project so that NISP doesn't have to accept responsibility for it. As the application says, the highway is an impediment to the project rather than part-and-parcel to years of construction and extreme alteration of the land.

Cultural resources would be lost. There are almost 100 eligible or potentially eligible sites. Many of these sites are eligible or potentially eligible for listing on the National Register of Historic Places, they are important to our history and culture, yet not, apparently, important enough to be dealt with prior to this monumental land use decision.

The project will cause air pollution, including massive amounts of fugitive dust and chemicals that are precursors to ozone, and Larimer County is often in a severe non-attainment situation with respect to ozone. How is it possible to entertain the idea of a project that could impair public health, but provide no public benefit? Mitigation for air pollution is punted to some later CDPHE process, so we are left wondering if we, our families, and friends would be harmed. Will we be told to "stay inside" during more and more of the gorgeous summer days? If so, why would we choose to live here?

The project has the potential to cause fires, both during construction and operations, especially if 400,000 visitors, with their fires, cigarettes, illegal fireworks, and firearms roaming around these fire-prone hills.

We take extreme care with fire, creating defensible space around our homes and avoiding activities that could start fires. But many wildfires are started by people, and visitors who don't understand, or blatantly disregard, the rules put us at extreme risk. Fire prevention and potential suppression costs are glossed over in the application materials, although Larimer County is extremely fire prone, and in the past decade or so, devastating fires have occurred immediately adjacent to the proposed Glade location. It is not appropriate for the county to authorize the project and simply hope for the best when millions of dollars of property damage and possibly lives are at stake.

It is unlikely (but as yet undisclosed) how encouraging almost 400,000 visitors (almost 80,000 vehicles during summer) would affect law enforcement and emergency services, some of which are all volunteer fire and EMS services. We are concerned about how much Larimer County's law enforcement and emergency services be stretched, and what would happen to the level of service to its residents if resources are diverted to the thousands messing around on Glade.

The project would bring noise and light pollution to an area where currently there is little such pollution. Should the reservoir ever fill, which is unlikely, motorboat noise would careen up the valley and into our community, affecting property values. We choose to live here because it is quiet, and at night, it is dark. One can hear the birds during the day, and the nighthawks, owls, and crickets during the night. We foster this on our land, by maintaining its native attributes. Deny this project so that there are still places where Larimer County citizens can enjoy these qualities of life.

Construction would take 5 to 7 years, according the application (although it varies, depending on whether you look at the application or FEIS, so we wonder, which is correct?). Most construction project experience delays, so it's safe to say that we will face a decade of construction impacts. Traffic, congestion, noise, dust, air pollution, helicopters—6 days per week, all daylight hours, and up to 500 workers. This is massive and it will be horrible for a long time. It is not acceptable that we should have to bear this severe burden for the (purported) benefit of cities and agencies far away and mostly outside Larimer County.

The project will contribute to climate changes. The engines from the pumping stations will emit thousands of tons per year of greenhouse gases. Colorado's current policy, signed into law by Governor Polis last year, calls for reductions in greenhouse gas emissions, so the project flies in the face of state policy. We despise the effects of climate change, we can see it evidenced by the outbreak of the pine bark beetle, which as devastated the forests throughout the Rocky Mountains, for example, to the loss of wildlife, etc. We applaud Colorado for its policy and remind Larimer County that it must consider how this project would hinder the state achieving its goals and deny this project.

Our yard is composed of native grasses that survive just fine in the natural climate. We are surrounded by native grasses, forbs, trees and shrubs. We vehemently object to a project to supply water to water lawns. We are aware that subdivisions are still requiring green lawns, and that much of Colorado's most precious resource is being used for this purpose. We say no, it's time to shift the collective thinking. We especially say no to the proliferation of reservoirs (Glade and the Seaman and Halligan expansions and who knows what's to come?) so that grass may grow in urban areas. It defies logic. It's an environmental disaster.

We also oppose the project because of its impacts on the Poudre River. It is a regional treasure, an important part of the very identity of northern Colorado, wild and scenic, and vital to the riparian, agricultural, foothills, and mountain landscapes. Taking more, as our climate dries, would ruin its health and strip us of its many precious benefits. To our great loss.

For the NISP project, the U.S. Army Corps on Engineers must comply with NEPA, and the state of Colorado has permitting requirements for water quality, but the land use issues and the protection of Larimer County citizens and our ways of life are ultimately and undeniably the county's responsibility, and the county must say "no" to NISP. It would be harmful. The county has outlined its vision for the county in the Comprehensive Plan, adopted in 2019, which shows the area proposed for Glade as Mountains and Foothills and Natural Resource. We applaud the county for this. Hook and Moore Glade is a unique and beautiful place, with grassy valleys surrounded by striking, tall, red, layers hogbacks. When we travel down valley, we are treated to the scenic mouth of Poudre Canyon and the productive, agricultural setting around Ted's Place. When we go north, we see striking views of the Rocky Mountain, the northern-most stand of pinyon pine in the western U.S., expansive rangeland, and eerie, wind-carved hoodoos of the Sherman Granite. All of this is valuable, and rare. Once these places are gone, they are gone.

We strongly urge the county to deny NISP. The project is speculative, the benefits cannot be achieved, and the impacts are far-reaching, permanent, harmful, and potentially devastating.

Sincerely,

Karyn D. Coppinger

Mr. Helmick,

This le. er is to voice my opposion t o the NISP project for Glade Reservoir. I know others are subming detailed informaon on the poorly planned aspects of this pr oject, including lack of water rights to fill to reservoir, road, noise polluon and des trucon of the P oudre River water flow and wildlife migratory paths, so I will not reiterate those points.

I have been a 30+ year resident of Larimer County and would be directly affected by the construcon and long-term effects of this project. The entry to my area of residence is via HWY 287. The proposed re alignment of HWY 287 would feed traffic back on to the highway just south of our current entry point. This is already a hazardous spot, with no dedicated turn lane serious accidents occur o en. Why isn't the highway being re-routed to Owl Canyon Road (also a proposed route) where there's room (and the need) for a safely designed turn, exit design? The road re-alignment is another example of a poorly planned aspect of this enr e project.

The proposed NISP/Glade project would be the largest EVER construcon pr oject in Larimer county, yet is basically for the benefit of Weld County communies do wn river at the expense of Larimer County natural resources. The destrucon t o these resources, including historic Overland Trail path, Bellvue valley view sheds, natural habitat (including nesng eagles) riparian w aterways, wild life migraon pa ths and the quality of rural life would never be able to be reclaimed-gone FOREVER!

There are alternav es available that would deliver the water to growing Weld county communies tha t should be examined and implemented instead of NISP. Underground storage sites have been idenfied (in Larimer County) that would sas fy the water storage requirement--combined with increased conservaon measures such as xeriscaping, and the use of grey water storage /use within residenal and c ommercial buildings and parks need to be a part of future planning.

There ARE feasible alternav es to the project as proposed. Let's require NISP to find a soluon tha t does not create irreparable damage to the ciz ens and natural resources of Larimer County for the benefit of poorly planned growth in neighboring counes.

Respecully submi ed,

Rose Walker

Rob Helmick
Larimer County / Community Development

Dear Mr Helmick,
I am writing to give you my comments on the proposed NISP construction. There are those who believe extracting water from the Poudre River can be achieved without doing harm to the already much altered water shed. I have tried to inform myself of the merits of the NISP proposal and am concerned that it is more likely to become an environmental disaster than anything else. In our arid western location with several reservoirs already in place along the Poudre River water shed it might be better to rethink ways to acquire and manage water for future development. Research into various techniques for the procurement of water for people is underway and the future holds promise if entities like the Northern Colorado Water Conservancy District were to require it. In addition to my environmental concerns the construction of NISP will be long, disruptive, and extremely expensive. Even if banks and communities are willing to make financial commitment's for the costs and maintenance of NISP; I suspect that at some point all the taxpayers of the state of Colorado might find themselves paying for the project. The pipeline and road construction will make daily life in the area miserable and leave the landscape torn up and marred for many years and never to be restored to its present state.
Many thanks for your consideration of my comments.
Sincerely,
Tara

Rob Helmick, Senior Planner

PO Box 1190
Fort Collins, CO 80521

Dear Rob,

As a property owner in the Eagle Lake neighborhood, I am writing you with my concerns regarding the 1041 Application for the Northern Water (NISP) pipeline plan. My understanding is NISP is proposing a pipeline route independent from the Thornton pipeline, which is also under consideration by the county. I attended multiple public hearings where county representatives stated that the Douglas Road route, which has established right of ways, is a viable option for the installation of a single pipeline, but not two. Traffic can be diverted and/or detoured so that those living along, or using, Douglas Road would have acceptable access. The problem with the installation of two pipelines is that significant sections of Douglas Road would have to be closed to traffic during construction.

I believe approval of the NISP 1041 Application that takes the pipeline through the Eagle Lake neighborhood, requiring seizure of private property through eminent domain, would and should be challenged in court. The county would be required to prove in court that no other viable option exists. I do not believe the county could prove this to be true.

I am asking the county to deny the 1041 Application for the NISP pipeline as proposed.

Sincerely,

Ted Zibell

DAVID ROY <david.roy@comcast.net> Fri, Jun 5, 2020 at 4:33 PM
Reply-To: DAVID ROY <david.roy@comcast.net>
To: pcboard@larimer.org, bocc@larimer.org, ccsl@fcgov.com

Good afternoon, Larimer County Commissioners;

Legacy. Politics. The environment.

Commissioners Johnson, Kefalas, and Donnelly; you will each have the incredible, once in a lifetime chance, to leave a shared legacy that future citizens will enjoy while protecting and preserving the Cache la Poudre River.

The Northern Integrated Supply Project, if approved and constructed as currently envisioned, will birth 600,000 Colorado citizens on the arid Eastern Plains of Northern Colorado, with the land use and transportation woes that number indicates.

As envisioned, it will also mean the death of one of the most cherished natural resources that Larimer County, in fact, the State of Colorado, has within its jurisdiction; the Cache la Poudre River.

The Cache la Poudre is too often called a 'working river'. It is a dying river. Much of the year, the river channel through Fort Collins is made up of only puddles. For too long, we have been blind to its degradation, because we had fields to irrigate, rooftops to build, and lawns to water.

The three of you can choose to be part of a shared legacy; you can protect and preserve the Cache la Poudre River, give citizens 75 years from now the chance to enjoy it, and improve the habitat that is critical for wildlife and nature to survive along the riparian corridor of the Cache la Poudre River.

The water for NISP is owned by Northern Water. You aren't. Each of you were elected to protect the health and safety of the citizens of Larimer County and the resources of Larimer County. There is no natural resource more precious and important to the citizens here than the Poudre River.

In your roles as elected officials, representing the wishes and values of the citizens of Larimer County, I request that you create legislation that mandates Northern Water run their water for citizens yet to live in Eastern Colorado, under rooftops yet to be built, down the Cache la Poudre River, instead of through a costly and disruptive pipeline.

A healthier Cache la Poudre River, enjoyed 75 years from now by our great grandchildren, is a legacy the three of you can work on together, across the aisle, doing what is best for Larimer County and for the citizens who live here now, and for those who will live here tomorrow.

Thank you for your positive consideration of my request for the three of you to do this meaningful work for the future of the Cache la Poudre River, Larimer County, and the citizens you represent.

Best regards,

David Roy

2 minute time limit on speaking at NISP public comment hearings

2 messages

Brent Hawley <bhawleys@frii.com> Fri, Jun 5, 2020 at 4:14 PM
To: Steve Johnson <swjohnson@larimer.org>, Tom Donnelly <tdonnelly@larimer.org>, John Kefals <jkefalas@larimer.org>, Rob Helmick <rhelmick@larimer.org>

To: Larimer County Commissioners and Rob Helmick

Topic: The unreasonable 2 minute time allowance for speaking at the NISP public hearings (instead of the usual 3 minute).

I am writing to voice my opposition to the change from 3 minute to 2 minute speaking time. In 2 minutes a speaker can barely introduce them selves and give the most simple point of view. In no way can any detail be expressed. I feel like you are trying to mute dissenting voices to the NISP project.

I hope you reconsider and revert to the usual 3 minute time allowance. If you are afraid these hearings would take too long, so be it. That reflects of the size of the project and the concerns of the public.

Thank you for your time.

Respectfully, Brent Hawley

6521 Placer Ct, Bellvue, Colo. 80512

email - bhawley@frii.com

Steve Johnson <johnsosw@co.larimer.co.us> Fri, Jun 5, 2020 at 4:23 PM
To: Brent Hawley <bhawleys@frii.com>
Cc: Steve Johnson <swjohnson@larimer.org>, Tom Donnelly <tdonnelly@larimer.org>, John Kefals <jkefalas@larimer.org>, Rob Helmick <rhelmick@larimer.org>, Lesli Ellis <ellislk@co.larimer.co.us>

Brent, given the large number of people that we expect to want to speak and the limitations on how many people can be in the room at one time due to the pandemic restrictions is the reason we are using a 2 minute time limit. This will enable us to have several groups to come in and speak and leave and another group replace them during each days hearing. We will utilize an online scheduling reservation system for those folks who do want to come in and speak in person. I believe the Planning Commission is using the same time limit. What we are encouraging people to do is to submit written comments by email. There is no limitation on the amount of material that you can submit in writing the head of the hearing. Also another advantage of doing this is that gives all of us a chance to review the material in advance. We also suspect that there will be a large number of people who might have health vulnerabilities to the virus who do not want to be in a crowd of people at this time. We're encouraging them to it written comments as well. Thank you for your email.

Subject: I support the NISP project
To: bocc@larimer.org <bocc@larimer.org>

I saw on Reddit.com/r/fortcollins that there is a form letter by the Sierra Club stating that we should write that we oppose the project.

I just wanted to say that having studied the project, read through a lot of the documentation, and actually surveyed the area where the reservoir would be placed with my wife and children and that we support the project - particularly if the water diversions to fill it are gradual so as to not affect the downstream habitats too much.

It seems like every couple of years the Poudre ends up flooding - in fact, there's a flooding issue that has impacted the Poudre River Trail from Windsor to Greeley right now - and I think having the option to store this water for future droughts that we know are coming is wise. Opponents will say that the solution is conservation but this to me seems like a short-sighted approach. I think a combination of conservation coupled with a solid plan for the future is the best option.

I consider myself an environmentalist, I own an electric car, and we have solar on our house. I am signed up for the green energy option from Fort Collins Utilities for electricity and I do spend time on the Poudre with my family. I am worried about the impact of the outflows but I do trust that the project will be implemented wisely and carefully and thoughtfully and I believe the NISP is necessary for the future.

Subject: Northern Integrated Supply Project
To: <bocc@larimer.org>

Dear Larimer County Commissioners,

I respectfully request that you deny 1041 permit for the proposed Northern Integrated Supply Project based on solid studies that show it would be destructive to the Poudre River and its ecosystem as it flows through Fort Collins and beyond.

Currently, almost 60% of the Poudre?s water is diverted for agricultural, municipal, and industrial uses. If built, during peak flows, NISP could dry up another 71% of the flow through Fort Collins. Studies show that such a reduction would have dire consequences to fish and other aquatic life, riparian ecosystems, water quality, flow volume, and recreation use.

The NISP is expected to cost at least $1.2 billion, although those costs will rise because Northern Water has not obtained enough water rights to date to fill the reservoir. Northern Water must buy ?dozens and dozens? of Larimer and Weld County farms to obtain the water rights needed. Of the 15 communities and water districts that hold shares in NISP, many are outside the Poudre?s watershed.

The NISP is an extremely expensive project that would cause great destruction; disrupt and displace residents around the proposed reservoir, residents along Highway 287, and residents along the proposed pipeline route; and it isn?t needed. There are many conservation actions that would provide all the water proposed to be delivered by Glade, including improved water efficiency by municipal districts, industry, and agriculture; public education and awareness programs; repairs to leaking ditches and pipelines, landscape irrigation improvements, and much more.

The NISP is a controversial project that is of great interest to many people in Larimer County who want full opportunity to comment on the permitting process and to appear at public hearings. Because of the scope and controversy surrounding this proposed project, the Commissioners should wait until the coronavirus pandemic has subsided enough to allow for full in-person public participation.

Sincerely,

Subject: Northern Integrated Supply Project
To: <bocc@larimer.org>

Dear Larimer County Commissioners,

I respectfully request that you deny 1041 permit for the proposed Northern Integrated Supply Project based on solid studies that show it would be destructive to the Poudre River and its ecosystem as it flows through Fort Collins and beyond.

Currently, almost 60% of the Poudre?s water is diverted for agricultural, municipal, and industrial uses. If built, during peak flows, NISP could dry up another 71% of the flow through Fort Collins. Studies show that such a reduction would have dire consequences to fish and other aquatic life, riparian ecosystems, water quality, flow volume, and recreation use.

The NISP is expected to cost at least $1.2 billion, although those costs will rise because Northern Water has not obtained enough water rights to date to fill the reservoir. Northern Water must buy ?dozens and dozens? of Larimer and Weld County farms to obtain the water rights needed. Of the 15 communities and water districts that hold shares in NISP, many are outside the Poudre?s watershed.

The NISP is an extremely expensive project that would cause great destruction; disrupt and displace residents around the proposed reservoir, residents along Highway 287, and residents along the proposed pipeline route; and it isn?t needed. There are many conservation actions that would provide all the water proposed to be delivered by Glade, including improved water efficiency by municipal districts, industry, and agriculture; public education and awareness programs; repairs to leaking ditches and pipelines, landscape irrigation improvements, and much more.

The NISP is a controversial project that is of great interest to many people in Larimer County who want full opportunity to comment on the permitting process and to appear at public hearings. Because of the scope and controversy surrounding this proposed project, the Commissioners should wait until the coronavirus pandemic has subsided enough to allow for full in-person public participation.

Sincerely,

Megan Thorburn

Cc: jkefalas@larimer.org, Steve Johnson <johnsosw@co.larimer.co.us>, Tom Donnelly <donnelt@co.larimer.co.us>

To all concerned,

A very real fact stated by the International Panel on Climate Change (IPCC) is that should our world society fail to cut greenhouse gas emissions (GHG) by almost 50% before 2030 and not reach net zero emission by 2050, we will not keep temperatures below a livable 1.5°C. The world is on course for a catastrophic 3.2°C of warming by the end of the century. The time for correction in now and our time is short.

I don't know if the environment impact statement (EIS) assessed NISP's GHG emissions but logically, given the amount of cement and fossil fuel used to construct it, the miles of new highway, and the energy used to pump/fill the reservoir with river water, it will be enormous. There isn't time for NISP as far a mitigation of the climate is concerned.

Drought and evaporation must be taken into account. The City of Fort Collins commissioned a water supply vulnerability study that considered a range of risks that could plausibly impact the City's future water supplies. The study concluded that "climate change is the most important vulnerability" facing Fort Collins' water supplies and probably all of Colorado's. Northern Water does not have the water rights to fill Glade during low water years, so where will they get the water. Farms? Scientists tell us that higher temperatures will result in lower crop yields. Please read and ponder Save Rural NoCo's hydrological modeling before making this life changing decision regarding NISP, a ramification which will affect so many lives and life itself.

I have played in the Poudre all of my 82 years. As a kid the Poudre was the destination for adventure - hunting snakes with my brother, riding logs after a big flood in mirky water. Later fishing with my mom and dad, rafting and inner tubing, playing with my dog. It would be an utter shame that girls and boys and dogs and folks would miss out, that the natural wildness of the trees and grasses would lose vitality for the lack of sufficient river water.

We know the world is changing but we must do all we can to preserve life. Please vote to find NISP unacceptable.

Sincerely,
Nancy York

No More Dams or Pipelines for the Poudre!

1 message

Trish Babbitt <chaang61@gmail.com> Mon, Jun 8, 2020 at 12:26 PM
To: pcboard@larimer.org, bocc@larimer.org

Dear Larimer County Planning Board & Commissioners,

I am very concerned about some terribly destructive proposals being considered by our planning board & county commissioners concerning the potential for more damming and building of pipelines to carry water out of our precious, overworked Poudre River. As I watch President Trump allow for more and more destruction on many of our formerly protected lands and waters, I fear that some of our local officials are feeling pressured to follow our president's detrimental choices in comparable ways.

Over the past 30 years 1,355 dams were removed in the US. In fact, in 2018, 82 dams were taken down, and in 2019, 90 more were demolished, thereby restoring thousands of miles of wildlife habitat. (Jessie Thomas-Blate, 2/20/19). The trend to remove dams began to increase as well-educated leaders came to realize how much damage dams have caused to wildlife habitats and how much more potential damage there could be if they are not removed. Also, over the past 30 years, growing numbers of people have learned why **we should NOT to build more dams** throughout the United States. Unfortunately, here in northern Colorado, there seems to be a push to build more dams and pipelines to provide water for problematic uses, as is evident with the proposals to dam and pipe the life out of our precious Poudre River.

How is it that certain land developers and government officials are even able to discuss the possibility of damming & building pipelines from Poudre River water when it has national heritage status and when there is so much evidence that damming and piping the Poudre will cause so much harm to the river and its surrounding habitats? (This is the same type of question I ask as I learn of the destruction of formerly protected lands and waters throughout the USA.) I know that in the past many Fort Collins citizens and elected officials have shown progressive thinking in various realms; I hope our current elected officials will listen to their concerned constituents and choose to protect our Poudre and its surrounding wildlife habitats now.

Countless individuals as well as members of community organizations such as the *Sierra Club, Save the Poudre, Save Rural NoCo, & No Pipe Dream* have been working hard to educate elected officials as to why we need to preserve our precious river. While I absolutely share the concerns that many people in these groups hold, I also have other concerns that are often not discussed.

Our elected officials frequently say that we need to dam and pipe our Poudre River to accommodate the masses of people whom they believe will be moving to northern Colorado in the coming years. They lead people to believe that this water will be used for daily uses such as cooking, bathing, and caring for our (maybe?) xeriscaped outdoor areas. Unfortunately, they rarely (if ever) address the huge amount of our water that will be allotted for unsustainable meat and dairy production in northern Colorado.

Our Covid-19 crisis has given some people a tiny glimpse of the terrible conditions in which meat processing workers have been working in Greeley, as well as other meat processing plants throughout the country. Unfortunately, it didn't reveal how much water is used to process meat (and dairy) items that were deemed "essential". While protesters are finally beginning to make their voices heard in the *Black Lives Matter* movement, as videos have shown social injustices happening in real time, "Ag-Gag" laws prevent concerned citizens from revealing the egregious social and environmental injustices that occur in the agriculture industry, especially animal agriculture and which are happening now in northern Colorado. Do we really need to build dams and pipelines that will destroy our river habitats and also perpetuate outdated and cruel working conditions for workers and animals in our animal agriculture industries?

I can't help but believe that animal agriculture lobbyists are pressuring our elected officials to dam and pipe our Poudre River as a way of preserving the unsustainable meat production practices & worker abuses that have been hidden in Greeley from the general public for years. When I asked a NISP representative a few years ago about future-plans for agriculture in Northern Colorado, he said that in a few years all agriculture operations would be moved to Nebraska and Kansas! I can't help but wonder how many local agriculture workers are aware of this plan, and how many government officials and corporate farm operations are in on this secret? It seems that if our elected officials vote to allow our Poudre River to be dammed and piped in the ways that are currently being proposed, it won't be much of a stretch for those in power to continue the pipelines to Nebraska and Kansas to enable corporate farming operations to continue using our water in some very objectionable ways, as the Poudre River and surrounding areas dry up and die.

It is my hope that all of you will listen carefully to the very valid concerns being voiced and act prudently in the decisions you make about the fate of this river. Please don't allow for any further exploitation of this valuable river which has been overworked and could suffer greatly—as could the abundant wildlife that depends on it—if developers et.al. are given permission to build more dams and pipelines, as are currently being proposed.

Sincerely,

Patricia K. Babbitt, 309 Scott Ave., Fort Collins, CO 80521

Reject/Disapprove NISP 1041 Application

1 message

Patrick Crotzer <patrick.crotzer@gmail.com> Mon, Jun 8, 2020 at 10:51 AM
To: pcboard@larimer.org

Larimer County Planning Commission
As you prepare for the upcoming Planning Commission Hearings and follow on County Commissioners' meetings I wanted to provide a couple of general observations and questions as well as questions more focused on the CR 56 area.

I don't believe limiting comments to two minutes per person will allow in-depth information to be exchanged with the Planning Commission and the County Commissioners. There should be a way for people to yield time to a larger group so that more detailed information than "not in my backyard" comments can be made. This would allow more reasonable discussions in the public input. It is worth noting that it was presentations from local grassroots groups like No Pipe Dream and Save the Poudre that brought to light the misinformation put forward by the City of Thornton in its 1041 application presentations, last year. I have attended NISP open houses and have noted a propensity to state opinion and preferences as hard unassailable facts. For this reason I recommend that all 1041 applicants provide their presentations and answers to questions from both the Planning Commission and County Commissioners under oath.

I believe that until the relocation of US Highway 287 has been firmly resolved including a reliable vetting of the ability of the NISP participants to pay for the relocation in full, especially given the strain of the current economic crisis, it is premature to approve either Glade Reservoir or the associated pipelines. In a similar vein it is premature to approve a reservoir for which NISP does not currently own enough water to fill it.

Even if Glade Reservoir is approved, there is no compelling reason to convey water through pipelines in Norther Larimer County. As the Board of County Commissioners have already made clear, water quality for municipal users is not the overarching concern of Larimer County. NISP assertion that there are no viable alternatives to pipelines is false. Water could be conveyed down the Poudre River or through the existing canal infrastructure. NISP already plans to flow water from Glade Reservoir to a point thirteen miles down river to the Poudre River Intake which if done properly would negate a Northern Tier pipeline altogether. Claims of diminished water quality while relatively true are overblown. The South Platt Regional Opportunities Water Group (SPROWG) is proposing to pipe water from near the Colorado Nebraska state lines all the way back to the Denver Metro area for treatment and reuse. Clearly, if that water is economically treatable then water taken from the Poudre River south of Fort Collins should be in even better condition.

Additionally, a survey of the 15 NISP participants websites and associated Water Quality Reports reveal that all but one receive some or all of their water in one way or another from local watersheds in conjunction with Northern Water and the Colorado Big Thompson project. This begs the question, could water from Glade be fed into Horsetooth Reservoir and then distributed via existing infrastructure to service all 15 participants?

NISP has long had a preference for traversing private property in lieu of utilizing existing easements to reduce the requirement to coordinate with other utilities and ditch companies. This puts a huge burden on private property owners who have no choice when faced with eminent domain. Full disclosure, my wife and I own property which is currently on the NISP route. The Northern Tier Pipeline route in the vicinity of CR56 would require easements from a dozen properties instead of just a few or none if it stayed in existing utility, county road and access road easements. Many of the properties already have ditch and utility easements and don't need to be further encumbered. If a pipeline is ultimately approved then we would appreciate Larimer County leadership stipulating use of existing easements along CR 56 until past Elder Lake to make the turn south to Douglas Road.

Thank You for your Time and Consideration

Best Wishes
Patrick Crotzer

patrick.crotzer@gmail.com

Dear Commissioners Kefalas, Johnson, and Donnelly,

I write to you today about the Northern Integrated Supply Project, a plan to provide Poudre River water to promote growth in 15 communities east and south of Fort Collins. I realize it is the purpose of Northern Water to plan and implement projects to meet the future water needs of Northern Colorado. However, the Glade Reservoir project will primarily benefit developers and people outside Larimer County who presently don't even live in this area. This project is looking to accommodate future growth based on an insecure water supply. The drought conditions we see today are predicted to worsen over the next several decades, and building a reservoir that exceeds the capacity of the Poudre River to fill is not sensible or sustainable. Three major problems I see are:

1. the proposed pipeline which will disrupt local communities, and possibly open the door to Thornton's pipe dream to siphon Poudre River water from the mouth of the canyon. This should not be allowed, as the flow through Fort Collins is needed to flush the river and keep it healthy. Also, it will impact the new water park recently completed in Old Town Fort Collins, which relies on a healthy flow to achieve its purpose.

2. Relocating Highway 287 further east to Taft Road, disrupting the lives and properties of the many residents who chose to live in rural Larimer County.

3. Diminishing the natural resources and peaceful environment in rural Larimer County by allowing uncontrolled growth, which will increase pollution and noise due to more traffic through our neighborhoods.

All of these aspects threaten the quality of life rural Larimer residents chose for their lifestyle in this location. Some have been here for many generations. You County Commissioners have the power and tools to preserve our County. Ask yourselves who will benefit and who will pay the price for this project. Please say no to growth, and deny the NISP 1041 permit.

Sincerely,

Patricia Haley-Miller

To allow the Poudre River to become a stinking ditch through Fort Collins to supply water to cities like Erie, etc. should not happen. There has to be a limit to development in this desert area while buying up farms to take their water is short-sighted at best. Drying farmland should not be allowed. Some day we might need the farms to feed our nation.

People will keep coming as long as we build homes, etc. But there should be limit to the destruction to our area because people keep selling farms for residential and commercial use. Hate should be the limit and people should move elsewhere.

Also, we need to stop watering acres of lawns. Conservation must be in the mix so we don't dry up the Poudre River.

Comments on NISP 1041

2 messages

CHARLES KOPP Owner <charleskop@centurylink.net> Sun, Jun 7, 2020 at 1:24 PM
To: pcboard@larimer.org

Dear Planning Commissioners:

I respectfully urge you to deny the 1041 application for NISP, which I along with a multitude of residents of Larimer County feel is simply not worth all the expense and dire environmental consequences that will affect our county. It should be your job to put the interests of Larimer County first when there is a conflict of interests. And this is acting in the name of legitimate self-interest, and not selfishness, as some outside detractors might claim. You know that most of the municipalities that support NISP are outside Larimer County, and feel that they need it to supply enough water for their excessive development plans; and to me the latter is the crux of the problem. It's high time we look at the projected amount of development as a choice and not something inevitable for NOCO. And I get very frustrated when I hear people who even consider themselves environmentalists say things like: "I hate all the development that's coming, but what can we really do about it? The fact is we can put the brakes on it, or at least curtail it; but we need decision-makers like yourselves to be on the side of conservation----and not influenced by profit-driven big development companies that are the driving force behind it.

I'm certainly not against all development. I think much of the development that's occurred in NOCO for years has had very positive results on the region----providing many amenities, more population diversity, culture, and other good things that have made it a really great place to live. However, just because something has been good doesn't mean that more----and especially a lot more----will make things even better, when it fact it can actually make things worse. I really believe that we're at the point now where we should be saying that "enough is enough" when it comes to development, and that it's time to try to stabilize our population----or at least not encourage growth at the projected rate. Of course, we can't directly prohibit large amounts of people from moving here, but there are legitimate and fair things that can be done to discourage it, rather than encourage it----which is what NISP would do.

You well know that despite all the space Colorado has for more development, we live in a semi-arid region where water supply is very precarious, and will probably be getting moreso due to climate trends. So it's expected that the proposed Glade Reservoir would often be reduced to more of a mudhole and also not fit for the recreational purposes planned. And regarding that, I also feel that we certainly don't need another big recreational reservoir in such proximity to Horsetooth. One of the most disturbing things I've heard is that in order to meet the water requirements for NISP----now only about 50% provided according to the analysis----more farmland needs to be purchased in Larimer and Weld Counties for the water rights. In this day and age, we need to preserve more farmland, NOT sell it to development interests. And for what?----so there can be more big subdivisions with thirsty bluegrass lawns and more golf courses? Only the big development companies will profit from such a scheme.

If the 15 or so communities supposedly in favor of NISP really want the development, they have the right under Home Rule the way I understand it. But it shouldn't be at the expense of our great natural resources like the Poudre River and great landscapes in Larimer County. Your decision-making gives us leverage that we should use to act in our best interests, and the NISP communities I'm sure can come up with more innovative and less destructive ways----like more

simple water conservation----to provide the water they think they need. River diversions and new dams and reservoirs really are 19th and 20th century methods that should largely be left in those past centuries. I have supported Save the Poudre, Save Rural NOCO, and No Pipe Dream----the three grassroots organizations---and now more allied---in the long fight against NISP And I really hope that your final decision will be on our side. It would be better to err on the side of conservation----even if such a decision turned out to be a mistake---for such a decision could be reversed. But obviously not so if the final decision is to allow the degradation of our natural resources and quality of life by allowing a massive,expensive, and destructive project.

Lastly, I'll remind you to consider your legacy as decision makers, which I'm sure you want to be a positive one. Do you want to be remembered for acting to protect our great local resources and quality of life for the present and future generations, or for selling out on these things to what amounts to the interests of big developers and the misguided "continuous growth" philosophy? I think the answer is obvious. PLEASE SAY NO TO NISP!

Sincerely,

Charles Kopp

Dear Commissioners and Planning Commission:

Commissioner Johnson
Commissioner Kefalas
Commissioner Donnelly
Rob Helmick

My father resides in the area of the proposed Glade reservoir and I am currently staying at his home acting as his caregiver. I grew up across the state border in Laramie, and since moving to Oregon I have come back year after year to this unique and beautiful area to visit him and my other family members living in Colorado. I want to express concerns with the proposed Glade Project and the negative impacts that would occur if the project moves forward.

The primary benefits of this proposed reservoir would be enjoyed by the 15 subscriber towns or agencies that receive the proposed Glade water. Most of these towns and agencies are outside Larimer County. The most obvious and intense costs would be borne by local and other surrounding communities.

In general, my concern is that the scope and scale of this proposed project, if approved, would have significant, detrimental, and permanent impacts on the rural community and environment.

Specifically, the environment would be negatively impacted in the following ways:

1) Noise - The rerouted highway over the most eastern hogback would have an unobstructed view from residences in the foothills, there would be no middle hogback to block truck and auto noise. The NISP publications suggest that recreation would include motorboats and jet skis. Boats and skis are loud, they would likely be louder than current road traffic.

2) Light Pollution – This rural area enjoys fairly dark skies. The proposed recreational activities would generate significant exterior lighting for boats, facilities, camping, pumping facilities, traffic, etc. and headlights from traffic coming down the hogback on the rerouted 287 would shine into the adjacent private property. This could destroy the enjoyment of night skies.

3) New development - It is not known what sort of development would occur near and north of proposed Glade. The rerouted highway 287 would invite more residential development on the plains. The reservoir would invite more development in the adjacent foothills and valleys. It's not inconceivable that more commercial development catering to visitors would encroach into currently uncommercialized lands, forever altering the rural nature of the area.

4) Trespass – Plans for proposed Glade project almost 400,000 visitors per year. This would include boaters, campers, fishers and hikers and bikers, among others. There is every reason to believe that not all these visitors would stay within the confines of designated recreational areas. Some visitors are likely to explore the inviting foothills that border the reservoir and trespass, however inadvertently, on private property.

5) Wildlife – Proposed Glade would become a significant barrier to the permanent and migratory herds of deer and elk that reside in our area and would be disruptive to other wildlife. In a world where wildlife and nature are under stress, and is diminishing generally owing to human activities, should we be contributing to those activities for unnecessary purposes? Residents encourage the county to find alternatives that don't result in the significant loss of open space and wildlife habitat that this project would cause.

6) Wildfires – In this century three major wildfires burned over 100,000 acres on and around Glade. Two of the three forest fires were caused by careless people. Can we rely on the >1000 daily visitors to proposed Glade to be careful?

7) Emergency response – The recreation on the proposed reservoir is projected to be almost 400,000 visitors per year. Such a large increase in recreationalists would likely increase the number of emergency calls thereby further stretching

emergency response agency resources. Costs would be borne by Larimer County taxpayers, and emergency services that are diverted to Glade would not be readily available to serve the local communities.

8) Air quality – Because Glade would have junior water rights, the water level of the proposed reservoir would be highly variable, unlike Horsetooth. The water level frequently would drop precipitously, often changing proposed Glade Reservoir to Glade Mudflats, and could stay that way for years. The large “bathtub ring” that would materialize around the reservoir would become dry soil that would blow in our strong winds causing air quality and visual concerns. The hundreds or thousands of vehicles that would travel to the area emit gases, particulates, and ozone precursors (i.e., health hazards).

9) Climate change – the pumps, the construction vehicles, the recreational vehicles: the project would result in considerable burning of fossil fuels, forever, and the emission of greenhouse gases. The pumping stations alone would emit the equivalent of adding 7000 GHG emitting cars at a time when Colorado is implementing zero emissions vehicle standards.

10) Aesthetic - The drive from Livermore to Laporte would no longer be through the heritage rangeland and the familiar hogbacks. Since the proposed reservoir would likely be only partially filled much of the time, instead of beautiful hogbacks and grassy foothills, the viewshed would be marred by the barren sides (bathtub ring) and murky surface of a partially filled reservoir.

11) Social justice - While the benefits of proposed Glade would be enjoyed by people who live and work far from the reservoir site, the costs would be borne by those whose quality of life would be severely lessened.

12) Conservation and Alternatives – Conservation is not being adequately considered. While the Colorado Front Range is land-rich for development, it is semi-arid and thus water-limited. About 2/3 of the Poudre is already taken out, and Glade would take another 40% of what’s left. Yet another reservoir is nothing but a temporary fix for a small portion of the state’s water needs; but one with permanent, destructive impacts on a large part of rural northern Colorado. The time is way past due for developing long-term solutions based on state-of-the-art technologies and widespread education on the absolute necessity to conserve water, and to stop relying on 19th century solutions for 21st century challenges.

The Larimer County Commissioners must save its rural communities and be good stewards of its natural resources by saying no Glade Reservoir!

Sincerely,

--

Board of County Commissioners, Larimer County

200 West Oak Street
Fort Collins, CO 80521

Sirs:

I encourage you to deny the NISP 1041 permit. This project is a boondoggle, an environmental and economic disaster that will further compromise the Cache la Poudre River and scar the rural landscape for eternity. Up to half of the time it will be little more than a huge mud puddle, largely negating any claims of its recreational benefits. Please consider alternatives to this poorly planned and wasteful project, including a serious regional water conservation effort.

Sincerely,

Grant Campbell

Dear Planning Comissioners,

Take and take and take the Poudre's water--will that be the "plan" then?

What an awful, unsustainable idea for a hundred reasons, prominently including the ones laid out carefully and clearly in so many communicaons sen t to you for years now from Save the Poudre, other common-sense organizaons, and so man y of us ordinary ciz ens.

Please say no to this very, very bad idea.

I'm an un-radical, very concerned, long-me (34 y ears) Larimer County resident.

Sincerely--John Calderazzo

Subject: message about NISP 1041
To: <bocc@larimer.org>

Dear County Commissioners:

I respectfully urge you to reject the NISP 1041 application. You should definitely put the interests of Larimer County first when there is a conflict of interests, as much as possible, even if outside detractors might say that acting for such legitimate sell-interest is selfish. The mainly out of county communities in favor of NISP should not be allowed to realize their massive, extremely expensive, and unnecessary project at the expense of the already highly-stressed Poudre River and other great natural resources in our county, while also degrading our quality of life. What's really driving NISP are the interests of profit-driven, big national development companies that have influenced community decision-makers and even enough members of these communities. It's high time that we re-examine this runaway development which many regard as inevitable---almost like a law of physics---when it really isn't. Rather it's a choice we make---or at least decision-makers like yourselves make---and I get very frustrated when I hear even people who consider themselves environmentalists say things like: "I really hate all the development that's coming, but what can we really do about it?"

I'm definitely not opposed to development itself, and think that the large amount that NOCO has seen for years has had a lot of positive effects---offering more amenities, a more diverse population, culture, and other good things that have made our region a great place to live. But I really feel we've come to a point where "enough should be enough," and just because something has been good doesn't mean that a lot more will be even better---when in fact it can make things worse. I believe now is the time we should try to stabilize our population, or at least oppose the projected rate of growth, which is bound to undermine our quality of life. Of course we can't directly prohibit a lot of people from moving to NOCO, but there are legitimate and fair-minded ways we can discourage excessive growth, and not encourage it like NISP would do.

If the 15 or so communities behind NISP really want a high level of development, it's their right under Home Rule the way I understand it. But again, it should not come at the expense of our precious environment in Larimer County; and you as decision-makers have the leverage to stop this from happening. If denied NISP, I would bet highly that these communities will find other, and more innovative and environmentally-friendly ways to achieve their goals----including sounder water-conservation policies. You well know that Colorado has the space for more development but a semi-arid climate where water supply is precarious, and likely to get more so with climate trends. The proposed Glade Reservoir is expected to sometimes be reduced to not much more than a mud hole----also precluding many of the recreational opportunities planned for it. And on that matter, it doesn't seem that we at all need another big recreational reservoir in such proximity to Horsetooth. One of the most disturbing things I've heard is that NISP has only provided about 50% of the necessary water supply according to the present analysis; and as a result needs to buy farmland in Larimer and Weld Counties for more water rights. This at a time when we should really be doing all we can to preserve farmland, and NOT sell it for development interests. And for what? ---so there can be more big subdivisions with thirsty, bluegrass lawns and more golf courses?

I've been a supporter of Save the Poudre, Save Rural NOCO, and No Pipe Dream---the three grassroots organizations leading the charge against NISP that are now more allied in the fight. I really hope that your final decision will be on our side. I came from New Jersey, where decades ago a massive project similar to NISP that the Federal government was involved in called Tocks Island was defeated after a very drawn-out battle----which would have dammed the free-flowing Delaware River and created a huge reservoir. For a long time it seemed like a done deal. But it's eventual undoing is still considered one of the great victories of the early years of the environmental movement. If you don't know much about this issue, I suggest you google it. I say that if Tocks Island could be defeated, so can NISP----but we need your help.

Lastly, I'll remind you to consider your legacy as decision-makers, which I'm sure you'd like to be a positive one. Do you want to be remembered for voting in favor of conservation of our great natural resources and our quality of life for present and future generations, or for selling out to pressures from big development interests and the misguided philosophy of "continuous growth?" The answer seems pretty obvious. And voting against conservation in this case would be irreversible, where erring on the side of conservation---should it possibly turn out to be a mistake---isn't. SO PLEASE REJECT NISP!

I also request that the upcoming hearings be further postponed until a time when there can be full participation by the public on this critical issue, and not restricted by conditions of the pandemic, which I presume the scheduled ones would be.

Sincerely,

Charles Kopp

Hello Larimer County Commissioners,

I am writing today to ask you not approve the NISP and Glade Reservoir planned projected.

My thinking is in complete agreement with the following groups:

- Save the Poudre
- Save Rural NoCo
- No Pipedream

By now I believe you have reviewed their objections such as water rights required will have to be purchased from hundreds of farms like in “Buy and Dry” similar to other projects, failure to quantify any requirements to meet state water quality standards, and the overall harm to the Poudre River and riparian forest near it.

This is just a bad idea for the citizens or Larimer County.

Thank you for your attention and please take care of us by not approving this project.

Bill Jenkins

hearings regarding NISP 1041

2 messages

CHARLES KOPP Owner <charleskop@centurylink.net> Sun, Jun 7, 2020 at 4:09 PM
To: pcboard@larimer.org

Dear Planning Commissioners:

I recently sent a message expressing my strong opposition to the NISP 1041 application, and forgot to mention and request that the scheduled hearings on this very big issue be postponed to a time when there can be full and normal public participation in them, without the restrictions due to the pandemic, which I presume the upcoming ones will involve that are bound to limit participation. So please delay them if at all possible. It's too important an issue to limit in-person public participation.

Sincerely,

Charles Kopp

Larimer County Should Not Approve the NISP 1041 Permit Project No. 20-ZONE 2657

1 message

Gregory Holley <gcholleycolorado@gmail.com> Mon, Jun 8, 2020 at 9:12 PM
To: rhelmick@larimer.org, tdonnelly@larimer.org, swjohnson@larimer.org, jkefalas@larimer.org

Dear Commissioners and Planning Commission:

Commissioner Johnson
Commissioner Kefalas
Commissioner Donnelly
Rob Helmick

Esteemed Commissioners,

My great grandmother first purchased a home in the upper Poudre Canyon along the banks of the Cache la Poudre River in 1919. I currently have a home less than a mile from that original homesite, so for over 100 years our family has been living in and enjoying the pristine, majestic, and unparalleled beauty of the Poudre Canyon and surrounding mountain areas. And for the past 40 years or more, we have been constantly on guard and battling those who want to build a dam on the Poudre River to encourage industrial development and supply water to individuals and interests far from the source. Way back when Friends of the Poudre first originated, when Don't Damn the Poudre, Save the Poudre, and many other slogans expressed the desire to protect and conserve the glorious natural world that abounds around the free flowing Poudre river, we have been fearing and fighting this development. And now it's raising its ugly head again, this time more immediate, extensive, and damaging than ever before.

We and countless other residents of Larimer County and beyond were elated, exhilarated, and overjoyed many years ago when the Poudre River was designated as a Wild and Scenic River and granted protected status, as that was supposed to protect the river and its surrounding ecosystems from ever being dammed or developed. However, with the current proposed Glade Reservoir and associated project, that designation and protection is being ignored, and the disastrous effects from the completion of this project would be profound, irreversible, and devastating beyond anything that is conceivable or acceptable. This is a blatantly ill-conceived and ill-advised plan, and its successful completion is highly unlikely. It would inevitably be vastly over budget, extremely under funded, take infinitely much longer than projected, never realize the dreamed of capacity, and cause incalculable damage and destruction to the river, the landscape, ecosystems, habitats, and wildlife. Not just in the immediate area of the impoundment and reservoir, but over the entire course of the river and all the surrounding and adjacent forests, meadows, fields, and terrain. The damage and destruction would encompass many square miles and thousands of acres of gorgeous Colorado mountain landscape. The countless ripple effects of each layer and level of destruction would be far reaching and exceedingly damaging beyond comprehension. This project will never truly fulfill the overblown promises and projections of the proponents, and should be stopped immediately from going any further.

I encourage you to consider in full the long term catastrophic impacts of this disastrous proposal, and I request that you, the commissioners, stewards, and guardians of Larimer County and its residents, to act with insight, integrity, and foresight to deny the 1041 permit for the Northern Integrated Supply Glade Reservoir Project. As you contemplate the reality of the end result, remember that the glossy visions, rosy dreams, inflated projections, and overly optimistic predictions, along with all those individuals who propose and support them, will all disappear and vanish into the mist fairly soon. But the massive destruction, inestimable loss, inescapable problems, negative consequences, and vast devastation will last forever.

Thank you,

--

NISP project

1 message

Gayla Martinez <gmaxwellmartinez@gmail.com> Mon, Jun 8, 2020 at 1:18 PM
To: pcboard@larimer.org

Dear Commissioners,

I am writing to ask that the permit application for the NISP project be denied. We have only begun to explore the many options available to conserve and recycle the water currently available to Front Range residents and businesses.

Our personal water usage has been significantly reduced since upgrading our home's toilets and washing machine, as well as converting our front yard into a native plant habitat. And we are exploring more ways to reduce our water usage even further!

Others can do the same. As a community, we can save our beloved river and learn to live within our means!

Respectfully,
Gayla Maxwell Martinez

To: rhelmick@larimer.org

Dear Mr. Helmick,

We thank the county for the opportunity to comment on the subject NISP project. Please find attached the letter we sent to all three county commissioners.

Appreciatively,

Dean Biggins

NISP letter Biggins 200607.docx
15K

7 June 2020

To: John Kefalas, Larimer County Commissioner
From: Dean and Denise Biggins
Subject: NISP 1041 Permit Application
Project No. 20-ZONE 2657

Dear Mr. Kefalas,

We are writing this letter to express our opposition to the NISP Glade Reservoir Project. Although we find ourselves agreeing with most of the points made by other critics (we are associated with Save Rural NoCo), such as their objections to the increased traffic, noise, ultimate recreational uses, and the general degradation of quality of life in northern Colorado, we would like to take the time here to emphasize one theme in particular. That theme is the sharing of space by human and non-human life.

We have not found the previous discussion of impacts of Glade Reservoir on wildlife particularly satisfying because that discussion represents a piecemeal approach which, by intent, applies to this specific project without much regard to cumulative effects of historic and future developments. Proposed mitigation measures that attempt to compensate for losses specific to this project are commendable but inadequate over the long term. Also, most species are not included in the planning discussion because they do not fall into any statutory category of concern or they have no special economic or recreational value. The latter two (value) criteria we find especially problematic because they avoid consideration of the intrinsic value of non-human life.

Our home is a short distance north of the proposed Glade Reservoir, and we believe the natural community on our property is somewhat representative of the wildlife community that will be destroyed by the reservoir itself and impacted by associated development. Our land is dominated by a mixed shrub-grassland, crossed by several intermittent streams (tributaries of Owl Creek). These sub-irrigated plant communities form riparian habitat that is critical to the biodiversity of the area. We have identified more than 150 species of plants, 98 birds, 28 mammals, 6 reptiles, and 4 amphibians on our property. The total number of vertebrate species is doubtless dwarfed by the number of invertebrate species. The latter may ultimately be the most important of all. As biologist E. O. Wilson put it, “If insects were to vanish, the environment would collapse into chaos.” Unfortunately, insects are indeed vanishing at a higher rate than other organisms (notwithstanding the exceptions like our recent invasion of miller moths). To us, “wildlife” includes all non-human life (not just deer and elk). The point here is to engage ourselves in thinking about the bigger picture beyond our vertebrate tally. There is no doubt in our minds that the riparian zones in our area are important to the overall welfare of larger-scale wildlife habitats. Again, in the words of Wilson, “The most vulnerable habitats of all…are rivers, streams, and lakes…” Thus, we find it particularly disturbing that the Glade project proposes to reduce water flows in a river in order to flood an area with wetlands and intermittent watercourses, resulting in a form of double jeopardy.

We can imagine folks already responding with something like, "So what? This is just one small area of northern Colorado. There is plenty of habitat left." One problem with that logic is the failure to consider cumulative impacts. As E. O. Wilson put it "…the problems created by humanity are global and progressive." We believe longer-term thinking would consider something like Wilson's "Half-Earth" concept. In general, this is a proposal to allocate half of the planet's habitats and "resources" to supporting native ecosystems and their non-human life (and human life indirectly). By some measures, 60% of the water in the Poudre River is already taken for use by humans—we have already locally compromised Wilson's proposal. How much is enough? If one finds the views of an ecologist like Wilson unconvincing, perhaps listening to a theologian will help. In his book, *For the Beauty of the Earth*, Steven Bouma-Prediger writes "…the blue-green sphere on which we live is finite...There is only so much to go around."

When it comes to making difficult decisions, it seems we have another recent lesson from the COVID-19 pandemic. The federal government was generally risk averse, failed to be decisive at critical points, and passed the buck to the states. Some states found it equally difficult to take the responsibility and be decisive, deferring to municipalities and counties. Similarly, when it comes to decisions regarding what our local landscapes are to look like after another 50 or 100 years, the buck may stop with you, the county commissioners. You may think of this as a political nightmare and a liability. We like to think of it as an opportunity. We urge you to deny the present 1041 permit for the Glade project. We hope that this will give you more time to consider the long-term future of Larimer County and how it could become an example for Colorado and for the nation in terms of achieving a unity of high quality human life coupled with an appropriate sharing of space with non-human life. We believe humans can be part of a fully functioning natural ecosystem if we enter the relationship with humility and consideration for other life. We would hope that a high percentage of your constituents would agree if given the chance to reflect and voice their opinions.

Sincerely,

Dean and Denise Biggins

2009

LARIMER COUNTY

Rob Helmick <helmicrp@co.larimer.co.us>

Northern Integrated Supply Project

1 message

Jan Rothe (lemmule@gmail.com) Sent You a Personal Message Mon, Jun 8, 2020 at 10:12 AM
<automail@knowwho.com>
To: pcboard@larimer.org

Dear Larimer County Commissioners,

I respectfully request that you deny 1041 permit for the proposed Northern Integrated Supply Project based on solid studies that show it would be destructive to the Poudre River and its ecosystem as it flows through Fort Collins and beyond.

Currently, almost 60% of the Poudre?s water is diverted for agricultural, municipal, and industrial uses. If built, during peak flows, NISP could dry up another 71% of the flow through Fort Collins. Studies show that such a reduction would have dire consequences to fish and other aquatic life, riparian ecosystems, water quality, flow volume, and recreation use.

The NISP is expected to cost at least $1.2 billion, although those costs will rise because Northern Water has not obtained enough water rights to date to fill the reservoir. Northern Water must buy ?dozens and dozens? of Larimer and Weld County farms to obtain the water rights needed. Of the 15 communities and water districts that hold shares in NISP, many are outside the Poudre?s watershed.

The NISP is an extremely expensive project that would cause great destruction; disrupt and displace residents around the proposed reservoir, residents along Highway 287, and residents along the proposed pipeline route; and it isn?t needed. There are many conservation actions that would provide all the water proposed to be delivered by Glade, including improved water efficiency by municipal districts, industry, and agriculture; public education and awareness programs; repairs to leaking ditches and pipelines, landscape irrigation improvements, and much more.

The NISP is a controversial project that is of great interest to many people in Larimer County who want full opportunity to comment on the permitting process and to appear at public hearings. Because of the scope and controversy surrounding this proposed project, the Commissioners should wait until the coronavirus pandemic has subsided enough to allow for full in-person public participation.

Sincerely,

Jan Rothe

LARIMER COUNTY

Rob Helmick <helmicrp@co.larimer.co.us>

Do Not Approve NISP 1041 Project No. 20-ZONE 2- Save Our Rural Northern Colorado

1 message

John Tschirhart <cheerheart@msn.com> Mon, Jun 8, 2020 at 4:36 PM
To: rhelmick@larimer.org, tdonnelly@larimer.org, swjohnson@larimer.org, jkefalas@larimer.org

Dear Commissioners and Planning Commission:

Commissioner Johnson
Commissioner Kefalas
Commissioner Donnelly
Rob Helmick

There are myriad reasons for rejecting the proposed Glade Reservoir, including, but not limited to the facts that: 1) the FEIS statement that the Glade alternative would ensure that almost no agricultural land will be lost is false, because NISP must now purchase large amounts of water rights from farmers; 2) the Poudre River cannot afford to have large amounts of water diverted for a reservoir if it is to remain a valuable source of scenery, recreation and solace to the Ft. Collins region; and 3) that the proposed reservoir would replace scenic areas north of LaPorte, with a giant mud pit for much of its existence given NISP's low priority water rights. These points and others notwithstanding, I would like to step back and look at the broader idea of building a large dam and reservoir, a 20th Century approach to water management, in a rapidly changing world where our civilization, according to voluminous scientific studies, is having huge and irreversible impacts on the planet's resources.

Locally, the fundamental question is whether a 20th Century approach to water management is still appropriate for the rapidly changing Western U.S., and in particular our rapidly changing Larimer County. The County's population has grown by leaps and bounds in recent decades, and it has experienced the many growth pains that come from pushing up against available ag lands, as more housing, roads, schools, commercial businesses and so on must expand to keep pace with the population growth. But the challenges are just beginning. The County's population is expected to double by 2050. DOUBLE! Where are the already stressed resources going to come from to meet the future challenges?

Considering the need for water, where will the water come from? Building a reservoir like Glade is nothing more than a small band-aid. It would provide a drop in the large bucket that growth will require. In addition, there are few opportunities left for dam building sites, so that Glade would be the last of a 20th Century technology used in the County for dealing with water needs. And it will largely be a failed reservoir at that, given the low priority water rights.

A smarter approach to deal with future growth would be to not rely one more time on a 20th Century technology, but to start developing new approaches and technologies that ensure adequate water supplies. Why spend several billion dollars on a dying technology when funding could be dedicated to searching for, testing, and implementing new methods. Let it be known to future generation that the County, and the County Commissioners in 2020, turned the corner and recognized that the past ways of dealing with growth and water needs were not going to solve the coming problems. Instead they set our direction toward new ideas, both technical and legal, to maintain the quality of life in Larimer County.

NISP comment - Glade

1 message

JOHN TSCHIRHART <cheerheart@msn.com> Mon, Jun 8, 2020 at 2:05 PM

Dear Rob
I'd like the attached comment be added to the comments re the proposed Glade Reservoir. It is also shown below.
thanks
John Tschirhart

There are myriad reasons for rejecting the proposed Glade Reservoir, including, but not limited to the facts that: 1) the FEIS statement that the Glade alternative would ensure that almost no agricultural land will be lost is false, because NISP must now purchase large amounts of water rights from farmers; 2) the Poudre River cannot afford to have large amounts of water diverted for a reservoir if it is to remain a valuable source of scenery, recreation and solace to the Ft. Collins region; and 3) that the proposed reservoir would replace scenic areas north of LaPorte, with a giant mud pit for much of its existence given NISP's low priority water rights. These points and others notwithstanding, I would like to step back and look at the broader idea of building a large dam and reservoir, a 20th Century approach to water management, in a rapidly changing world where our civilization, according to voluminous scientific studies, is having huge and irreversible impacts on the planet's resources.

Locally, the fundamental question is whether a 20th Century approach to water management is still appropriate for the rapidly changing Western U.S., and in particular our rapidly changing Larimer County. The County's population has grown by leaps and bounds in recent decades, and it has experienced the many growth pains that come from pushing up against available ag lands, as more housing, roads, schools, commercial businesses and so on must expand to keep pace with the population growth. But the challenges are just beginning. The County's population is expected to double by 2050. DOUBLE! Where are the already stressed resources going to come from to meet the future challenges?

Board of County Commissioners, Larimer County

200 West Oak Street
Fort Collins, CO 80521

Gentlemen,

I am writing in strong opposition of NISP 1041 and strongly urge you to deny this application. I believe that it will have lasting environmental effects on our county and is not economically wise. It will pull more water from the Poudre River, but not deliver the promised recreational benefits in the reservoir. In fact, much of the time the area will be a huge mud puddle and eye sore for those of us living in this beautiful area. Other important issues are the negative impact on wildlife, increased traffic, increased risk of fires, and increased pollution. Alternative solutions should be explored that involve a clear commitment to water conservation rather than destruction of the environment.

Sincerely,
Jacqueline Voss

Dear Commissioners,

I am writing to ask that the permit application for the NISP project be denied. We have only begun to explore the many options available to conserve and recycle the water currently available to Front Range residents and businesses.

Our personal water usage has been significantly reduced since upgrading our home's toilets and washing machine, as well as converting our front yard into a native plant habitat. And we are exploring more ways to reduce our water usage even further!

Others can do the same. As a community, we can save our beloved river and learn to live within our means!

Respectfully,
Gayla Maxwell Martinez

Do Not Approve NISP 1041 Project No. 20-ZONE 2- Save Our Rural Northern Colorado

1 message

Herb Schaal <herb.schaal@bellvueemporium> Mon, Jun 8, 2020 at 1:38 PM
To: rhelmick@larimer.org, tdonnelly@larimer.org, swjohnson@larimer.org, jkefalas@larimer.org

Dear Commissioners and Planning Commission:

Commissioner Johnson
Commissioner Kefalas
Commissioner Donnelly
Rob Helmick

We are landowners residing in the area of the proposed Glade reservoir that have concerns with the proposed Glade Project and the negative impacts that would occur if the project moves forward.

The primary benefits of this proposed reservoir would be enjoyed by the 15 subscriber towns or agencies that receive the proposed Glade water. Most of these towns and agencies are outside Larimer County. The most obvious and intense costs would be borne by local and other surrounding communities.

In general, our concerns are that the scope and scale of this proposed project, if approved, would have significant, detrimental, and permanent impact on our rural community, environment, and lifestyle we enjoy today and desire to have in the future.

Specifically, our rural environment we believe would be negatively impacted in the following ways:

1) Noise - The rerouted highway over the most eastern hogback would have an unobstructed view from residences in the foothills, there would be no middle hogback to block truck and auto noise. The NISP publications suggest that recreation would include motorboats and jet skis. Boats and skis are loud, they would likely be louder than current road traffic.

2) Light Pollution – This rural area enjoys fairly dark skies. The proposed recreational activities would generate significant exterior lighting for boats, facilities, camping, pumping facilities, traffic, etc. and headlights from traffic coming down the hogback on the rerouted 287 would shine into the adjacent private property. This could destroy the enjoyment of our night skies.

3) New development - We do not know what sort of development would occur near and north of proposed Glade. The rerouted highway 287 would invite more residential development on the plains. The reservoir would invite more development in the adjacent foothills and valleys. It's not inconceivable that more commercial development catering to visitors would encroach into currently uncommercialized lands, forever altering the rural nature of the area.

4) Trespass – Plans for proposed Glade project almost 400,000 visitors per year. This would include boaters, campers, fishers and hikers and bikers, among others. There is every reason to believe that not all these visitors would stay within the confines of designated recreational areas. Some visitors are likely to explore the inviting foothills that border the reservoir and trespass, however inadvertently, on our private property.

5) Wildlife – Proposed Glade would become a significant barrier to the permanent and migratory herds of deer and elk that reside in our area and would be disruptive to other wildlife. In a world where wildlife and nature are under stress, and is diminishing generally owing to human activities, should we be contributing to those activities for unnecessary purposes? We encourage the county to find alternatives that don't result in the significant loss of open space and wildlife habitat that this project would cause.

6) Wildfires – In this century three major wildfires burned over 100,000 acres on and around Glade. Two of the three forest fires were caused by careless people. Can we rely on the >1000 daily visitors to proposed Glade to be careful?

7) Emergency response – The recreation on the proposed reservoir is projected to be almost 400,000 visitors per year. Such a large increase in recreationalists would likely increase the number of emergency calls thereby further stretching emergency response agency resources. Costs would be borne by Larimer County taxpayers, and emergency services

Fort Collins Nursery

June 8, 2020 LETTER OF OPPOSITION

Re: NISP 1041 Permit Application

To the members of the Larimer County Planning Commission,

I own and operate Fort Collins Retail Nursery, and am an authorized representative for AJA Properties, LLC, the entity that owns the property Fort Collins Nursery occupies, located at 2121 E. Mulberry St. in Fort Collins (the "Property"). The current plan to pass the pipeline through the center of the Property would be extremely disruptive and costly to my business. The following sets forth the major issues I foresee at this time:

- The proposed Pipeline route would bisect significant portions of the Property. During a meeting with Northern Water engineers, including Stephanie Cecil, P.E., I learned that the construction of the Pipeline would require a 100 foot wide berth along the Pipeline route. At times, they could reduce that to 40 feet, but not for the entire distance that the route would run through the Property. Even at the minimum 40 foot width, the path occupied during the construction phase would cause massive disruptions to daily operations. The easement route itself is a critical thoroughfare through the Property for operations, customer traffic, and truck traffic, including waste hauling, receiving, and service vehicles. Due to the width of the proposed easement, we would also be required to temporarily remove some of our enclosed growing facilities, which would impact our ability to grow the plants our business depends on.

- Should NISP ever need to service the Pipeline, my understanding is that they would have the right to perform that service at any time they deem necessary. While Northern Water has assured me they have a strong track record of not needing to do disruptive repairs, it is unreasonable to think that the possibility of disruption could ever be eliminated. This means that we would never be clear of the threat of further disruptions, and could not pick or choose the timing of disruptions. My business is highly seasonal. Should repair become necessary the revenue loss would be severe. The potential disruption to our business and inability to fully access our Property at any time of year would increase operating costs and create issues with our ability to effectively serve customers, damaging our bottom line and our hard-won reputation.

- A permanent utility easement through the Property would significantly cap any potential development value the Property possesses. Moreover, with the City of Fort Collins taking clear and obvious steps to annexing this portion of East Mulberry St. into the City, frontage road property will increase in value. This type of easement, at 100 feet in width, bisecting the Property would eliminate our ability to enjoy any potential appreciation in value.

- Our business cannot survive without a reliable water source. A vast majority of the plants we grow and sell in our business rely on an adjudicated well that is part of the Cache la Poudre Augmentation Plan, overseen by the Larimer County Underground Water Users Association, located on the Property ("Well"). Any major underground work poses the potential risks of interfering with the Well, including without limitation impacting the amount of water that can be pumped from the Well. In the event of a significant disruption or reduction in the pumping capacity or yield from the Well, we would be forced to forego a reliable water source and switch to using municipal water. This switch

would be costly both in the installation and in the long term cost of using treated water for agricultural applications.

In sum, the proposed Pipeline route will significantly impact our business, the use of our Property and value of the same, and our livelihood. Further, based on the current proposed plans and specifications for the Pipeline route, our Property appears to be the only one that runs an operational business right in the middle of the proposed Pipeline alignment. Accordingly, given the significant impacts that the Pipeline route will have on our business and the Property, I respectfully request that the Larimer County Planning Commission does not approve the proposed route for the Pipeline through our Property, and, instead, consider alternative, less invasive routes. I welcome continued discussion of such alternatives to the proposed route, and I am confident that with your help, a route can be established that does not so disproportionately affect our business.

Thank you for your consideration.

Jesse Eastman
Owner, Fort Collins Retail Nursery, Inc.

To: pcboard@larimer.org, bocc@larimer.org

Dear County Commissioners,

Water has the ability to do more than generate profits for developers and taxes for Thornton. Water can help the flora and fauna along the Cache la Poudre River survive and thrive. But water can do that only if you put it through the river.

You were elected to look out for the interests of Larimer County. Please decide to preserve the natural resources of Larimer County by maintaining healthy flows through the Cache la Poudre River.

Re: NISP 1041 Permit Application; Project No. 20-ZONE 2657

Larimer County Board of County Commissioners
200 West Oak Street
Fort Collins, CO 80521

Dear Commissioners:

We are landowners residing in northern Larimer County close to the northern end of the proposed Glade Reservoir. Please include this letter, together with your response, in the administrative record for the 1041 permitting process for this ill-advised and unsustainable project. For the reasons expressed in this letter and the detailed comments already provided to you by Save the Poudre and Save Rural Northern Colorado, we respectfully request that you deny the permit application for this harmful, ill-conceived, and inadequately mitigated project.

The comments filed by Save the Poudre and Save Rural Northern Colorado explain the numerous significant and irreversible adverse environmental impacts, habitat loss, degradation of property values, and destruction of the rural and aesthetic characteristics of the impacted area. We support those comments and request that you give them careful and diligent consideration in making your decision on this permit application.

While those who live in proximity to this proposed project would bear the brunt of those extensive impacts, the alleged "benefits" of the project would primarily accrue to special interests outside of Larimer County. In this regard, it is especially important that our Larimer County Commissioners give careful and diligent consideration as to whether the benefits claimed for this project will ever become a reality. In particular, in light of the extensive adverse economic impacts and budget shortfalls resulting from the Coronavirus pandemic, the permit review process must include a careful and detailed independent analysis of the financial feasibility of this project in light of these new economic realities, which were unforeseen and unaccounted for during the conception and planning of this project.

No permit should be approved unless a review by Larimer County conclusively demonstrates that highway relocation, reservoir completion, water rights acquisition, and implementation of all necessary mitigation measures is fully assured in light of the current budget and economic climate. Failure to perform such a thorough and careful analysis would create an unacceptable risk that the many well documented adverse impacts associated with this project would begin to accrue upon project initiation, only for the so-called "benefits" of the project which were relied upon in justifying those impacts to never materialize.

In addition, it is essential that any consideration given to this proposed project take into full account its cumulative impacts with the proposed Seaman's and Halligan expansions. Both of those projects, together with the proposed Glade Reservoir, will have cumulative impacts on the environment and local rural communities well beyond the scope of their individual project effects. Failure to fully consider and analyze such cumulative impacts when reviewing the proposed Glade Reservoir permit would result in an inadequate and flawed decision making process that fails to adequately consider and account for the full effects associated with the project over time. Failure to consider such cumulative effects would also preclude the ability to make adequate judgments as to the need for, and scope of, each of these projects, alternatives thereto, and potentially create an arbitrary situation where project review is conducted in isolation based upon a "first-come-first-served" approach.

Lastly, we are particularly concerned about the potential for any power boat usage to occur on the proposed reservoir. The noise, lights, and general disturbance that would be created from such activities would be especially adverse to any property owners, such as ourselves, located in direct view of, and above, the proposed reservoir location, Highway noise from US 287, which is currently partially screened by a middle hogback, is already extensive and will significantly worsen with the highway realignment proposed to accommodate the reservoir. Allowance of power boat usage would compound this problem to unacceptable levels and negatively impact property values.

We appreciate the opportunity to provide these comments and ask that you give these careful consideration during your 1041 permitting process.

Sincerely,

John Lishman

Joanne Lishman

Northern Integrated Supply Project

1 message

CLAUDIA PARKER (clp484@gmail.com) Sent You a Personal Message Mon, Jun 8, 2020 at 8:49 AM
<automail@knowwho.com>
To: pcboard@larimer.org

Dear Larimer County Commissioners,

I respectfully request that you deny 1041 permit for the proposed Northern Integrated Supply Project based on solid studies that show it would be destructive to the Poudre River and its ecosystem as it flows through Fort Collins and beyond.

Currently, almost 60% of the Poudre?s water is diverted for agricultural, municipal, and industrial uses. If built, during peak flows, NISP could dry up another 71% of the flow through Fort Collins. Studies show that such a reduction would have dire consequences to fish and other aquatic life, riparian ecosystems, water quality, flow volume, and recreation use.

The NISP is expected to cost at least $1.2 billion, although those costs will rise because Northern Water has not obtained enough water rights to date to fill the reservoir. Northern Water must buy ?dozens and dozens? of Larimer and Weld County farms to obtain the water rights needed. Of the 15 communities and water districts that hold shares in NISP, many are outside the Poudre?s watershed.

The NISP is an extremely expensive project that would cause great destruction; disrupt and displace residents around the proposed reservoir, residents along Highway 287, and residents along the proposed pipeline route; and it isn?t needed. There are many conservation actions that would provide all the water proposed to be delivered by Glade, including improved water efficiency by municipal districts, industry, and agriculture; public education and awareness programs; repairs to leaking ditches and pipelines, landscape irrigation improvements, and much more.

The NISP is a controversial project that is of great interest to many people in Larimer County who want full opportunity to comment on the permitting process and to appear at public hearings. Because of the scope and controversy surrounding this proposed project, the Commissioners should wait until the coronavirus pandemic has subsided enough to allow for full in-person public participation.

Sincerely,

Hello. I am a resident of Larimer County and moved to Fort Collins almost 4 years ago.

One reason for our move here was to enjoy the Poudre and the benefits of clean water in Northern Colorado. My husband and I are avid outdoorspeople, and are also xeric gardeners. Water is extremely important to us and we feel that if it weren't for how Larimer County manages the Poudre, with limited resources, our county would suffer.

Please vote NO to NISP. It's a bad idea that will negatively affect our way of life in Northern Colorado.

Thank you for doing the right thing and preserving our precious water resource.

Sincerely,

Renee P. Walkup

Subject: PLEASE NO NISP PIPELINE!
To: <pcboard@larimercounty.org>, <bocc@larimer.org>

The NISP project will affect the quality of life with a huge pipeline project through northern neighborhoods.
I object to it taking water out of the Poudre River which is already depleted.
Please stand up for Northern Larimer County residents and say NO.

Susan Davis
1103 Bateleur Lane, Fort Collins, CO 80524

June 9, 2020

Dear Mr. Helmick,

I am writing to inform the Larimer County Planning Commission and County Commissioners of concerns with the NISP proposal.

1. As with the Thornton pipeline proposal not all residents in the proposed impact areas were notified by mail as required by the public input process. This is an ongoing issue with applications like these. As a resident of the S BAR G conservation development, I have registered several times with Thornton to be on mailing lists and there was never a change in the amount of contacts I received. I am afraid the same lack of citizen input is happening with the NISP process. There should be a requirement for the applicant, NISP in this case, that the county mailing list may not be complete and they are responsible for ensuring that affected residents are notified of application process timelines and deadlines for input. I was notified late last night about the deadline for today's input for NISP to ensure my comments go in the planning commission packet. I have no problem getting my property tax bills so I know I am in the county database.

2. The public notice process is also suspect for the NISP project as placing a notice at the courthouse was impeded by the Governor's stay at home orders in Larimer County and the closure of the county offices that draw people who may read that posting and become aware of the project.

3. How can a project the size of NISP go through the EIA and EIS process and still have a note that moving highway 287 is to be done by others. If this is the case then the same Federal Nexus for that realignment should also go through the Federal EIA and EIS process prior to moving the highway. As such the NISP project needs to wait a little longer for this to happen.

4. It appears that not all of the 1041 requirements were met in the application as other have pointed out. Will this result in another lawsuit by NISP parties against the county? If so does the county have a plan to defend itself and require NISP to repay the citizens for legal fees. Legal fees do cause harm to the county and should be noted as such in the NISP application form which they are not.

Unfortunately I was denied sufficient time to review and respond to the NISP application for the above mentioned reasons. I hope the planning commission, the board of county commissioners and other citizens concerns will be heard as my concerns as well.

Regards,

Scott GLick

Daniel Teska <dt2885@gmail.com> Mon, Jun 8, 2020 at 7:59 PM
To: "bocc@larimer.org" <bocc@larimer.org>, "ccsl@fcgov.com" <ccsl@fcgov.com>, "pcboard@larimer.org" <pcboard@larimer.org>

Dear Commisioners Donnelly, Johnson, and Kefalas,

I am writing you today to urge you to oppose NISP. The Cache la Poudre River is the heart and soul of Larimer County and Fort Collins, and allowing NISP to move forward would result in the destruction of the very river that provides irrigation for farmers, recreation, wildlife habitat, and aesthetics and beauty for our community.

You have the opportunity to provide a legacy for our children and grandchildren. If NISP is allowed to be built, the chance for them to enjoy the river as it now exists would disappear. Imagine if the National Park system was not created. We would have lost the public lands that we now enjoy, the incredible beauty of the country that we see every day. Without the Endangered Species Act, we would have lost many of the flora and fauna that are an essential part of a functioning ecosystem, and a chance to enjoy the plants and animals that Would have otherwise been lost. We would have lost our national symbol, the Bald Eagle, as well as many plant and animal species that have been saved because of the ESA.

You have heard the arguments for opposing NISP, but they are worth repeating here. Water from the reservoirs created by NISP would go outside of Larimer County, to Weld and Boulder County towns. It would reduce Poudre River flows to a trickle through Fort Collins and beyond, after the city spent millions building a new whitewater park. There would be massive dam construction impacts for local residents and massive pipeline construction impacts, destroying or damaging many Larimer County and Fort Collins natural areas. It would be necessary for NISP to buy 20,000 acres of farms for their water rights, taking farmland out of production that is needed for our future.

The impact on our rural communities would be huge. The noise, traffic, and air pollution caused by dam construction would negatively impact their way of life. Irreparable harm of the land, air, water and rural character would result from this project.

Pipeline construction impacts would be massive. Private property would need to be seized by eminent domain, road construction and environmental impacts would have a detrimental effects on day to day life. Natural areas would be lost, resulting in degraded ecosystems and recreational opportunities, not to mention the effects on wildlife and habitat.

NISP would result in the degradation of flows and water quality of the Poudre. It would mean the destruction of the river as we know it.

Is that the legacy you want to leave, or do you want to leave a legacy where the Poudre River would be protected and preserved for future generations? There are alternatives to provide water for future residents of Larimer County. But if you allow NISP to go forward, the loss of the river as we know it would be unimaginable.

Thank you for the opportunity to share my thoughts on this important subject. Please oppose NISP. Our children and grandchildren will thank you for the vision to make a very difficult decision.

Sincerely,

Dan and Val Teska

Do Not Approve NISP 1041 Project No. 20-ZONE 2- Save Our Rural Northern Colorado

1 message

Linda Griego <dakolinda@gmail.com> Mon, Jun 8, 2020 at 4:23 PM
To: rhelmick@larimer.org, tdonnelly@larimer.org, swjohnson@larimer.org, jkefalas@larimer.org

Dear Commissioners and Planning Commission:

Commissioner Johnson
Commissioner Kefalas
Commissioner Donnelly
Rob Helmick

RE NISP 1041 Permit Application; Project No. 20-ZONE 2657

Hello, my name is Linda Griego and I am a home owner on County Road 29C, which is the closest neighborhood to the proposed Glade reservoir. We have 29 households that have NOT had a say in the planning of this project because NISP did not – I repeat, DID NOT reach out to us or our neighbors who live on Bonner Peak, which is the next closest neighborhood to the proposed Glade project, other than one general meeting in Livermore. And that was after I contacted Northern Water and asked why they had not reached out to the closest communities to the project. When asked why we had not been contacted about NISP, I was told they did not have to contact anyone unless they were within ½ mile of the project. We are less than a quarter mile away. This is totally unacceptable considering the fact NISP has claimed they have done extensive outreach.

We strongly urge the county to deny the 1041 permit application based on the fact it will cause permanent damage to our quality of life. We are especially concerned about the following:

1) Noise - The rerouted highway over the most eastern hogback would have an unobstructed view from residences in the foothills, there would be no middle hogback to block truck and auto noise. The NISP publications suggest that recreation would include motorboats and jet skis. Boats and skis are loud; they would likely be louder than current road traffic.

2) Light Pollution – This rural area enjoys fairly dark skies. The proposed recreational activities would generate significant exterior lighting for boats, facilities, camping, pumping facilities, traffic, etc. and headlights from traffic coming down the hogback on the rerouted 287 would shine into the adjacent private property. This could destroy the enjoyment of our night skies.

3) New development - We do not know what sort of development would occur near and north of proposed Glade. The rerouted highway 287 would invite more residential development on the plains. The reservoir would invite more development in the adjacent foothills and valleys. It's not inconceivable that more commercial development catering to visitors would encroach into currently un-commercialized lands, forever altering the rural nature of the area.

4) Trespass – Plans for proposed Glade project almost 400,000 visitors per year. This would include boaters, campers, fishers and hikers and bikers, among others. There is every reason to believe that not all these visitors would stay within the confines of designated recreational areas. Some visitors are likely to explore the inviting foothills that border the reservoir and trespass, however inadvertently, on our private property.

5) Wildlife – Proposed Glade would become a significant barrier to the permanent and migratory herds of deer and elk that reside in our area and would be disruptive to other wildlife. In a world where wildlife and nature are under stress, and is diminishing generally owing to human activities, should we be contributing to those activities for unnecessary purposes? We encourage the county to find alternatives that don't result in the significant loss of open space and wildlife habitat that this project would cause.

6) Wildfires – In this century three major wildfires burned over 100,000 acres on and around Glade. Two of the three forest fires were caused by careless people. Can we rely on the >1000 daily visitors to proposed Glade to be careful?

7) Emergency response – The recreation on the proposed reservoir is projected to be almost 400,000 visitors per year. Such a large increase in recreationalists would likely increase the number of emergency calls thereby further stretching

emergency response agency resources. Costs would be borne by Larimer County taxpayers, and emergency services that are diverted to Glade would not be readily available to serve the local communities.

8) Air quality – Because Glade would have junior water rights, the water level of the proposed reservoir would be highly variable, unlike Horsetooth. The water level frequently would drop precipitously, often changing proposed Glade Reservoir to Glade Mudflats, and could stay that way for years. The large “bathtub ring” that would materialize around the reservoir would become dry soil that would blow in our strong winds causing air quality and visual concerns. The hundreds or thousands of vehicles that would travel to the area emit gases, particulates, and ozone precursors (i.e., health hazards).

9) Climate change – the pumps, the construction vehicles, the recreational vehicles: the project would result in considerable burning of fossil fuels, forever, and the emission of greenhouse gases. The pumping stations alone would emit the equivalent of adding 7000 GHG emitting cars at a time when Colorado is implementing zero emissions vehicle standards.

10) State Land Usage - The large area of state land west of the proposed reservoir is devoted to hunting and cattle grazing. The state and federal lands in this region of northern Colorado provide abundant and easily accessible opportunities for recreation, which we gratefully utilize. Impacts to use of or access to the state land is a negative impact to our communities.

11) Aesthetic - The drive from Livermore to Laporte would no longer be through the heritage rangeland and the familiar hogbacks. Since the proposed reservoir would likely be only partially filled much of the time, instead of beautiful hogbacks and grassy foothills, our viewshed would be marred by the barren sides (bathtub ring) and murky surface of a partially filled reservoir.

12) Lack of combined Project evaluation/coordination - There is no apparent coordination of the NISP or the proposed Seaman’s expansion or the Halligan expansion. All these projects surround our properties and would leave us on a peninsula of land cut from the rural environment we now enjoy. We met with the City of Greeley in August 2018 and learned that they are not planning to cooperate with other cities due to “challenges” and are proceeding on an expansion of Seamen’s reservoir from 5,000 to 80,000 acre-feet. In the 21st century, surface storage just doesn’t make sense; this is a semi-arid climate that is getting drier. Alternatives are available and should be seriously considered.

13) Social justice - While the benefits of proposed Glade would be enjoyed by people who live and work far from the reservoir site, the costs would be borne by those whose quality of life would be severely lessened.

14) Conservation and Alternatives – Conservation is not begin adequately considered. While the Colorado Front Range is land-rich for development, it is semi-arid and thus water-limited. About 2/3 of the Poudre is already taken out, and Glade would take another 40% of what’s left. Yet another reservoir is nothing but a temporary fix for a small portion of the state’s water needs; but one with permanent, destructive impacts on a large part of rural northern Colorado. The time is way past due for developing long-term solutions based on state-of-the-art technologies and widespread education on the absolute necessity to conserve water, and to stop relying on 19th century solutions for 21st century challenges.

In addition, I would add a few more serious concerns of the negative impacts that particularly relate to our neighborhood:

1) The majority of residents living on County Road 29C are older - retired citizens with a median age range of 65, many who are living with already existing health conditions, including myself. In light of that, safety and air pollution in addition to the light, and noise pollution would have a very serious negative impact on our health and our neighborhood during the 5-7 plus years of construction.

2) The structural integrity of our homes, our wells and our septic systems, with heavy equipment moving and blasting in the area will have a negative impact on our property and our values, especially with the sight of a ‘DAM’ in our front windows, which would take away the aesthetic values of why we moved out there in the first place. Would you want to look out your front window and see such a 280 foot monstrosity instead of deer, coyotes or hawks and eagles?

3) The impact on wildlife and conservation in the surrounding area, in particular, a Bald Eagle’s nest which is less than a third mile away, possibly nesting within the 1,500 ft. regulation distance for construction. I have watched these Bald eagles for 20+ years raise many fledglings and I felt privileged the day I saw them mating one year over the Poudre River. The NISP Environmental Impact Statement has plans to block this nest while they destroy the surrounding area because the state rule says they cannot do heavy construction within a certain distance of the nest. Is this what Larimer County Commissioners support for this community?

4) The ATLAS Missile Silo 13 may be disrupted, which according to several websites and articles, the possibility remains that there may STILL be the danger of a plume front which could not only contaminate our water supply but possibly the Poudre River and the Glade reservoir water supply.

I’d also like to question what analysis has been done in the permit application or the EIS of what impacts the NISP project

will have on businesses in Laporte. I frequent the Old Feed Store, owned by an older couple, and question whether the relocation of highway 287 will negatively impact small businesses such as these. Will they suffer and possibly be force to close from the lack of traffic coming from Red Feather, Livermore and other local communities along Highways 287 and 14, etc., who now frequent their store to buy livestock and pet food but will be redirected much further north?

And finally, I am asking the County Commissioners to please deny the 1041 permit based on all these damaging impacts to the community and to Larimer County residents. I personally believe this project would have the greatest negative environmental impact in the history of Larimer County.

Thank you,

Linda Griego

NISP comments

1 message

Larry Lechner <larlec@frii.com> Mon, Jun 8, 2020 at 6:49 PM
To: jkafalas@larimer.org, swjohnson@larimer.org, tdonnelly@larimer.org, rhelmick@larimer.org

To all concerned, I am listing my comments on the NISP project into the body of this email and attaching a copy as a .pdf as well in case this aids your record keeping or suits you reading style better.

June 8, 2020

To the Larimer County Commissioners,

As a resident of Bellvue who lives less than five miles from the proposed NISP Glade Reservoir I would like to voice my strong opposition to the project.

I will not attempt to articulate the many technical, legal and community issues with the project as they have been articulated by others much more capable than me. I do request that you do pay close attention to those concerns and note that I share many of them.

Beyond those concerns I request that you consider the following:

1. Larimer County does not necessarily accrue any direct concrete benefits from the project and all benefits such as recreation (the only real benefit I could perceive) are at best potential and would not necessarily benefit the residents of Larimer County as most likely many of those recreating would come from neighboring communities and/or the Denver metropolitan area. This could severely impact the quality of life for those of us currently residing in the area with increased traffic, noise, vandalism, etc.

2. Pleasant Valley has been the site of several major construction projects during the last several years – the upgrade of the Fort Collins pipeline, improvements to the Greeley pipeline, the Noosa Yogurt factory and a large expansion of the Morning Fresh Dairy. This too has lowered the quality of life substantially for many in the valley with increased noise, traffic and construction activities. Enough is enough. We do not need several years of construction noise, traffic rerouting and heavy machinery in our area especially if it brings no value to our lives or the local community.

3. The land upon which Glade will be build is, at present, an excellent component of the corridor connection between the mountain and planes ecotypes and the Front Range is losing these connection points at an alarming rate due to increasing development. How does it benefit Larimer County to sacrifice such an important landscape? What do we gain by foreclosing yet another key part of our environment to development? Nothing.

4. There is not adequate zoning in place to control the increased development associated with this type of development and, as we have seen, the voices of the development community are much louder than local voices and the resident communities, in this case Bellvue and Laporte, suffer. Without strong zoning based upon local community values in place there is no security for our communities.

5. It is clear that the cities and districts that would benefit from this project need water if they are to continue their rapid pace of development. However, the Glade project is not the correct solution especially since we pay the price and derive no benefit. Perhaps they should consider their plans

more carefully understanding the natural constrains of this landscape. It is not our problem to solve.

As indicated earlier there are many reasons to deny the Glade proposal, far beyond what I have presented here. My hope is that you hear all the concerns expressed in the growing chorus of opposition by members of your constituency. We elected you as our representatives so please hear our voices and turn down this project.

Warm regards,

Larry Lechner

To: pcboard@larimer.org
Cc: bocc@larimer.org

Hello Planning Commissioners,
Thank you for your thoughtfulness on planning issues that affect Larimer County. I am writing regarding the NISP application that was recently deemed complete by the Board of County Commissioners.

As you have likely read in the formal letter from No Pipe Dream, Save the Poudre and Save Rural NoCo's attorneys, there are many reasons why the application is not complete. One of the biggest being the exclusion of the relocation of Highway 287 from the 1041 application. Excluding the relocation of a 7 mile stretch of a major highway/truck route (and deeming it a separate CDOT project) is obviously manipulative and wrong. Pulling this from the original proposal can only speak to concerns that it wouldn't be accepted if it was included. This relocation is a huge expense, and will also have major impacts on public safety, disruption of private land and visual impacts. All these costs and impacts must be considered.

I am also concerned that water for the reservoir has yet to be secured--relying on a hopeful Buy and Dry scheme of area farms (which as you know leaves land unusable)--and the negative impact it will have on the flow of the Poudre River.

I ask you to deem the NISP application incomplete until these, and several other concerns, are addressed.

Thank you,
Lynn Utzman-Nichols
Fort Collins

LARIMER COUNTY

Rob Helmick <helmicrp@co.larimer.co.us>

Do Not Approve NISP 1041 Project No. 20-ZONE 2- Save Our Rural Northern Colorado

1 message

mila garelle <milagarelle@gmail.com> Mon, Jun 8, 2020 at 10:09 PM
To: rhelmick@larimer.org, tdonnelly@larimer.org, swjohnson@larimer.org, jkefalas@larimer.org

Dear Commissioners and Planning Commission:

Commissioner Johnson
Commissioner Kefalas
Commissioner Donnelly
Rob Helmick

We are landowners residing in the area of the proposed Glade reservoir that have serious concerns regarding the proposed Glade Project and the negative impacts if the project moves forward.

My concerns are that the scope and scale of this proposed project, if approved, would have significant, detrimental, and permanent negative impact on our rural community, environment, and safety we enjoy today and depend on to have in the future.

Specifically, our rural environment would be negatively impacted in the following ways:

The rerouted highway 287 would:
be so much more dangerous than it is now (which is already deadly), especially in winter!,
destroy more natural landscapes, (pave paradise)
destroy wildlife habitat and further interfere with migrations,
encourage more invasive weeds to our agricultural economy,
create an eyesore 24/7 over the ridge east of the glade,
create significantly more noise (24/7) from trucks going up and braking going down the reroute over the ridge,
create light pollution far and wide from headlights every night from vehicles, especially trucks going up and over the ridge.
The current routing of 287 is in the valley and prevents widespread negative impact from noise, light and weed dispersal that would result from rerouting over the ridge.
Do NOT reroute over the ridge. It makes no sense for the environment, budget and routing of semi's livestock trailers, RVs, trucks, motorcycles and other vehicles that use this route heavily every day.

Air quality – Because Glade would have junior water rights, the water level of the proposed reservoir would be highly variable, unlike Horsetooth. The water level frequently would drop precipitously, often changing proposed Glade Reservoir to Glade Mudflats, and could stay that way for years. The large “bathtub ring” that would materialize around the reservoir would become dry soil that would blow in our strong winds causing air quality and visual concerns. The hundreds or thousands of vehicles that would travel to the area emit gases, particulates, and ozone precursors (i.e., health hazards).

Climate change – the pumps, the construction vehicles, the recreational vehicles: the project would result in considerable burning of fossil fuels, forever, and the emission of greenhouse gases. The pumping stations alone would emit the equivalent of adding 7000 GHG emitting cars at a time when Colorado is implementing zero emissions vehicle standards.

Conservation and Alternatives – Conservation is not begin adequately considered. While the Colorado Front Range is land-rich for development, it is semi-arid and thus water-limited. About 2/3 of the Poudre is already taken out, and Glade would take another 40% of what’s left. Yet another reservoir is nothing but a temporary fix for a small portion of the state’s water needs; but one with permanent, destructive impacts on a large part of rural northern Colorado. The time is way past due for developing long-term solutions based on state-of-the-art technologies and widespread education on the absolute necessity to conserve water, and to stop relying on 19th century solutions for 21st century challenges.

The Larimer County Commissioners is obligated to serve and protect our rural communities and be good stewards of our natural resources by saying no Glade Reservoir!

Sincerely,

Mila GarelleEssam

To allow the Poudre River to become a stinking ditch through Fort Collins to supply water to cities like Erie, etc. should not happen. There has to be a limit to development in this desert area while buying up farms to take their water is short-sighted at best. Drying farmland should not be allowed. Some day we might need the farms to feed our nation.

People will keep coming as long as we build homes, etc. But there should be limit to the destruction to our area because people keep selling farms for residential and commercial use. Hate should be the limit and people should move elsewhere.

Also, we need to stop watering acres of lawns. Conservation must be in the mix so we don't dry up the Poudre River.

Re: **NISP 1041 Permit Application; Project No. 20-ZONE 2657**
Citizen Comment on 1041 Application for the Northern Integrated Supply Project

Pleasant Valley is a Special Place in Larimer County, with substantial intact conservable assets worthy of protection. To that end, Citizen Activists from THIS AREA successfully eliminated NISP's planned pipeline to connect Horsetooth and Glade which would have struck like a mad rattlesnake through the heart of Pleasant Valley.

Other pipelines are needed to convey water from Glade Reservoir and pipeline alignment and construction is a disruptive and devastating activity as you have witnessed recently with the challenges to the Thornton Pipeline alignment. We have experienced more than our share of pipeline disruption here in Bellvue in recent years. These pipelines also rob the Poudre of it's function as a natural water conveyance, and in supplying distant ratepayers, place even more stress on the river ecosystem below the North Poudre diversion point.

The Poudre River created this beautiful landscape, in combination with other natural forces, over millennia and deserves conservation. Yet now, for many months of the year, the Poudre does not flow at Bellvue. What will NISP bring? Quality and quantity of water far below that required for a "healthy" river, according to Northern's project documentation and submittals. When the peak flows are diverted, the only time of the year that the Poudre truly flows, will end. A trickle of water passing through Fort Collins will do nothing to heal this blow to the health of the Poudre River. At this point Northern Water does not own sufficient water rights to fill Glade Reservoir - why the rush to permitting and construction? Predicted prolonged droughts may mean it will never be filled. Look to Lakes Powell and Mead as foreshadowing the folly of this venture.

Recreational opportunities are being offered as a panacea for the damage to the Poudre River, however Larimer County has not negotiated any substantive, binding agreements with Northern Water regarding this possibility. I note from the document entitled "Larimer County 1041 Permit Technical Memorandum No. 4 Glade Reservoir Recreation Voluntary Permit Conditions" that, "The parties will begin development of this plan after the issuance of, and acceptance by the NISP Participants, of the 1041 Permit," "Northern Water shall have the right to modify a recreation facility design or location at any time if, in its sole discretion, it determines it is necessary to comply with NISP operations or maintenance, NISP permit conditions, or other issues that present a conflict with the primary water supply purposes of the Project," and that Larimer County will be paying 25% of the cost to construct facilities on land it does not own. None of these points appear to strongly represent and protect the interest of Larimer County residents, who bear virtually all of the burden of disruption.

By the time NISP is complete, the 15 participating entities will have spent well over $1 billion, financed by municipal debt and to be repaid through the sale of taps in their communities, and fees paid by the ratepayers. Any prolonged downturn interrupting the cash flows needed to fund the repayments has the possibility of creating devastating municipal bankruptcies in these communities. If the past 90 days have shown us anything, it's that nothing is certain, especially the ability to service a large debt in a time of crisis.

We demand that the Commissioners DENY the 1041 permit for NISP and urge Northern Water to pursue alternatives for which their own rate-payers, who will receive the benefits, will bear the brunt of the negative impacts, financial, and otherwise.

Sincerely;

Elizabeth L Ashbach and Michael P Eland, 1501 Red Mesa Lane, Bellvue, CO

Hello,

I would like to add my voice to the people urging you to reject the NISP, and preserve the flow of the Poudre River. Please don't support a mistake that would forever change this important feature of northern Colorado. Thank you.

2046

Please DO NOT approve the NISP project!
We don’t need a giant pipeline disrupting our neighborhoods, creating traffic flows that are contesting and polluting.
I want to go on the Poudre River trails and enjoy watching the new white water park in downtown Fort Collins, seeing a substantial water flow making the white water park usable and the wildlife on the river possible.
As a taxpayer of local, state, and federal taxes I should not have to pay for a major realignment of Route 287.
Then there are the fault lines underneath the proposed site of the Glade reservoir. I don’t want to go through another major earthquake when it could be prevented by you rejecting this project.

Larimer County residents don’t benefit from such a large financial and environmental disruption.

Thank you,

Elaine Spencer

Do Not Approve NISP 1041 Project No. 20-ZONE 2- Save Our Rural Northern Colorado

1 message

Dave & Julie Abramoff <daveabramoff@gmail.com> Mon, Jun 8, 2020 at 7:21 AM
To: rhelmick@larimer.org, tdonnelly@larimer.org, swjohnson@larimer.org, jkefalas@larimer.org

Dear Commissioners and Planning Commission:

Commissioner Johnson
Commissioner Kefalas
Commissioner Donnelly
Rob Helmick

We are landowners residing in the area of the proposed Glade reservoir that have concerns with the proposed Glade Project and the negative impacts that would occur if the project moves forward.

The primary benefits of this proposed reservoir would be enjoyed by the 15 subscriber towns or agencies that receive the proposed Glade water. Most of these towns and agencies are outside Larimer County. The most obvious and intense costs would be borne by local and other surrounding communities.

In addition it has been shown in many other communities around the country and the world that with intelligent planning, strong conservation efforts, water sharing agreements, and water saving devices, tat water usage can be significantly reduced.

In general, our concerns are that the scope and scale of this proposed project, if approved, would have significant, detrimental, and permanent impact on our rural community, environment, and lifestyle we enjoy today and desire to have in the future.

Specifically, our rural environment we believe would be negatively impacted in the following ways:

1) Noise - The rerouted highway over the most eastern hogback would have an unobstructed view from residences in the foothills, there would be no middle hogback to block truck and auto noise. The NISP publications suggest that recreation would include motorboats and jet skis. Boats and skis are loud, they would likely be louder than current road traffic.

2) Light Pollution – This rural area enjoys fairly dark skies. The proposed recreational activities would generate significant exterior lighting for boats, facilities, camping, pumping facilities, traffic, etc. and headlights from traffic coming down the hogback on the rerouted 287 would shine into the adjacent private property. This could destroy the enjoyment of our night skies.

3) New development - We do not know what sort of development would occur near and north of proposed Glade. The rerouted highway 287 would invite more residential development on the plains. The reservoir would invite more development in the adjacent foothills and valleys. It's not inconceivable that more commercial development catering to visitors would encroach into currently uncommercialized lands, forever altering the rural nature of the area.

4) Trespass – Plans for proposed Glade project almost 400,000 visitors per year. This would include boaters, campers, fishers and hikers and bikers, among others. There is every reason to believe that not all these visitors would stay within the confines of designated recreational areas. Some visitors are likely to explore the inviting foothills that border the reservoir and trespass, however inadvertently, on our private property.

5) Wildlife – Proposed Glade would become a significant barrier to the permanent and migratory herds of deer and elk that reside in our area and would be disruptive to other wildlife. In a world where wildlife and nature are under stress, and is diminishing generally owing to human activities, should we be contributing to those activities for unnecessary purposes? We encourage the county to find alternatives that don't result in the significant loss of open space and wildlife habitat that this project would cause.

6) Wildfires – In this century three major wildfires burned over 100,000 acres on and around Glade. Two of the three forest fires were caused by careless people. Can we rely on the >1000 daily visitors to proposed Glade to be careful?

7) Emergency response – The recreation on the proposed reservoir is projected to be almost 400,000 visitors per year.

Such a large increase in recreationalists would likely increase the number of emergency calls thereby further stretching emergency response agency resources. Costs would be borne by Larimer County taxpayers, and emergency services that are diverted to Glade would not be readily available to serve the local communities.

8) Air quality – Because Glade would have junior water rights, the water level of the proposed reservoir would be highly variable, unlike Horsetooth. The water level frequently would drop precipitously, often changing proposed Glade Reservoir to Glade Mudflats, and could stay that way for years. The large “bathtub ring” that would materialize around the reservoir would become dry soil that would blow in our strong winds causing air quality and visual concerns. The hundreds or thousands of vehicles that would travel to the area emit gases, particulates, and ozone precursors (i.e., health hazards).

9) Climate change – the pumps, the construction vehicles, the recreational vehicles: the project would result in considerable burning of fossil fuels, forever, and the emission of greenhouse gases. The pumping stations alone would emit the equivalent of adding 7000 GHG emitting cars at a time when Colorado is implementing zero emissions vehicle standards.

10) State Land Usage - The large area of state land west of the proposed reservoir is devoted to hunting and cattle grazing. The state and federal lands in this region of northern Colorado provide abundant and easily accessible opportunities for recreation, which we gratefully utilize. Impacts to use of or access to the state land is a negative impact to our communities.

11) Aesthetic - The drive from Livermore to Laporte would no longer be through the heritage rangeland and the familiar hogbacks. Since the proposed reservoir would likely be only partially filled much of the time, instead of beautiful hogbacks and grassy foothills, our viewshed would be marred by the barren sides (bathtub ring) and murky surface of a partially filled reservoir.

12) Lack of combined Project evaluation/coordination - There is no apparent coordination of the NISP or the proposed Seaman’s expansion or the Halligan expansion. All these projects surround our properties and would leave us on a peninsula of land cut from the rural environment we now enjoy. We met with the City of Greeley in August 2018 and learned that they are not planning to cooperate with other cities due to “challenges” and are proceeding on an expansion of Seamen’s reservoir from 5,000 to 80,000 acre-feet. In the 21st century, surface storage just doesn’t make sense; this is a semi-arid climate that is getting drier. Alternatives are available and should be seriously considered.

13) Social justice - While the benefits of proposed Glade would be enjoyed by people who live and work far from the reservoir site, the costs would be borne by those whose quality of life would be severely lessened.

14) Conservation and Alternatives – Conservation is not begin adequately considered. While the Colorado Front Range is land-rich for development, it is semi-arid and thus water-limited. About 2/3 of the Poudre is already taken out, and Glade would take another 40% of what’s left. Yet another reservoir is nothing but a temporary fix for a small portion of the state’s water needs; but one with permanent, destructive impacts on a large part of rural northern Colorado. The time is way past due for developing long-term solutions based on state-of-the-art technologies and widespread education on the absolute necessity to conserve water, and to stop relying on 19th century solutions for 21st century challenges.

The Larimer County Commissioners must save our rural communities and be good stewards of our natural resources by saying no Glade Reservoir!

Sincerely, dave and Julie abramoff

Larimer County Should Not Approve the NISP 1041 Permit Project No. 20-ZONE 2657

1 message

Herb Schaal <herb.schaal@bellvueemporium.com> Tue, Jun 9, 2020 at 2:12 PM
To: rhelmick@larimer.org, tdonnelly@larimer.org, swjohnson@larimer.org, jkefalas@larimer.org

Dear Commissioners and Planning Commission:

Commissioner Johnson
Commissioner Kefalas
Commissioner Donnelly
Rob Helmick

I'm a landowner residing in northern Larimer County, near the proposed location of Glade Reservoir, it's massive dam, forebay, pumps, pipelines, campgrounds, parking lots, boat ramps, and other facilities. We strongly urge the Board of County Commissioners to deny the 1041 permit for the Northern Integrated Supply Project because it would forever impact the fundamental nature of the rural landscape in which we live and harm our quality of life.

We choose to live in northern Colorado for its beautiful natural landscapes, its wild and scenic rivers, it's clean air and quiet surroundings, its wildlife, its opportunities for outdoor recreation on the abundant state and federal lands in the area. These are key pieces to our quality of life; key pieces that would be lost if this project is constructed and operated as proposed. Our land, water, and communities would be harmed by this project, and any benefits of the project would accrue to communities mostly outside Larimer County.

It is unacceptable that our rural northern Colorado communities must bear the impacts and unmitigable risks of this massive and ill-conceived project, the biggest ever proposed for Larimer County.

If construction is executed as planned, there would be seven years of heavy construction impacting our communities. We would be subjected to lots of heavy truck traffic, since the main artery to and from the reservoir site is Highway 287, which is also our main route; 6-days-a-week heavy traffic and heavy machinery operations, and the unwelcome, intrusive, and obnoxious presence of widespread and large-scale construction activity, noise, dust, and danger, over a long period of time. The intrusion would turn the hundreds of acres of the landscape into a construction zone, and take away the attractiveness, the clean air, the quiet – the things we depend on for health and happiness.

Northern Water is currently buying farms in northern Colorado to make up a more than 50% shortfall in the water rights needed for a successful project. In addition, recent prolonged droughts, which are becoming more common, have affected the amount of water that would be available from the Poudre River and other sources. For us, this means that we would endure the years and years of construction, and the irreparable loss of the unique landscape in which we live, all for an unfulfilled promise that "if they build it, the water would come" which is by no means guaranteed. The water shortage will only get worse as the climate dries, so Larimer County should deny this project, which will likely fail to meet its objectives. Less expensive, less destructive alternatives to water supply should be seriously considered.

Encouraging almost 400,000 visitors per year to this area would alter it from the quiet, rural and sparsely populated landscape we sought and invested in, to a busy recreational area with noise, dust, traffic, activity, accidents, and fires. Noise from motorboats on Glade would exceed state standards, would be heard miles away, and would significantly disrupt our lives. For some owners, the noise would cause property values to decline.

That's if the reservoir fills. The photographs Northern Water shows of a beautiful full reservoir are misleading at best, because the reservoir would rarely, if ever, look like that. It would generally look like an abandoned industrial facility marring the area's aesthetics.

Since the reservoir would not fill, and likely would not be full during much of its life, the project would look like an abandoned muddy puddle much of the time, and the recreational facilities would be mostly empty. Who would pay for the upkeep of the unused recreational facilities, Larimer County taxpayers? The project ruins the aesthetics of the valley and hogbacks – a unique and beautiful landscape – for a project that would provide little or no benefit to Larimer County and in fact would negatively impact its residents and its coffers.

The project would also contribute to climate change. Over 30,000 tons per year of CO2 would be emitted by engines to pump water into Glade. Other greenhouse gases would also be produced, both during construction and operation. Air

pollution would also occur due to the project, including gases that form ozone, a severe health hazard.

Dust blown from the barren shorelines would be swept up the valley on the area's strong winds and seep into our homes and further degrade our lives. The EIS states that it would take an 80-mph wind to generate any fugitive dust from the shorelines of the operating reservoir, an assertion that doesn't pass the laugh test for anyone living in this rural landscape. What else has have they got wrong? Are we to be the guinea pigs for some ill-conceived experiment?

We are very concerned about the potential for fire. We live in a high fire hazard, and we take many precautions with our homes and properties to protect against fires. Many visitors, who would be visiting in summer when the land is hottest and driest, would not be aware of how easy it is to cause a wildfire in this landscape. Some would be careless with campfires, with cigarettes, with illegal fireworks, or with firearms, and wildfires would be inadvertently ignited. Their vehicles can start fires. Unfortunately, arson is possible. Our climate is getting drier. Larimer County must recognize the seriousness of this issue and deny this permit. The county cannot simply hope for the best because our homes, our property, our animals would all be put at unacceptable risk of wildfire due to construction, high visitation, and incomplete understanding. These increased risks would also cause increased demands on local emergency services, especially fire, medical, and law enforcement.

No project this big can be undertaken without significant and irreparable impacts. We ask Larimer County to be a good steward and deny this permit and prevent the loss of open space and wildlife habitat, increased risk of wildfires and other public safety hazards, increased demands on local volunteer emergency services, noise, light pollution where now there is little, increased development and traffic in ever-widening circles around the reservoir, reduced air quality, climate change, increased illegal activities such as trespass on adjacent private land, decreased property values, and the loss of unique visual and aesthetic values. The natural and rural quality of this land is very important to our lives and communities.

Sincerely,

--

To Larimer County Board of Commissioners:

This is a copy of a message we sent to the Larimer County Planning Commission about NISP:

We are totally opposed to the proposed Northern Integrated Supply Project (NISP) as it has been thus far presented to the Planning Department. There are far too many issues that would adversely affect the environmental quality of life in Northern Colorado. It will further drain water needed in the Poudre River to support valuable recreation and wildlife. It would also be a major disruption to citizens residing in the path and nearby the proposed reservoir and the pipeline. The project has very little bene it to Larimer County, and instead feeds the insatiable population growth in Weld and other counties. At some point there has to be a limit to the exploitation of our limited water resources here in Colorado. Please do the right thing and do not approve this horrendously damaging project proposal.

Respectfully submitted,

Janet Carabello and James Hill, concerned citizens and voters

NISP 1041 Permit Application; Project No. 20-ZONE 2657

Dear County Commissioners

I have been a licensed health care provider in Colorado since 1975 and a resident of Larimer County for 30 years. My life has been one of service and not financial gain. We moved to the Front Range and bought property in Bellvue in 1990. My wife grew up in Littleton and wanted to be closer to her family so our daughters could spend more time with their grandparents. We strategically picked our home location in Bellvue to be rural and with limited growth potential. We live in a beautiful area above the entrance to Lory State Park and are surrounded by public land. The Glade Reservoir project will not affect us directly but will have, I believe, a devastating impact on rural Larimer County, the Front Range and future generations.

It is interesting that the county commissions represent unincorporated Larimer County but I do not believe any of you live in a rural area and may have a hard time understanding us, why we chose to live where and how we do, and many of our issues. For us the inconvenience of having to drive to town for shopping, children sports, etc. is the price of admission for our wonderful rural life close to nature. Living in unincorporated Larimer County is like being the kid in junior high that is always being bullied and the County Commissioners are our only protectors. The USA is the bastion of capitalism in the world and there is both good and bad in this system, as with everything. We have bicycle-toured in many different countries including communist Cuba, and I am grateful every day for being born in the USA, especially living here in the foothills of Colorado. Nothing happens in this country unless someone makes an obscene amount of money doing it. Rural Larimer County does not have the financial power, legal power, political power or resources to protect ourselves from the interests of the large cities of the Front Range, from venture capitalists and hedge funds. We (your constituents) elected you to look after our interests and the principles that our country was founded upon: Life, Liberty and the pursuit of happiness.

The re-routing US highway 287 if Glade Reservoir is built will be to an area where people settled for a quiet rural life and is inconsistent with the above values.

What have you learned from the last few months and our current pandemic? What is really important in life (just money)? Do you think this will never happen again? The people most affected by Covid 19 in Colorado are/were in high density areas. The purpose of Glade Reservoir is to increase population growth – great for a virus but not so great for your constituents and our economy. My grandmother used a saying "enough is enough".

I will leave the issues of environmental impact, social impact and growth that never pays for itself (the current residents bear the brunt of taxes and decrease to their quality of life) to others as well as inconceivable issues like building a reservoir above the Poudre River that will require massive energy expenditures to pump water up into the reservoir. What will future generations think of this idea?

Remember back a few months ago what was important to the younger generation in both our country and the world. It was global warming and hopefully this will still be an issue at the next general election. Looking east from our deck we can see I-25 in the distance. For years the brown cloud has gotten progressively worse. With the decrease in travel due to Covid 19, the brown cloud has disappeared for the last month. Driving on I-25 (what was called the Valley Highway) last month

reminded us of driving in the 1980s. We live in a beautiful place but have a significant air quality issue; for years the ozone levels have been out of compliance. Why would we exacerbate this issue by approving a reservoir that is targeted to increase growth, population, congestion, air pollution, and global warming? Is this progress?

In the past, parents always tried to improve life for their children. My children will never get to have the outdoor experiences I have had. The Milky Way used to be bright and vivid at our home and now it is barely visible on the darkest nights. I was able to go on backpack and river trips and not see anyone else – now reservations and sometimes lotteries are needed for backcountry camping. We actually drank water from the streams without any treatment. It troubles me how our quality of life and spiritually has been diminished by insatiable greed and the now holy US dollar.

My father dropped out of high school, enlisted in the army infantry and spent two and a half years fighting from Normandy to the Netherlands during WWII sleeping most nights under a tank. The first lesson he taught me was that a man is only as good as his word. A hard lesson to start learning in elementary school but it has been important to me all my life. I ask that you imagine your children's children's world, and review the oath you took when becoming a County Commissioner before voting on the permit for Glade Reservoir.

Thank You

Alan Miller

Larimer County Should Not Approve the NISP 1041 Permit Project No. 20-ZONE 2657

1 message

Donba Bathory <magiamagpie@gmail.com> Tue, Jun 9, 2020 at 10:14 AM
To: rhelmick@larimer.org, tdonnelly@larimer.org, swjohnson@larimer.org, jkefalas@larimer.org

Dear Commissioners and Planning Commission:

Commissioner Johnson
Commissioner Kefalas
Commissioner Donnelly
Rob Helmick
Dear commissioners,
Below is the letter from my organisation, but I wish to tell you personally that I believe the time for damaging rivers to fuel growth in Colorado and the west is over. Many dams are actually being removed, as I'm sure you are aware. Short term greed will eliminate good long term life in Larimer county if you do not act in the right way now.. I'm hoping you will, and rely on you as our elected representatives.
Thanks

I'm a landowner residing in northern Larimer County, near the proposed location of Glade Reservoir, it's massive dam, forebay, pumps, pipelines, campgrounds, parking lots, boat ramps, and other facilities. We strongly urge the Board of County Commissioners to deny the 1041 permit for the Northern Integrated Supply Project because it would forever impact the fundamental nature of the rural landscape in which we live and harm our quality of life.

We choose to live in northern Colorado for its beautiful natural landscapes, its wild and scenic rivers, it's clean air and quiet surroundings, its wildlife, its opportunities for outdoor recreation on the abundant state and federal lands in the area. These are key pieces to our quality of life; key pieces that would be lost if this project is constructed and operated as proposed. Our land, water, and communities would be harmed by this project, and any benefits of the project would accrue to communities mostly outside Larimer County.

It is unacceptable that our rural northern Colorado communities must bear the impacts and unmitigable risks of this massive and ill-conceived project, the biggest ever proposed for Larimer County.

If construction is executed as planned, there would be seven years of heavy construction impacting our communities. We would be subjected to lots of heavy truck traffic, since the main artery to and from the reservoir site is Highway 287, which is also our main route; 6-days-a-week heavy traffic and heavy machinery operations, and the unwelcome, intrusive, and obnoxious presence of widespread and large-scale construction activity, noise, dust, and danger, over a long period of time. The intrusion would turn the hundreds of acres of the landscape into a construction zone, and take away the attractiveness, the clean air, the quiet – the things we depend on for health and happiness.

Northern Water is currently buying farms in northern Colorado to make up a more than 50% shortfall in the water rights needed for a successful project. In addition, recent prolonged droughts, which are becoming more common, have affected the amount of water that would be available from the Poudre River and other sources. For us, this means that we would endure the years and years of construction, and the irreparable loss of the unique landscape in which we live, all for an unfulfilled promise that "if they build it, the water would come" which is by no means guaranteed. The water shortage will only get worse as the climate dries, so Larimer County should deny this project, which will likely fail to meet its objectives. Less expensive, less destructive alternatives to water supply should be seriously considered.

Encouraging almost 400,000 visitors per year to this area would alter it from the quiet, rural and sparsely populated landscape we sought and invested in, to a busy recreational area with noise, dust, traffic, activity, accidents, and fires. Noise from motorboats on Glade would exceed state standards, would be heard miles away, and would significantly disrupt our lives. For some owners, the noise would cause property values to decline.

That's if the reservoir fills. The photographs Northern Water shows of a beautiful full reservoir are misleading at best, because the reservoir would rarely, if ever, look like that. It would generally look like an abandoned industrial facility marring the area's aesthetics.

Since the reservoir would not fill, and likely would not be full during much of its life, the project would look like an abandoned muddy puddle much of the time, and the recreational facilities would be mostly empty. Who would pay for the

upkeep of the unused recreational facilities, Larimer County taxpayers? The project ruins the aesthetics of the valley and hogbacks – a unique and beautiful landscape – for a project that would provide little or no benefit to Larimer County and in fact would negatively impact its residents and its coffers.

The project would also contribute to climate change. Over 30,000 tons per year of CO2 would be emitted by engines to pump water into Glade. Other greenhouse gases would also be produced, both during construction and operation. Air pollution would also occur due to the project, including gases that form ozone, a severe health hazard.

Dust blown from the barren shorelines would be swept up the valley on the area's strong winds and seep into our homes and further degrade our lives. The EIS states that it would take an 80-mph wind to generate any fugitive dust from the shorelines of the operating reservoir, an assertion that doesn't pass the laugh test for anyone living in this rural landscape. What else has have they got wrong? Are we to be the guinea pigs for some ill-conceived experiment?

We are very concerned about the potential for fire. We live in a high fire hazard, and we take many precautions with our homes and properties to protect against fires. Many visitors, who would be visiting in summer when the land is hottest and driest, would not be aware of how easy it is to cause a wildfire in this landscape. Some would be careless with campfires, with cigarettes, with illegal fireworks, or with firearms, and wildfires would be inadvertently ignited. Their vehicles can start fires. Unfortunately, arson is possible. Our climate is getting drier. Larimer County must recognize the seriousness of this issue and deny this permit. The county cannot simply hope for the best because our homes, our property, our animals would all be put at unacceptable risk of wildfire due to construction, high visitation, and incomplete understanding. These increased risks would also cause increased demands on local emergency services, especially fire, medical, and law enforcement.

No project this big can be undertaken without significant and irreparable impacts. We ask Larimer County to be a good steward and deny this permit and prevent the loss of open space and wildlife habitat, increased risk of wildfires and other public safety hazards, increased demands on local volunteer emergency services, noise, light pollution where now there is little, increased development and traffic in ever-widening circles around the reservoir, reduced air quality, climate change, increased illegal activities such as trespass on adjacent private land, decreased property values, and the loss of unique visual and aesthetic values. The natural and rural quality of this land is very important to our lives and communities.

Sincerely,

--

Rob Helmick <helmicrp@co.larimer.co.us>

Deny 1041 permit application for NISP (Project No. 20-ZONE 2657)

1 message

quailspg@frii.com <quailspg@frii.com> Tue, Jun 9, 2020 at 3:51 PM
To: "bocc@larimer.org" <bocc@larimer.org>
Cc: "rhelmick@larimer.org" <rhelmick@larimer.org>

COMMISSIONERS DONNELLY, JOHNSON, and KEFALAS:

I am writing to ask that the 1041 permit for NISP be denied. Below are my reasons.

1) My concern about this project is long term. I have attended NISP open houses. I attended a lecture at CSU that explained the negative impacts on wildlife of a reduced peak flow. Over the years I have sent letters to and attended the hearings of -- and even summoned the courage to speak in front of -- City Council, Planning Commission, and County Commissioners.

2) I am not interested in mitigation. "Mitigation" means that the river will still lose and Northern Water customers (including myself) will pay for window dressing.

3) I'm not interested in the recreational opportunities that have been dangled before the public to sweeten the deal. (They are not even a certainty and, apparently, may be substantially changed or eliminated if Northern Water chooses.)

4) My highest concern is for the health of the ecosystems associated with the river.

5) My lowest concern is for the communities whose plans are to grow their population ad infinitum. Unlimited growth is so 20th century!

6) When their allotted amount of water taken annually from the Poudre has been parceled out in taps, where will these communities go next?

7) If water is a finite resource and its availability limits growth, communities will EVENTUALLY have to decide how to cope with a finite supply. Shouldn't we be retooling our approach to growth NOW -- while the river is still viable -- rather than later, when the river and its attendant ecosystems have been exhausted?

8) I am dismayed that private property is condemned for pipelines and the resulting benefits are transferred to private citizens -- housing developers, for instance -- in other communities.

9) I have never understood why the BOCC has accommodated Northern Water, favoring communities in other jurisdictions while neglecting to protect its own citizens.

10) Pleasant Valley, where my home in Bellvue is located, has been in the crosshairs of outside interests for a long time. We have endured pipeline projects in the past. They are noisy, intrusive, and leave right-of-way scars. The Pleasant Valley Pipeline crossed my own property some years back; it is not a happy memory. Thankfully, the proposed pipeline between Glade and Horsetooth is off the table -- for now. We have no guarantee that it will not return.

11) Although a major pipeline has, on paper, been rerouted and avoids Bellvue, it is now set to run along HWY 287 for a stretch, about three quarters of a mile from my house. Since I can plainly hear traffic from the highway (these days loud and seemingly continual), I shudder to think about construction noise. And what of the equipment and supply trucks traveling to the reservoir construction site? And for how many years?

12) I have lived in Bellvue for the past forty years. Although my house is three quarters of a mile away, in quiet moments I can hear the Poudre roar during periods of high runoff. It's one of the dwindling amenities here; drought, fire, ridgeline building, increased traffic, and expanded commercial endeavors have substantially eaten away our quality of life. The Glade Reservoir project is guaranteed to do more of the same.

Concerns regarding the Northern Integrated Supply Project (NISP) 1041 Permit Application

1 message

Jon Elliott <jonwelliott@gmail.com> Tue, Jun 9, 2020 at 12:47 PM
To: rhelmick@larimer.org, bocc@larimer.org

Mr. Helmick,

Please find the attached letter stating my concerns, as a Larimer County resident, regarding the NISP Glade Reservoir 1041 application. I appreciate that this letter will be included in the Planning Commission's hearing packet.

Thank you,
Jon Elliott
3725 S Bar G Lane
Fort Collins, Co 80524

NISP Letter_6-9-2020.pdf
221K

To: Mr. Rob Helmick, Larimer County Planning Commission
CC: The Board of County Commissioners

From: Jonathan Elliott
3725 S Bar G Lane
Fort Collins, CO 80254

Date: 6/9/2020

Re: Concerns regarding the Northern Integrated Supply Project (NISP) 1041 Permit Application

Mr. Helmick,

As a Larimer County resident, I am writing to express my concerns regarding information included in the NISP 1041 application and that should be considered before approval.

1) My first concern is that none of the residents on S Bar G Lane (e.g. the S Bar G Conservation Development) which is located on West Douglas Road just east of Eagle Lake were made aware, in writing, of the 1041 application submission, review hearings or deadlines to provide comment on this matter. I was made aware of today's deadline for comments via email by a resident of Eagle Lake.

2) Secondly, the NISP document entitled "Larimer County Analysis – Supplement 1 to Technical Memorandum No. 9 Traffic Impact Study" and dated April 28, 2020 shows (see image attached on next page) that US highway 287 is to be replaced ***'BY OTHERS'***. Since this highway is a federal and state travel route, the 'others' indicated here in this case are tax payers who are supplying funding that is distributed via the Federal Highway Administration and State DOTs. The cost to relocate US highway 287 should fall on those who receive the direct benefit of water from the Glade Reservoir project and not the tax payer in general.

3) I feel it's important that NISP better/further explain how they forecast the proposed recreation income that will be generated by the NISP project for Larimer County. Since this could be a benefit for Larimer county residents, a better description to validate the economic forecast of recreation income that the reservoir will create should be provided before a 1041 application is approved. The benefit of recreation income for the county generated by this project is a major *'selling point'*, and more attention should be given to guarantee the accuracy of claims made regarding this matter by NISP in the application.

Thank you for considering these concerns and including them in the public record.

Jonathan Elliott

Larimer County Should Not Approve the NISP 1041 Permit Project No. 20-ZONE 2657

1 message

Julee Dettenwanger <jdettenwanger@gmail.com> Tue, Jun 9, 2020 at 4:01 PM
To: rhelmick@larimer.org, tdonnelly@larimer.org, swjohnson@larimer.org, jkefalas@larimer.org

Dear Commissioners and Planning Commission:

Commissioner Johnson
Commissioner Kefalas
Commissioner Donnelly
Rob Helmick

I'm a landowner residing in northern Larimer County, near the proposed location of Glade Reservoir, it's massive dam, forebay, pumps, pipelines, campgrounds, parking lots, boat ramps, and other facilities. We strongly urge the Board of County Commissioners to deny the 1041 permit for the Northern Integrated Supply Project because it would forever impact the fundamental nature of the rural landscape in which we live and harm our quality of life.

We choose to live in northern Colorado for its beautiful natural landscapes, its wild and scenic rivers, it's clean air and quiet surroundings, its wildlife, its opportunities for outdoor recreation on the abundant state and federal lands in the area. These are key pieces to our quality of life; key pieces that would be lost if this project is constructed and operated as proposed. Our land, water, and communities would be harmed by this project, and any benefits of the project would accrue to communities mostly outside Larimer County.

It is unacceptable that our rural northern Colorado communities must bear the impacts and unmitigable risks of this massive and ill-conceived project, the biggest ever proposed for Larimer County.

If construction is executed as planned, there would be seven years of heavy construction impacting our communities. We would be subjected to lots of heavy truck traffic, since the main artery to and from the reservoir site is Highway 287, which is also our main route; 6-days-a-week heavy traffic and heavy machinery operations, and the unwelcome, intrusive, and obnoxious presence of widespread and large-scale construction activity, noise, dust, and danger, over a long period of time. The intrusion would turn the hundreds of acres of the landscape into a construction zone, and take away the attractiveness, the clean air, the quiet – the things we depend on for health and happiness.

Northern Water is currently buying farms in northern Colorado to make up a more than 50% shortfall in the water rights needed for a successful project. In addition, recent prolonged droughts, which are becoming more common, have affected the amount of water that would be available from the Poudre River and other sources. For us, this means that we would endure the years and years of construction, and the irreparable loss of the unique landscape in which we live, all for an unfulfilled promise that "if they build it, the water would come" which is by no means guaranteed. The water shortage will only get worse as the climate dries, so Larimer County should deny this project, which will likely fail to meet its objectives. Less expensive, less destructive alternatives to water supply should be seriously considered.

Encouraging almost 400,000 visitors per year to this area would alter it from the quiet, rural and sparsely populated landscape we sought and invested in, to a busy recreational area with noise, dust, traffic, activity, accidents, and fires. Noise from motorboats on Glade would exceed state standards, would be heard miles away, and would significantly disrupt our lives. For some owners, the noise would cause property values to decline.

That's if the reservoir fills. The photographs Northern Water shows of a beautiful full reservoir are misleading at best, because the reservoir would rarely, if ever, look like that. It would generally look like an abandoned industrial facility marring the area's aesthetics.

Since the reservoir would not fill, and likely would not be full during much of its life, the project would look like an abandoned muddy puddle much of the time, and the recreational facilities would be mostly empty. Who would pay for the upkeep of the unused recreational facilities, Larimer County taxpayers? The project ruins the aesthetics of the valley and hogbacks – a unique and beautiful landscape – for a project that would provide little or no benefit to Larimer County and in fact would negatively impact its residents and its coffers.

The project would also contribute to climate change. Over 30,000 tons per year of CO2 would be emitted by engines to pump water into Glade. Other greenhouse gases would also be produced, both during construction and operation. Air

pollution would also occur due to the project, including gases that form ozone, a severe health hazard.

Dust blown from the barren shorelines would be swept up the valley on the area's strong winds and seep into our homes and further degrade our lives. The EIS states that it would take an 80-mph wind to generate any fugitive dust from the shorelines of the operating reservoir, an assertion that doesn't pass the laugh test for anyone living in this rural landscape. What else has have they got wrong? Are we to be the guinea pigs for some ill-conceived experiment?

We are very concerned about the potential for fire. We live in a high fire hazard, and we take many precautions with our homes and properties to protect against fires. JOHN MCKEAN <AG_ENT@msn.com> Tue, Jun 9, 2020 at 12:55 PM
To: "pcboard@larimer.org" <pcboard@larimer.org>, JOHN MCKEAN <ag_ent@msn.com>

The new principles and requirements for cost-benefit (CBA) of federal water-related projects

In 2014, **t**he federal rules for applying CBA to water resources (U.S. Water Resources Council, 1983) were replaced by the U.S. Council on Environmental Quality (Mar. 2013, Dec. 2014) as required by Congress (Water Resources Development Act Section 2031, 2007). The rules were updated to be consistent with the CBA protocol already required for other types of federal actions, such as regulations. A critical modification in the new water resources CBA protocol is to require the measurement of non-use economic values explicitly.

In 2014, the replacement was finalized for the 1983 *Economic and Environmental Principles and Guidelines for Water and Related Land Resources Implementation Studies*. The new CBA protocol is defined (partly) in two documents created by the U.S. Council on Environmental Quality, *The Principles and Requirements* (Mar. 2013), and *Chapter III Interagency Guidelines* (Dec. 2014). Most important, *Circulars A-4* and *A-94* (U.S. Office of Management and Budgets, 1992, 2003) are referenced in *Chapter III* where it states, ″Monetization should follow sound economic principles and practices (See OMB *Circulars A-94* and *A-4* for examples of currently accepted monetization practices . . .” (*Circular A-4* explicitly requires the measurement of existence and bequest values.) The new requirements protocol is more concisely described in a single U.S. Department of Interior (July 2015) publication, *Agency Specific Procedures for Implementing the Council on Environmental Quality's Principles, Requirements and Guidelines for Water and Land Related Resources Implementation Studies*. The new rules for analyzing water-related projects have great significance because CBA's are now required to include non-use values (existence, bequest, and option value) for the effects of a federal water project. Most important, secondary sources for the non-market benefit estimates (benefit transfer) are not allowed for significant water projects.

An example of the required measurement of non-market benefits and costs is the final report dated April 2008, *Estimating the Economic Benefits of Maintaining Peak Instream Flows in the Poudre River through Fort Collins, Colorado* by Dr. John Loomis.

Dear Larimer County Commisioners Kefalas, Johnson, and Donnelly,

We live in the Bonner Spring Ranch Area near the sight of the proposed Glade Reservoir. We strongly urge the Board of County Commissioners to **deny** the 1041 permit for the Northern Integrated Supply Project.
It would forever impact the fundamental nature of the rural landscape in which we live and harm our quality of life.

- We will have to live for seven years (at least) next to a massive construcon pr oject, with noise, dust, poluon, and tr affic delays.
- It will divert water from the, already stressed, Poudre River during the cric al spring run off. This is cric al to clean the river of sediment and maintain river health.
- It will bring thousands of visitors to our peaceful area with motor boats, jet skis, lots of noise and traffic. With it will come more chances of wildfire.
- It's primary benefit is to developers, mostly not in Larimer County, who will get rich and we the residents will bear the burden of this reservoir for their profit.
- It will encourage more irresponsible and uncontrolled growth and sprawl of which our roads and infrastructure already can not keep up with.
- There is a high likelihood that the reservoir will be only half full or empty most of the me cr eang an ugly, dusty mud puddle. Northern Water does not even have the required water rights needed.
- There are other water conservaon measur es that could be taken to allow responsible, controlled, development along the front range.

For these reasons and more we ask that you deny the 1041 permit and protect the residents of Larimer County.

Sincerely,

Joel and Carole Meeter
3264 Bonner Springs Ranch Rd

NISP Comments for the Record

1 message

K Artell <artellme2@gmail.com> Tue, Jun 9, 2020 at 1:21 PM
To: "pcboard@larimer.org" <pcboard@larimer.org>, jkefalas@larimer.org, Steve Johnson <swjohnson@larimer.org>, "tdonnelly@larimer.org" <tdonnelly@larimer.org>

Hello Larimer County Planning Commission and County Commissioners

Please take care regarding Northern Water's proposed pipelines through Larimer County.

I think Poudre River water should be left in the River through Fort Collins to be picked up by a pipeline east of I-25.

The County Commissioners declined to approve Thornton's pipeline which seems to be a similar route through Larimer County as the NISP Pipeline. Is the NISP Pipeline different?

The second additional Poudre Delivery Pipeline is touted by Northern Water as bringing water directly to the Poudre River and through Fort Collins with water being picked up east of Fort Collins. Please note the route of the Poudre Delivery Pipeline (see attached maps and links below). The Pipeline starts in the Homestead Natural Area in Fort Collins and the Pump Station is in the Kingfisher Natural Area in Fort Collins and takes a route through Kingfisher and River Bend Natural Areas as the pipeline heads southeast past I-25. The route is not "east of Fort Collins" as Northern Water claims on its NISPTalk page. The route goes through Fort Collins natural areas within City limits and the City's GMA area.

The Poudre Delivery Pipeline route is detrimental to the Natural Areas on which taxpayers have spent $millions to improve the health of the Poudre River, riparian areas, wildlife and recreation. As you know the health of Larimer County depends in part on the health of the Poudre River. The detriment to the River and Natural Areas includes pipeline construction with accompanying noise and air quality impacts on wildlife and area residents and businesses and includes Northern Water's permanent easement along the pipeline route. How can Northern Water mitigate the damage done to the Poudre River and surrounding area?

How does running a pipeline through Natural Areas and the River's riparian area "provide positive benefits to the river corridor and enhance the aquatic and riparian environment" as Northern Water claims? The proposed pipeline should be changed and ideally the water should run through in the Poudre River to be picked up east of I-25.

Hello,

My concerns include, but are not limited to, the following:

1. Damning the wild and scenic river, the Poudre, would be heartbreaking. The people who follow us will question how we could have allowed this to happen.

2. People can move to where there is water. We do not need to support people who want to move where there is no water. "Get the water and they will come". Is that what we want?

3. Do we want to give up the Poudre for developers to make money and build houses in the Denver metro area?

4. What is the benefit to we who live in Fort Collins area? I'm waiting, waiting, for the answer.

5. Our friends and neighbors, your constituents will be subject to years of inconvenience and construction for something with no benefit to them.

6. The relocation of #287 must be addressed in the 1041. Why is the cost no longer discussed in the 1041? Why should taxpayers pay for huge road costs that are only needed because of sending water south to the Denver area?

7. The relocation of #287 will bring increased risk to those who travel on the highway, and it is already a dangerous road, as shown by accidents and deaths.

8. What about the power that this whole project will need? And the environmental costs?

9. Where is the proof that the benefits are worth the costs of this project?

Thank you for hearing my concerns,

Kathy Cosgrove Green

NISP, Glade Reservoir, ad 54" Pipeline BAD for Fort Collins and the Planet

1 message

Kathie Dudzinski <bikeskik@gmail.com> Tue, Jun 9, 2020 at 10:20 AM
To: pcboard@larimer.org
Cc: bocc@larimer.org, No Pipe Dream <info@nopipedream.com>

To Whom it may concern:

As residents of Terry Point in Larimer County just north of Fort Collins for the last 47 years, we have been horrified to watch the Poudre River dwindle as cities downstream extract its water for increased development.

We have watched the county struggle to pay for important projects.*

Not only have we paid our taxes to Larimer County, as ardent supporters of "No Pipe Dream", we have found it necessary to donate to help pay for lawyers to prevent water being pulled from the Poudre upstream, and being diverted through a 54" Pipeline near us destined for Thornton. As NISP is being proposed to support even more development, we are ardently against it. Decreased snowpack due to global warming has already decreased the Poudre's flow, and this will get worse. No more water should be pulled from the river! Healthy flows of the river as described by Save the Poudre are exceptionally important and must be addressed.

We totally agree with and thank Bobbi Norman for her detailed letter describing the deficiencies in NISP's 1041 Glade Reservoir application.

Highlights which need to be addressed in its application for the 1041:

Negative impact on health and safety:

* The fact that NISP has passed on the **cost** on to **Larimer County of relocating HWY 287**… necessary only for its own specific project is totally unfair and ridiculous, and the **reroute** places the highway in **much less safe terrain**.

It is frightful to imagine water being contaminated by carcinogenic compounds in a plume at the base of the Glade Dam from the DoD Nuclear Missile site, of the Dam, with its weight and that of the water against it being set above 2 large earthquake prone faults.

Other negative impacts:
The huge demand for power to pump the water from the Poudre into the reservoir and the related huge transmission towers and power lines with similarity to the size of Glen Canyon Dam is inconsistent with the quality of life Larimer County stands for…and is NOT for the benefit of Larimer County residents, but for yet unbuilt (and unnecessary) congestion downstream.

In order for Glade Reservoir to be filled, hundreds of farms in Weld County need to be purchased which has not yet been done.

That mitigation is not being addressed at this point, and is being put off for 30 years is unfathomable! It must be totally addressed NOW in the1041.

This proposal will have a much greater impact on the Poudre River, Larimer County and the whole state of Colorado than was considered when first imagined.

THERE IS NO PLACE IN THE 21ST CENTURY FOR SUCH A PLAN AS NISP!!
Do not allow approval of the 1041 application!

LET US REMEMBER, THE QUANTITY OF WATER IS DECREASING AS THE POPULATION IS INCREASING. We must be careful with water use!

Sincerely, Kathie and Paul Dudzinski

Larimer County Board of County Commissioners + Planning Staff
200 West Oak Street, Suite 3100, PO Box 1190
Fort Collins, CO 80521

Dear Commissioners Johnson, Kefalas, and Donnelly,

I am a landowner residing in northern Larimer County and own two properties near the proposed location of Glade Reservoir and its associated massive infrastructure**. I am strongly opposed to this project and urge the Board of County Commissioners to deny the 1041 permit for the Northern Integrated Supply Project. This project will harm the environment of Larimer county and the livelihoods and quality of life of its residents.**

I live in northern Colorado because I value the rural landscapes, wildlife, recreation and public lands, including the Poudre River. The land, water and communities in Larimer County will be harmed by Glade Reservoir, with any benefits being realized mostly outside Larimer County.

I oppose this project for many reasons. Below I highlight just a few:

- increased **wildfire** risk during construction and due to recreation and camping around Glade.
- multiple years of **construction – nuisance** for getting to my workplace and my children to school; **dust, noise, air quality, contributions to climate change**, among other issues.
- addressing our critical water issues in the county requires **conservation, smart growth, and addressing climate change – not Glade**. Analysis reveals this won't be anything like Horsetooth in terms of recreation – it won't even be full much of the time.
- the Poudre River is our local treasure and it is already overallocated**. This Wild and Scenic River defines our community, unites us, is a source of life and livelihood and physical/spiritual survival for this community. Please don't take this away from us.**

I agree with the conclusion of Save Rural NOCO:

"No project this big can be undertaken without significant and irreparable impacts. We ask Larimer County to be a good steward and deny this permit *and prevent the loss of open space and wildlife habitat, increased risk of wildfires and other public safety hazards, increased demands on local volunteer emergency services, noise, light pollution… increased development and traffic… reduced air quality, climate change, increased illegal activities such as trespass…, decreased property values, and the loss of unique visual and aesthetic values… The natural and rural quality of this land is very important to our lives and communities."*

Sincerely,

Julia A. Klein

Letter re: NISP 1041 Application

Dear County Commissioners Donnelly, Kefalas and Johnson and Mr. Rob Helmick -

I would like to thank you for the opportunity to voice my thoughts regarding the NISP Reservoir and Pipeline. I respectfully request that you deny approval of the 1041 application. Most notably, because there are significant engineering flaws and a very viable alternative which is clearly less expensive, safer, and overall less damaging to private land owners and county residents. I am in support of Dr. Tom Sale's subsurface water storage and recovery solution as the most practical alternative. An alternative that can work! Additionally, as with the Thorton proposal, there is a pipeline component that is very concerning. Please support Larimer county residents and ensure that private properties are not utilized. Such destruction would be completely reckless. If pipeline is necessitated, pathways should ONLY be permitted if impacted lands are publically owned or owned by applicant explicitly for such purpose or existing utility infrastructure is leveraged without additional harm.

I come to you as a Doctor of Veterinary Medicine of 25 years with special expertise in preserving rare and endangered wildlife and ensuring we can co-exist with our animal friends. I am writing specifically to ensure our protected areas, conservation land, agricultural land are protected as they were designed to be protected! The entire S Bar G neighborhood was specifically built according to conservation guidelines. I live at 4100 S Bar G Lane and have worked hard to create my land and home as a sanctuary for rare birds and wildlife (38.5 acres). My property as well as adjoining land owned by Woody Creek subdivision has received a distinguished designation of Important Bird Area (IBA) by the National Audubon Society making it off-limits to destructive activity. (See documentation attached.) It is one of the few in Larimer County outside of Fort Collins that is home to the rare Mountain Bluebird (a very sensitive species to urban /suburban sprawl and development) and a breeding pair of Great Horned Owls. The Great Horned owl pair has taken sanctuary on my land for 4 years running as their primary territory and nesting site. These federally protected birds of prey have 2-3 owlets each year. My land which I maintain as pristine protected habitat also includes Black Lake which I maintain as an untouched marshland of shallow water. All in all provides appropriate diversity of unique habitats, food, shelter and water availability. The inventory of birds on the land is ever growing and includes also blue herons, Canada geese, seagulls, mallard ducks, rarer wood ducks, Bald eagles, nesting Red Tailed Hawks, red winged black birds, flickers, pelicans, 20+ identified songbirds and more!

Furthermore, I have preserved 8 acres of my land as a long standing naturally established Milkweed plot such that the struggling Monarch Butterfly has a safe and reliable place to reproduce in summer as they are exclusively dependent on the one and only Milkweed plant. I am also conducting a 10-year study for the endangered Jumping Mouse with Wildlife biologists from CSU. We are tracking this rare endangered species through conduct of an annual inventory of my property.

With this as well as some critical issues regarding severely unstable soils on the land and neighboring homes(Eagle Lake, Woody Creek, S Bar G) and the precarious water movement throughout, I object to any invasion of such activity on my property as my neighbors do with theirs; it would be catastrophic to all! I also depend on the subirrigation to stay as is

for the my haying and pasturing of my livestock. This is a rare protected piece of property which could NEVER return to normalcy if a pipeline passed through it. Mammals such as foxes, bobcat and Colorado mink would also be negatively impacted and would be displaced. This is my property and the only one I can protect. I intend to do so! If NISP (and Thorton) wish to create destruction through Larimer County, please have them do it by utilizing their own property, existing infrastructure if/where it already exists, innovative solutions for water collection. We don't need another reservoir and we certainly don't need a pipeline. Let's keep Larimer County a refuge for animals and unique species that live with us.

Much thanks for your support.

Best,

Christine Kratt, DVM

August 9, 2017

To: Lairmer County Planning, Larimer County Commissioners and City of Thoroton;

Audubon Rockies is writing this letter to express our deep concern regarding any possible water pipeline project along or through the Kratt Acreage Important Bird Area (IBA). It has come to our attention that the Kratt Acreage is within a corridor in consideration by City of Thorton. Such potential development plans could have detrimental effects on the birds and other wildlife using The Kratt Acreage IBA.

The Kratt Acreage was recently identified as an Important Bird Area by Audubon Rockies. Audubon Rockies' Important Bird Areas program has developed an inventory of the *key sites* within Colorado that support a significant abundance and diversity of birds including breeding, wintering and/or migrating birds. The Kratt Acreage property is one of 55 sites totaling more than 1.3 million acres of land and water that is a critical part of our bird habitat and conservation network. For a site to be identified as an Important Bird Area it must meet one or more of a set of standardized criteria that were developed by a committee of bird experts from throughout the state. Each nominated site is reviewed and determined whether or not it meets the criteria based on the ornithological and habitat data submitted.

Audubon Rockies determined that the Kratt Acreage met the established Important Bird Areas designation criteria. This site is considered important because it supports special-concern species and unique habitat within Colorado. To this point, Audubon Rockies would like to express our concern with the potential water pipe project and the effects it may have on the Kratt IBA. Due to the fact that the property serves as migratory stopover, feeding and breeding ground for a host of waterfowl, shorebird and songbird species couple with the existing development surrounding the area, we believe that if disturbed, the birds and other wildlife could be negatively impacted. Specifically, Audubon's concerns include:

1. Further disturbance to numerous nesting, foraging and migrating shorebirds, raptors, waterfowl and songbirds in an already fragmented landscape. Due to urban and suburban sprawl of Fort Collins, the Kratt Acreage IBA provides a unique and much needed refuge for these birds. This includes the very sensitive Western Bluebird which has been utilizing the property for over the last 15 years as well as Federally Protected birds of prey (Great Horned Owls, Bald Eagles, Red Tailed Hawks and various other raptors).
2. Potential disturbance of the existing water table and thus impacts on bird habitat. The property includes Black Lake, a reliable and currently stable water source in a very complex geology including designated wetland areas, Woody Creek to the north, a natural spring to the east an irrigation ditch within the property's perimeter.

In conclusion, Audubon Rockies is very concerned over the potential impacts the potential project could have on this environmentally sensitive area. Given the species of concern documented using the area (I.e. Bald Eagle, Great Blue Heron and Red-tailed Hawk, Mountain Blue Bird, etc.) we would like the opportunity to discuss the impacts the development could have on our native wildlife before the project location is determined.

Sincerely,

Alison Holloran
Executive Director, Audubon Rockies
Vice President, National Audubon Society

IMPORTANCE OF CONSERVING AND PROTECTING WILDLIFE HABITAT AND AGRICULTURAL LAND

Objection to NISP 1041 application

07 June 2020

Christine Kratt, DVM

Conservation Development, Agricultural land and Important Bird Areas

- Several developments have worked diligently to adhere to Conservation Development standards of Larimer County.
- Between agricultural land, conservation developments, and designated protected areas, we have well-established wildlife and bird corridors of which the Kratt Wild Sanctuary plays a big part.
- Only two areas in Larimer County have the Important Bird Area (IBA) designation by Audubon Society… and we in North Fort Collins have one of them! Kratt Wild Sanctuary and adjoining Wood Creek, dedicated to protecting sensitive bird habitats.

Ms. Christine Kratt
4100 S Bar G Lane
Fort Collins, CO 80524

Dear Ms. Kratt;

It is my honor and privilege to congratulate you and the Kratt Acreage on being accepted and identified as an Important Bird Area. Audubon Rockies' Important Bird Areas program has developed an inventory of the *key sites* within Colorado that support a significant abundance and diversity of birds including breeding, wintering and/or migrating birds. Your property is one of 55 sites totaling more than 1.3 million acres of land and water and is a critical part of our bird habitat and conservation network.

For a site to be identified as an Important Bird Area (IBA) it must meet one or more of a set of standardized criteria that were developed by a committee of bird experts from throughout the state. Each nominated site is reviewed and determined whether or not it meets the criteria based on the ornithological and habitat data submitted.

The Important Bird Areas program is a program of the National Audubon Society and has *no regulatory authority* with no regulations attached to sites that receive IBA designation. Rather, Audubon Rockies looks forward to working with you in protecting the birds, water and critical habitat provided by the ranch ecosystem.

Audubon Rockies has determined that the Kratt Acreage has met the established Important Bird Areas designation criteria. This site is considered important because it supports special-concern species, other high conservation priority species, unique habitat, and significant concentrations of land birds, waterfowl, and shorebirds within Colorado. We recognize that your stewardship of the land has contributed to it being a location where these birds have and will continue to thrive. We hope to support your stewardship efforts and to find unique opportunities to work cooperatively to ensure that sites like Kratt Acreage IBA remain areas that are important sanctuaries for birds as well as much needed riparian habitat.

Congratulations again on being selected. Please feel free to contact me with any questions or concerns you may have regarding the IBA Program.

Sincerely,

Alison Holloran
Executive Director, Audubon Rockies
Vice President, National Audubon Society

Birds of Prey – Federally protected:

Great Horned Owls (and numerous babies each year)
Bald eagles
Red Tailed Hawks
Gryfalcons

BCC 08/17/20

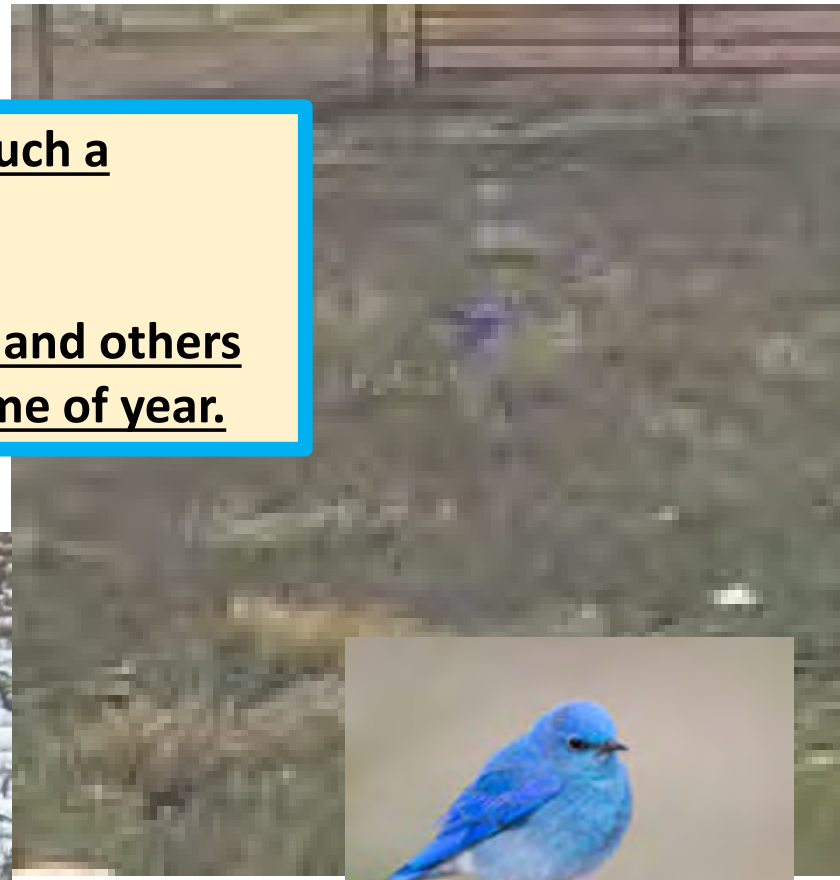
NISP

2081

BCC 08/17/20

Mountain Blue Birds are always such a beautiful sight:

Plus numerous blackbirds, robins and others live in 100s here depending on time of year.



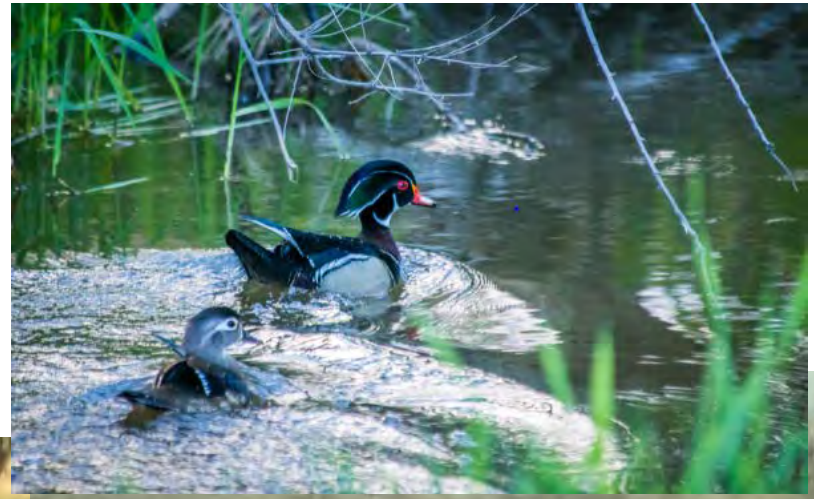
NISP

2082

Canada Geese, Herons and Ducks:

Geese in several 100s at a time eat and stay on black lake and migrate through. Geese, Mallard ducks and Wood ducks all build nests and raise young here! Lots of herons seen in ditch….year round.Fly over, between reservoirs

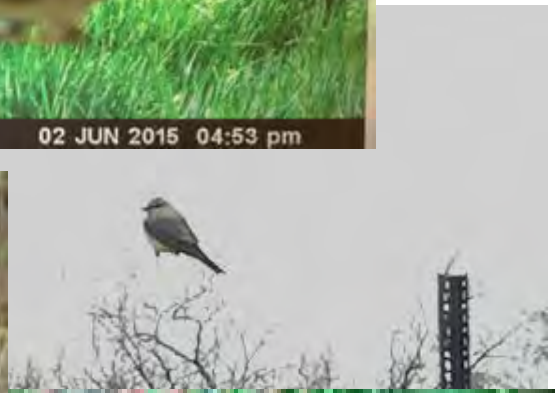
Also: Pelicans (white ones)



Numerous Song Birds and Others:

BCC 08/17/20

Finches
Songbirds
Robins
Black Birds (love the cat tails in the ditch and wetland areas)
Flickers
Loggerhead shrike (rare!!)



Wild Turkeys:

NISP

In the last three years, lucky photo captures of secretive wild turkeys!

2084

BCC 08/17/20

Lots of flowers, bushes, wild fruit trees:

- And milkweed for the soon-to-be endangered Monarch butterflies to complete their lifecycle.
- Rabbit brush provides late-summer/fall forage for 5 additional species of butterflies!

NISP

2085

BCC 08/17/20

What is here!

Mule Deer, White-tailed deer, foxes, bobcats and mountain lions!

Once these animals are gone, they are gone! Let's share with our animal neighbors. We can't be fooled, destruction and construction zones going cross-country through habitats will have irreversible effects.

NISP

Beautiful Northern Fort Collins in Larimer County! Let's keep it special.

NISP: The same old dam way of thinking.

1 message

Michael Anthony <manthony@skybeam.com> Tue, Jun 9, 2020 at 10:00 AM
To: jkefalas@larimer.org, swjohnson@larimer.org, tdonnelly@larimer.org, pcboard@larimer.org

Humans need to stop releasing carbon dioxide into the atmosphere. How does this project further that collective human objective? It does not!

This project will release millions (billions?) of tons of CO2 into the atmosphere during dam, pipeline and road construction, then demand huge amounts of coal to be burned to generate electricity (half lost in transmission) to run the pumps to get the water up over the dam. There is no mention of a hydroelectric station below the dam to offset some of that carbon when water is released. Really no thought of that? How much coal will have to mined, transported and burned each year to sustain this dam pumping scheme? This dam is useless without continuous energy input. An environmental disaster all the way around.

Times have changed, this project is outdated. It is time for real solutions not more of the same old dam thinking.

What will the end result of this project be? More water (with lots of embedded fossil fuel energy) for urban development which will encourage more urban development, which will require more dams, more pipelines and more carbon release. Enough! We have to be smarter than NISP.

Humbly submitted after another night of destructive weather events,

Michael Anthony

NISP 1041 Permit Application Comments

1 message

mikepruz@gmail.com <mikepruz@gmail.com> Tue, Jun 9, 2020 at 4:03 PM
To: rhelmick@larimer.org

DISCLOSURE: I am an elected director of the Fort Collins Loveland Water District. My comments are my own personal option as a private citizen. I cannot and do not speak on behalf of the district, or the board, or any member or employee of the district. I speak solely for myself. These comments are my personal comments and my comments alone.

I was originally an NISP objector. However, after Northern addressed my concerns with roughly $60M in mitigations, including guaranteed releases, fish ladder support, and monitoring, I became a supporter of the project.

Also, note, while I have a side and my comment are biased towards items that support that side, please note that I'm not asking for a particular outcome. I asking for honor and integrity in the process. If my assumptions and information is wrong or inaccurate, then it is. Most of my comments are questions. I think the answers to those questions will support my position. As a resident of a NISP area, as a resident of Fort Collins, as a resident of Larimer County, NISP is needed for all. Look at local drought predictions. Current water isn't enough. Northern, Fort Collins, Greeley all looking to expand water supplies. The slow growth ballet issue failed, candidates running on no growth lose. Don't be confused about where public support really is. The project and the pipeline are needed, unless there is a regional growth moratorium and additional conservation requirements and all saved water is dedicated to the river. If you disagree with my thoughts, please make sure your response clearly documents why.

1) The opposition is making claims the Grey Mountain Reservoir. It is my understand that these are the same water rights for NISP. That the off stream proposal was supported as part of ending the Grey Mountain in stream project. Now it appears the opposition revoking their support for the alternative they previously supported. These facts should be verified.

2) The opposition is claiming NISP will destroy the new White Water Park. My understanding is that the minimum flows and down stream diversion are specifically to support the White Water Park. Please verify these facts before making a decision.

3) Ask why the opposition is opposing NISP, but not Halligan and Semans. Ask why Fort Collins thinks it shallow Ridgen reservoir is good, but the shallow NISP fore bay is bad. Ask why Fort Collins thinks turning green space into NISP and 2-stroke water craft is bad, but turning green space into Montava and it dirty 2-stoke lawn equipment is good. There many contradictions, be sure to do your diligence or risk losing a lawsuit.

4) Ask why dams are opposed, but the dam for the White Water park is supported. Ask what the opposition goal is and what a full win will look like. At one point I saw a presentation that said the flushing flows they want at the canyon mouth would flood Greeley. Flooding Greeley is illegal. They may not be able to get what they want.

5) Claim of river hard are clearly exaggerated. NISP has already help build the Watson Fish Ladder with the City of Fort Collins. NISP is already improving river health. NISP is also working with Fort Collins on a fish ladder a the downstream diversion. Be sure to do your fact checking.

6) Keep in mind that Fort Collins lost some of its Halligion Water Rights a few years back. Those rights did not go away. They refiled and went from being in front of NISP to being behind NISP. The rights did not go away, they did not get dedicated to the river. Be sure to understand water right law, if you block this project, Northern could sell that expensive 287 land for well over what they paid, buy cheaper land up the canyon, and we may be back to an in stream reservoir.

7) Keep in mind that conserved water doesn't go to the river. The utility gets to keep it and re-sell it to developers. I ran for Fort Collins mayor to create a problem to allow conserved water to be dedicated to the river. Be sure to understand if the opposition supporter or opposed me. This will tell you if they really care about river protection and enhancement or are just using delay tactics to drive up the cost of growth in the county and harm both citizens and businesses.

8) What would it cost Larimer County if all the NISP residents had to go to Xeriscape? 10k/home, 50k/home? What if NISP residents were put on rationing because new water source could not be acquired? Double rates? Quadruple rates? What would that do the economy, housing, and schools in South Fort Collins? Would create a economic and housing dead zone? Would it be isolated to South Fort Collins? Would it cause irreparable to the County Seat and non-NISP areas of the county?

9) An important point to understand and consider is what happens to the water rights if the project is blocked? Does that water get dedicated to the river in perpetuity? Or can it be sold to frackers that will take it out of the basin? NISP is committed to minimum flows. Will those flows be lost? Will the opposition really get the flushing flows they want? Will Northern just build a different reservoir some place else?

10) Thornton offered the county a win-win deal. The county turned it down is now facing a win-lose lawsuit. Be sure to understand the downside. Don't vote down the pipeline with Northern's current benefits just to lose in court and the pipeline without those benefits. An illegal blockage could hold the county liable. Make sure you cannot get sued this time.

11) Understand that, like it or not, the law says Northern has the right to take that water out of the river. The county has no authority over that right. The right essentially says the water is trespassing on the river and must be removed for the beneficial purpose listed on the right. The state has already ruled on this point. The county has not authority to hear arguments to stop the pipeline based on opposition view that right is not beneficial. There is a state water court process for that.

12) Be sure to ask the opposition what alternative location and flows and conditions they would support? If the answer is none, then be diligent that you are not supporting a possibility that cannot happen.

Michael Pruznick
Personal Opinion as a private citizen

Rob Helmick <helmicrp@co.larimer.co.us>

Larimer County Should Not Approve the NISP 1041 Permit Project No. 20-ZONE 2657

1 message

Rodger Ames <rodger.b.ames@gmail.com> Tue, Jun 9, 2020 at 12:48 PM
To: rhelmick@larimer.org, tdonnelly@larimer.org, swjohnson@larimer.org, jkefalas@larimer.org

Dear Commissioners and Planning Commission:

Commissioner Johnson
Commissioner Kefalas
Commissioner Donnelly
Rob Helmick

I'm a landowner residing in northern Larimer County, near the proposed location of Glade Reservoir. I would like have my comments on Northern Water's 1041 Permit Application for the Northern Integrated Supply Project (NISP) entered in the agenda for the upcoming Larimer County Planning Commission and BoCC Hearings.

My family choose to live in northern Colorado for its beautiful natural landscapes, its wild and scenic rivers, it's clean air and quiet surroundings, its wildlife, its opportunities for outdoor recreation on the abundant state and federal lands in the area. These are key pieces to our quality of life; key pieces that would be lost if this project is constructed. Our land, water, and communities would be harmed by this project, and any benefits of the project would accrue to communities mostly outside Larimer County.

If construction is executed as planned, there would be seven years of heavy construction impacting our communities. We would be subjected to lots of heavy truck traffic, since the main artery to and from the reservoir site is Highway 287, which is also our main route; 6-days-a-week heavy traffic and heavy machinery operations, and the unwelcome, intrusive, and obnoxious presence of widespread and large-scale construction activity, noise, dust, and danger, over a long period of time. The intrusion would turn the hundreds of acres of the landscape into a construction zone, and take away the attractiveness, the clean air, the quiet – the things we depend on for health and happiness.

There is broad scientific consensus that future climate warming will cause more frequent and prolonged droughts in our region. Storage in reservoirs on the lower Colorado River Basin is at all time lows. The same situation could easily become a reality for reservoirs along the Front Range. The potential adverse impacts of droughts on water supplies to Glade are significant and have not been throughly evaluated in the NISP EIS process or Northern Water's 1041 Application.

An analysis of water storage at Glade conducted by Save Rural NoCo indicates that water levels at Glade may not support flat water recreation to the extent indicated in the NISP FEIS and Glade Recreation Plan. Furthermore, similarities in proposed recreation use at Glade to those at Horsetooth presented in the FEIS are misleading because Horsetooth is supplied by C-BT water, which is an entirely different, and historical data indicate more resilient to drought conditions, water supply than the Poudre River Basin.

The City of Fort Collins recently commissioned a water supply vulnerability study which concluded climate change is the most significant risk facing future water supplies to the City. However, hydrological modeling in the NISP FEIS relies solely on historical streamflows to predict future water supplies, and does not account for a range of risks to future water supplies. The ability to maintain consistently high water levels is paramount to the viability of flat water recreation at Glade. The county and its residents should be informed of risks, and the potential impacts of these risks on recreation value of Glade, before the project is allowed to proceed.

During times when the proposed Glade Reservoir and appurtenant recreation facilities support recreation use, the almost 400,000 visitors per year to this area would alter it from the quiet, rural and sparsely populated landscape we sought and invested in, to a busy recreational area with noise, dust, traffic, activity, accidents, and fires. For some owners, the noise would cause property values to decline.

The NISP would also contribute to climate change at a time when the Colorado and the county are working diligently to reduce GHG emissions. Over 30,000 tons per year of CO2 would be emitted by engines to pump water into Glade. That's equivalent to CO2 emissions from over 7000 gasoline powered vehicles. Other greenhouse gases would also be produced, both during construction and operation. Water storage options that rely on gravity to fill storage catchments would seem to be preferable alternatives at at time when so much effort is being put into GHG emission reduction

policies.

The project would also produce other air quality issues. Dust blown from barren shorelines would be swept up the valley on the area's strong winds. The EIS states that it would take an 80-mph wind to generate any fugitive dust from the shorelines of the operating reservoir. The air quality analysis presented in the NISP EIS, particularly potential impacts from wind blow dust due to exposed lake beds at Glade, should be reviewed with more scrutiny before the project is allowed to proceed.

As a local landowner, I am very concerned about the potential for fire. We live in a high fire hazard, and we take many precautions with our homes and properties to protect against fires. Many visitors, who would be visiting in summer when the land is hottest and driest, would not be aware of how easy it is to cause a wildfire in this landscape. Wildfire potential is a serious issue Larimer County must consider in the 1041 permit process. Increased wildfire risk would also increased demands on local emergency services, especially fire, medical, and law enforcement.

No project this big can be undertaken without significant and irreparable impacts. Speaking as a private citizens and local landowners, we ask Larimer County to be a good steward and deny this permit and prevent the loss of open space and wildlife habitat, increased risk of wildfires and other public safety hazards, increased demands on local volunteer emergency services, noise, light pollution, increased development and traffic, reduced air quality, and potential decreased local property values, and the loss of unique visual and aesthetic values. The natural and rural quality of this land is very important to our lives and communities.

Sincerely,

--

Subject: NISP 1041 Permit
To: <bocc@larimer.org>

On behalf of my cattleman/professor/sportsman husband Dr. James Brinks who died 5 years ago this week, I beg that you do nothing more to gut the Poudre River, 1/2 mile of which flows through and irrigates our Laporte farm. Use that permit we fought so hard for, and say no.

Larimer County Planning Commission

Larimer County Board of County Commissioners

To all concerned,

I'm writing as a Larimer County resident, property owner and tax payer, with respect to the Northern Integrated Supply Project (NISP), and its pending 1041 Permit request.

For very many reasons, I believe the Planning Commission must reject the 1041 permit request by the project's proponents, Northern Water. Personally speaking, it is certainly not in my best interests. Nor, I believe, is it in the interest of those whom I suspect to be the vast majority of Larimer County residents. In fact, this project proposal represents significant public harms. I will only mention a few here, in partial explanation for why I oppose it and hope you will deny the 1041 permit.

As you likely know, the Poudre River is already stressed and endangered , in large part by diversions. NISP, if completed, will severely cut off the "peak flows" needed to maintain the river's health and habitats. There is no way to avoid this if this project is built as planned, and it is impossible to mitigate these system-wide impacts. One of the direct ones will likely be a reduction of habitat for trout species. While I'm not an angler myself, I have very many friends who are. Yet, even if there wasn't a single person who personally cared about fishing, we have a moral duty to preserve what we have.

Also with respect to the Poudre itself, I'm extremely concerned about the gradually increasing effects of climate change, whose effects may well be exacerbated by diversions from the river. What is the tipping point? Just how far are we willing to go? While I understand water rights, I would urge the Planning Commission and Board of Commissioners not to play a part in further damaging the river.

NISP's plan is also incompatible with Larimer County's Comprehensive Land Use Plan that pertains to the area in question. Larimer County should defend this plan and its visionary objectives, for the benefit of residents, both today's and tomorrow's; and put Larimer County's interests first.

That Northern Water will buy up farms in Weld County for their water rights is another reason for denial. Why does this matter? For one thing, the drying up of farms in Weld will be yet another heavy blow to agriculture in Northern Colorado, which has already been harmed by speculation in water and land. For another, all that "dry" land will then have only one perceived use- development. This will drive up vehicle miles traveled (VMT), a major contributor to both highway congestion and air quality problems that continue to lower quality of life while driving up costs for all. Several failed attempts to win public support for highway expansions illustrate the growing difficulty of ignoring this problem.

Unfortunately, the federal EIS missed the latter impacts, erroneously concluding that the project has no need for additional water rights (it will), and therefore, no farms would be purchased in order to fill the reservoir. This error alone casts significant doubt on the reliability of the federal EIS.

Of course, NISP won't just drive land development and sprawl in Weld County. The communities participating in NISP are faced with every-increasing costs to finance it. There will be even greater pressures on each for expansion for revenue development to cover these costs. This is ill-advised in an area already literally choking on the effects of high growth rates. NISP, in effect, creates a vicious cycle of deb-fueled expansion which leads to yet further costs for local governments and their taxpayers. This is madness. It is unsustainable and counters everything we try to do to keep Larimer County a great place to live.

Besides such harms, I'm also concerned about the potential long-term costs to residents here from trying to accommodate NISP. I marvel that this can even be considered without a prior public discussion and hearing on whether Larimer County should agree to the relocation of US287, along with the consequences of that.

Summing this up, this is a very bad deal for Larimer County and its residents. I hope that we, who will bear many (but not all) of the negative consequences will be your primary concern in this regard.

Respectfully,

Roger Hoffmann

NISP 1041 is incomplete

1 message

normanranch <normanranch@earthlink.net> Mon, Jun 8, 2020 at 10:20 AM
To: bocc@larimer.org, pcboard@larimer.org, rhelmick@larimer.org

Dear Commissioners,

NISP has its 1041 Glade Reservoir and Pipeline application deemed complete by the Planning Department. There are numerous deficiencies and the completeness determination should be reversed.

The issues below need to be addressed more thoroughly by NISP before ever going before the Planning Commissioners.

Here are just a few of the many concerns we have over NISP's 1041 application:

1. The relocation of 7 miles of Highway 287, a major federal highway, would not occur but for the NISP project. NISP is treating the 7 miles of highway 287 relocation as "not our problem" and is claiming the relocation and all of its impacts is a separate "CDOT" project, to be funded by taxpayers! The relocation of 287 started out in the NISP proposal, "NISP includes the following facilities located in Larimer County**: the Glade Unit**; the Glade Pump Station; raw water distribution piping; and the **relocation of U.S. Highway 287**." NISP then changed its mind and excluded the 287 relocation from the proposal. The relocation will have major impacts to Larimer County and its taxpayers, public safety, visual impacts, historic structures,etc.. The relocation of U.S. Highway 287 is part and parcel of NISP, please insist it is addressed in the 1041.

2. Not adequately addressing 1041 Criteria 6, "The proposal will not negatively impact public health and safety".

a. The proposal will push a missile site carcinogenic chlorinated solvent plume into domestic drinking water wells. As stated by geological expert, Tom Sales, "Historical operations at a DoD Nuclear Missile Site at the base of the Glade Dam created a large plume of carcinogenic chlorinated solvents in groundwater that currently passes out beneath the proposed forebay for Glade. Plumes of this nature last many lifetimes and it is implausible that site specific efforts to clean up the plume have been effective. Northern installed more than 20 monitoring wells in 2019 located through the plume, but no public records are available regarding data from the Northern 2019 monitoring well network." The forebay is a below dam small reservoir of the Poudre water which will be pumping water 375 feet up into Glade Reservoir. This groundwater carcinogenic contamination must be addressed thoroughly in the 1041. Why wasn't the NISP monitoring well information made public? Please insist this information is included in the 1041.

b. The relocation will take a benign straight highway alignment along a valley bottom and turn it into a dangerous road up and over a high hogback. This rocky terrain, and curvy reroute will be a longer and more dangerous road, causing higher accident rates. Blind corners will undoubtedly cause an increase in vehicle/vehicle and vehicle/wildlife accidents. I concur with attorney, John Barth's statement, "The new alignment will increase emergency response times by at least 5 minutes, critical minutes in a life-threatening emergency." This reroute is only for the benefit of NISP, and unnecessarily endangers Larimer County residents and visitors. Please insist these safety issues are addressed in the 1041 application.

c. Two large faults, the North Fork Fault and the Bellvue Fault, pass under the proposed Glade Dam site. Tom Sale, geological expert, states, " 1) the faults represent vertical intervals of broken rock and 2) that they pass directly under the proposed dam site (that will have up to 400 feet of differential water level) it seems highly likely that leakage under the dam along the faults will be severe. NISP's "Oh, by the way" inclusion in the application is**,** "There are two earthquake faults mapped within the Glade unit. The Bellvue Fault and North Fork Fault have been intercepted at depth by test holes advanced during the project's geotechnical investigations."…. "Both faults are inactive and do not present a seismic risk to the project." **All faults are inactive until they aren't**. NISP's remark of "Do not present a seismic risk to the project" has no reference to a government agency verifying there is no seismic risk. Any seismic risk, no matter how small, is unacceptable when it involves a dam holding back 170,000 acre feet of water!. Please demand a more thorough analysis from a federal authority and insist on a qualified government agency's certification that the two faults will never present a seismic risk to the project. Larimer County citizens lives depend on it!

3. Inadequate Criterion #5, "The proposal will not adversely affect any sites and structures listed on the State or National Registers of Historic Places." The Final EIS states there are 82 eligible or potentially eligible cultural sites present in the disturbed area. Eight of the sites are officially eligible and 74 require additional data and formal evaluation. These are dismissed by NISP as minor to moderate impacts. There are numerous additional sites in the APEs of the 287 reroute that are not even mentioned. The FEIS states mitigation will be decided at a future time. This is unacceptable. Please assure that historical sites are individually addressed, by appropriate historical societies as to impact.

4. Proposal has not addressed Criterion #4, "The proposal will not have a significant adverse affect on or will adequately mitigate significant adverse affects on the land or its natural resources, on which the proposal is situated and on lands adjacent to the proposal." To get the Poudre River water into Glade reservoir will take 80MW of power supplied by huge transmission towers similar to those used at Glen Canyon Dam (see below image).The forebay is the holding reservoir for water from the Poudre River, and from where the Poudre water will be pumped 400 feet up into the Glade Reservoir. "The proposed peak pumping rate in Northern's application to Larimer County, from the forebay, is 1,200 cubic feet per second and will require 81 MW (megawatt) of power. To put 81 MW in context, it is equivalent to the power required by Fort Collins' approximately 62,000 residences and 90% of the reported generation capacity of Glen Canyon Dam," states Tom Sale, civil and environmental engineering expert. We also want answers in the 1041 to Tom Sales questions of:

- How will NISP get the required electrical power to the pumps,
- Where is the approval for an 80 MW power line, and
- What is the visual impact of these enormous power lines?

We would like to add to that list:

- What is the carbon footprint in the producon, ins tallaon, and main tenance of the transmission towers and power lines, and

- What is the on going carbon footprint from the producon the electricity r equired to run those huge pumps?
- Where is the assessment assuring there are no protected and endangered species along the hogback that would be impacted by the towers and lines?

Below is the 90 MW power source illustration, from Tom Sales' comment letter, showing the transmission towers of 90 MW necessary for the Glen Canyon Dam. NISP has stated it will need 80 MW for the proposed Glade Reservoir. The towers needed will be unsightly in this beautiful valley and may have a huge impact of wildlife and human safety. Where is the assessment documentation that there are no protected and endangered species along the hogback?
 Glen Canyon Electric Power Source

Some things just don't make sense, and Glade Reservoir is one of them.

Thank you,

Roberta and John Norman

Commissioners Johnson, Kefalas, and Donnelly;

I have a background as a geologist and I have significant concerns about the safety of The Northern Integrated Supply Project, if approved and constructed as currently envisioned. I am concerned that this reservoir dam is proposed to be constructed at the intersection of some major geological faults and the underlying rock below the water pool at the proposed Glade Reservoir is known to contain gypsum karst features that readily dissolve and years later cause dangerous and expensive to mitigate seepage problems such as as occurred at Horsetooth Reservoir (https://www.coloradoan.com/story/news/2017/04/15/look-back-why-horsetooth-reservoir-nearly-drained/100463850/). You can read the details of my concerns in the attached letter that I sent as a comment to the Corps of Engineers in 2009.

If my memory serves me correct, The Corps of Engineers response to my concerns was that they would be addressed during the construction phase which I take it as meaning that they will just pump cement grout into any fractured earth and caverns that they find during construction and then leave the future leakage and dam saftey issues for the future officals to mitigate.

In addition, the riparian areas of the Poudre River need the recharge water of a flood in order to maintain the habitat along the river that we all enjoy and cherish. Do you really want to turn the Poudre into a Los Angeles River situation? I don't.

I would like to thank The United States Army Corps of Engineers for extending the time period allowed for comments on the draft EIS of the Northern Colorado Water Conservancy District's NISP project.

I will start with comments on the geology of the Glade Reservoir proposal.

First, the problem with the draft EIS is that there was not enough detailed geological mapping in the field, field sampling, or drilling to try to determine the exact locations of the North Fork fault, the Bellvue fault, the splays of the Bellvue fault, and the rock composition underneath the dam and reservoir site. Performing these tasks is necessary because:

- You must determine the exact locations of these faults, their dips, and the geology the area.
- The scientists who have studied these faults suggest that the North Fork Fault (a fault with an estimated 2 km of movement) cuts through the valley underneath the dam axis (both the old and current proposal sites of the dam).
- The Bellvue fault splay locations have always been mapped as questionable. This means that all geologists, including the authors of the draft EIS, who have mapped the Bellvue fault are guessing at its location, dip, etc.

I believe the dam axis is constructed above the intersection of at least two major geological faults, the North Fork fault and the Bellvue fault. Also, If you look at the geological maps (or take a walk in this area) of the Laporte to Livermore area you will see that the North Fork fault commonly breaks into large shears zones. Considering that the dam axis crosses two or more fault zones, there is a great potential for the ground underneath the dam to be composed of:

- large shears zone of crumbled up, crushed, and fractured sediments, most probably pieces of the Lykins Formation which has a very well documented seepage problems from gypsum-

karsts and possibly the Ingleside formation, which the draft EIS also acknowledges has seepage problems from gypsum karsts.

The geological formation underlying the dam axis, and the main reservoir pool, is the Lykins Formation. The Lykins Formation contains gypsum-karst features, such as breccias that cut across the strata, large semicircular collapse chimneys that also cut across the formations stratigraphy, solution cavities and conduits in pervious limestone beds, and discontinuous bodies of massive gypsum. (Pearson, Ronald M, U.S. Bureau of Reclamation). These features readily dissolved into water and are the cause of seepage problems. As is well known, during the late 1980s sinkholes formed at the south end of the Horsetooth Reservoir underneath the Lykins Formation and in late 2000, a sink hole was discovered on the upstream toe of the dam. This necessitated the expenditure of tens of millions of dollars to attempt to seal these karst features and insert stem walls to stop the seepage. At Carter Lake dam number 2, over 4 ft.^{3} per second of seepage exist downstream of the dam. Samples of the seepage water have shown it is almost saturated with dissolved gypsum, thus, once again, indicating problems with seepage from karst features in the Lykins Formation. I am not aware of the existence of current estimates for how much it will cost to try to stem off or seal off the seepage in the Lykins Formation at Carter Reservoir, but I suspect, will be in the multimillions. I keep wondering where the seepage will occur at these reservoirs and another 25 years, and how much more money will be spent to try to stem off these karst features?

Gypsum Karst features have created large problems at other reservoirs, including failure of some dam sites. I refer you to a recently published (January 2008) article in the publication, *Environmental Geology*, entitled, *"Gypsum -- karst problems in constructing dams in the United States",* by Kenneth S. Johnson of the Oklahoma Geological Survey. He states,

> *These karst features can compromise on the ability of a dam to hold water in a reservoir, and can even cause the collapse of a dam. Gypsum karst in the abutments or foundation of a dam can allow water to pass through, and around, or under a dam and solution channels can enlarge quickly, once water starts flowing through such a karst system……. in Oklahoma, the proposed Upper Magnum Dam was abandoned before construction, because of extensive gypsum karst in the abutments and impoundment area. Catastrophic failure of the Quail Creek dike in southwest Utah in 1989 was due to flow of water through an undetected karstified gypsum unit beneath the earth-fill embankment…….*

He also later states,

> *Gypsum -- karst features may seriously compromise the ability or likelihood that a proposed reservoir would be able to contain and retain water, without extensive and expensive engineering actions (such as deep excavation, deep cut off trenches filled with impermeable material, and/or extensive and deep grout curtains). Such corrective measures still may not provide a permanent solution to the karst problem..... The hydraulic head of the reservoir may also cause clay filled cavities in the gypsum karst beds to weaken and failed, allowing water to flow through pre-existing karst features.*

It also has been reported (Jarvis, 2003) that the construction of the Anchor Dam, near Thermopolis Wyoming, proceeded in spite of the known existence of sinkholes and karst conditions, because it was thought that remedial efforts (grouting) would eliminate any seepage or structural problems from karst features. There has been significant drainage of water from the reservoir, and the

abutments of the reservoir are on karst features and to date only a small quantity of water is being stored in the reservoir.

The catastrophic failure of the earthfill dam in the Huesca provenance of northeast Spain also has been reported in Environmental Geology, (2003). The abstract of this paper states:

> *……this case study demonstrates that frequently hidden limitations that evaporitic sediments* (gypsum) *and dispersive clay* (karst clay) *materials pose to the construction of dams……..*

In addition to the problems around the Glade Reservoir dam site, there is a significant potential that water stored in the reservoir pool will be lost through seepage into the bedrock and underground aquifers via fractures, faults, and gypsum karsts, breccias, etc.. This makes it imperative that detailed geological mapping, sampling, and core drilling in the reservoir basin area be done before the US Corps of Engineers comes to a conclusion on the viability of this project. These tasks need to analyze the potential for water seepage losses from the reservoir pool into the bedrock and underground aquifers via fractures, faults, and gypsum karsts, branches, etc... Both the Lykins Formation (which underlies the main pool), and the Ingleside formation (which contacts and underlies a portion of the smaller pool of water) have well documented problems with water loss via seepage into the bedrock.

Gypsum in the Lykins Formation and this area is so common that Colorado Lien extracts and produces gypsum from the Munroe Quarry, just north of the Glade Reservoir site. The gypsum is extracted from the Permian Lykins Formation, the same formation that underlies the main pool of the Glade Reservoir. Annual production averages about 50,000 standard tons. This implies that there is a very high potential that this reservoir will not be able to hold and store the water pumped into its pool because of water loss via seepage into the bedrock.

So in summary, from my reading of the draft EIS of NISP, and the analysis of the current geological opinions of the geology, geological structures, formations, and tectonics of the area, it appears that the Glade Reservoir dam is being proposed to be approved for construction without a detailed evaluation of the geological structures, formations, and seepage potential underneath the dam axis and abutments. Furthermore, given the high potential for hidden seepage features, no matter how well you drill and sample the area, it is my opinion that this dam will have a very high risk of seepage in the future, no matter how much remediation grouting and stem wall building is done.

This dam site is essentially located at the intersection of two major faults, and both with a high potential for large shears zones. The large shears zones will be composed dominantly of the Lykins Formation, which contains significant amounts of gypsum bodies, and gypsum-karst features, which have been tumbled and ground up. On top of this, it is proposed to build a large dam to hold back a larger reservoir of water. **This is an extremely risky proposition, with unknown potential seepage and structural problems in the future.**

Secondly, I would like to address likelihood of active earthquakes in the area of the dam site. The definition of active faults/earthquakes in the Front Range of Colorado is being currently reevaluated by scientists.

In the 1880s there was a magnitude 6.6 earthquake centered near the northeast corner of Rocky Mountain National Park. This is the largest historic earthquake to be recorded in Colorado. The 1882 earthquake frightened people in Denver and other northern Front Range cities. It was so strong that the bolts holding the electric generators for Denver were snapped off and power was knocked out. The Glade Reservoir area was within the area that also felt aftershock earthquakes.

In addition, Matthews, 2004, reports on two major new geological structural features in Colorado:

> *…….The upper crust underlying the northern Front Range and Denver Basin appears to be broken into three major blocks separated by* ***two northeast-striking lineaments*** *that are interpreted as scissor faults (Figure 3). The lineaments cross the Front Range and extend to the axis of the Denver Basin.* ***Modern earthquakes possibly occurred along the lineaments…****……*

If you examine the map Matthews has created, one northeast striking fault zone extends through the northeast corner of Rocky Mountain National Park (near the 1882 earthquake center) and on up through the Livermore embayment area. The proposed Glade Reservoir is located just south of the Livermore embayment, which is where this lineament extends out into the plains of the Front Range. The North Fork fault, which intersects of the dam of Glade Reservoir, extends north up into the Livermore embayment where it is cut off by a series of faults in the northeast striking lineaments that is described by Matthews.

All this suggests that before the US Corps of Engineers makes a decision on this project, the earthquake potential of the area should be reevaluated and then the dam structures are built concordantly to the reevaluated potential. It would not be difficult to contact the geologists who are currently studying and reevaluating the earthquake potentials of the Front Range of Colorado. Most of them work for the state of Colorado, or one of the state universities of Colorado.

The third point I would like to discuss, is about potential water salinity problems in the alternative reservoir that is proposed, the Cactus Hill Reservoir.

According to the draft EIS, the water will be relatively clean when it is pumped into Cactus Hill reservoir, however salts will leach out of the soils (and bedrock?) and cause the water to become saline. The authors of the draft EIS assume, "The *quality of runoff within the watershed may be similar to the quality of Lonetree Creek, which was sampled intensively by the USGS in 1993 through 1995 at a location north of the Cactus Hill site near Carr, Colorado."*

The authors are assuming the soils at the Cactus Hill site are the same as soils 10 to 15 miles away. **The composition of soils can change over just tens of feet. To make the assumption that the soils at the Cactus Hill dam site are the same as soils that were sampled 10 to 15 miles away is unacceptable.** Before the US Army Corps of Engineers approves this project, the soils and the bedrock at the Cactus Hill site should be intensively mapped, sampled, and drilled. The mapping should look for potential large and small fault zones and fractures, any evidence of anhydrite or gypsum (which have been documented in the upper Pierre in northern Colorado) which could cause seepage problems, breccia zones, caliche zones, and evidence of, "teepee buttes or cold seep mounds" which could cause water loss through seepage. In addition to the usual geotechnical

sampling and mapping, **the Pierre Shale should be analyzed for radioactive elements which have been found in the upper Pierre.**

I also question the validity of the model that the authors of the draft EIS used to estimate the potential salinity concentrations of the water pool at Cactus Hill. The authors state that a model was developed, however the model is not available to the public to analyze. In the draft EIS the authors use this model to predict that there will be salinity problems in the water from Cactus Hill for eight years, and then the water will stabilize because all of the salts will be have been leached out of the soils. The authors do not know the exact composition of the soils, because they have not sampled them in the field, rather they used the analysis of soils 10 to 15 miles away. They also assumed that only soils will leach salts into the water, they do not predict that the bedrock, which is known to contain salt formations, will leach salts into the water. Why they chose not to include leaching of salts from the bedrock, I do not know.

Since the data going into the model is suspect, and the distinct possibility that the model used is invalid, I suggest everything that the authors of the draft EIS say about the salinity of the Cactus Hill reservoir is invalid and the United States Corps of Engineers must not approve this project until the soils and bedrock have been properly sampled, mapped, and analyzed and the model that the authors use to estimate the leach rate of salts at Cactus Hill reservoir be made available to the public so its validity can be confirmed.

If I was a shareholder in this project, I certainly would not want to spend tens of millions of dollars in order to receive salty water for my community.

In conclusion, I would once again like to thank the United States Corps of Engineers for allowing the public an extended period of time in which to comment on the NISP project.

I recommend to the United States Corps of Engineers that they do not approve the construction of the Glade Reservoir because of the uncertainty of the geology that lies underneath the dam and water pool and the extremely high probability that no matter how much grouting and how many stem walls are sunk into the bedrock, eventually water seepage will occur, possibly resulting in the inability to hold and store water in the pool and potential dam failures.

In addition, I recommend to the United States Corps of Engineers that they do not approve the construction of the Cactus Hill Reservoir until the site has been thoroughly sampled, mapped, and drilled, the potential leakage issues are addressed, the water salinity problems are properly modeled, and the results (including the models used to make the predictions) made available to the public.

Finally, I would suggest that the owners of this project look to eventually put their water storage in rock formations, such as granites or clean, well cemented sandstones, where there are no potential leakage or salinity problems and in the meantime I suggest that they pursue alternative options for providing water their customers' desire.

Larimer County Should Not Approve the NISP 1041 Permit Project No. 20-ZONE 2657

1 message

Doug Prince <dprince01821@msn.com> Tue, Jun 9, 2020 at 1:27 PM
To: rhelmick@larimer.org, tdonnelly@larimer.org, swjohnson@larimer.org, jkefalas@larimer.org

Dear Commissioners and Planning Commission:

Commissioner Johnson
Commissioner Kefalas
Commissioner Donnelly
Rob Helmick

I'm a landowner residing in northern Larimer County, near the proposed location of Glade Reservoir, it's massive dam, forebay, pumps, pipelines, campgrounds, parking lots, boat ramps, and other facilities. We strongly urge the Board of County Commissioners to deny the 1041 permit for the Northern Integrated Supply Project because it would forever impact the fundamental nature of the rural landscape in which we live and harm our quality of life.

We choose to live in northern Colorado for its beautiful natural landscapes, its wild and scenic rivers, it's clean air and quiet surroundings, its wildlife, its opportunities for outdoor recreation on the abundant state and federal lands in the area. These are key pieces to our quality of life; key pieces that would be lost if this project is constructed and operated as proposed. Our land, water, and communities would be harmed by this project, and any benefits of the project would accrue to communities mostly outside Larimer County.

It is unacceptable that our rural northern Colorado communities must bear the impacts and unmitigable risks of this massive and ill-conceived project, the biggest ever proposed for Larimer County.

If construction is executed as planned, there would be seven years of heavy construction impacting our communities. We would be subjected to lots of heavy truck traffic, since the main artery to and from the reservoir site is Highway 287, which is also our main route; 6-days-a-week heavy traffic and heavy machinery operations, and the unwelcome, intrusive, and obnoxious presence of widespread and large-scale construction activity, noise, dust, and danger, over a long period of time. The intrusion would turn the hundreds of acres of the landscape into a construction zone, and take away the attractiveness, the clean air, the quiet – the things we depend on for health and happiness.

Northern Water is currently buying farms in northern Colorado to make up a more than 50% shortfall in the water rights needed for a successful project. In addition, recent prolonged droughts, which are becoming more common, have affected the amount of water that would be available from the Poudre River and other sources. For us, this means that we would endure the years and years of construction, and the irreparable loss of the unique landscape in which we live, all for an unfulfilled promise that "if they build it, the water would come" which is by no means guaranteed. The water shortage will only get worse as the climate dries, so Larimer County should deny this project, which will likely fail to meet its objectives. Less expensive, less destructive alternatives to water supply should be seriously considered.

Encouraging almost 400,000 visitors per year to this area would alter it from the quiet, rural and sparsely populated landscape we sought and invested in, to a busy recreational area with noise, dust, traffic, activity, accidents, and fires. Noise from motorboats on Glade would exceed state standards, would be heard miles away, and would significantly disrupt our lives. For some owners, the noise would cause property values to decline.

That's if the reservoir fills. The photographs Northern Water shows of a beautiful full reservoir are misleading at best, because the reservoir would rarely, if ever, look like that. It would generally look like an abandoned industrial facility marring the area's aesthetics.

Since the reservoir would not fill, and likely would not be full during much of its life, the project would look like an abandoned muddy puddle much of the time, and the recreational facilities would be mostly empty. Who would pay for the upkeep of the unused recreational facilities, Larimer County taxpayers? The project ruins the aesthetics of the valley and hogbacks – a unique and beautiful landscape – for a project that would provide little or no benefit to Larimer County and in fact would negatively impact its residents and its coffers.

The project would also contribute to climate change. Over 30,000 tons per year of CO_2 would be emitted by engines to pump water into Glade. Other greenhouse gases would also be produced, both during construction and operation. Air

pollution would also occur due to the project, including gases that form ozone, a severe health hazard.

Dust blown from the barren shorelines would be swept up the valley on the area's strong winds and seep into our homes and further degrade our lives. The EIS states that it would take an 80-mph wind to generate any fugitive dust from the shorelines of the operating reservoir, an assertion that doesn't pass the laugh test for anyone living in this rural landscape. What else has have they got wrong? Are we to be the guinea pigs for some ill-conceived experiment?

We are very concerned about the potential for fire. We live in a high fire hazard, and we take many precautions with our homes and properties to protect against fires. Many visitors, who would be visiting in summer when the land is hottest and driest, would not be aware of how easy it is to cause a wildfire in this landscape. Some would be careless with campfires, with cigarettes, with illegal fireworks, or with firearms, and wildfires would be inadvertently ignited. Their vehicles can start fires. Unfortunately, arson is possible. Our climate is getting drier. Larimer County must recognize the seriousness of this issue and deny this permit. The county cannot simply hope for the best because our homes, our property, our animals would all be put at unacceptable risk of wildfire due to construction, high visitation, and incomplete understanding. These increased risks would also cause increased demands on local emergency services, especially fire, medical, and law enforcement.

No project this big can be undertaken without significant and irreparable impacts. We ask Larimer County to be a good steward and deny this permit and prevent the loss of open space and wildlife habitat, increased risk of wildfires and other public safety hazards, increased demands on local volunteer emergency services, noise, light pollution where now there is little, increased development and traffic in ever-widening circles around the reservoir, reduced air quality, climate change, increased illegal activities such as trespass on adjacent private land, decreased property values, and the loss of unique visual and aesthetic values. The natural and rural quality of this land is very important to our lives and communities.

Sincerely,

--

To: pcboard@larimer.org

Dear Larimer County Commissioners,

I respectfully request that you deny 1041 permit for the proposed Northern Integrated Supply Project based on solid studies that show it would be destructive to the Poudre River and its ecosystem as it flows through Fort Collins and beyond.

Currently, almost 60% of the Poudre?s water is diverted for agricultural, municipal, and industrial uses. If built, during peak flows, NISP could dry up another 71% of the flow through Fort Collins. Studies show that such a reduction would have dire consequences to fish and other aquatic life, riparian ecosystems, water quality, flow volume, and recreation use.

The NISP is expected to cost at least $1.2 billion, although those costs will rise because Northern Water has not obtained enough water rights to date to fill the reservoir. Northern Water must buy ?dozens and dozens? of Larimer and Weld County farms to obtain the water rights needed. Of the 15 communities and water districts that hold shares in NISP, many are outside the Poudre?s watershed.

The NISP is an extremely expensive project that would cause great destruction; disrupt and displace residents around the proposed reservoir, residents along Highway 287, and residents along the proposed pipeline route; and it isn?t needed. There are many conservation actions that would provide all the water proposed to be delivered by Glade, including improved water efficiency by municipal districts, industry, and agriculture; public education and awareness programs; repairs to leaking ditches and pipelines, landscape irrigation improvements, and much more.

The NISP is a controversial project that is of great interest to many people in Larimer County who want full opportunity to comment on the permitting process and to appear at public hearings. Because of the scope and controversy surrounding this proposed project, the Commissioners should wait until the coronavirus pandemic has subsided enough to allow for full in-person public participation.

Sincerely,

Jessica Stewart

Dear Larimer County Commissioners,

I respectfully request that you deny 1041 permit for the proposed Northern Integrated Supply Project based on solid studies that show it would be destructive to the Poudre River and its ecosystem as it flows through Fort Collins and beyond.

Currently, almost 60% of the Poudre?s water is diverted for agricultural, municipal, and industrial uses. If built, during peak flows, NISP could dry up another 71% of the flow through Fort Collins. Studies show that such a reduction would have dire consequences to fish and other aquatic life, riparian ecosystems, water quality, flow volume, and recreation use.

The NISP is expected to cost at least $1.2 billion, although those costs will rise because Northern Water has not obtained enough water rights to date to fill the reservoir. Northern Water must buy ?dozens and dozens? of Larimer and Weld County farms to obtain the water rights needed. Of the 15 communities and water districts that hold shares in NISP, many are outside the Poudre?s watershed.

The NISP is an extremely expensive project that would cause great destruction; disrupt and displace residents around the proposed reservoir, residents along Highway 287, and residents along the proposed pipeline route; and it isn?t needed. There are many conservation actions that would provide all the water proposed to be delivered by Glade, including improved water efficiency by municipal districts, industry, and agriculture; public education and awareness programs; repairs to leaking ditches and pipelines, landscape irrigation improvements, and much more.

The NISP is a controversial project that is of great interest to many people in Larimer County who want full opportunity to comment on the permitting process and to appear at public hearings. Because of the scope and controversy surrounding this proposed project, the Commissioners should wait until the coronavirus pandemic has subsided enough to allow for full in-person public participation.

Sincerely,

Donna Wild

I respectfully request that you deny 1041 permit for the proposed Northern Integrated Supply Project based on solid studies that show it would be destructive to the Poudre River and its ecosystem as it flows through Fort Collins and beyond.

Currently, almost 60% of the Poudre?s water is diverted for agricultural, municipal, and industrial uses. If built, during peak flows, NISP could dry up another 71% of the flow through Fort Collins. Studies show that such a reduction would have dire consequences to fish and other aquatic life, riparian ecosystems, water quality, flow volume, and recreation use.

The NISP is expected to cost at least $1.2 billion, although those costs will rise because Northern Water has not obtained enough water rights to date to fill the reservoir. Northern Water must buy ?dozens and dozens? of Larimer and Weld County farms to obtain the water rights needed. Of the 15 communities and water districts that hold shares in NISP, many are outside the Poudre?s watershed.

The NISP is an extremely expensive project that would cause great destruction; disrupt and displace residents around the proposed reservoir, residents along Highway 287, and residents along the proposed pipeline route; and it isn?t needed. There are many conservation actions that would provide all the water proposed to be delivered by Glade, including improved water efficiency by municipal districts, industry, and agriculture; public education and awareness programs; repairs to leaking ditches and pipelines, landscape irrigation improvements, and much more.

The NISP is a controversial project that is of great interest to many people in Larimer County who want full opportunity to comment on the permitting process and to appear at public hearings. Because of the scope and controversy surrounding this proposed project, the Commissioners should wait until the coronavirus pandemic has subsided enough to allow for full in-person public participation.

Sincerely,

Rhonda Mickelson

The NISP is expected to cost at least $1.2 billion, although those costs will rise because Northern Water has not obtained enough water rights to date to fill the reservoir. Northern Water must buy ?dozens and dozens? of Larimer and Weld County farms to obtain the water rights needed. Of the 15 communities and water districts that hold shares in NISP, many are outside the Poudre?s watershed.

The NISP is an extremely expensive project that would cause great destruction; disrupt and displace residents around the proposed reservoir, residents along Highway 287, and residents along the proposed pipeline route; and it isn?t needed. There are many conservation actions that would provide all the water proposed to be delivered by Glade, including improved water efficiency by municipal districts, industry, and agriculture; public education and awareness programs; repairs to leaking ditches and pipelines, landscape irrigation improvements, and much more.

The NISP is a controversial project that is of great interest to many people in Larimer County who want full opportunity to comment on the permitting process and to appear at public hearings. Because of the scope and controversy surrounding this proposed project, the Commissioners should wait until the coronavirus pandemic has subsided enough to allow for full in-person public participation.

Sincerely,

Harry Rose

Dear Larimer County Commissioners,

I respectfully request that you deny 1041 permit for the proposed Northern Integrated Supply Project based on solid studies that show it would be destructive to the Poudre River and its ecosystem as it flows through Fort Collins and beyond.

Currently, almost 60% of the Poudre?s water is diverted for agricultural, municipal, and industrial uses. If built, during peak flows, NISP could dry up another 71% of the flow through Fort Collins. Studies show that such a reduction would have dire consequences to fish and other aquatic life, riparian ecosystems, water quality, flow volume, and recreation use.

The NISP is expected to cost at least $1.2 billion, although those costs will rise because Northern Water has not obtained enough water rights to date to fill the reservoir. Northern Water must buy ?dozens and dozens? of Larimer and Weld County farms to obtain the water rights needed. There are many conservation actions that would provide all the water proposed to be delivered by Glade, including improved water efficiency by municipal districts, industry, and agriculture; public education and awareness programs; repairs to leaking ditches and pipelines, landscape irrigation improvements, and much more.

The NISP is a controversial project that is of great interest to many people in Larimer County who want full opportunity to comment on the permitting process and to appear at public hearings. Because of the scope and controversy surrounding this proposed project, the Commissioners should wait until the coronavirus pandemic has subsided enough to allow for full in-person public participation.

Sincerely,

Camille Hansen

Dear Larimer County Commissioners,

I respectfully request that you deny 1041 permit for the proposed Northern Integrated Supply Project based on solid studies that show it would be destructive to the Poudre River and its ecosystem as it flows through Fort Collins and beyond.

Currently, almost 60% of the Poudre?s water is diverted for agricultural, municipal, and industrial uses. If built, during peak flows, NISP could dry up another 71% of the flow through Fort Collins. Studies show that such a reduction would have dire consequences to fish and other aquatic life, riparian ecosystems, water quality, flow volume, and recreation use.

The NISP is expected to cost at least $1.2 billion, although those costs will rise because Northern Water has not obtained enough water rights to date to fill the reservoir. Northern Water must buy ?dozens and dozens? of Larimer and Weld County farms to obtain the water rights needed. Of the 15 communities and water districts that hold shares in NISP, many are outside the Poudre?s watershed.

The NISP is an extremely expensive project that would cause great destruction; disrupt and displace residents around the proposed reservoir, residents along Highway 287, and residents along the proposed pipeline route; and it isn?t needed. There are many conservation actions that would provide all the water proposed to be delivered by Glade, including improved water efficiency by municipal districts, industry, and agriculture; public education and awareness programs; repairs to leaking ditches and pipelines, landscape irrigation improvements, and much more.

The NISP is a controversial project that is of great interest to many people in Larimer County who want full opportunity to comment on the permitting process and to appear at public hearings. Dear Larimer County Commissioners,

I respectfully request that you deny 1041 permit for the proposed Northern Integrated Supply Project based on solid studies that show it would be destructive to the Poudre River and its ecosystem as it flows through Fort Collins and beyond.

Currently, almost 60% of the Poudre?s water is diverted for agricultural, municipal, and industrial uses. If built, during peak flows, NISP could dry up another 71% of the flow through Fort Collins. Studies show that such a reduction would have dire consequences to fish and other aquatic life, riparian ecosystems, water quality, flow volume, and recreation use.

The NISP is expected to cost at least $1.2 billion, although those costs will rise because Northern Water has not obtained enough water rights to date to fill the reservoir. Northern Water must buy ?dozens and dozens? of Larimer and Weld County farms to obtain the water rights needed. Of the 15 communities and water districts that hold shares in NISP, many are outside the Poudre?s watershed.

The NISP is an extremely expensive project that would cause great destruction; disrupt and displace residents around the proposed reservoir, residents along Highway 287, and residents along the proposed pipeline route; and it isn?t needed. There are many conservation actions that would provide all the water proposed to be delivered by Glade, including improved water efficiency by municipal districts, industry, and agriculture; public education and awareness programs; repairs to leaking ditches and pipelines, landscape irrigation improvements, and much more.

The NISP is a controversial project that is of great interest to many people in Larimer County who want full opportunity to comment on the permitting process and to appear at public hearings. Because of the scope and controversy surrounding this proposed project, the Commissioners should wait until the coronavirus pandemic has subsided enough to allow for full in-person public participation.

Sincerely,

Carla Bamesberger

Studies show that such a reduction would have dire consequences to fish and other aquatic life, riparian ecosystems, water quality, flow volume, and recreation use.

The NISP is expected to cost at least $1.2 billion, although those costs will rise because Northern Water has not obtained enough water rights to date to fill the reservoir. Northern Water must buy ?dozens and dozens? of Larimer and Weld County farms to obtain the water rights needed. Of the 15 communities and water districts that hold shares in NISP, many are outside the Poudre?s watershed.

The NISP is an extremely expensive project that would cause great destruction; disrupt and displace residents around the proposed reservoir, residents along Highway 287, and residents along the proposed pipeline route; and it isn?t needed. There are many conservation actions that would provide all the water proposed to be delivered by Glade, including

improved water efficiency by municipal districts, industry, and agriculture; public education and awareness programs; repairs to leaking ditches and pipelines, landscape irrigation improvements, and much more.

The NISP is a controversial project that is of great interest to many people in Larimer County who want full opportunity to comment on the permitting process and to appear at public hearings. Because of the scope and controversy surrounding this proposed project, the Commissioners should wait until the coronavirus pandemic has subsided enough to allow for full in-person public participation.

Sincerely,

Stephen Rosenberg

To: pcboard@larimer.org

Dear Larimer County Commissioners,

I respectfully request that you deny 1041 permit for the proposed Northern Integrated Supply Project based on solid studies that show it would be destructive to the Poudre River and its ecosystem as it flows through Fort Collins and beyond.

Currently, almost 60% of the Poudre?s water is diverted for agricultural, municipal, and industrial uses. If built, during peak flows, NISP could dry up another 71% of the flow through Fort Collins. Studies show that such a reduction would have dire consequences to fish and other aquatic life, riparian ecosystems, water quality, flow volume, and recreation use.

The NISP is expected to cost at least $1.2 billion, although those costs will rise because Northern Water has not obtained enough water rights to date to fill the reservoir. Northern Water must buy ?dozens and dozens? of Larimer and Weld County farms to obtain the water rights needed. Of the 15 communities and water districts that hold shares in NISP, many are outside the Poudre?s watershed.

The NISP is an extremely expensive project that would cause great destruction; disrupt and displace residents around the proposed reservoir, residents along Highway 287, and residents along the proposed pipeline route; and it isn?t needed. There are many conservation actions that would provide all the water proposed to be delivered by Glade, including improved water efficiency by municipal districts, industry, and agriculture; public education and awareness programs; repairs to leaking ditches and pipelines, landscape irrigation improvements, and much more.

The NISP is a controversial project that is of great interest to many people in Larimer County who want full opportunity to comment on the permitting process and to appear at public hearings. Because of the scope and controversy surrounding this proposed project, the Commissioners should wait until the coronavirus pandemic has subsided enough to allow for full in-person public participation.

Sincerely,

Fernando Ibarra

Dear Larimer County Commissioners,

I respectfully request that you deny 1041 permit for the proposed Northern Integrated Supply Project based on solid studies that show it would be destructive to the Poudre River and its ecosystem as it flows through Fort Collins and beyond.

Currently, almost 60% of the Poudre?s water is diverted for agricultural, municipal, and industrial uses. If built, during peak flows, NISP could dry up another 71% of the flow through Fort Collins. Studies show that such a reduction would have dire consequences to fish and other aquatic life, riparian ecosystems, water quality, flow volume, and recreation use.

The NISP is expected to cost at least $1.2 billion, although those costs will rise because Northern Water has not obtained enough water rights to date to fill the reservoir. Northern Water must buy ?dozens and dozens? of Larimer and Weld County farms to obtain the water rights needed. Of the 15 communities and water districts that hold shares in NISP, many are outside the Poudre?s watershed.

The NISP is an extremely expensive project that would cause great destruction; disrupt and displace residents around the proposed reservoir, residents along Highway 287, and residents along the proposed pipeline route; and it isn?t needed. There are many conservation actions that would provide all the water proposed to be delivered by Glade, including improved water efficiency by municipal districts, industry, and agriculture; public education and awareness programs; repairs to leaking ditches and pipelines, landscape irrigation improvements, and much more.

The NISP is a controversial project that is of great interest to many people in Larimer County who want full opportunity to comment on the permitting process and to appear at public hearings. Because of the scope and controversy surrounding this proposed project, the Commissioners should wait until the coronavirus pandemic has subsided enough to allow for full in-person public participation.

Sincerely,

Matthew Dietrich

To: pcboard@larimer.org

Dear Larimer County Commissioners,

I respectfully request that you deny 1041 permit for the proposed Northern Integrated Supply Project based on solid studies that show it would be destructive to the Poudre River and its ecosystem as it flows through Fort Collins and beyond.

Currently, almost 60% of the Poudre?s water is diverted for agricultural, municipal, and industrial uses. If built, during peak flows, NISP could dry up another 71% of the flow through Fort Collins. Studies show that such a reduction would have dire consequences to fish and other aquatic life, riparian ecosystems, water quality, flow volume, and recreation use.

The NISP is expected to cost at least $1.2 billion, although those costs will rise because Northern Water has not obtained enough water rights to date to fill the reservoir. Northern Water must buy ?dozens and dozens? of Larimer and Weld County farms to obtain the water rights needed. Of the 15 communities and water districts that hold shares in NISP, many are outside the Poudre?s watershed.

The NISP is an extremely expensive project that would cause great destruction; disrupt and displace residents around the proposed reservoir, residents along Highway 287, and residents along the proposed pipeline route; and it isn?t needed. There are many conservation actions that would provide all the water proposed to be delivered by Glade, including improved water efficiency by municipal districts, industry, and agriculture; public education and awareness programs; repairs to leaking ditches and pipelines, landscape irrigation improvements, and much more.

The NISP is a controversial project that is of great interest to many people in Larimer County who want full opportunity to comment on the permitting process and to appear at public hearings. The NISP is an extremely expensive project that would cause great destruction; disrupt and displace residents around the proposed reservoir, residents along Highway 287, and residents along the proposed pipeline route; and it isn?t needed. There are many conservation actions that would provide all the water proposed to be delivered by Glade, including improved water efficiency by municipal districts, industry, and agriculture; public education and awareness programs; repairs to leaking ditches and pipelines, landscape irrigation improvements, and much more.

The NISP is a controversial project that is of great interest to many people in Larimer County who want full opportunity to comment on the permitting process and to appear at public hearings. Because of the scope and controversy surrounding this proposed project, the Commissioners should wait until the coronavirus pandemic has subsided enough to allow for full in-person public participation.

Sincerely,

Tom Schultz

Dear Larimer County Commissioners,

I respectfully request that you deny 1041 permit for the proposed Northern Integrated Supply Project based on solid studies that show it would be destructive to the Poudre River and its ecosystem as it flows through Fort Collins and beyond.

Currently, almost 60% of the Poudre?s water is diverted for agricultural, municipal, and industrial uses. If built, during peak flows, NISP could dry up another 71% of the flow through Fort Collins. Studies show that such a reduction would have dire consequences to fish and other aquatic life, riparian ecosystems, water quality, flow volume, and recreation use.

The NISP is expected to cost at least $1.2 billion, although those costs will rise because Northern Water has not obtained enough water rights to date to fill the reservoir. Northern Water must buy ?dozens and dozens? of Larimer and Weld County farms to obtain the water rights needed. Of the 15 communities and water districts that hold shares in NISP, many are outside the Poudre?s watershed.

The NISP is an extremely expensive project that would cause great destruction; disrupt and displace residents around the proposed reservoir, residents along Highway 287, and residents along the proposed pipeline route; and it isn?t needed. There are many conservation actions that would provide all the water proposed to be delivered by Glade, including improved water efficiency by municipal districts, industry, and agriculture; public education and awareness programs; repairs to leaking ditches and pipelines, landscape irrigation improvements, and much more.

To: pcboard@larimer.org

Dear Larimer County Commissioners,

I respectfully request that you deny 1041 permit for the proposed Northern Integrated Supply Project based on solid studies that show it would be destructive to the Poudre River and its ecosystem as it flows through Fort Collins and beyond.

Currently, almost 60% of the Poudre?s water is diverted for agricultural, municipal, and industrial uses. If built, during peak flows, NISP could dry up another 71% of the flow through Fort Collins. Studies show that such a reduction would have dire consequences to fish and other aquatic life, riparian ecosystems, water quality, flow volume, and recreation use.

The NISP is expected to cost at least $1.2 billion, although those costs will rise because Northern Water has not obtained enough water rights to date to fill the reservoir. Northern Water must buy ?dozens and dozens? of Larimer and Weld County farms to obtain the water rights needed. Of the 15 communities and water districts that hold shares in NISP, many are outside the Poudre?s watershed.

The NISP is an extremely expensive project that would cause great destruction; disrupt and displace residents around the proposed reservoir, residents along Highway 287, and residents along the proposed pipeline route; and it isn?t needed. There are many conservation actions that would provide all the water proposed to be delivered by Glade, including improved water efficiency by municipal districts, industry, and agriculture; public education and awareness programs; repairs to leaking ditches and pipelines, landscape irrigation improvements, and much more.

The NISP is a controversial project that is of great interest to many people in Larimer County who want full opportunity to comment on the permitting process and to appear at public hearings. Because of the scope and controversy surrounding this proposed project, the Commissioners should wait until the coronavirus pandemic has subsided enough to allow for full in-person public participation.

Sincerely,

Warren Snyder

Currently, almost 60% of the Poudre?s water is diverted for agricultural, municipal, and industrial uses. If built, during peak flows, NISP could dry up another 71% of the flow through Fort Collins. Studies show that such a reduction would have dire consequences to fish and other aquatic life, riparian ecosystems, water quality, flow volume, and recreation use.

The NISP is expected to cost at least $1.2 billion, although those costs will rise because Northern Water has not obtained enough water rights to date to fill the reservoir. Northern Water must buy ?dozens and dozens? of Larimer and Weld County farms to obtain the water rights needed. Of the 15 communities and water districts that hold shares in NISP, many are outside the Poudre?s watershed.

The NISP is an extremely expensive project that would cause great destruction; disrupt and displace residents around the proposed reservoir, residents along Highway 287, and residents along the proposed pipeline route; and it isn?t needed. There are many conservation actions that would provide all the water proposed to be delivered by Glade, including improved water efficiency by municipal districts, industry, and agriculture; public education and awareness programs; repairs to leaking ditches and pipelines, landscape irrigation improvements, and much more.

The NISP is a controversial project that is of great interest to many people in Larimer County who want full opportunity to comment on the permitting process and to appear at public hearings. Because of the scope and controversy surrounding this proposed project, the Commissioners should wait until the coronavirus pandemic has subsided enough to allow for full in-person public participation.

Sincerely,

Shelly Hudson

Of the 15 communities and water districts that hold shares in NISP, many are outside the Poudre?s watershed.

The NISP is an extremely expensive project that would cause great destruction; disrupt and displace residents around the proposed reservoir, residents along Highway 287, and residents along the proposed pipeline route; and it isn?t needed.

There are many conservation actions that would provide all the water proposed to be delivered by Glade, including improved water efficiency by municipal districts, industry, and agriculture; public education and awareness programs; repairs to leaking ditches and pipelines, landscape irrigation improvements, and much more.

The NISP is a controversial project that is of great interest to many people in Larimer County who want full opportunity to comment on the permitting process and to appear at public hearings. Because of the scope and controversy surrounding this proposed project, the Commissioners should wait until the coronavirus pandemic has subsided enough to allow for full in-person public participation.

Sincerely,

Suzanne Stratford

Dear Larimer County Commissioners,

I respectfully request that you deny 1041 permit for the proposed Northern Integrated Supply Project based on solid studies that show it would be destructive to the Poudre River and its ecosystem as it flows through Fort Collins and beyond.

Currently, almost 60% of the Poudre?s water is diverted for agricultural, municipal, and industrial uses. If built, during peak flows, NISP could dry up another 71% of the flow through Fort Collins. Studies show that such a reduction would have dire consequences to fish and other aquatic life, riparian ecosystems, water quality, flow volume, and recreation use.

The NISP is expected to cost at least $1.2 billion, although those costs will rise because Northern Water has not obtained enough water rights to date to fill the reservoir. Northern Water must buy ?dozens and dozens? of Larimer and Weld County farms to obtain the water rights needed. Of the 15 communities and water districts that hold shares in NISP, many are outside the Poudre?s watershed.

The NISP is an extremely expensive project that would cause great destruction; disrupt and displace residents around the proposed reservoir, residents along Highway 287, and residents along the proposed pipeline route; and it isn?t needed. Dear Larimer County Commissioners,

I respectfully request that you deny 1041 permit for the proposed Northern Integrated Supply Project based on solid studies that show it would be destructive to the Poudre River and its ecosystem as it flows through Fort Collins and beyond.

Currently, almost 60% of the Poudre?s water is diverted for agricultural, municipal, and industrial uses. If built, during peak flows, NISP could dry up another 71% of the flow through Fort Collins. Studies show that such a reduction would have dire consequences to fish and other aquatic life, riparian ecosystems, water quality, flow volume, and recreation use.

The NISP is expected to cost at least $1.2 billion, although those costs will rise because Northern Water has not obtained enough water rights to date to fill the reservoir. Northern Water must buy ?dozens and dozens? of Larimer and Weld County farms to obtain the water rights needed. Of the 15 communities and water districts that hold shares in NISP, many are outside the Poudre?s watershed.

The NISP is an extremely expensive project that would cause great destruction; disrupt and displace residents around the proposed reservoir, residents along Highway 287, and residents along the proposed pipeline route; and it isn?t needed. There are many conservation actions that would provide all the water proposed to be delivered by Glade, including improved water efficiency by municipal districts, industry, and agriculture; public education and awareness programs; repairs to leaking ditches and pipelines, landscape irrigation improvements, and much more.

The NISP is a controversial project that is of great interest to many people in Larimer County who want full opportunity to comment on the permitting process and to appear at public hearings. Because of the scope and controversy surrounding this proposed project, the Commissioners should wait until the coronavirus pandemic has subsided enough to allow for full in-person public participation.

Sincerely,

Rachel Sanborn

Currently, almost 60% of the Poudre?s water is diverted for agricultural, municipal, and industrial uses. If built, during peak flows, NISP could dry up another 71% of the flow through Fort Collins. Studies show that such a reduction would have dire consequences to fish and other aquatic life, riparian ecosystems, water quality, flow volume, and recreation use.

The NISP is expected to cost at least $1.2 billion, although those costs will rise because Northern Water has not obtained enough water rights to date to fill the reservoir. Northern Water must buy ?dozens and dozens? of Larimer and Weld County farms to obtain the water rights needed. Of the 15 communities and water districts that hold shares in NISP, many are outside the Poudre?s watershed.

The NISP is an extremely expensive project that would cause great destruction; disrupt and displace residents around the proposed reservoir, residents along Highway 287, and residents along the proposed pipeline route; and it isn?t needed. There are many conservation actions that would provide all the water proposed to be delivered by Glade, including

improved water efficiency by municipal districts, industry, and agriculture; public education and awareness programs; repairs to leaking ditches and pipelines, landscape irrigation improvements, and much more.

The NISP is a controversial project that is of great interest to many people in Larimer County who want full opportunity to comment on the permitting process and to appear at public hearings. Because of the scope and controversy surrounding this proposed project, the Commissioners should wait until the coronavirus pandemic has subsided enough to allow for full in-person public participation.

Sincerely,

Barbara Curwood

Northern Water must buy ?dozens and dozens? of Larimer and Weld County farms to obtain the water rights needed. Of the 15 communities and water districts that hold shares in NISP, many are outside the Poudre?s watershed.

The NISP is an extremely expensive project that would cause great destruction; disrupt and displace residents around the proposed reservoir, residents along Highway 287, and residents along the proposed pipeline route; and it isn?t needed. There are many conservation actions that would provide all the water proposed to be delivered by Glade, including improved water efficiency by municipal districts, industry, and agriculture; public education and awareness programs; repairs to leaking ditches and pipelines, landscape irrigation improvements, and much more.

The NISP is a controversial project that is of great interest to many people in Larimer County who want full opportunity to comment on the permitting process and to appear at public hearings. Because of the scope and controversy surrounding this proposed project, the Commissioners should wait until the coronavirus pandemic has subsided enough to allow for full in-person public participation.

Sincerely,

Pam Sheeler

Dear Larimer County Commissioners,

I respectfully request that you deny 1041 permit for the proposed Northern Integrated Supply Project based on solid studies that show it would be destructive to the Poudre River and its ecosystem as it flows through Fort Collins and beyond.

Currently, almost 60% of the Poudre?s water is diverted for agricultural, municipal, and industrial uses. If built, during peak flows, NISP could dry up another 71% of the flow through Fort Collins. Studies show that such a reduction would have dire consequences to fish and other aquatic life, riparian ecosystems, water quality, flow volume, and recreation use.

The NISP is expected to cost at least $1.2 billion, although those costs will rise because Northern Water has not obtained enough water rights to date to fill the reservoir. Northern Water must buy ?dozens and dozens? of Larimer and Weld County farms to obtain the water rights needed. Of the 15 communities and water districts that hold shares in NISP, many are outside the Poudre?s watershed.

The NISP is an extremely expensive project that would cause great destruction; disrupt and displace residents around the proposed reservoir, residents along Highway 287, and residents along the proposed pipeline route; and it isn?t needed. Northern Water must buy ?dozens and dozens? of Larimer and Weld County farms to obtain the water rights needed. Of the 15 communities and water districts that hold shares in NISP, many are outside the Poudre?s watershed.

The NISP is an extremely expensive project that would cause great destruction; disrupt and displace residents around the proposed reservoir, residents along Highway 287, and residents along the proposed pipeline route; and it isn?t needed. There are many conservation actions that would provide all the water proposed to be delivered by Glade, including improved water efficiency by municipal districts, industry, and agriculture; public education and awareness programs; repairs to leaking ditches and pipelines, landscape irrigation improvements, and much more.

The NISP is a controversial project that is of great interest to many people in Larimer County who want full opportunity to comment on the permitting process and to appear at public hearings. Because of the scope and controversy surrounding this proposed project, the Commissioners should wait until the coronavirus pandemic has subsided enough to allow for full in-person public participation.

Sincerely,

Sandra McLuckie

Dear Larimer County Commissioners,

I respectfully request that you deny 1041 permit for the proposed Northern Integrated Supply Project based on solid studies that show it would be destructive to the Poudre River and its ecosystem as it flows through Fort Collins and beyond.

Currently, almost 60% of the Poudre?s water is diverted for agricultural, municipal, and industrial uses. If built, during peak flows, NISP could dry up another 71% of the flow through Fort Collins. Studies show that such a reduction would have dire consequences to fish and other aquatic life, riparian ecosystems, water quality, flow volume, and recreation use.

The NISP is expected to cost at least $1.2 billion, although those costs will rise because Northern Water has not obtained enough water rights to date to fill the reservoir. Northern Water must buy ?dozens and dozens? of Larimer and Weld County farms to obtain the water rights needed. Of the 15 communities and water districts that hold shares in NISP, many are outside the Poudre?s watershed.

The NISP is an extremely expensive project that would cause great destruction; disrupt and displace residents around the proposed reservoir, residents along Highway 287, and residents along the proposed pipeline route; and it isn?t needed. Of the 15 communities and water districts that hold shares in NISP, many are outside the Poudre?s watershed.

The NISP is an extremely expensive project that would cause great destruction; disrupt and displace residents around the proposed reservoir, residents along Highway 287, and residents along the proposed pipeline route; and it isn?t needed. There are many conservation actions that would provide all the water proposed to be delivered by Glade, including improved water efficiency by municipal districts, industry, and agriculture; public education and awareness programs; repairs to leaking ditches and pipelines, landscape irrigation improvements, and much more.

The NISP is a controversial project that is of great interest to many people in Larimer County who want full opportunity to comment on the permitting process and to appear at public hearings. Because of the scope and controversy surrounding this proposed project, the Commissioners should wait until the coronavirus pandemic has subsided enough to allow for full in-person public participation.

Sincerely,

Jocelyn Pronko

To: pcboard@larimer.org

Dear Larimer County Commissioners,

I respectfully request that you deny 1041 permit for the proposed Northern Integrated Supply Project based on solid studies that show it would be destructive to the Poudre River and its ecosystem as it flows through Fort Collins and beyond.

Currently, almost 60% of the Poudre?s water is diverted for agricultural, municipal, and industrial uses. If built, during peak flows, NISP could dry up another 71% of the flow through Fort Collins. Studies show that such a reduction would have dire consequences to fish and other aquatic life, riparian ecosystems, water quality, flow volume, and recreation use.

The NISP is expected to cost at least $1.2 billion, although those costs will rise because Northern Water has not obtained enough water rights to date to fill the reservoir. Northern Water must buy ?dozens and dozens? of Larimer and Weld County farms to obtain the water rights needed. Of the 15 communities and water districts that hold shares in NISP, many are outside the Poudre?s watershed.

The NISP is an extremely expensive project that would cause great destruction; disrupt and displace residents around the proposed reservoir, residents along Highway 287, and residents along the proposed pipeline route; and it isn?t needed. There are many conservation actions that would provide all the water proposed to be delivered by Glade, including improved water efficiency by municipal districts, industry, and agriculture; public education and awareness programs; repairs to leaking ditches and pipelines, landscape irrigation improvements, and much more.

The NISP is a controversial project that is of great interest to many people in Larimer County who want full opportunity to comment on the permitting process and to appear at public hearings. Because of the scope and controversy surrounding this proposed project, the Commissioners should wait until the coronavirus pandemic has subsided enough to allow for full in-person public participation.

No Pipe Dream Corporation
Save Rural NoCo Corporation
Save the Poudre

June 9, 2020

By email
Larimer County Planning Commission (pcboard@larimer.org)
Rob Helmick (helmicrp@co.larimer.co.us)
Larimer County Planning Department
200 West Oak Street, Suite 3100
Fort Collins, Colorado 80521

Re: Planning Commission Hearing Comments to the Northern Integrated Supply Project (NISP) Pending 1041 Permit Application, Project No. 20-ZONE 2657

Dear Mr. Helmick:

On behalf of No Pipe Dream Corporation, Save Rural NoCo Corporation, and Save the Poudre (collectively "Larimer County NGOs"), we submit the following comments and concerns for the upcoming Planning Commission hearing regarding Northern Colorado Water Conservancy District's ("Northern") pending 1041 permit application ("1041 application") for the Northern Integrated Supply Project ("NISP").

By means of background, No Pipe Dream Corporation is a Colorado nonprofit corporation composed of Larimer County property owners and taxpayers established to protect citizens from the intense adverse impacts of multiple proposed pipeline and reservoir projects in Larimer County, including but not limited to NISP. Save Rural NoCo Corporation is a Colorado nonprofit corporation composed of property owners and taxpayers whose mission is to protect existing land, water, and communities in rural northern Colorado from harmful development through research and public education. Save the Poudre is a Colorado nonprofit membership organization primarily composed of residents of Larimer County, including outdoor recreationists, scientists, property owners, and taxpayers that would be adversely impacted by the construction and operation of NISP. Save the Poudre's members live, work, and recreate on and around the Cache la Poudre River ("Poudre River" or "River") in Larimer County. Some members own property or have residences near the Poudre River in the City of Fort Collins.

The membership of these three (3) nonprofit corporations would be uniquely and adversely impacted by construction and operation of NISP. More specifically, landowners and taxpayers may lose their homes and/or property either by forced easements or outright eminent domain. The affected citizens will also be adversely

impacted by the noise, air pollution, water pollution, and aesthetic injury associated with the multi-year construction of NISP. Save Rural NoCo members will be permanently impacted by the construction and operation of a new public recreation area at Glade Reservoir resulting in increased traffic, noise, litter, increased fire danger, trespass, and other impacts associated with opening an area to the general public. Further, No Pipe Dream and Save Rural NoCo members will be forced to live with a traffic nightmare for several years while the pipeline, dam, and reservoir construction results in road closures in their neighborhoods. Members of Save the Poudre will also be injured by NISP's adverse impacts to the Cache la Poudre River. More specifically, Save the Poudre members' interests in clean water and maintaining flows for swimming, fishing, kayaking, and aesthetic enjoyment would be detrimentally impacted by NISP. NISP would add to negative impacts to the ecological health and beauty of the Cache la Poudre River through Fort Collins and natural areas valued by Save the Poudre members. Further NISP will negatively impact the downstream riparian ecosystem, including fish populations, insects, birds, mammals and the wetland and riparian vegetation along the river.

To summarize some of our comments and concerns, the Larimer County NGOs believe that the Planning Commission should recommend denial of Northern's 1041 application because: 1) the proposal suffers from similar deficiencies as did the Thornton Water Project, which resulted in a precedent setting Board denial of a water pipeline 1041 application; 2) the proposal does not meet the Land Use Code criteria for approval of a 1041 application; 3) the application is incomplete, speculative, and fails to evaluate the cumulative impacts of the various pipeline and water projects proposed for Larimer County; and, 4) the proposal would result in numerous significant adverse impacts to Larimer County residents and the Cache la Poudre River that cannot be mitigated.

I. Request for Group Presentation by Larimer County NGOs.

The Planning Commission Bylaws specifically allow for "group presentations."[1] The Larimer County NGO's hereby collectively request 45 minutes at the July 8, 2020 Planning Commission hearing to make a joint group presentation. The presentation will be well organized allowing each group to present for approximately 15 minutes each. The group presentation will save time by minimizing repetition. Further, it is impossible to adequately comment on a 1041 permit application composed of thousands of pages within 2-minute individual comment time limit. Please confirm in writing no later than June 24, 2020 that the Larimer County NGO's have a 45-minute time slot for their group presentation on July 8, 2020. Because the groups will have their attorneys and technical experts present at the hearing, we request that our time slot be immediately after Northern's presentation or at the commencement of the hearing.

[1]Exhibit 1 hereto (Planning Commission Bylaws, p. 3, Section V. A.4. "Procedure for Consideration of Agenda Items" dated 4/28/2020).

II. Recusal of Sean Dougherty and Jeff Jensen.

The Larimer County NGOs hereby request that Planning Commissioners Sean Dougherty and Jeff Jensen recuse themselves from participating in the adjudication of the NISP 1041 application.

Mr. Dougherty has publicly stated his support for NISP. More specifically, Mr. Dougherty has unequivocally stated, "I am in full support of the Northern Integrated Supply Project, known as NISP."[2] Mr. Dougherty also publicly stated, "NISP and Windy Gap Firming Project need to be completed…"[3]

Mr. Jensen is running for Steve Johnson's seat on the Board this November. Mr. Jensen has been publicly endorsed by Steve Johnson.[4] Mr. Johnson has endorsed and supported NISP.[5] Having requested and received the endorsement of the sitting Commissioner who himself has endorsed the project that is the subject of the 1041 application, Mr. Jensen's independent and impartial participation in this quasi-judicial process has been tainted. These facts create the appearance of bias within the citizenry of Larimer County. Mr. Jensen must recuse himself.

Further, it is the practice of the Planning Commissioners to recuse themselves when they may be required to act on a pending land use application in a potential future role as a Larimer County Commissioner. For example, Sean Dougherty recused himself as a Planning Commissioner from participation in the Loveland Ready Mix Laporte gravel pit Special Review application based on the fact that he was a candidate for an open Board seat following the death of Lew Gaiter. Since Mr. Jensen is a candidate for Commissioner in November 2020, he too should recuse himself based on the practice of the Commission.

The constitutional floor of due process requires "a realistic appraisal of psychological tendencies and human weakness" to determine whether these undisputed facts pose "such a risk of actual bias or prejudgment that the practice must be forbidden if the guarantee of due process is to be adequately implemented." *City of Manassa v. Ruff*, 235 P.3d 1051, 1057 (Colo. 2010)(quoting *Caperton v. A.T. Massey Coal Co.,* 556 U.S. 868, 883-84 (2009).

Further, Article XXIX(1)(c) of the Colorado Constitution requires that local governments "avoid conduct that is in violation of their public trust or that creates a justifiable impression among members of the public that such trust is being violated." The Larimer County Land Use Code requires that a quasi-judicial officer, recuse himself

---

[2] Exhibit 2 hereto (screen shot of https://instabusters.net/hashtag-photos/SeanForLarimerCounty taken 6/9/2020).
[3] Exhibit 3, p. 6 hereto (Fort Collins Business Community Candidate Endorsement Questionaire).
[4] https://www.jensen4lcc.com/endorsements/
[5] Exhibit 4 hereto (Northern's NISP website, November 2019)

from any quasi-judicial decision if he "believe[s] they have a conflict of interest or for any other reason believes that they cannot make a fair and impartial decision."[6] The Code also states that quasi-judicial officers must avoid any conflict of interest and that all official actions "must represent unconflicted loyalty to the interest of the citizens of the entire county."[7]

Under Colorado law a local government's land use application determinations are quasi-judicial in nature. *Margolis*, 638 P.2d at 304-05. A quasi-judicial decision must provide for due process and adhere to fundamental principles of fairness. *Canyon Area Residents v. Bd. of Cnty Comm'rs,* 172 P.3d 905, 908 (Colo. App. 2006). A quasi-judicial hearing must be conducted in an atmosphere evidencing fairness in the adjudication. *Id.* Due process requires recusal of a quasi-judicial decision maker when such decision maker has a direct, personal, substantial, pecuniary interest in the pending matter; or when "extraordinary" facts create an impermissible probability of bias. *Tumey v. Ohio*, 273 U.S. 510, 523 (2000); *Caperton*, 556 U.S. at 887.

Mr. Dougherty and Mr. Jensen must recuse themselves from this quasi-adjudicative process. Their prior statements supporting NISP, or their association with others that support NISP, creates an atmosphere of bias in favor of the project within the Larimer County community.

We ask that Mr. Dougherty and Mr. Jensen each respond in writing to this request for recusal at least one (1) week prior to the first Planning Commission hearing on the NISP 1041 application.

III. Incorporation of DEIS and FEIS comments.

Northern's 1041 application repeatedly refers to the pending National Environmental Policy Act Final Environmental Impact Statement ("EIS"). However, because the County's 1041 process evaluates criteria that are separate and distinct from the federal EIS process, Northern's 1041 application must stand on its own and be adjudicated independent of any EIS filings. Nevertheless, since Northern repeatedly refers to documents in the federal EIS proceeding, the Larimer County NGOs hereby incorporate herein by reference their comment letters submitted to the federal agencies in the EIS process.[8] Four filings were made to the Army Corps in response to the DEIS (2008), SDEIS (2015), FEIS (2018), and a request for "Supplemental NEPA studies" (2019). Further, we also incorporate herein by reference the County's own comments on

[6] Larimer County Land Use Code ("LUC") § 2-67(10).
[7] LUC § 2-71.
[8] Exhibit 5 (DEIS comment letter); Exhibit 6 (SDEIS comment letter); Exhibit 7 (FEIS comment letter); Exhibit 8 (SEIS comment letter).

the EIS.[9] Finally, we incorporate the City of Fort Collins' comments on the DEIS and SDEIS.[10]

IV. The Cache la Poudre River is ill and NISP will make it worse.

The Cache la Poudre River is in crisis. The River is already over-appropriated. *Three Bells Ranch Associated v. Cache La Poudre Water Users Ass'n,* 758 P.2d 164, 166 (*en banc* Colo. 1988). As shown below, segments of the river near Fort Collins are often dry.

Photo: Save The Poudre, October 2009, near Lions Park, Laporte, CO.

The River has been seriously altered by heavy agricultural and urban water use since early settlement in the 1870's.[11] "The human footprint continues to expand, placing additional pressure (or stresses) on the river ecosystem and the natural processes that sustain it."[12] Extensive existing dam and diversion infrastructure, as well as proposed additional water development, such as the proposed Northern Integrated Supply Project,

[9] Exhibit 9 hereto (County's comments on DEIS).
[10] Exhibit 10 hereto (Ft. Collins comments on DEIS) and Exhibit 11 hereto (Ft. Collins comments on SDEIS).
[11] Exhibit 12 hereto, p. 2 ("Bestgen study").
[12] Exhibit 13 hereto, p. 3 of pdf ("State of the Poudre River 2017" (SOPR)).

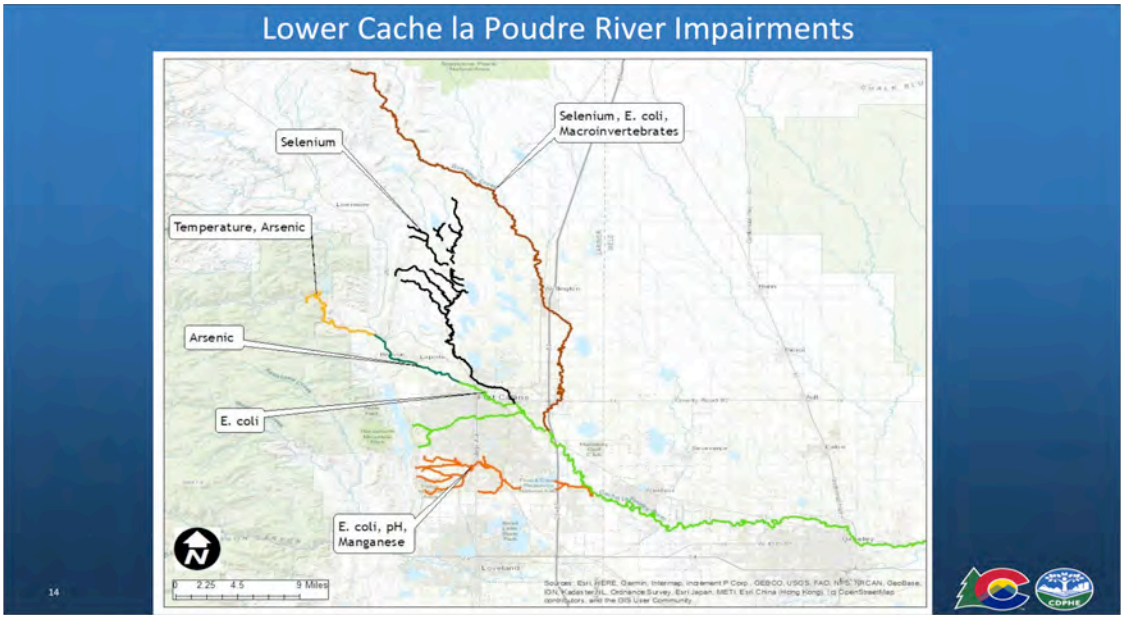
"have significantly altered the peak and base flows, the effects of which are exacerbated the further one travels downstream. Diversions also cause unnatural fluctuations in flow volume, which likely affects critical habitat and reproductive needs of fish and insects in the river."[13]

The towns and cities in the thirsty Denver metro area, including Boulder County and Weld County, have exhausted the local water supplies in Clear Creek, Boulder Creek, the mighty St. Vrain River and other watersheds. Now they are moving north to grab water from the Cache la Poudre River. Currently proposed water diversion and/or storage projects in the upper Cache la Poudre River watershed include NISP, the Halligan Reservoir expansion, the Seaman Reservoir expansion, and the Thornton Water Project. These water grabs are often accomplished by implementing a "buy and dry" strategy whereby these irresponsible and rapidly growing municipalities buy irrigated farms in the Cache la Poudre River watershed, convert the water to municipal use, and attempt to pipe it south and east to towns and cities. Both NISP and the Thornton Water Project would take Cache la Poudre River water out of its natural watershed south to these metro communities. In some cases, as with NISP, the water developer has not even secured the water rights needed to fully supply the water project, but still moves forward in attempting to acquire necessary permits, such as this 1041 permit application, theoretically making it possible for construction to proceed and serving up all the impacts and none of the benefits.

In the Cache la Poudre River, "populations of native fish are [also] in sharp decline. These declines are most likely due to fragmented habitat and extended periods of extremely low base flows. Other stresses likely influencing fishery health include rapid fluctuation of flows…and altered water temperatures."[14] The flow regime in the Cache la Poudre River score poorly in all segments of the river "suggesting substantially-impaired functionality…[i]mpairment mainly arises from the effects of water management."[15]

As shown below, the River also suffers from numerous existing water quality impairments, including *Escherichia* coli.

[13] *Id.*, p. 4 (SOPR).
[14] Exhibit 12, p. ii (SOPR).
[15] *Id.*, pp. 41, Table 4.1, and p. 42 (SOPR).



These water quality impairments will worsen if additional stream flow is removed from the River.

In 2019 Fort Collins Utilities ("FCU") commissioned the Water Supply Vulnerability Study ("WSVS") to evaluate the future risks associated with meeting the water needs of its service territory.[16] The #1 risk was climate change. The WSVS Report states:

> Climate change is the most important vulnerability faced by the FCU system. Future climate conditions may be more impactful to FCU's ability to meet its water supply planning policy criteria than the occurrence of any particular infrastructure outage or environmental condition simulated by the WSVS risk scenarios.[17]

Based on a review of previous climate change studies for the Front Range region, the WSVS study evaluated a worst case climate change temperature range increase from 0 to 8 degrees F compared to average annual 1981 to 2010 observed temperature and precipitation risk ranges from -10% to +15% of average annual 1981 to 2010 observed

[16] Exhibit 14 hereto ("WSVS study").
[17] *Id.* at p. ES-16 ("WSVS study").

precipitation ("P").[18] The WSVS Study concludes:

> Temperature and precipitation changes in the range adopted for the WSVS were found to have significant effects on streamflow contributing to the FCU water supply. The hottest/driest climate condition (T = +8 degrees F, P = -10%) reduced the Poudre River at the Canyon Mouth mean annual streamflow by an average of 30%...[19]

Even if precipitation does not change (delta P=0%), the WSVS Study shows that an increase in temperature ("T") of +8 degrees F is predicted to reduce streamflow at the mouth of the Canyon by more than 10 percent.

Meteorological data provides ample evidence that air temperature along the Front Range has increased over time. Data collected at the Joe Wright Reservoir SNOTEL site, located just east of the continental divide at 10,120 feet and within the Poudre River watershed, is critically important for assessing how climate change has impacted temperature and precipitation within the watershed. Average winter, spring, summer, and September daily temperatures at this site have increased by between 3 and 4 degrees F since 1990 – particularly after year 2004. The effect of post 2005 drought conditions on reservoir storage in the proposed Glade Reservoir is evaluated by Save Rural NOCO below in this document.

Winter temperatures determine if precipitation occurs as snow or rain, spring temperatures control the timing of runoff, and summer and fall temperatures affect the soil moisture deficit that impact streamflow volumes in the next snowmelt season. Additional studies reveal that climate change will significantly reduce flows in Western watersheds.[20]

The Cache la Poudre River is in dire need of restoration, not further flow depletion. "River restoration requires understanding linkages between specific flow conditions and ecosystem attributes to provide ***clear, quantified management targets."***[21] Recently a group of researchers developed an Ecological Response Model ("ERM") for the Cache la Poudre River to design a river management system to improve the health of the river in light of current and future water extraction and storage. *Id*. The purpose of the study "was to produce a scientifically credible and comprehensive analysis to inform the public and assist water managers interested in sustainable management of the Poudre River ecosystem." *Id.* at p. 2.

The Bestgen Study incorporated climate change data and information. "To

[19] *Id.* at ES-4.
[20] Exhibit 15 hereto, p. 2404 hereto ("The twenty-first century Colorado River hot drought and implications for the future." Water Resources Research 2017 ("Udall and Overpeck Report").

[21] Exhibit 12, p. 2 (Bestgen Study).

incorporate climate change impacts, the present operations scenario was modified using predictions from global climate circulation models…that describes climate-changed hydrologic scenarios for the western United States."[22] The Bestgen Study concluded that "additional flow regime modification [such as from NISP] would further alter the structure and function of the Poudre River aquatic and riparian ecosystems due to multiple and interacting stressors." *Id.* at p. 1. The ERM found that the river would benefit from "higher and more stable base flows and high peak flows." *Id.*

V. Objection to the narrow scope of Northern's 1041 application

Northern incorrectly states that "the scope of the 1041 Permit evaluation is the siting and development of proposed conveyance pipelines and the site selection and construction of Glade Reservoir and its appurtenant facilities…" According to Northern, an analysis of the Highway 287 relocation and alternatives to the siting and development of Glade Reservoir are beyond the scope of its 1041 application.

The Larimer County NGO's object to Northern's limitation of the scope of the 1041 application. Northern has the burden to comply with all review criteria for the "site selection and construction of a new water storage reservoir."[23] This includes a presentation of alternatives to constructing the Glade Reservoir—including all environmental impacts associated with those alternatives-- as well as reservoir siting alternatives.[24] Because Northern attempts to illegally limit the scope of the 1041 analysis, its 1041 application completely fails to undertake an alternatives analysis for Glade Reservoir.

Northern's 1041 application is also required to analyze impacts and alternatives to the Highway 287 relocation. More specifically, Northern has the burden of complying with 1041 review criteria for "all appurtenant uses" of its proposed "new water storage reservoir" which include "all…roads."[25] This includes a presentation of alternatives to the relocation of Highway 287 as well as siting alternatives.[26] This also includes alternatives to constructing the access road to Glade Reservoir as well as road siting alternatives.

In summary, Northern's application is fatally defective due to its illegal attempt to limit its scope in violation of the plain language of the LUC. For this reason alone, the Planning Commission must summarily recommend denial of Northern's 1041 application.

VI. There is precedent for denying Northern's application.

In 2018 the Planning Commission recommended denial of a similar water

[22] Exhibit 12 at pp. 9-10.
[23] LUC §14.4.K.
[24] LUC §14.10.D.2.
[25] LUC §14.4.K.
[26] LUC §14.10.D.2.

pipeline project, namely the Thornton Northern Project ("TNP", aka "Thornton Water Project"). Thornton proposed construction of a pumping plant and raw water conveyance pipeline from Water Supply and Storage Company ("WSSC") Reservoir #4 in a corridor east along either Douglas Road or County Road 56 to I-25. In a hearing on May 16, 2018, the Planning Commission voted to recommend denial of the pumping plant and pipeline.[27] The reasons for the Commissions recommendation of denial were: 1) the application was incomplete; 2) there was an inadequate presentation of alternatives; 3) there was inadequate mitigation of harm; and, 4) the application did not balance the benefits to the County.[28]

Ultimately, the Board of County Commissioners ("Board") agreed with the Planning Commission and denied Thornton's 1041 application.[29] Among the reasons for the Board's denial of the Thornton 1041 application were: 1) the Board's inability to assess the impacts on private property because Thornton proposed a ¼ mile wide pipeline "corridor" instead of identifying with specificity the alignment of the pipeline;[30] 2) the application did not contain adequate "information about and consider the cumulative impacts of irrigated farmland turning to dryland";[31] 3) "the siting alternatives proposed by Thornton are not reasonable and cannot be sufficiently evaluated by the Board" and "Thornton failed to present reasonable siting alternatives"[32]; 4) "noise and visual impacts from the pumphouse are of concern"[33]; 5) "impacts will significantly impair residents' quality of life and use of their properties"[34]; 6) the proposal "would require an unreasonable lengthy construction cycle, up to four years, which neighbors of the route testified would cause significant disruption to their homes and daily lives"[35]; 7) "The sheer size and uncertainty of the proposed 500' to ¼ mile wide corridor prevents the Board and private property owners from reasonably considering all impacts. This uncertainty is, in itself, a significant impact of this project"[36]; 8) the application "does not account for the cumulative impacts of the project as a whole"[37]; 9) "a balancing of those impacts with the benefits must be performed"[38]; and, 10) "The Board is not yet convinced, however, that the two proposed routes for the pipelines and the location for the pump house are the only and/or best and least impactful and that other routes are not

[27] Exhibit 16 hereto (Transcript of May 16, 2018 Planning Commission hearing, pp. 199-200).

[34] *Id.*
[35] *Id.*
[36] *Id.* at p. 10.
[37] *Id.*
[38] *Id.*

viable."[39]

Ultimately, the Board found that Thornton's 1041 application failed to meet the following review criteria of the LUC: Section 14.10.D.1. ("consistent with the master plan"); Section 14.10.D.2. ("reasonable siting and design alternatives"); Section 14.10.D.3 ("conforms with adopted county standards"); Section 14.10.D.4. ("proposal will not have a significant adverse affect"); Section 14.10.D.6. ("proposal will not negatively impact public health and safety"); Section 14.10.D.10 ("the benefits of the proposed development outweigh the losses of any natural resources or reduction of productivity of agricultural lands"); and, Section 14.10.D.11 ("a reasonable balance between the costs to the applicant to mitigate significant adverse affects and the benefits achieved"). The Board recently defended its position in Court by opposing Thornton's efforts to overturn the decision.[40]

Other important reasons for the rejection of the TWP that are applicable and parallel to the NISP Northern Tier pipeline proposal are: 1) the likely use of disfavored eminent domain processes in order to put the pipeline in place, as no private landowner agreements along the proposed route have been found through a public records search or Colorado Open Records Act ("CORA") request to Northern; 2) the significant impact upon lands, especially between WSSC Reservoirs 3 and 4; and 3) a CORA request showing there still has been no meaningful discussion or consultation between Northern Water and Thornton about the possibility of co-locating multiple pipelines, despite the BOCC specifically mentioning the difficulty of planning for the possibility of multiple pipelines in its Thornton 1041 denial.

It is undisputed that Northern's proposal will cause exponentially greater adverse impacts than would the Thornton pipeline, which was rejected both by this Commission and the Board. For example, Northern's 1041 application involves similar pipeline design and siting and pump station impacts, but also involves relocating a federal highway and construction of a new dam, reservoir, a new diversion structure on the Poudre River upstream of the Mulberry Treatment Plants for the Poudre River Intake, and recreation area. In summary, Northern's 1041 application suffers from the same deficiencies as did Thornton's application, but is also compounded by numerous, even more significant adverse impacts. This Commission must apply the same analysis to Northern's application that it used to recommend denial of Thornton's application. For the reasons stated herein, the Planning Commission must recommend denial of Northern's 1041 application.

[39] *Id.*
[40] Exhibit 18 hereto (County's legal brief opposing Thornton's challenge to the decision).

VII. The NISP 1041 application does not comply with review criteria.

A. Applicable law.

The Larimer County Land Use Code ("LUC") establishes a standard of approval of a 1041 application. Review of 1041 applications is governed by Section 14 of the Larimer County Land Use Code ("LUC").[41] Section 14.10.B of the LUC states:

> A 1041 permit application may be approved **only when** the **applicant has satisfactorily demonstrated** that the proposal, including all mitigation measures proposed by the applicant, **complies with all of the applicable criteria** set forth in this section 14. If **the proposal does not comply with all the applicable criteria, the permit shall be denied**, unless the county commissioners determine that reasonable conditions can be imposed on the permit which will enable the permit to comply with the criteria (emphasis added).

This standard is consistent with the State 1041 law which states, "[i]f the proposed activity does not comply with the guidelines and regulations, the permit shall be denied." C.R.S. § 24-65.1-501(4). If a proposed project fails to satisfy even one criterion, the Planning Commission must recommend denial of the requested permit. *Colo. Springs v. Eagle County*, 895 P.2d 1105, 1110 (Colo. Ct. App. 1994).

This standard requires the Planning Commission to recommend denial of the 1041 application unless the applicant demonstrates compliance with all criteria ("the permit **shall** be denied"). Use of the word "shall" in the above standard of review is mandatory, meaning that the Planning Commission does ***not*** have discretion to recommend approval of a 1041 permit application that fails to comply with all applicable criteria.[42] The Planning Commission may not presume all criteria have been met. Instead, the applicant bears the burden of proof that each 1041 criterion has been "satisfactorily demonstrated."[43]

The County's 1041 regulations contain a list of criteria that must be satisfied by the applicant before a 1041 permit may be issued.[44] These criteria include requirements that: the proposal be consistent with the Master Plan; that the applicant present reasonable siting and design alternatives or explain why no reasonable alternatives are available; the proposal conforms with adopted county standards and review criteria contained in the Code; the proposal will not have a significant adverse impact on lands

---

[41] This comment letter incorporates herein by reference the entire Larimer County Land Use Code found at: https://library.municode.com/co/larimer_county/codes/code_of_ordinances?nodeId=PTIILAUSCO. The Larimer County NGOs request that the County include the entire current land use code in the administrative record for this 1041 permit application proceeding.
[42] LUC § 3.3.C.
[43] LUC § 14.10.B.
[44] LUC § 14.10.D.

and natural resources; and the benefits of the project will outweigh, or be reasonably balanced against, the adverse affects. Section 14.10.A. of the LUC also states that a 1041 permit "applicant must submit a complete and sufficient application…"

For the reasons stated herein, the Planning Commission must recommend denial of the NISP 1041 application.

B. The NISP 1041 application is incomplete.

As noted above, Section 14.10.A. of the LUC also states that a 1041 permit "applicant must submit a complete and sufficient application…" In adopting the State legislation for the 1041 law, the legislature recognized that, "[a]dequate information on land use and systematic methods of definition, classification, and utilization thereof are either lacking or not readily available to land use decision makers." C.R.S. §24-65.1-101(1)(b). The purpose of Colorado's 1041 statute is to remedy this lack of information to land use decision makers by requiring developers to provide information on the full scope of development "which may have an impact on the people of the state beyond the immediate scope of the project." *City County of Denver v. Bergland*, 517 F. Supp. 155 (D.Colo. 1981); *City County of Denver v. Bd. of County Comm'rs*, 760 P.2d 656 (Colo. App. 1988), aff'd, 782 P.2d 753 (Colo. 1989). Northern's 1041 application violates the letter and spirit of Colorado's 1041 statute by denying Larimer County and its residents the opportunity to evaluate the direct and indirect impacts of NISP.

Northern's 1041 application provides only fragments of the whole picture and actually states "*Plans and designs presented in this 1041 Permit application have been developed at a conceptual level*."[45] This is the opposite of the level of detail that should be undertaken on a project such large impacts on land, water, and communities and that has previously been required by this Commission and the Board. Further, the project has had two major changes since the FEIS was published in 2018. The application does not, therefore, provide a complete project description.

On April 17, 2020 the Larimer County NGOs submitted a letter to Leslie Ellis, Director of the County Community Development Department identifying significant deficiencies with the NISP 1041 application as posted to the County's webpage at: https://www.larimer.org/planning/NISP-1041.[46] These 1041 permit application deficiencies include, but are not limited to:

- The application is incomplete as to the relocation of Highway 287. The relocation of 7 miles of a major federal highway would not occur "but for" the NISP project, so attempting to bifurcate major components of NISP and treat the highway relocation as a separate "CDOT" project would unacceptably leave out major impacts to Larimer County resources and

[45] Technical Memo #1, p. 31.
[46] Exhibit 19 hereto (Larimer County NGOs' April 17, 2020 letter to Ellis, which is incorporated in its entirety by reference).

residents. The relocation of U.S. Highway 287 is part and parcel of NISP, it must be included in the 1041 application.

- The application is incomplete because it doesn't provide sufficient and necessary information on the feasibility of the project, specifically with regards to water rights. The project is relying on a farm-buying scheme that 1) the Corps of Engineers has deemed doesn't meet the purpose and need for the project and 2) will have significant environmental and socio-economic impacts which aren't analyzed in any environmental document.
- The application states, "Plans and designs presented in this 1041 Permit application have been developed at a conceptual level." The project has had 2 major changes in the past year, since the final EIS was published. The application does not, therefore, provide a complete project description. Because significant impacts from the project as currently proposed to the County have not been fully disclosed and mitigation has not been appropriately developed, determinations regarding evaluation criteria cannot be made.
- The application is incomplete because it relies on an outdated County Master Plan. The application refers to the 1997 Master Plan and provides rationale for project compliance with that plan. However, the County adopted The Larimer County Comprehensive Plan in 2019. Based on our correspondence with the County, this is the appropriate governing document for this 1041 permit application (and the existing land use code is still in effect, although it is being revised).
- The application does not address the questions posed by The Larimer County Comprehensive Plan for the Mountains and Foothills and Natural Resource Areas that Glade Reservoir would occupy.
- The application is incomplete because it presents no alternatives. The application refers to the alternatives analysis conducted for the federal EIS process, which is unnecessarily limited to a water storage project and is out of date. There are many less costly and less environmentally destructive alternatives for water development now available.
- The application is for an alternative that involves both the Glade Reservoir and a farm-buying scheme that has not been evaluated in any of the federal EIS or Clean Water Act Section 404 documents. Failing to present alternatives is a "my way or the highway" approach that would preclude informed decision-making contrary to the letter and spirit of the LUC.
- The application is incomplete because it does not adequately identify environmental impacts, analysis of key impacts to the land and natural resources is incorrect or inadequate, is not specific enough for local land use decision-making, or is deferred to some later permitting/approval process. For example: the noise analysis did not identify sensitive receptors in the residential areas around the proposed dam or reservoir and did not monitor or model expected noise increases due to construction or

recreation at these sensitive receptors; the air quality impact analysis is incorrect because it is based on a faulty calculation that it would take an 80-mph wind to raise any dust off the lakeshore; the visual/aesthetic impacts would be significant; the visual impacts from the relocation of Highway 287 would also be significant. The elevated highway would be visible for miles, and the light pollution from nighttime headlights, also elevated to be seen for miles, would also severely impact visual resources in and around the reservoir; noise associated with the elevation of highway 287 is not addressed. Once the highway rises above the topographic screens, the noise from over 6,000 vehicle trips per day, much of it large trucks, would have a unobstructed path into the surrounding hills; the effects on property values of dam and a partially full reservoir with exposed, un-vegetated lakeshores have not been disclosed; most of the mitigation planning is deferred to a later date, to another agency, to another process, etc.

- The application is incomplete because it does not adequately analyze wildfire impacts. Public safety may be adversely affected by wildfire.
- The application is incomplete because it fails to evaluate the possible public health issues the project's many air emissions may exacerbate.
- Larimer County would pay 25% of the $21.8 million cost to develop the recreational facilities, or $5.5 million. The application predicts that total economic benefits would be between $13 and $30 million, but these estimates are incorrect because they are based on the 1) a full compliment of water rights, which Northern Water does not possess, 2) the proponent's modeling (which does not account for future hydrologic conditions and therefore likely overstates reservoir fill levels, and 3) the proponents faulty calculations regarding revenue. The application, therefore, lacks a realistic forecast of recreational income. Operation of Horsetooth Reservoir costs over $2 million per year, and most of the costs are paid for by entrance fees. If Glade would rarely be "full enough" to provide recreational (especially in the form of motorized watercraft with its high entrance fees), then who will pay the operational fees? The risks and costs to taxpayers must be thoroughly explained in the application.
- The FEIS does not assess potential impacts from the range of risks to water supplies to Glade. Climate change, including rising temperatures and the very real threat of increasing frequency of prolonged droughts, and uncertainties in future water policy and water rights acquisitions, represent plausible risks to water supplies to Glade. A robust water supply vulnerability study that considers the range of plausible risks to water supplies at Glade should be part of the County's review process. As it stands, the FEIS does not provide decision-makers and the public the information necessary to evaluate the feasibility, levels of service, and potential value of proposed recreation at Glade.

- The application is incomplete because it does not identify the farms that will be purchased to acquire the water needed to implement the project. Without information on the location of the farms and water rights to be purchased in Larimer County, it is impossible to determine whether the benefits of the proposed development outweigh the losses of any natural resources or reduction of productivity of agricultural lands as a result of the proposed development.
- The application is incomplete because it fails to analyze the negative impact to the Cache la Poudre River from removing vast quantities of water from the watershed. There is no analysis of the "benefit" of draining the River and storing water in Glade Reservoir versus keeping the water in the River.
- The application is incomplete because there is no discussion of costs and adverse impacts to the River versus the benefit of such mitigation.

Despite these numerous and significant deficiencies with the NISP 1041 permit application, we never received a response from Ms. Ellis.

The following comments provide a more detailed examination of several incomplete aspects of the 1041 application.

Northern's indefinite, incomplete, and speculative pipeline corridor.

Like Thornton, Northern also proposes a 100' wide pipeline "corridor" rather than a detailed identification of the location of the pipeline and properties it will impact.[47] Northern's application also states, "the final route designed and constructed may deviate from the presented route as more information is gathered and final design is completed."

As noted above, both the Planning Commission and Board previously denied a 1041 permit application for the vague and speculative Thornton pipeline corridor. The Board found that the lack of specificity of a pipeline corridor prevented the Board from assessing actual impacts, resulting in denial of Thornton's 1041 permit application.

Having set this precedent, the Planning Commission must apply the same analysis and conclusion to Northern's 1041 application. The Planning Commission must remain consistent and find that Northern's 1041 application is incomplete and recommend denial.

Relocation of U.S. Highway 287.

The proposed relocation of Highway 287 has been handled inconsistently throughout this 1041 process. The relocation of the highway is included in several of the alternatives analyzed in the FEIS, was included on the NISP website as an anticipated

[47] Technical Memorandum #3, p. 4.

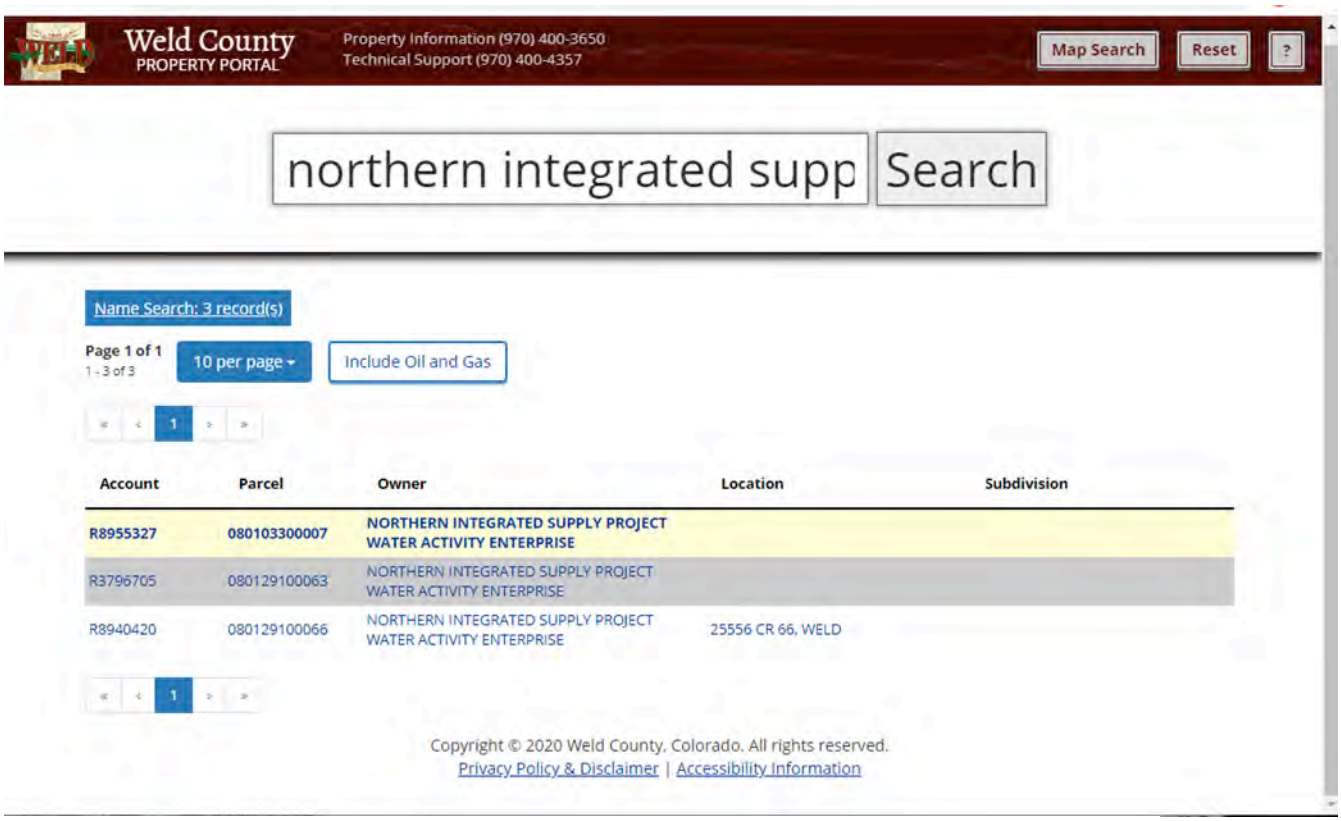
part of the county permitting process until late in 2019, but was excluded from the 1041 permit application, submitted February 2020. For a period of 16 years, the highway relocation has been presented to the public as part of the project, yet, at the last minute, this major construction project was unaccountably dropped from the county process.

The relocation of 7 miles of a major federal highway would not occur "but for" the NISP project, so attempting to isolate this major component of NISP and treat the highway relocation as a separate "CDOT" project unacceptably leaves out major impacts to Larimer County resources and residents. The relocation of U.S. Highway 287 is part and parcel of NISP, it must be included in the 1041 application, and everything to date lead the public to believe it would be.

Information on the farms and water supply is incomplete

The project is, in fact, not feasible and highly speculative specifically with regards to water rights. The project is relying on a farm-buying scheme, announced by Northern Water in early 2019, that the FEIS (p. 2.5.8) states: "*Implementation of the No Action Alternative would take about 10 to 12 years and would differ from the Applicant's Preferred Alternative due to the additional time required to procure a change in agricultural water rights, and it is unknown whether the Participants could acquire sufficient agricultural water rights to meet their future firm yield*." In other words, the path that Northern Water is currently taking is documented, in the FEIS, as speculative and does not meet the purpose and need for the project. In addition, the program would have significant environmental and socio-economic impacts that aren't analyzed in any environmental document.

Northern Water is conducting a farm-buying program in Weld County to obtain 22,000 acre-feet of water for the NISP project (Loveland Herald Reporter 2/28/19). At approximately $11,000/acre-foot, the purchase of 22,000 acre-feet will cost over $242,000,000. The FEIS states that water rights costs will be zero, and that no farms would be bought in order to fill Glade. The figure below is a screen shot from the Weld County assessors' website and shows that Northern Integrated Supply Project in 2019 purchased three parcels. The very real fact that the NISP project lacks over half its water rights wasn't revealed until about 12 months after the FEIS was finalized. In spite of over 15 years of development and environmental analysis, the project lacks over half of its key ingredient, water.



About half of the water rights required for Glade were purported to come from an exchange with ditch users in Weld County. The plan was to exchange clean Poudre River water for less clean South Platte River water, and the clean Poudre water would be taken out of the Poudre and pumped into Glade. The users in Weld County rejected the proposal and opted to retain the clean Poudre water, leaving the project with its current, severe, shortfall.

Throughout the permit application, the project relies on the FEIS as a crucial part of the 1041 permit decision. The application even encourages and "directs" the Larimer County Board of Commissioners to rely on the EIS. However, the 2019 after-the-fact change to a buy Weld County farms instead of exchanging the water with farmers means the EIS is no longer a reliable source – not for land use issues, not for comparing costs of the alternatives, not for water modeling (and thus for fish and wildlife), not for recreation. For example:

- the FEIS says that no farms will be bought, yet now at least 20,000 acres of farms must be bought
- the FEIS says there will be no costs associated with water rights acquisition, but the costs will actually be <u>at least</u> $242,000,000
- whereas it's stated that water deliveries would occur in 2030, there would, in reality, be an unknown but very long amount of time to acquire the water rights
- the FEIS says that the No Action Alternative (which was a farm-buying approach) was not feasible technologically and it was too expensive. The NISP project is

currently more expensive than some of the previously dismissed alternatives, and it is relying on the farm-buying approach the FEIS claims doesn't meet the project needs

- what if the Weld County farmers won't sell? How would the very purpose of this project be met?

The federal government should have recognized that the 2019 change to the proposed action would warrant a supplemental EIS, but so far has failed to act even though a comprehensive legal document was given to the Army Corps requiring a supplemental EIS. Even so, the 1041 application continually urges Larimer County to rely on the FEIS and to remember its participation as a cooperating agency, i.e., it is being asked to rely on a document that is fundamentally flawed. Furthermore, the FEIS states that the farm-buying approach, presented as part of the No Action Alternative in the FEIS, has been deemed 'not feasible" in the FEIS, and the County has no choice but to not approve the project. A robust evaluation of risks facing water supplies to Glade should be part of Larimer County's decision-making process when considering Northern's 1041 permit application. The FEIS fails to provide such an assessment.

Further, Save The Poudre sent a request to the U.S. Army Corps of Engineers for "Supplemental NEPA analysis" in response to this failure of the FEIS. That request has been inserted into this record.

Lack of water means lack of recreation

Northern Water claims the proposed Glade Reservoir would provide a "high-quality" recreation experience with economic benefits to Larimer County, ranging from $13 to $30 million per year (there is no documentation for these very high projections, and we show below that the project would result in a financial burden for the County). What Northern doesn't mention is the many years when water levels at Glade would be too low to attract boaters and other recreationalists.

As noted above, Northern Water does not have the water rights to fill Glade during low water years. NISP's obligations to deliver water to municipalities outside Larimer County would severely deplete water levels at Glade when water supplies are stressed.

Further, droughts are predicted to increase in frequency and duration in response to climate warming. Extended droughts would turn Glade into a vast mud pit that provides little or no recreation value to the County. A once pristine natural glade (the Hook and Moore Glade) would be rendered an eyesore for local residents and visitors alike.

The FEIS claims overall economic benefits from recreation at Glade would range from $13 to $30 million per year. For comparison, recreation at Horsetooth generated $2.5 million in 2019. Even by generous estimates, visitation at Glade would be roughly

half of that at Horsetooth. The FEIS provides no evidence to support Northern's overinflated recreation value at Glade.

In fact, during dry years, visitation to Glade could be much less than predicted in the FEIS. Neighboring Horsetooth Reservoir is often used as a yardstick to estimate recreation value at Glade. Historical data from Horsetooth show that recreation opportunities, such as boat access, are provided during more than 90% of the peak (May-August) recreation season, even during drought years. However, during low water years, recreation at Glade would be compromised due to Northern's junior water rights on the Poudre. Northern's own hydrological modeling predicts that recreation opportunities, such as motorized boat access, would be severely restricted, if not curtailed altogether, during dry years. This situation would become worse in the future.

The effects of climate change, including a widely accepted increasing frequency of prolonged droughts, could severely undermine recreation value at Glade. The City of Fort Collins recently commissioned a water supply vulnerability study that considered a range of risks that could plausibly impact the City's future water supplies. The study concluded that "climate change is the most important vulnerability" facing Fort Collins' water supplies. A robust water supply vulnerability study that assesses risks facing water supplies to Glade was not conducted for the NISP FEIS.

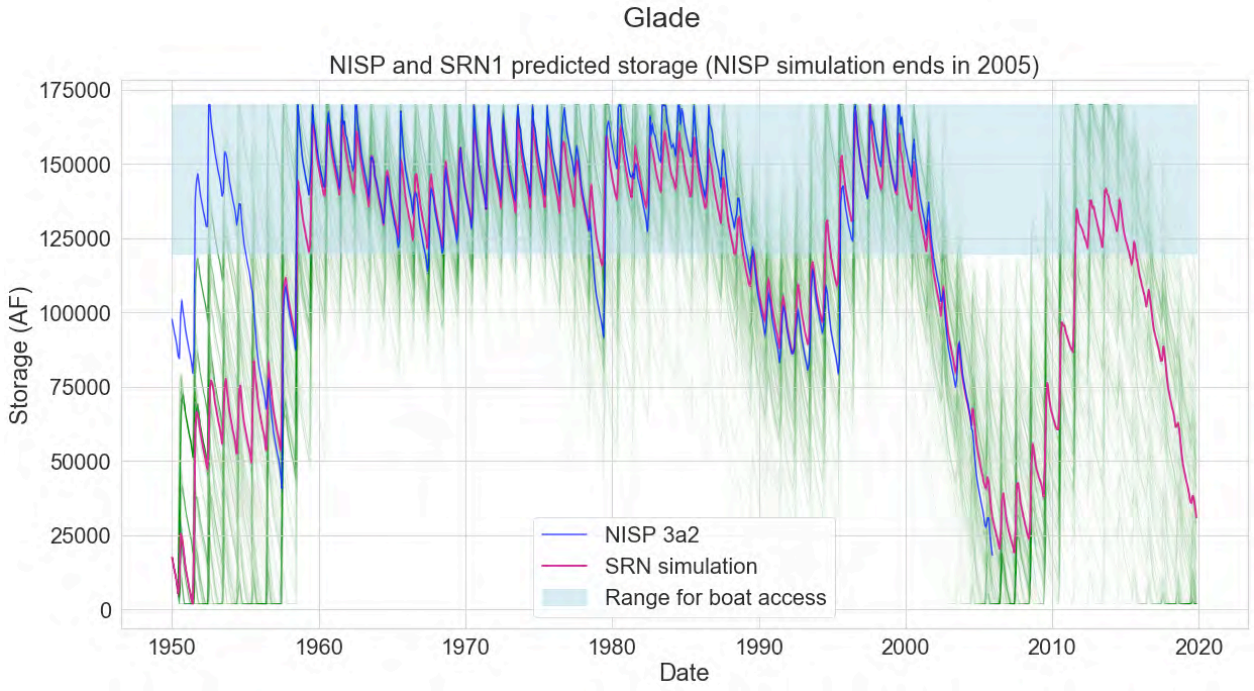
Neither Northern's Recreation Plan for Glade nor their 1041 permit application, address ***levels of service*** for recreation at Glade. For example, ***how often*** would water levels be high enough to provide access for motorized boating, ***how long*** would low water levels last, and ***how severe*** would water drawdowns be during droughts? Save Rural NoCo conducted its own analysis of storage volumes at Glade to answer these questions.

Save Rural NoCo developed a statistical model to evaluate a range of plausible operational scenarios at Glade, including: realistic estimates of the time required for the initial fill; refill characteristics following the severe water drawdowns resulting from cyclical drought conditions that are common to this region; and impacts of more frequent and prolonged droughts (which are widely anticipated in response to regional climate warming). The model was used to predict how each of these scenarios would affect water levels, and ultimately recreation services, at Glade. The results show that recreation services, such as recreational boat access via the proposed boat ramp, would be considerably reduced under any of these scenarios. The resulting decline in recreation use will undermine recreation value at Glade and result in lost revenue to the county. A technical report with details of SaveRuralNoCo's analysis is available on the organization's website.

The lack of a robust vulnerability study, akin to the 2019 Fort Collins Water Supply Vulnerability Study, is an unacceptable omission from the NISP EIS and Northern's 1041 application. Since streamflow data are readily available it is particularly concerning that hydrological modeling for the NISP does not include 2006-2019 Poudre River streamflow data. The importance of recent streamflow observations cannot be

understated because they follow a severe water drawdown at Glade predicted by Northern's own hydrological modeling at the end of 2005. The omission of recent streamflow data denies the public and the county valuable information on refill characteristics at Glade following severe water drawdowns.

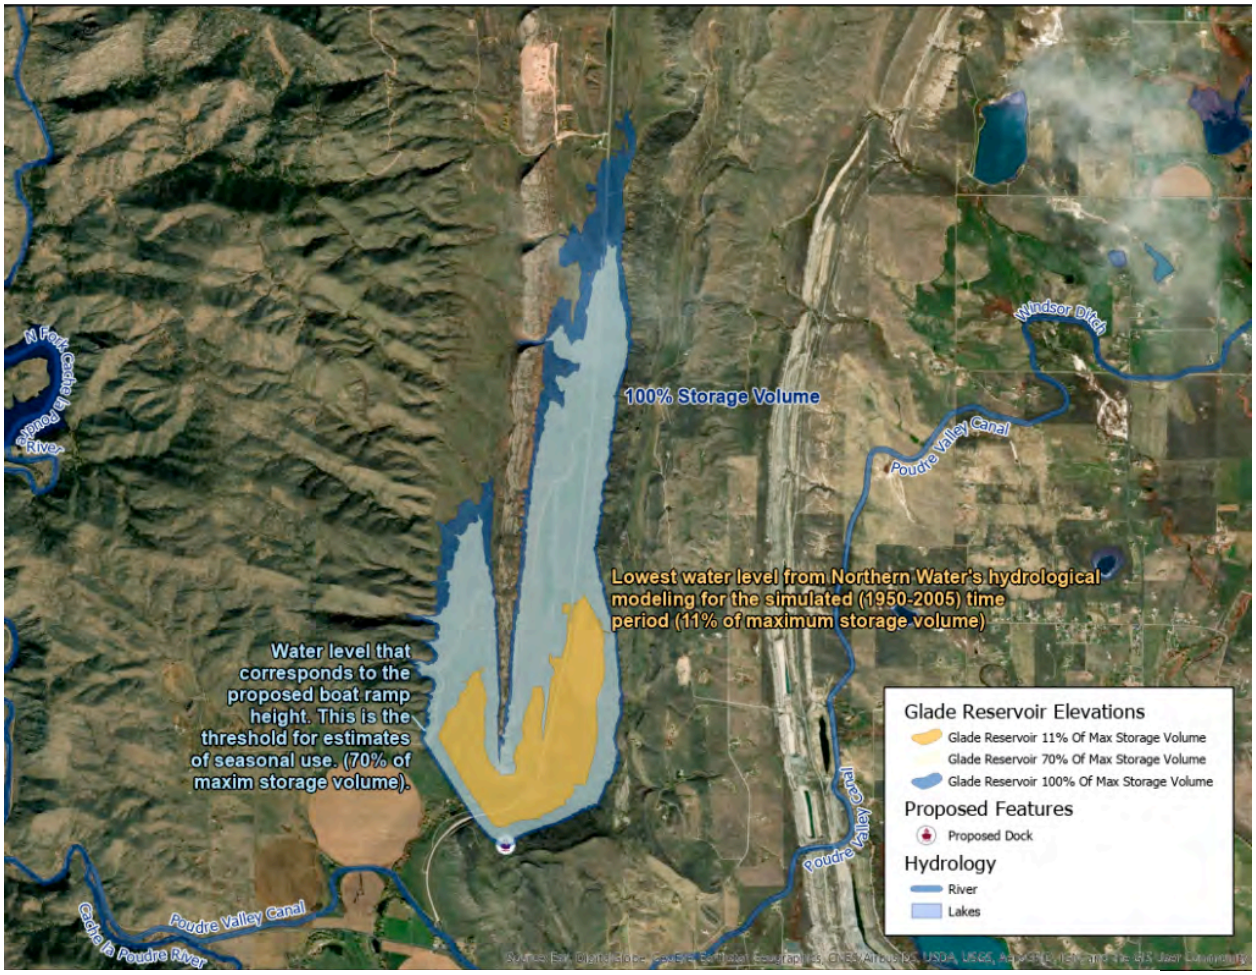
The figure below shows how such severe water drawdowns would affect the water surface area at Glade. In the last year of Northern's simulation (2005), storage volumes dropped precipitously, resulting in water storage at 11% of full capacity and water levels more than 160 feet below the high-water line.



The potential adverse impacts of extreme low water levels at Glade are enormous. However, such conditions are not acknowledged in the application or the FEIS, despite being predicted by Northern's own hydrological modeling.

Northern Water's "if you build it, they will come" approach would be costly. The County would have to pay 25% of the price tag (Larimer County's portion is currently estimated to be almost $6 million) to develop recreation facilities at Glade. In the many years when the boat ramp won't reach the water, the County will be faced with on-going annual losses. Not only will motorized boating be precluded, but the non-motorized experience will be poor due to miles of exposed, barren, aesthetically unappealing shoreline. If the County cannot recover upfront costs and future operating expenses, the burden will be on the taxpayer. Northern Water has not demonstrated that revenue from recreation would cover costs, particularly during droughts that are increasingly common to the region.

The economic value of recreation at Glade should be informed by a robust study that considers the current realities (the project lacks 22,000 acre-feet of water rights, drought, climate change) and the range of plausible future risks to water supplies at Glade. Neither the FEIS nor the 1041 permit application provides decision-makers and the public the information necessary to evaluate the feasibility and potential value of proposed recreation at Glade. In fact, the information presented to date demonstrates that recreation would be limited for years on end. When Glade is nearly empty, Larimer County's citizens will get nothing but the bill.



Northern's simulated water levels at Glade. The high-water line (dark blue), the minimum water level for the proposed boat ramp (35 feet below the high-water line), and the severe low water level from Northern Water's hydrological modeling (orange) 165 feet below the high-water line. Save Rural NoCo's modeling shows more frequent low water conditions when the water wouldn't reach the boat ramp and recreational opportunities would be negligible.

In conclusion, the county cannot approve a permit authorizing almost a decade of construction impacts for a project that has grossly insufficient water rights to meet any of its objectives. The erection of a huge industrial and commercial complex in rural northern Colorado, one that simply sits and waits for some, as yet unknown (and likely

never available, due to trend towards drier conditions), future water supply, does not even begin to comply with Larimer County's Comprehensive Plan or Land Use Code ("LUC").

For the reasons stated above and otherwise in this letter, the NISP 1041 application fails to comply with Section 14.10.A. of the Larimer County LUC requiring that a 1041 permit "applicant must submit a complete and sufficient application…" For this reason, we request that the Planning Commission recommend denial of the application.

There is recent precedent for such a recommendation. In the Planning Commission's review of the Thornton water pipeline 1041 application, the Planning Commission recommended denial of the application based in part on the fact that the application was incomplete with regard to the scope of the application, lack of alternatives analyzed, lack of mitigation, and inadequate balancing of the benefits to Larimer County.[48] Citing these inadequacies with the Thornton 1041 application, Commissioners Jensen, Dougherty, Cox and Carraway voted to recommend denial. Because the NISP application suffers from these same deficiencies, we ask that the Planning Commission vote to recommend denial of the NISP 1041 application. Consistency in the application of the LUC is the hallmark of good government. Having established a standard and precedent for completeness of a 1041 application, the Planning Commission is bound to apply this same standard to the NISP application.

C. The NISP 1041 application does not comply with review criterion D.1.

Section 14.10.D.1. of the LUC review criteria imposes a burden on the applicant to prove that the "proposal is ***consistent with the master plan*** and applicable intergovernmental agreements affecting land use development." For the reasons stated below, Northern has failed to prove that its NISP proposal is consistent with the master plan.

First, when county land use codes include a master plan compliance requirement, the master plan requirements become mandatory and not merely advisory. *See also, Beaver Meadows v. Bd. County Com'rs*, 709 P.2d 928, 936 ftn 6 (Colo. 1985 *en banc*) and *Board of County Commissioners of Larimer County v. Conder*, 927 P.2d 1339, 1345-46 (Colo. 1996 *en banc*)(both cases interpreting provisions of the Larimer County Code and Master Plan).

Second, the Larimer County NGOs request that the Planning Commission issue a ruling regarding which version of the Master Plan is applicable to Northern's 1041 application. We believe the current Master Plan is applicable. The County adopted its new Comprehensive Plan on July 17, 2019.[49] Northern's 1041 application was not

[48] Exhibit 16 hereto, pp. 184-200 (Thornton Planning Commission hearing transcript).
[49] The current Comprehensive Plan can be found at: https://www.larimer.org/planning/documents and is incorporated herein by reference.

submitted until February 14, 2020.[50] The purpose of the LUC is to "implement the Larimer County Master Plan adopted Nov. 19, 1997 ***and any future amendments***." (emphasis added). Further, projects "will be reviewed under regulations in effect on the date of the application."[51] Despite this clear language of the LUC, Northern's 1041 application fails to evaluate consistency with the effective July 2019 Comprehensive Plan and instead provides a very cursory discussion of consistency with the 1997 Master Plan.[52]

The Planning Commission must recommend denial of Northern's 1041 application because it fails to evaluate compliance with the Comprehensive Plan in effect at the time of the submission of its 1041 permit application.

Moreover, NISP does not comply with the 2019 Comprehensive Plan. The project is not in alignment with the Larimer County Comprehensive Plan for the Mountains and Foothills and Natural Resource Areas that Glade Reservoir would occupy. The Plan indicates that projects proposed for these areas should adequately address the following resource issues:

- *How does the project adequately protect air and water quality, cultural and natural resources, and minimize fragmentation of the landscape?* The application defers air quality and cultural resources protection to some later permitting/planning effort. The project would not adequately protect natural resources, as described in Section F below. The landscape would be severely fragmented by the project's huge and sprawling infrastructure (plus the relocation of a major federal highway).
- *How does the project avoid impacts to the open character of rural areas, unique or highly visible viewsheds, landforms and ridgelines?* The project would not avoid such impacts.
- *How does the project consider the natural terrain in its design and siting to minimize environmental impacts and avoid or reduce hazard risk to an acceptable level?* The project would severely alter the natural terrain and exacerbate hazard risks.
- *How does the project mitigate risks and reduce economic costs of natural hazard events to increase resiliency?* The projected influx of up to 500 people per day during construction and almost 400,000 people per year during operations to this high fire risk area would only increase the potential for fires. More human activity would increase the likelihood and frequency of human-caused fires, putting local homeowner's lives and property at risk.
- *How does the project comply with County policy, Code, Master Plans, and initiatives in relation to hazard risk reduction?* It doesn't. The application presents only conceptual plans (see section 12.0 in the application); a massive

[50] Northern's NISP 1041 application, p. 1.
[51] LUC § 3.6.D.
[52] Northern's 1041 application, Technical Memo #2, pp. 7-8.

construction project, with huge infrastructure and the potential for hordes of visitors only increases hazard risk, especially fires and medical emergencies.

Further, even if the 1997 Master Plan was effective, Northern's cursory evaluation is woefully incomplete. By means of example, the 1997 Master Plan states:

> **"ES-16-s1: Larimer County will not support future transfers of existing water resources out of the County without consideration of the impacts on present and future land uses including agriculture."[53]**

Thus, the Master Plan contains a strong statement disfavoring Thornton's proposal to transfer water out of the County that has historically irrigated agricultural lands. This requirement of the Master Plan also imposes a duty on Northern to satisfactorily demonstrate "the impacts on present ***and future*** land uses" from NISP. As such, the Planning Commission may "***not support***" (recommend approval of) Northern's 1041 application without full and complete consideration of all impacts on present and future land uses resulting from Northern's diversion of water from the County. Because Northern has yet to acquire the farms and associated water rights needed to implement NISP, it is completely unable to prove consistency with the requirements of ES-16-s1 and the 2019 Comprehensive Plan containing similar requirements.[54]

The failure to fully evaluate the affects of drying irrigated agriculture was one of the Board's reasons for denying the Thornton 1041 application. Having set this precedent, the same analysis and conclusion must be reached here.

Because Northern's 1041 application fails to evaluate consistency with the currently effective Comprehensive Plan, or even adequately evaluate consistency with the 1997 Master Plan, it has failed to meet its burden of proof on all applicable criteria in the LUC and thus the Planning Commission must recommend denial of the permit application.[55]

D. The NISP 1041 application does not comply with review criterion D.2.

Section 14.10.D.2. of the LUC review criteria imposes a burden on the applicant to prove that the "applicant has ***presented reasonable siting and design alternatives*** or explained why no reasonable alternatives are available." For the reasons stated below, Northern has failed to prove that it has presented reasonable siting and design alternatives or explained why no reasonable alternatives are available.

Northern's 1041 application does not present any alternatives or adequately explain why no reasonable alternatives are available.[56] Instead, Northern only presents

[53] Plan at p. 6-15.
[54] *See,* 2019 Comprehensive Plan, Vol. 1, pp. 44-47 and Vol. 2, pp. 122-123.
[55] LUC Section 14.10.B.
[56] Northern 1041 application, Technical Memorandum No. 1 (Project Description) p. 18.

"the final alignment" of its self-selected alternative.[57] Northern refers to its self-selected sole alternative as the "Northern Tier Delivery Pipeline."[58]

Northern's 1041 application claims that "[d]iscussions related to alternatives considered and evaluated" by Northern can be found in the "Project Summary Memo, the 1041 Evaluation Memo, and the Conveyance Pipeline Memo."[59] However, a narrative of "discussions related to alternatives considered and evaluated" by Northern is not the same as a presentation of alternatives from which the citizens of Larimer County and the Board may choose. Northern's presentation of a single "final alignment" does not satisfy the requirements of LUC § 14.10.D.2. Further, Northern's application fails to meet its burden of proving why no reasonable alternatives are available.

Importantly, Northern's 1041 application did not consider any alternatives to the Glade Reservoir. The 1041 application also did not present alternatives to relocating Highway 287 or siting alternatives for any such relocation. Northern also fails to present any alternatives to its "refined-conveyance concept." Northern's so-called alternatives analysis for its self-selected Northern Tier did not analyze any pipeline routing alternatives to the Glade Release/Poudre Release Pipeline in Project Area 0.[60]

Alternatives to NISP have been forwarded by multiple groups including Save The Poudre and Western Resource Advocates. The "Healthy Rivers Alternative" promoted by Save The Poudre includes enhanced water conservation and efficiency, better growth management, using 'growth displaced water', and pursuing water transfer mechanisms with farmers.[61]

The "Better Future for the Poudre River" alternative promoted by Western Resource Advocates also advocates for enhanced water conservation, better growth management, and using "growth displaced water."'[62]

Save The Poudre also supports the approach of "**Cleaning the River through Fort Collins and using the river as a conveyance, instead of the pipeline."** This alternative approach is described in Save The Poudre's comment letter to the Colorado Water Quality Control Division in Dec. 2019, wherein it notes that this approach also applies to the Larimer County 1041 permit process.[63] Northern Water claims that they could only run 1/3rd of their water down the Poudre River, again due to the pollution

level in the river. The "Clean The River" alternative describes how stormwater technology can allow all of the NISP water to flow through Fort Collins at a significantly cheaper cost than building the Northern Tier Pipeline.[64]

Again, the Board and this Commission found that Thornton had failed to present adequate alternatives when it only offered the County the choice between two pipeline routes (Douglas Road and CR 56). Northern's 1041 application is even more defective because ***it fails to offer any presentation of alternatives for any aspect of the project.*** Having set a precedent in the Thornton pipeline case, the Planning Commission must apply the same analysis and reach the same conclusion that Northern has failed to comply with LUC § 14.10.D.2.

E. The NISP 1041 application does not comply with review criterion D.3.

Section 14.10.D.3. of the LUC review criteria imposes a burden on the applicant to prove that the 1041 application "conforms with adopted county standards, review criteria and mitigation requirements concerning environmental impacts, including but not limited to those contained in this Code." For the reasons stated below, Northern has failed to prove that its 1041 application conforms to adopted county standards, review criteria and mitigation requirements concerning environmental impacts.

Northern's pump station at Glade Reservoir would be "approximately 40,000 horsepower with a capacity of approximately 1,200 cfs."[65] The Glade pump station would require a 40 mega-volt ampere power supply need to be served by Xcel Energy, which would run a new transmission line to the station from a Tri-State 115 kV transmission line.[66] The Glade pump station would also require a new electrical substation.[67]

The new pump station upstream of the Mulberry plant would be "1,000 to 1,300 horsepower" with a capacity of "18 to 25 cfs."[68]

Very little information is presented in Northern's 1041 application related to the new Larimer County pump stations. However, pump stations are industrial uses of land. Pump stations generate significant noise, ground vibration, glare, aesthetic, and other impacts.

The requirement to "conform with adopted county standards" includes compliance with zoning requirements. More specifically, Section 14.10.D.3 of the LUC requires that "[t]he [1041] proposal conform[] with adopted county standards, review criteria and mitigation requirements concerning environmental impacts, including but not

[65] Technical Memorandum No. 1, p. 4.
[66] Northern's 1041 application, Memorandum, Glade Reservoir Preliminary and Detailed Design, February 14, 2020, p. 5.
[67] *Id.*
[68] Technical Memorandum No. 1, p. 6.

limited to those contained in this Code." The zoning requirements are county land use standards contained in the Code.[69]

Northern's 1041 application is incomplete because it fails to demonstrate that the pump stations conform with zoning restrictions. Northern is a water "utility." Section 4 of the Larimer County LUC identifies which "utility" uses are allowed in each zoning district. For example, in "Open" zoning district the only uses allowed for "utilities" are "commercial radio service" and "radio and television transmitters."[70] The LUC recognizes "pumping stations for water" as an industrial type use by utilities and thus any argument that such industrial uses are allowed in all zoning districts must be rejected.[71]

Yet again, the Board rejected the Thornton 1041 application because it failed to prove that the pump station would comply with county standards. The same is true with regard to Northern's deficient 1041 application which contains even less information about the zoning and standards applicable to the pump station and whether the facility is in compliance with those requirements. Northern's application fails to meet its burden of compliance with review criteria Section 14.10.D.3 because it fails to identify the zoning for each parcel upon which it plans to located each pump station and it fails to prove that each parcel is zoned to allow such a utility use. As such, the Planning Commission must recommend denial of Northern's 1041 application for failure to conform with zoning standards.

In light of climate change, we must also consider the carbon footprint of creating a pump station and its subsequent power lines and transmission towers. To get the Poudre River water into Glade reservoir, it will take 80MW of power supplied by huge transmission towers similar to those used at Glen Canyon Dam (see below image). The forebay is the holding reservoir for water from the Poudre River, and from where the Poudre water will be pumped 400 feet up into the Glade Reservoir. The proposed peak pumping rate in Northern's application to Larimer County, from the forebay, is 1,200 cubic feet per second and will require 81 MW (megawatt) of power. To put 81 MW in context, it is equivalent to the power required by Fort Collins' approximately 62,000 residences and 90% of the reported generation capacity of Glen Canyon Dam. This begs the questions – How will NISP get the required electrical power to the pumps? If the power comes from coal or gas fired-power plants, operation of the pumps will generate significant greenhouse gas emissions. Additionally, what is the visual impact of these enormous power lines?

---

[69]LUC § 2.4(C)("[t]his code and the official zoning map govern the application of the zoning districts and related standards."); and, LUC § 3.4(A)("[t]he location and boundaries of the zoning districts established by this code are shown on the official zoning maps of Larimer County. These maps have been adopted by the county commissioners and are incorporated as part of this code").

[70] LUC § 4.1.5.

[71] LUC § 2.2.E.5.e.

F. The NISP 1041 application does not comply with review criterion D.4.

Section 14.10.D.4. of the LUC review criteria imposes a burden on the applicant to prove that the proposal "will not have a significant adverse affect on or will adequately mitigate significant adverse affects on the land or its natural resources, on which the proposal is situated and on lands adjacent to the proposal." For the reasons stated below, Northern has failed to prove that its proposal will not have a significant adverse affect on or will adequately mitigate significant adverse affects on the land or its natural resources.

NISP would involve seven years of heavy construction. According to the application, there would be five years of construction in and around the dam site impacting our communities, and an additional two years in the South Platte portion of the project, impacting other rural communities. For a project of this magnitude and complexity, delays are inevitable. The rural public would be subjected to 6-days-a-week heavy traffic and heavy machinery operations, and the unwelcome, intrusive, and obnoxious presence of a massive construction project, with all of its activity, congestion, noise, dust, and danger, over a long period of time. Helicopter noise would spoil the skies. Construction would turn the hundreds of acres of the landscape into a heavy industrial zone, and take away the attractiveness, the clean air, the quiet – the things we depend on for health and happiness. The average life expectancy of Colorado residents is 80.5 years – the approval of this project would force us to endure a huge construction project for <u>over 10% of our adult lives</u>. Project construction, therefore, would have a significant adverse affect on the land and its natural resources, both on project area land and on lands adjacent to the proposal. Furthermore, project construction contravenes Larimer County's goals for Rural Heritage or Environmental Stewardship (Larimer County Comprehensive Plan, pp. 18-19).

The Board denied the Thornton 1041 application because it would result in 4 years of adverse impacts to county residents. Again, Northern's application would result in longer and more severe adverse impacts. The Planning Commission and Board must remain consistent and deny Northern's 1041 application.

Further, the following significant adverse impacts have not been analyzed or mitigated.

<u>Noise</u>

The noise analysis did not identify sensitive receptors in the residential areas around the proposed dam or reservoir and did not monitor or model expected noise increases due to construction or recreation at these sensitive receptors.

As an example, Bonner Peak Ranch (Bonner Peak) is a community occupying 3,200 acres between Ted's Place and Livermore. Other small communities occur both south and north of Bonner Peak, west of Highway 287, and a larger community occurs near the dam site, along county road 29C (see figure below for the location of rural communities near proposed Glade). Bonner Peak's 75 homes are either due west or

northwest of the northern part of the proposed reservoir. Without Glade, the principle noise impacting Bonner Peak homeowners and neighboring communities is from traffic on 287. According to the FEIS, Highway 287 has an annual average daily traffic of 6,100 vehicles. Larger trucks (3 or more axles and single or multiple trailers) account for 830 of the 6,100 daily vehicles according to 2018 CDOT traffic counts available online. Homeowners can hear this traffic, always or sometimes; it depends on atmospheric absorption, wind/temperature gradients, and the location of the home. Trucks account for most of the audible traffic, with large trucks creating sound levels of 90-100 decibels (dBA) at a fifty-foot distance.[72] Sound levels decrease with the distance from the source to the receiver. Homes on Bonner Peak are anywhere from about 4,000 to over 14,000 feet from 287. Using the inverse square law between sound levels and distance[73], we determined that most homes on Bonner Peak are exposed to maximum truck noise between 51 and 74 dBA depending on geographic features, atmospheric absorption and wind/temperature gradients. To place in perspective, Larimer County standards consider 55 dBA for residential areas "excessive and unusually loud and is unlawful." (Noise Level Policy, Ordinance No. 97-03, https://www.larimer.org/policies/noise), and the Colorado Department of Transportation (CDOT) sets 66 dBA as the noise level at which noise abatement is recommended.

The proposed Glade reservoir operations would increase noise on Bonner Peak and the neighboring communities for two main reasons: a) the 287 realignment, and b) planned recreation on and near the reservoir. The current 287 passes directly by the Bonner Peak and other entrances. A rerouted 287 would continue to do so, but about a mile south of the entrance it would diverge from the existing highway and head roughly due east and cut through the easternmost hogback before turning south toward Fort Collins. Traffic that is now running north-south would be replaced by traffic running east-west. The realigned route would be elevated above the existing route, so the noise would likely exceed the noise from the existing route, because the proposed route will be in a direct line of sight to some homes (the existing topographic barrier would no longer block noise). In spite of the fact that traffic noise from the existing 287 can always or sometimes be heard by residents, the FEIS makes no mention of this situation. Information on noise in Section 4.15 of the FEIS is derived from the Hankford Noise Impact Analysis (2014) in which forty-one noise receptors were placed along the existing and rerouted 287 within 500 feet of the highway. However, no receptors were placed on Bonner Peak or any other communities.

The FEIS estimates that 379,000 visitors per year would recreate on or near the proposed reservoir, with substantially higher visitation levels in the warmer months (Headwaters 2017). Motor boating and jet skis would be among the recreation uses and would be new sources of noise to these communities. Similar to or exceeding large truck noise, an individual motorboat or jet ski creates sound levels of 90-100 or higher decibels (dBA) at a fifty-foot distance. However, there is no analysis of these new noise sources in

[72] Bureau of Reclamation. 2008. Resource Management Plan Navajo Reservoir area, Colorado and New Mexico, Final Environmental Assessment, Appendix E.
[73] https://www.engineeringtoolbox.com/inverse-square-law-d_890.html

any of the project documentation. The table below shows two estimates for the number of motorboats per day on Glade: the first is proportional to water surface areas, and the second is proportional to annual visitation. The range for the number of motorboats reflects low to high water levels predicted in the FEIS (which now are speculative, see "Information on farms and water supplies are incomplete" and "Lack of water means lack of recreation" above).

Estimated number of daily motorboats on the proposed Glade Reservoir.

Avg. Surface Area	Motorboats/day	Visitors/year	Motorboats/day
1240	59-248	379,000	52-218

How 52 to 248 motorboats impact noise levels on the neighboring communities will depend on where they recreate on the proposed reservoir. The further north they cruise, the more the impact on Ingleside and Bonner Peak; further south, the residents along 29C would be impacted. Moreover, unlike large trucks that drive by, motorboats can cruise up and down a reservoir as they set out for fishing spots or engage in sightseeing, water skiing, etc. In other words, while the noise from one large truck traveling on 287 may be heard for minutes, the noise from one motorboat may be heard for much more extended time periods. Because no noise analysis was conducted in the FEIS regarding motorboats, we will appeal to the table below to approximate the noise levels at points within Bonner Peak, as an example. The residences on Bonner Peak vary in distance from the proposed reservoir with the closest residences about 4,000 feet and more distant residences exceeding 14,000 feet. Noise levels from one motorboat at 4,000 feet distance would be 62 dBA while at 14,000 feet noise levels would be 51 dBA. These levels are for one motorboat: more boats will create more noise. If four boats are plying the waters of the proposed reservoir, then their cumulative dBA are 68 dBA for the closest residence and 57 dBA for the furthest.[74]

Decibel levels measured at residences located from 50 ft to 14,000 ft from motorboats.

	Feet from Motorboat									
No. Boats	50	100	1,000	4,000	5,000	6,000	8,000	10,000	12,000	14,000
1	100	94	74	62	60	58	56	54	52	51
4	106	102	80	68	66	64	62	60	58	57
10	110	104	84	72	70	68	66	64	62	61

These dBA levels would be a significant new source of noise to Bonner Peak, and for some residences they would exceed the 55 dBA which in Larimer County is considered "excessive and unusually loud and is unlawful" as pointed out above.

[74] Cumulative noise levels can be determined using the website: http://www.sengpielaudio.com/calculator-spl.htm.

Again, the FEIS does not investigate recreation as a new source of noise to residences, although it does investigate vehicle traffic noise along the proposed rerouted Highway 287. As mentioned above, according to the CDOT's Noise Abatement Criteria, residential locations are considered impacted by new traffic noise when: noise levels are predicted to approach or exceed CDOT's Noise Abatement Criteria (66 dBA), or where design-year noise levels are predicted to be a substantial increase (10 dB or more) over existing noise levels.

According to the FEIS (see Hankford 2014 for detail), estimated future traffic noise levels from a rerouted highway 287 require no noise mitigation for this Glade project. Some predicted traffic noise levels are very close to the 66 dBA criterion at which noise abatement is recommended, but the residences impacted in this way are along the rerouted 287 and its intersection with the current 287. Bonner Peak was not considered in these traffic noise studies, in addition to not being considered with respect to the motorboat noise.

Property values would be affected by the additional noise. For many residents, who desire a quiet, rural way of life, motorboat noise would diminish the quality of life. The FEIS states that the vehicle traffic noise impacts from the proposed Glade Reservoir will be minor, where minor is defined as noise "from new noise sources above existing levels but below existing noise standards." (FEIS, vol. 4, Table 4-111, p. 4-472 & p. 4-469) However, for some residents, motorboat noise would exceed these standard (see table below). In addition, if we consider the value of the lost quality of life for residents, the point is not whether the new noise is below noise standards, but rather is the new noise above existing noise levels.

Although placing a value on resident losses from motorboat noise is challenging, it is not novel. There are numerous economic studies that estimate losses that people experience from diminished environmental quality, where the sources of loss may be air, water or light pollution, or in the present case, noise pollution. Basically, these studies estimate how much people would be willing to pay not to be subjected to more noise. Economists do study housing property values, because house prices reflect what people are willing to pay for the bundle of characteristics that houses represent.[75] These studies are sometimes referred to as hedonic property value studies. (See Freeman (1995) for a survey of hedonic pricing.) One house characteristic is the noise level the house is exposed to; people have a choice of their residential location, so they have a choice between houses in noisy or peaceful locations. Because noise is undesirable, we would expect that if two houses are identical except for their exposure to noise, the house with the lower exposure will sell for a higher price. Examples of the use of property value studies applied to noise include Delucchi and Hsu (1998), Nelson (1982) and Wilhelmsson (2000). Using results from Nelson, we can estimate the loss in property

[75] Housing attributes may include, besides noise exposure, square footage, number of bathrooms, property size, presence of a pool or fireplace, neighborhood school quality, distance to work, and many others.

values on Bonner Peak associated with motorboat noise on the proposed Glade Reservoir. Nelson finds that for houses exposed to noise, there will be a mean reduction in the value of the house of 0.4% per each dBA of exposure. The range around the 0.4% is [0.16% - 0.63%] with a standard deviation of 0.23%. For example, take two $100,000 houses that are identical and are both exposed to 55 dBA. If one house experiences an increased exposure to 65 dBA, the increase in exposure is 10 dBA. Using the 0.4% for each dBA, the value of the higher exposed house will decrease by (10)(0.4%) = 4%. In dollars this is (4%)($100,000) or a $4,000 loss in value.

The total loss in Bonner Peak property values for houses within 14,000 ft of the proposed reservoir is $1,456,000. This averages almost $30,000 per household which would a significant burden to many property owners. These losses are completely ignored in the FEIS and the 1041 application.

Estimated Property Values Losses Due to Noise for Residences 4,000 to 14,000 feet from the Proposed Glade.

Distance from Reservoir (ft)	(A) Number of houses	(B) 10-boat dBA	(C) (B) – 50 dBA	(D) (C) x (0.4%)	(E) (A) x (D) x ($500,000)
4,000	3	72	22	8.8%	132,000
5,000	4	70	20	8.0%	160,000
6,000	3	68	18	7.2%	108,000
8,000	13	66	16	6.4%	416,000
10,000	8	64	14	5.6%	224,000
12,000	10	62	12	4.8%	240,000
14,000	8	61	11	4.4%	176,000
Total	49	--	--	--	1,456,000

We can point to several assumptions that if relaxed might increase or decrease the total loss.

- The number of motorboats used was ten, but this may be very low considering that 52 to 248 motorboats per day may be using the proposed reservoir based on visitation levels at Horsetooth. Obviously, increasing the number of boats would increase the noise levels and the total loss would be greater.
- The motorboats would ply the reservoir waters in the warm months only. Because the noise is not year-round, it may lower the total loss. However, there are insufficient data to establish this.
- Motorboat muffling technology may make some boats less noisy, but it is likely that many boats would be unmuffled.
- Jet skis were not included in the analysis for lack of data. Adding them at any level would increase the noise and the total loss.

- No traffic noise from a rerouted highway 287 was considered. Adding truck traffic could increase the dBA exposure and increase total loss.

People choose where they live based on a variety of reasons. Some people choose suburban or urban areas owing to the availability of cultural activities, or the convenience of being near schools and workplaces. These amenities are not as easily available to the affected rural northern Colorado residents; instead, residents are willing to tradeoff these amenities for a rural lifestyle and for peace and quiet. The proposed Glade Reservoir would be a major disruption to this peace and quiet, and it would irreversibly spoil rural ways of life.

Furthermore, the county must consider the fact that this type of analysis was completely overlooked in all of the environmental documentation for this project. So, while the application encourages and reminds the county of its long involvement in the development of the FEIS, the FEIS clearly did not adequately address these potential impacts and loss of property values.

Impacts to Visual/Aesthetic Quality of the Natural Landscape

The existing scenic quality of Hook and Moore Glade and surrounds is very high, with its gently sweeping natural valley of grasslands bordered by striking, tall, red, layered hogbacks. If you are traveling downslope, this view gradually opens onto the mouth of Poudre Canyon and the agricultural valley with its floodplains, cottonwoods, pivot irrigation, and dairy. If you are traveling upslope, you move into stunning rangeland and the sculpted hoodoos of Sherman Granite. It's spectacular, it's rare, and residents cherish it. The construction of Glade Reservoir would irreparably damage this unique scenery. The FEIS states that the scenic quality of residential areas near the reservoir would increase because the water would provide "texture". This smacks of jargon to put a shine on unmitigated folly. This landscape is beautifully, naturally textured, and the reservoir, with its bathtub ring, would be an industrial scar. The application, and the FEIS, fail to consider the extreme negative visual impacts of a partially filled reservoir and a barren shoreline. The avoidance and mitigation measures (re-vegetation and planting) don't even begin to address this issue – once it's gone, it's gone.

Visual and noise impacts from the relocation of Highway 287 would also be significant. The elevated highway would be visible for miles, and the light pollution from nighttime headlights, also elevated to be seen for miles, would also severely impact visual resources in and around the reservoir. Noise associated with the elevation of highway 287 is also not addressed. Once the highway rises above the topographic screens, the noise from over 6,000 vehicle trips per day, much of it large trucks, would have a unobstructed path into the surrounding hills.

The FEIS provides estimates of the number of acres that would be impacted due to road relocation. While much of the realigned highway would cross the Holcim Mine, which is currently begin reclaimed, the FEIS does not address land use issues associated

with the elevation of the highway across the eastern hogback, and how that would affect land and communities in the Hook and Moore Glade and foothills to the west. The FEIS provides a cursory evaluation of how the realignment might affect future land uses, but egregiously overlooks one very important current land use: rural communities.

With regards to the aesthetic effects of the realignment, the FEIS also notes that "vehicles traveling on the realignment would be noticeable from all visibility areas in northern, eastern and south portions of the study areas. Vehicles traveling on the realignment would also introduce visible light (from headlights at nighttime….the presence of vehicles on the realignment would reduce the scenic quality of portions of the study areas…. Additionally, the realignment would have relatively small cuts and or fills due to the nearly flat topography of the prairie [north of the Holcim Mine and east of the hogback]. Scenic quality would be reduced by the realignment due to the visible contrasting changes in landform, rock form, color, and texture. Visibility of the contracts would extend beyond the study are a predominately to the west and **would affect travelers on the highway**…..The realignment of U.S. 287 would unavoidably alter scenic quality in the realigned areas north of Holcim Mine." (emphasis added).

The glaring omission from this is that there is no mention of impacts to residents in the many small communities in the vicinity.

With regards to noise, the FEIS states that "Because predicted Leq (hourly) is below 66 dBA at all residential and campground receptors….minor permanent noise impacts are predicted…." However, the analysis did not consider sensitive receptors in the communities in and adjacent to Hook and Moore Glade. The analysis used 41 receptor locations within 500 feet of the centerline of the westernmost alignment and modeled noise levels for distances between 500 and 1000 ft of the alignment and construction areas. impacts based on those. Again, noise wasn't measured or explicitly modeled in our rural communities. The FEIS repeatedly ensures us that noise levels would be below standards, which a) isn't documented for the affected rural communities and b) doesn't consider the fact that we would be subjected to increased noise, within standards or not, that impact our quality of life.

By removing dramatic amounts of water from the Poudre River, NISP would case unmitigatible and dramatic negative impacts to the River, including to fish and aquatic species, wildlife habitat, riparian forest, wetlands, and to the recreational opportunities at the new Whitewater Park. These impacts have been described at length in Save The Poudre comments to the U.S. Army Corps of Engineers in the DEIS, SDEIS, FEIS, and Supplement NEPA process. Through previous comments in this letter, those comments to the Corps have already been incorporated by reference into this letter for the Larimer County 1041 permit process.

G. The NISP 1041 application does not comply with review criterion D.5.

Section 14.10.D.5. of the LUC review criteria imposes a burden on the applicant to prove that the proposal will not adversely affect any sites and structures listed on the

State or National Register of Historic Places. For the reasons stated below, Northern has failed to prove that its proposal will not adversely affect any sites and structures listed on the State or National Register of Historic Places.

The FEIS states that there are 82 eligible or potentially eligible cultural sites present in the Glade Reservoir Area of Potential Effect (APE). Eight of the sites are officially eligible and 74 require additional data and formal evaluation. There are numerous additional sites in the APEs of the 287 reroute and other proposed project facilities. The FEIS then states that all unavoidable adverse effects on historical properties would be mitigated following the process described in an as yet to be developed Final Programmatic Agreement. The Corps anticipates the Final Programmatic Agreement will contain a number of provisions for cultural resources mitigation. The Corps then anticipates that Northern Water would implement all feasible and prudent measures to avoid and minimize effects on historic properties and to mitigate all adverse effects. With all these yet to be conducted evaluations, agreements, and anticipations, the Corps (FEIS p.4-527: Section 4.19.14 Effect Determination) reaches the conclusion: "*Consequently, effects on directly affected historic properties would be either minor or moderate. Effects on indirectly affected historic properties would be either minor or moderate*."

According to the definition of moderate provided by the Corps in that same section: "*In accordance with criteria in 33CFR325, Appendix C, the following terms are used to describe potential effects on cultural resources: Moderate: The effect on a designated historic property would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association. Measures identified in the Programmatic Agreement to minimize or mitigate adverse effects reduce the intensity of impacts under NEPA from major to moderate. The determination of effect for Section 106 would be an adverse effect."* Thus, the determination of effect for Section 106 of Northern's proposed action on those affected historic properties that consequently end up post-mitigation as moderate as concluded by the Corps will by definition be adverse effects.

In summary, there are more than 82 cultural sites that are eligible for listing on the state or national Register of Historic Places, and some will be adversely affected. While none of the sites are currently "listed", they might indeed be important enough to our cultural heritage to warrant such listing. The listing determinations should be made, and if any site is listed, the project cannot be authorized. But doing it the other way around – i.e., granting the permit and then dealing with eligible sites, does not meet the letter or the spirit of this criterion.

H. The NISP 1041 application does not comply with review criterion D.6.

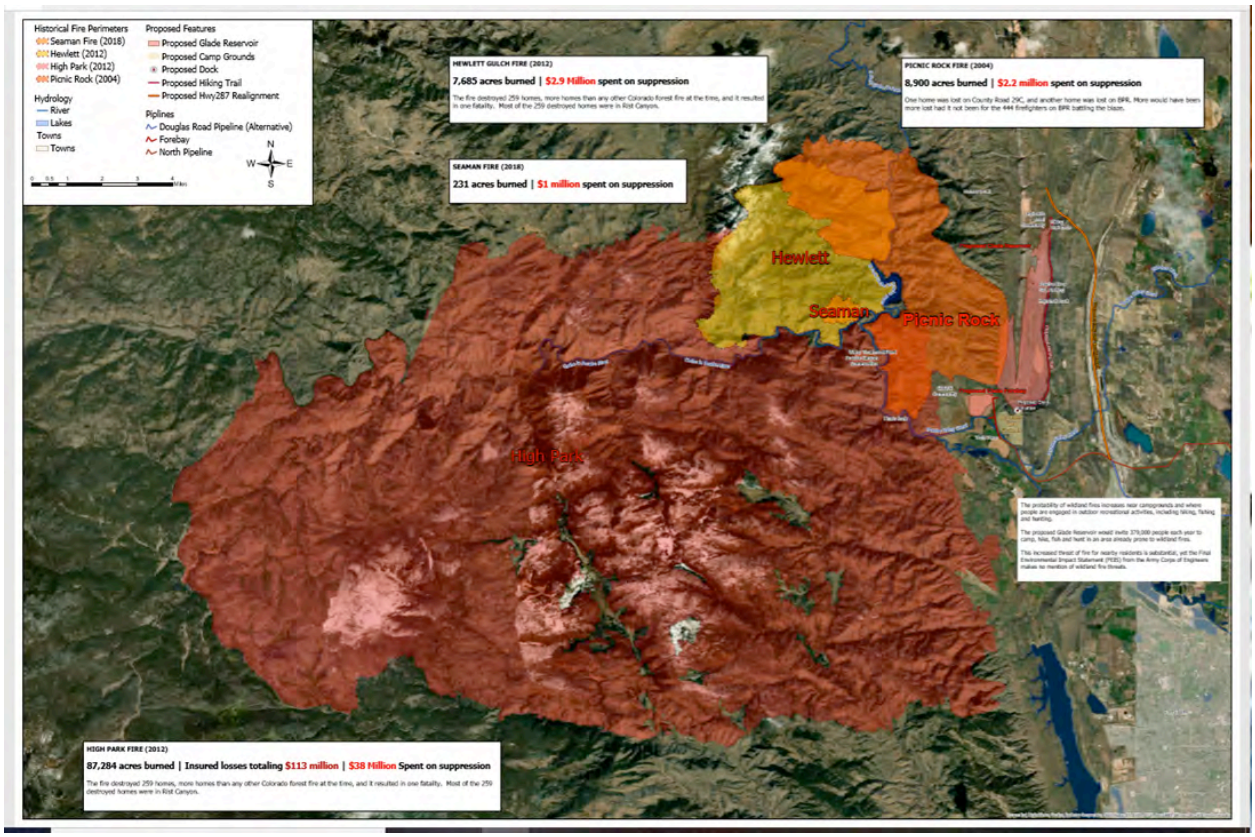
Section 14.10.D.6. of the LUC review criteria imposes a burden on the applicant to prove that the proposal "will not negatively impact public health and safety." For the reasons stated below, Northern has failed to prove that its proposal will not negatively impact public health and safety."

Impacts to Public Health from Wildfire.

An un-ignorable hazard in the hundreds of square miles west of the proposed reservoir is wildfire. The 87,284-acre High Park fire of 2012, the 7,685-acre Hewlett Gulch fire of 2012, the 8,900-acre Picnic Rock Fire of 2004, 231-acre Seamen Fire of 2018, burned over 100,000 acres (see figure below). Collectively, suppression costs were over $40,000,000 (in taxpayer dollars) and the High Park fire resulted in over $100,000,000 in insurance claims from rural residents, like us, whose property was destroyed.

Communities on these lands (see figure below) encompass hundreds of homes that have been threatened, and in many cases, destroyed by the fires. For examples, there are 26 homes along County Road 29C which lie directly west of the proposed campgrounds, with some homes less than a mile away. Residences on Ingleside Road and Bonner Peak sit adjacent to the proposed Glade Reservoir. North of Bonner Peak are another 30 or so homes (west of 287 and south of Livermore). More distant but still within reach of wildland fires that may ignite around the reservoir is Rist and Poudre Canyons which are a few miles from the campgrounds planned near the dam. There are hundreds of homes in Rist and Poudre Canyons.

The fires caused evacuations on County Road 29C, Bonner Peak and Rist Canyon. In the Picnic Rock Fire one home was lost on County Road 29C, and another home was lost on Bonner Peak. More would have been more lost had it not been for the 444 firefighters on Bonner Peak battling the blaze. The forest that remains on Bonner Peak is now in isolated patches instead of being on the eastern edge of a vast forestland. The High Park Fire destroyed 259 homes, more homes than any other Colorado forest fire at the time, and it resulted in one fatality. Most of the 259 destroyed homes were in Rist Canyon. Two fires were human caused, the third was caused by lightning. In addition to forest fires, there have been a significant number of grassland wildfires over the years adjacent to the proposed reservoir.

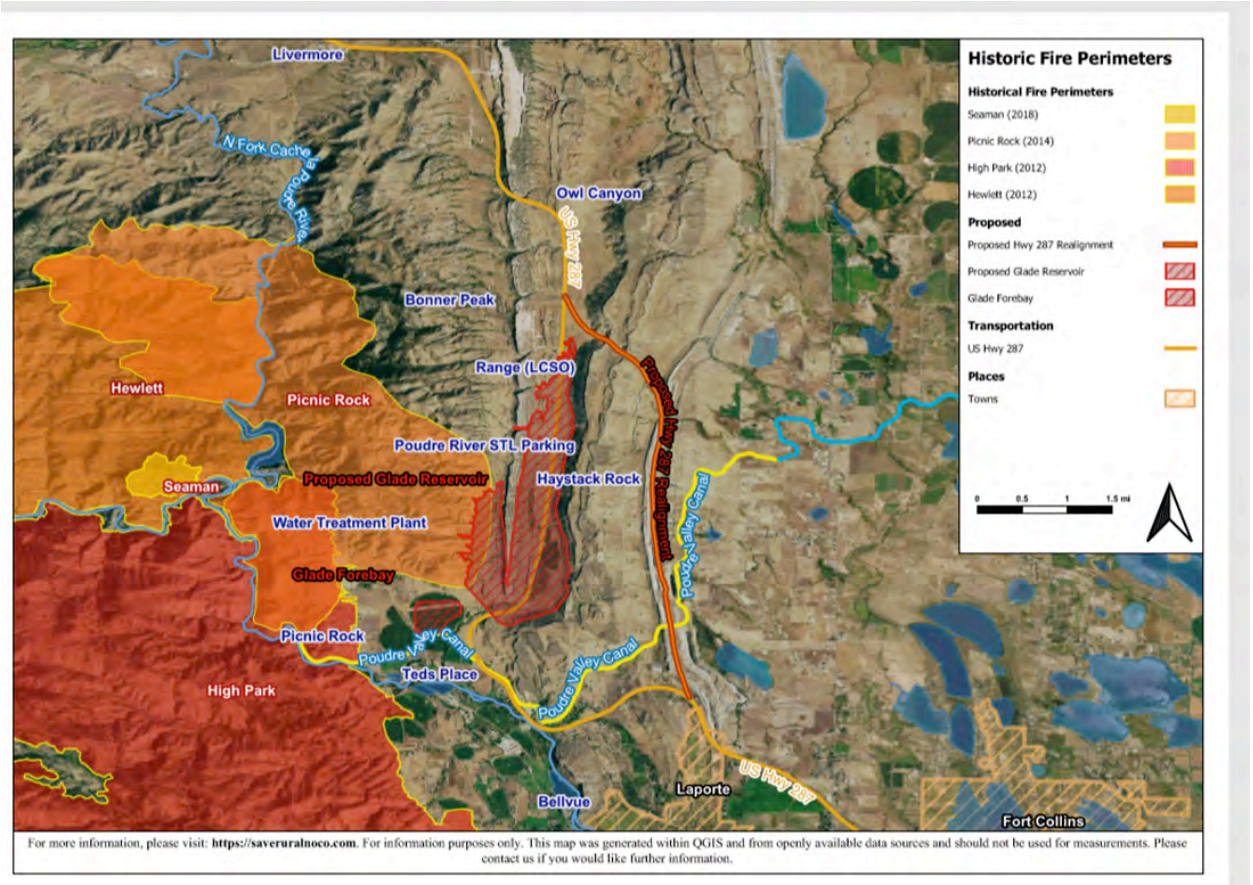


Past wildfire footprints relative to Glade Reservoir and facilities, estimated suppression and property damage costs.

Wild land fire frequency, intensity and duration have increased in the West in recent years, and according to the 2016 *Larimer County Multi-Jurisdictional Hazard Mitigation Plan*, Colorado is expected to experience greater fire risk in the future as the State becomes hotter and drier owing to climate change.[76] Larimer County has been ranked 2nd highest in Colorado for its level of wild land fire risk, and in the U.S. it is ranked 19th highest (Gude *et al*. 2008; Headwaters 2010; Radeloff *et al*. 2005; Brenkert-Smith *et al*. 2013). The Bonner Peak subdivision near proposed Glade is listed as being "high risk" according to the County's *Subdivision Wildfire Hazard Review*.[77] Presumably the adjacent communities, while not "subdivisions" per se, have similar risk.

Many factors contribute to the risk of wild land fires including topography, meteorological conditions, fuel type, and human activity. These factors are often categorized into natural caused fires and human caused fires. Worldwide, most fires are caused by people (Martinez *et al.* 2009). For instance, in California humans are currently responsible for approximately 95% of wild land fires (Mann *et al.* 2016).

[76] See https://www.larimer.org/sites/default/files/larimer-hmp.pdf.
[77] See https://www.larimer.org/emergency/fires/wildfire-review#/list/.



Past wildfire footprints the many affected rural communities.

The probability of wild land fires increases where people engage in outdoor recreational activities (Romero-Calcerrada *et al.* 2010; Vilar del Hoyo *et al.* 2011), and in locations close to campgrounds (Pew and Larsen 2001; Gonzalez-Olabarria *et al.* 2011; Mann *et al.* 2016) or fishing and hunting areas (Chang *et al.* 2013; Sitanggang *et al.* 2013). In Larimer County, lightning is a common natural cause of wild land fires.

The proposed Glade Reservoir would invite 379,000 people each year to camp, hike, fish and hunt in an area already prone to wild land fires. This increased threat of fire for nearby residents is substantial, yet the FEIS makes *no mention* of wild land fire threats and the 1041 permit application states that that "*After construction is complete, wildfire mitigation will follow Larimer County's Recreation Regulations*." (Wildfire Hazard Mitigation Plan, 2020, p. 3) To state the obvious, it's not the people who follow the regulations that cause the problems. This is passively "hoping for the best," ignoring the unacceptable risk to rural properties and lives and livestock, and is not a credible mitigation strategy.

The proposed Glade Reservoir would substantially increase access for people to recreate on lands that border our communities. Five new campgrounds would be developed near the proposed dam and less than a mile from homes on County Road 29C. The campgrounds would have at least 70 campsites to accommodate tent, car or RV

camping. Because campgrounds have been shown to be significant sources of wildland fires, and that "*Across all landscapes the number of fires increases with proximity to public and private campsites*." (Mann *et al.* 2016, p. 11). The location of these campgrounds would significantly increase the wildfire threat in the region.

Whether the number of hunters would increase or decrease as a result of a reservoir is not known, but a reservoir that generally brings more attention to the area may be expected to increase hunting usage, and with it, the potential for fires. The public is being told that fishing and hiking would also be available. While most visitors may obey trail rules, some would not and would trespass in our communities, innocently or otherwise. Most people would come in summer, when the land is hottest and driest, so this adds to the risk. Many visitors would not be aware of how easy it is to cause a wildfire in this landscape and may not take precautionary steps to prevent fires. Others would be careless, with campfires, with cigarettes, with illegal fireworks, or with firearms, and wildfires would be inadvertently ignited. Vehicles can start fires. The area is windy. Our climate is getting drier. One wrong fire in the right conditions could be very destructive.

Unfortunately, arson is possible. Data suggest that arson is not necessarily rare. For example, in the Daniel Boone National Forest in Kentucky more than 75% of forest fires are caused by arsonists (Maingi et al., 2007).

Construction of the project would bring 500 people and lots of heavy equipment, which can start fires, to the construction sites during summer, when fire hazard is highest. The Wildfire Mitigation Plan states that "*During construction of the Glade Unit, it is anticipated that the Contractor will employ fire mitigation strategies that include water trucks, coordination with the local fire department (Poudre Fire Authority), and other standard safety practices*." The fact that the proponent "anticipates" some future fire mitigation strategy is not an acceptable mitigation strategy, and is yet another example of how the application, and indeed the project, is full of empty promises, while the impacts will be real and could be devastating. The influx of heavy equipment and operators for the long-term construction period would increase the risk of fires.

The fire mitigation plan is grossly inadequate[78] and unaccountably fails to recognize the seriousness of this issue. Our homes, our property, our animals would all be put at risk of wildfire due to construction and high visitation. Both construction and operation would cause an unacceptable public safety risk.

Public Health Impacts on Air Quality

[78] The fire mitigation plan fails to acknowledge the serious fire danger in Larimer County and leaves dealing with fire to Poudre Fire Authority. The thousands of acres that have burned have required huge mutual aid efforts involving local and federal fire-fighting agencies, including out-of-state agencies. The plan falls far short, lacking any commitments to address a very real and potent risk of loss of life and property or the costs to taxpayers.

Lakeshore Dust. The FEIS, on which the 1041 application bases its environmental analysis, states that fugitive dust emissions during operation of Glade Reservoir would be negligible (FEIS Section 4.14.3.2, page 4-461). The "analysis" says that wind speeds would have to be over 80 mph before any dust would be raised from the lakeshore (see the Technical Memorandum attached to the FEIS). For those who live in rural northern Colorado, this doesn't pass. There is usually dust in the air, even with the slightest wind: we watch it lifted from the native prairie and foothills' surfaces, where, because of the area's dryness, vegetation doesn't completely cover the ground, and little rills, rivulets, and wind blown pockets expose soils to wind erosion. Residents watch it lifted from semi-vegetated slopes and from stream banks. They sweep it in clouds from our front steps and porches, and they wipe if off their furniture. Dust is part of everyday life, so the claim in the FEIS that the threshold wind velocity for fugitive dust emission is 79.7 mph, cannot be accurate. The every-day winds make this a very dusty environment.

The technical analysis for fugitive dust emissions was flawed because it relied on an Environmental Protection Agency guidance document AP-42, Chapter 13.2.5, as its starting point. It assumed that "Industrial Wind Erosion" is a good fit for the barren shorelines of a reservoir in northern Colorado. Industrial Wind Erosion is defined as follows:

> *Dust emissions may be generated by wind erosion of open aggregate storage piles and exposed areas within an industrial facility. These sources typically are characterized by nonhomogeneous surfaces impregnated with nonerodible elements (particles larger than approximately 1 centimeter [cm] in diameter). Field testing of coal piles and other exposed materials using a portable wind tunnel has shown that (a) threshold wind speeds exceed 5 meters per second (m/s) (11 miles per hour [mph]) at 15 cm above the surface or 10 m/s (22 mph) at 7 m above the surface, and (b) particulate emission rates tend to decay rapidly (half-life of a few minutes) during an erosion event. In other words, these aggregate material surfaces are characterized by finite availability of erodible material (mass/area) referred to as the erosion potential. Any natural crusting of the surface binds the erodible material, thereby reducing the erosion potential.*

The FEIS uses an Area Source Methodology used to estimate emissions of fine particulate matter less than 10 microns (PM10) from exposed lake beds in the San Joaquin Valley Air Basin to estimate fugitive dust from the shoreline of Glade. Erosion potentials are calculated using wind velocity data acquired by the National Climatic Data Center and then used to calculate PM10 emissions from wind events that may occur throughout the year.

The flaws with the fugitive dust emissions estimates in the FEIS are numerous and substantive:

- Open aggregate storage piles are not an appropriate surrogate for the shores of the proposed reservoir—a lakebed

- Non-homogeneous surfaces impregnated with non-erodible elements (particles larger than approximately 1 cm in diameter) are not remotely comparable to the shores of a reservoir where the source materials are silty-clay-loam soils that are continually pounded by water into finer and finer particle sizes
- Because of the repeated and continued cycles of seasons (ice in the winter, wave action on the shores the rest of the year, and the repeated raising and lowering of the water level, there in an infinite—not finite—availability of erodible material
- The potential for "natural crusting" is remote since waves and ice will keep breaking up the soils on the shoreline

Many of the native soils in and adjacent to the Glade footprint are fine sandy loams, clay loams, and silty clay loams, and fall into wind erodibility groups 3 and 4 (are moderately erodible), but the characteristics of native soils is only part of the dust problem.

Reservoir processes that affect shoreline erosion include reservoir operation (water levels), waves, reservoir currents, freeze-thaw cycles, slope, groundwater, and overland flow. Overall erosion potential depends on the frequency and magnitude of these processes, and how they interact on the specific landscape. In Hook and Moore Glade, the natural cycles of freezing and thawing, and strong winds, suggest that these forces would be major players in fugitive dust from the shores of a huge reservoir, yet they are not even mentioned.

Each winter, soils will freeze, then thaw in the spring, a process that will reduce particle size, destroy soil structural elements that hold soils in place, and increase erodibility. Each winter, the water would freeze and ice would scour the shoreline, pulverizing soil particles into smaller, looser particles.

Waves are the predominant erosional force on shorelines. This part of Larimer County is very windy (potential for gusts of over 150 mph[79] such that structures must be designed to withstand strong winds)(Larimer County Structural Design Information 1609 Wind Loads)), so strong and constant wave action caused by wind would occur on the shores of Glade Reservoir. Boats would also cause waves. Wave forces would reduce particle size. The effect of waves on shorelines is also influenced by water levels which control where and how waves hit the shore. Glade Reservoir would cycle up and down,

[79] According to the Colorado Front Range Gust Map (Cermak, Peterka, Petersen 2013), "*high wind speeds in the Front Range area on the plains adjacent to the Rocky Mountains and in the mountains east of the Continental Divide are well known to residents as winter and spring events that are sometimes damaging. The winds are known to occur from roughly the Continental Divide/Larimer County Line (the line of highest terrain running approximately north to south that marks the high terrain western edge of the Front Range area) to approximately I-25 (that runs north-south about 8-15 miles east of the intersection of the mountains with the plains). The Continental Divide is very close to the plains in the Front Range area, resulting in high downslope wind speeds where the mountains and plains intersect*."

and its shoreline (a bathtub ring) would be repeatedly exposed to these erosive forces, and without vegetation to help hold it in place, the small particles would easily become airborne.

Therefore, the shorelines of Glade Reservoir would not be "nonerodable particles" and a "finite source", as was incorrectly assumed in the FEIS: there would be an unlimited source of fine and highly erodible particles. The constant strong winds in the area will blow this dust all over the surrounding landscape, degrading the quality of life, impacting aesthetics (e.g., the clarity of the air) and threatening public health because air quality will be degraded.

As with the noise analysis, the FEIS upon which the 1041 application relies, fails to provide a realistic analysis of the effects on rural northern Colorado lands and its communities. We again urge the county to treat the FEIS with a large degree of skepticism, because was not developed for the purposes of local-scale land use decision-making and Larimer County's public would be adversely affected in ways that are not disclosed in <u>any</u> environmental document for the project.

<u>Construction and Operation Air Pollution</u>. Furthermore, the project would contribute to air pollution both during construction, due to 6-days-per week operation of heavy equipment and vehicles traveling to and from the site, and during operations, should almost 400,000 visitors per year travel to and from the reservoir. Emissions from vehicles includes particulates and gases, including gases that form ozone. Most of the visitation would occur on hot summer days when ozone readily forms from nitrogen oxides (NOx) and volatile organic compounds (VOC), and northern Colorado is already in an area rated has severe non-attainment for ozone. The environmental documents do not disclose how much ozone would be formed, whether it would travel up the valleys into the rural communities or down the valleys towards Bellevue, Laporte, and Fort Collins, and how it would impact Larimer County's residents.

<u>Air Quality Mitigation Plan</u>. The air quality mitigation plan punts any mitigation commitments to the future.

- In the first section (8.11.2) of the air quality mitigation plan, it states that "*the full state and federal applicability analysis will be completed as the dates of construction becomes closer and the Full Project parameters are known.*"
- Section 8.11.3 states "*Some of the engines in the construction fleet would be expected to meet Environmental Protection Agency (EPA) nonroad Tier 4 standards. As stated in the FEIS, Nitrogen Oxides (NOx) emissions can be reduced significantly if even a portion of the construction vehicles meet Tier 4 standards. The FEIS emission calculations make the assumption that there will be a 75% NOx reduction from vehicle exhaust emissions*."
- Section 8.11.3 states "*this submittal does not include the development of a separate air quality mitigation plan*." After identifying air pollution and emissions sources, this section goes on to say, "*The main strategy* [for minimizing

emissions] *is to develop air management plans that will be followed where appropriate*."

- In section 8.11.5, the "plan" unbelievably declares that "*It is also expected the Project will exceed CDPHE thresholds of 25 acres and the six-month duration requiring the development of a fugitive dust control plan. The fugitive dust control plan will be developed…..*"

The mitigation plan also notes that spraying water may be used for dust control: "Watering or treating with chemical dust suppressant roadways, storage piles, and loaded trucks." Further, it notes that it may undertake "washing…the exterior of haul trucks." In an era when water conservation is critical, it defies logic to spend almost a decade dumping water on a huge construction site and washing construction vehicles to minimize fugitive dust pollution. And if the dust suppression water is taken from municipal sources, is it not possible to trace those sources back to the Poudre River, or our other already over-taxed water supplies? Myopically treating one environmental issue (air quality) with water only compounds the much larger social and environmental issues associated with water supply.

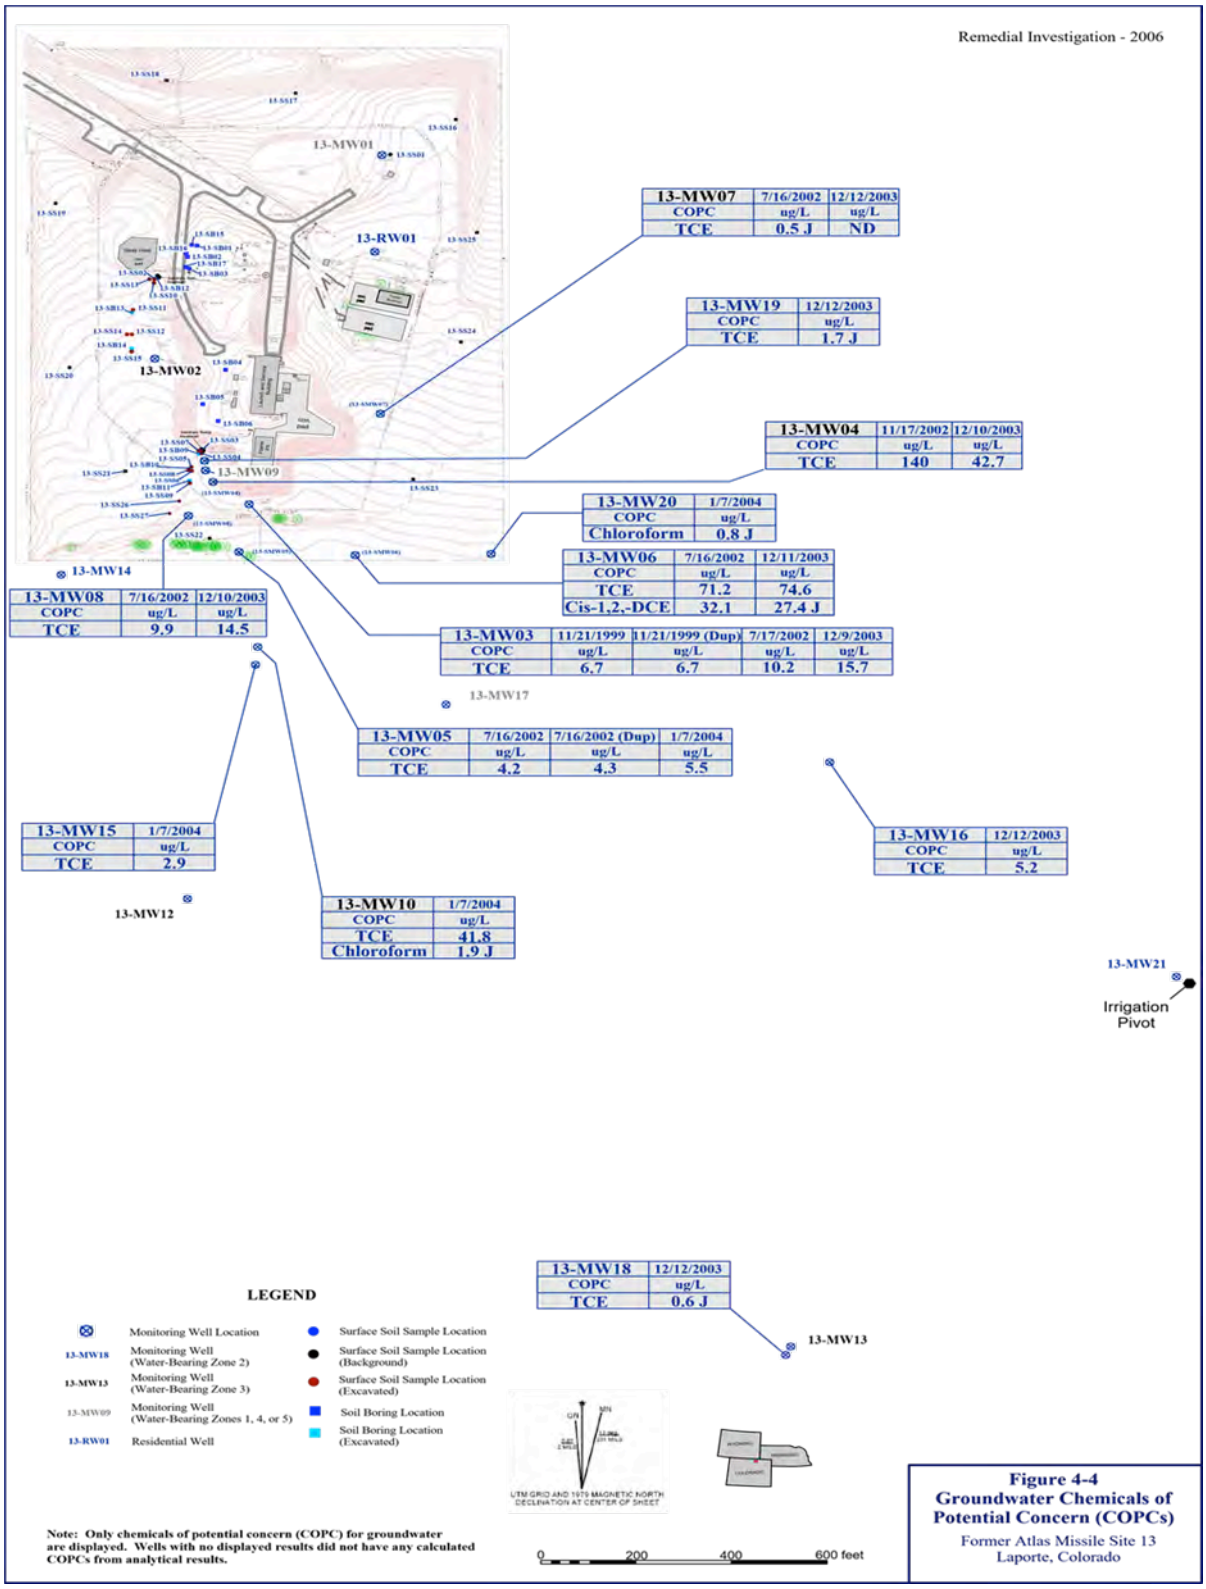
In summary, the air quality mitigation plan provided with the 1041 permit application is nothing but promises and examples. Any and all commitments for protecting air quality and reducing emissions are deferred to the permitting process of the Air Pollution Control Division of the Colorado Department of Public Health and Environment (CDPHE): all of the emissions and control plans for almost a decade of construction, and all of the emissions and control plans for the dust from operations, including the pump stations, barren shoreline, jet skis, motorboats, 78,200 vehicles during summer, are not disclosed to the county or the public in time for this important permitting process. The magnitude of this project ensures that the numerous and substantive sources of air pollutants and greenhouse gases (GHG) will be emitted, some in large quantities, and will degrade the quality of our air and exacerbate factors contributing to climate change.

<u>Public Health Impacts from the Trichloroethylene (TCE) Plume at the from the Former Atlas Missile Silo Site</u>

There is no satisfactory determination that the TCE plume is "gone" and will not spread into residential wells. Vias correspondence with the Army Corps of Engineers and CDPHE regarding the site, it appears that the plume is below a 5 ppm "acceptable" drinking water threshold, yet it should be noted that at least one monitoring well continued to show higher levels of TCE. According to the Colorado Division of Natural Resources permit records, Northern Water has recently drilled over a 20 monitoring wells in the vicinity. Residents have reached out to federal and state agencies, and to Northern Water, but are unable to understand how residential water wells and the Poudre River would be affected, or why the additional monitoring wells were installed. This needs to be fully disclosed by the county and to the public prior to taking action on this permit application.

Plumes of this nature last many lifetimes and it is implausible that site specific efforts to clean up the plume have been effective. Northern installed more than 20 monitoring wells in 2019 located through the plume, but no public records are available regarding data from the Northern 2019 monitoring well network." The forebay is a below dam small reservoir of the Poudre water which will be pumping water 375 feet up into Glade Reservoir. This groundwater carcinogenic contamination must be addressed thoroughly before the 1041 application is deemed complete.

The figure below shows the 2006 situation, in which several wells contained TCE levels in excess of standards. Monitoring by Northern Water and disclosed in the FEIS show that TCE levels were below standards in all but one well.



Ground water chemicals of potential concern at the former Atlas Missile Silo site, located near the proposed dam and forebay.

If portions of the plume continue to contain high TCE levels, and the weight of the dam, or the water in the forebay and/or behind the dam cause the plume to move in ways it has not previously moved, it may contaminate wells at the homes along county road 29C or the Poudre River.

Public Health Impacts from Greenhouse Gas Emissions.

In 2019, Governor Polis signed House Bill 19-1261, the Climate Action Plan, into law. The legislation amends Colorado's Air Pollution Prevention and Control Act and commits the state to economy-wide greenhouse gas emissions reductions goals of 26% below 2005 levels by 2025, 50 percent by 2030, and 90 percent by 2050 (M.J. Bradley and Associates 2020). Meeting the goals will require significant emission reduction across Colorado's economy. Repeat, across Colorado's economy.

Project sources of GHG emissions include:

- Biogenic sources
- Recreational vehicles traveling to and on Glade Reservoir
- Electrical pumping

With regards to GHG from biogenic sources, the FEIS states "*Given the lack of available data and accepted methodology for quantifying these emission, GHG emission have not been quantified for the NISP Alternatives*." Unfortunately, it is well known that lakes and reservoirs are significant emitters of harmful GHGs, and Glade would be a source. The FEIS goes on to state that "*Due to the relatively low temperature, low terrestrial net primary productivity, and non-tropical latitude of the NISP reservoirs, it is likely that the NISP Alternatives would produce far fewer GHG emissions from biogenic sources than similar projects in warmer regions at tropical latitudes*." First, this is the wrong approach, the analysis should disclose conditions with the project compared to current conditions without the project. Second, contrary to what this statement implies, reservoirs in temperate regions are known to emit large amounts of GHGs from biogenic sources. Biogenic methane (a significant GHG) emissions may be especially high. Although none of these emissions are quantified, its fair to say that if the state is looking to reduce emissions across all sectors, then emissions from a new, large reservoir and its pump stations and vehicles, the project is not in alignment with the new legislation.

The project will require pumps to move water from the forebay into Glade Reservoir, as well as for moving water at other segments of the project. According to the FEIS, the project would emit about 35,000 tons per year of CO_2 and about 4 tons per year of methane (FEIS Technical Memorandum, Maul, Foster, and Alongi 2018). The GHG emissions are equivalent to emissions from about 7,000 cars.

Save The Poudre did an independent analysis of the GHG emissions of the project and determined that it would create yearly emissions to the emissions from almost 13,500

automobiles on the road every year. Our analysis includes emissions from construction, pumping, and the destruction of carbon-sequestering wetlands[80].

Furthermore, since the project does not have sufficient water rights and is implementing a farm-buying program, emissions might be closer to those described for the No Action Alternative in the FEIS, which predicts 47,000 tons per year of CO_2 and 5 tons per year of methane. So, again, another problem with the post-FEIS plan to buy farms is that these emissions are not adequately and transparently disclosed.

Regardless, the project would emit significant GHG and thus would impede the state reaching its GHG emissions reduction goals.

I. The NISP 1041 application does not comply with review criterion D.7.

Section 14.10.D.7. of the LUC review criteria imposes a burden on the applicant to prove that the proposal "will not be subject to significant risk from natural hazards including floods, wildfire or geologic hazards." For the reasons stated below, Northern has failed to prove that its proposal will not be subject to significant risk from natural hazards especially related to wildfire as discussed in section VII.H.

Two large faults, the North Fork Fault and the Bellvue Fault, pass under the proposed Glade Dam site. Tom Sale, geological expert, and CSU Engineering professor stated in a recent letter to the County Commissioners, " 1) the faults represent vertical intervals of broken rock and 2) that they pass directly under the proposed dam site (that will have up to 400 feet of differential water level) it seems highly likely that leakage under the dam along the faults will be severe. NISP admits in their application that "there are two earthquake faults mapped within the Glade unit. The Bellvue Fault and North Fork Fault have been intercepted at depth by test holes advanced during the project's geotechnical investigations."... "Both faults are inactive and do not present a seismic risk to the project." Yet, as any geologist will tell you, all faults are inactive until they are not. NISP's remark that these faults "do not present a seismic risk to the project" is just that. Northern gives no reference to a government agency verifying there is no seismic risk. Any seismic risk, no matter how small, is unacceptable when it involves a dam holding back 170,000 acre feet of water. A more thorough analysis is needed from a governing authority. At the very least, a certification stating that the two faults do not present a seismic risk to the project is needed.

NISP would increase flooding downstream of the diversion point, including through Fort Collins and Greeley. These comments were presented in the City of Fort Collins comments on the DEIS, previously incorporated in this letter.

J. The NISP 1041 application does not comply with review criterion D.8.

[80] See Exhibit 21 hereto. See also, http://savethepoudre.org/stp-correspondence/2014-05-16-stp-letter2-corps-ghg-emissions-nisp.pdf

Section 14.10.D.8. of the LUC review criteria imposes a burden on the applicant to prove that there are "adequate public facilities and services available for the proposal or will be provided by the applicant, and the proposal will not have a significant adverse effect on the capability of local government to provide services or exceed the capacity of the service delivery system." For the reasons stated below, Northern has failed to prove that its proposal ensure adequate public facilities.

The application fails to disclose how the siting, construction, and operation of an industrial facility in a rural setting will impact sheriff, fire, and other emergency services. For example, the fire mitigation plan states that fires won't be an issue because the campgrounds will be operated in accordance with Larimer County regulations. But this ignores the fact that wildfires are often started by accident, or even by arson, and in this area, one wrong fire in the right conditions could be devastating. In addition, how will the LCSO deal with the additional traffic (~78,000 vehicles during the recreation season, FEIS Technical Memorandum, Maul, Foster, and Alongi 2018). How will the emergency services teams (some of which are all volunteers) that protect these rural areas compensate for or be compensated for the increased number of calls? What is the expected increase in number of calls? How will service to existing communities be impacted by the need to serve visitors? We have not been provided with sufficient information to evaluate these questions, and unless the county has been provided information that has not been made public, it too lacks sufficient information. However, we do know that county resources are limited, and can surmise that additional demands on law enforcement, fire suppression, and EMS would strain existing providers. Would the taxpayer have to pick up the bill to expand these services?

K. The NISP 1041 application does not comply with review criterion D.9.

Section 14.10.D.9. of the LUC review criteria imposes a burden on the applicant to prove that the "applicant ***will mitigate any construction impacts to county roads, bridges, and related facilities***." Northern has failed to prove that its proposal will adequately mitigate any construction impacts to roads, bridges and related facilities.

As noted herein, Northern has failed to present any alternative to relocating Highway 287 or any siting alternatives for any Highway 287 realignment. As such, Northern has completely failed to undertake its mitigation obligations with regard to Highway 287. Further, Northern's 1041 application is incomplete with regard to construction impacts associated with the proposed access road to the proposed Glade Reservoir. As such, Northern has failed to meet its burden of complying with LUC Section 14.10.D.9. and its application must be denied.

L. The NISP 1041 application does not comply with review criterion D.10.

Section 14.10.D.10. of the LUC review criteria imposes a burden on the applicant to prove that the "***benefits of the proposed development outweigh the losses of any natural resources*** or ***reduction of productivity of agricultural lands*** as a result of the proposed development." For the reasons stated below, Northern has failed to prove that

the proposed benefits of the proposed development outweigh the losses of any natural resources or reduction of productivity of agricultural lands.

One significant impact of NISP to natural resources is the interference with long term peak flows in the Cache la Poudre River needed to maintain a health river. NISP will substantially reduce peak flows of the river and then manage releases from Glade Reservoir. However, Northern's proposed flow program does not restore the volume or time period of peak flows necessary to protect and restore the health of the river.

The Refined Conveyance system was conceptually designed to maintain low flows in the Poudre River between the proposed reservoir and the Poudre River Intake (PRI) yet these flows would be variable in time and are inflated in the FEIS and the Mitigation Plan. Water would only be released to the Poudre when Northern is delivering water to NISP participants; thus, when demand is too low, releases would be curtailed. In addition, only one-third of the deliveries will be routed through the Poudre to the PRI. Per the FEIS, the projected full benefit of the Refined Conveyance mitigation would not be achieved until 2050 yet Northern claims the full benefit in the FEIS and the 1041 permit application inflating the long term benefit of the Refined Conveyance system. In fact, the Refined Conveyance system does little to mitigate low flows and by extension the health of the stream for an extended period of time.

Northern's 1041 application does not quantify the losses to these natural resources versus the benefits of NISP (if any) to the Cache la Poudre River. As such, Northern has not proven compliance with Section 14.10.D.10. of the LUC.

Northern has not provided the county with information on the number and location of farms they will buy and dry to obtain one-half of the water needed to fill Glade Reservoir. To obtain 22,000 AF likely will require purchase of 20,000 acres of farms or more (Section VII B in this document). Northern has not explained how the recreational benefit of Glade Reservoir outweighs the vast reduction of productivity of agricultural lands when water rights are severed from the land.

The recreational benefit of Glade Reservoir depends entirely on reservoir storage being at 70 percent of maximum storage. Modeling of storage levels in the proposed Glade Reservoir (Save Rural NOCO in Section VII B of this document) from 2005 to 2019 shows that, in dry years, Northern will not be able to maintain the reservoir at sufficient levels for power boating. Climate change impacts on streamflow will exacerbate this situation – further reducing the number of years where recreation at Glade Reservoir will be possible and the benefit of the project.

Northern's 1041 application does not quantify the loss of agricultural productivity versus the recreational benefits of NISP (if any). As such, Northern has not proven compliance with Section 14.10.D.10. of the LUC.

In 2017, Colorado Parks and Wildlife (CPW) entertained a draft "Fish and Wildlife Mitigation and Enhancement Plan". Save The Poudre provided comments to

describing the enormous lack of mitigation in the draft plan, most of which carries over into the final plan. Those comments are incorporated here as Exhibit 22.[81]

M. The NISP 1041 application does not comply with review criterion D.11.

Section 14.10.D.11. of the LUC review criteria imposes a burden on the applicant to prove that the proposal "demonstrates a reasonable balance between the costs to the applicant to mitigate significant adverse affects and the benefits achieved by such mitigation." Northern has failed to prove that its proposal demonstrates a reasonable balance between the costs to the applicant to mitigate significant adverse affects and the benefits achieved by such mitigation.

As noted herein, the costs of mitigation have not been fully evaluated because the impacts of the project have not been adequately disclosed. For example, impacts to agriculture from Northern's purchase of farms and water rights in Larimer County remain speculative and have not been quantified. Further, Northern's ability to mitigate adverse impacts to the Cache la Poudre River are flawed and speculative because Northern does not own the water rights to implement river mitigation measures and its ability to release water from Glade Reservoir is dubious. These flaws equally affect Northern's ability to accurately assess the benefits to be achieved by the speculative mitigation.

For the reasons stated in this comment letter, Northern has failed to meet its burden of complying with Section 14.10.D.11. of the LUC and its 1041 application must be denied.

N. The NISP 1041 application does not comply with review criterion D.12.

Section 14.10.D.12. of the LUC review criteria imposes a burden on the applicant to prove that the "recommendations of staff and referral agencies have been addressed to the satisfaction of the county commissioners." For the reason stated below, Northern has failed to prove that the recommendations of staff and referral agencies have been addressed to the satisfaction of the county commissioners.

The County previously submitted a comment letter identifying deficiencies with the NISP EIS.[82] Northern's 1041 application does not discuss whether the County's comments have been addressed, and if so, how. As such, Northern has not met its burden of proving compliance with Section 14.10.D.12. of the LUC. Further, the Larimer County NGO's do not have the benefit of the written staff recommendations and referral agencies at the time of submission of this comment letter because such comments have yet to be completed and/or posted to the public website. The Larimer County NGO's incorporated herein by reference all comments and recommendations of staff and referral agencies.

[81] Exhibit 21 hereto (STP comments on FWMEP).
[82] Exhibit 9 hereto (County's DEIS comments).

VIII. Reasonable Alternatives to NISP

Alternatives to NISP have been forwarded by multiple groups including Save The Poudre and Western Resource Advocates. The "Healthy Rivers Alternative" promoted by Save The Poudre includes enhanced water conservation and efficiency, better growth management, using 'growth displaced water', and pursuing water transfer mechanisms with farmers[83]. The "Healthy Rivers Alternative" would allow NISP communities to meet their water needs while protecting the Poudre River.

The "Better Future for the Poudre River" alternative promoted by Western Resource Advocates also advocates for enhanced water conservation, better growth management, and using 'growth displaced water'[84].

Save The Poudre also supports the approach of "**Cleaning the River through Fort Collins and using the river as a conveyance, instead of the pipeline". T**his alternative approach is described in Save The Poudre's comment letter to the Colorado Water Quality Control Commission in Dec. 2019, wherein it notes that this approach also applies to the Larimer County 1041 permit process. Northern Water claims that they could only run 1/3rd of their water down the Poudre River, again due to the pollution level in the river. The "Clean The River" alternative describes how stormwater technology can allow all of the NISP water to flow through Fort Collins at a significantly cheaper cost than building the Northern Tier Pipeline[85].

IX. Financial Issues

In light of the extensive adverse economic impacts and budget shortfalls resulting from the Coronavirus pandemic, which were unforeseen and unaccounted for during project planning, the permit review process must include a careful and detailed independent analysis of the financial feasibility of this project. No permit should be approved unless a review by Larimer County conclusively demonstrates that highway relocation (which as been punted to another review process), reservoir completion (construction details not yet disclosed), water rights acquisition (currently speculative), and implementation of all necessary mitigation measures (critically not yet developed or disclosed) is fully assured in light of the current budget and economic climate. Failure to perform such a thorough and careful analysis would create an unacceptable risk that the many well documented adverse impacts would begin to accrue upon project initiation, only for the so-called benefits of the project to never materialize, and for the county and it's citizens to be left holding the financial and environmental bag.

RULES AND BY-LAWS OF THE LARIMER COUNTY PLANNING COMMISSION

I. MEETINGS

A. Regular meetings shall be held on the third Wednesday of each month in the Hearing Room of the Larimer County Courthouse, Fort Collins, Colorado. Meetings shall begin at 6:00 p.m. All meetings and actions shall be in compliance with C.R.S. 24-6-402 regarding open meetings and any subsequent amendments to said statute. If the Chair and Commissioners determine that any application cannot be heard and considered for action by 10:00 p.m., it may be continued, heard, and considered at a specifically scheduled meeting or the next regularly scheduled meeting. Such application shall have priority at the next meeting and may be heard before any other matters or applications.

B. Special meetings of the Larimer County Planning Commission may be held at any time upon call of the Chair; by a majority of the entire membership of the Planning Commission; or upon request of the Board of County Commissioners. Notice of at least seven (7) calendar days shall be given to each member of the Planning Commission by telephone or by fax. Time, place and proposed agenda of Special Meetings shall be specified with information sent to each Commissioner of the Planning Commission notifying them of a Special Meeting.

II. MEMBERS/QUORUM

A. The Planning Commission shall consist of nine (9) Commissioners, appointed by the Board of County Commissioners. Term limits shall be in accordance with Larimer County Administrative Procedure 100.1. The Chair of the Planning Commission may be asked to interview applicants for vacancies by the Board of County Commissioners.

B. A quorum for transaction of business shall consist of half of the membership, plus one.

C. Actions shall be by a majority vote of Commissioners when a quorum is present except that any change to the Master Plan for Larimer County, or approval of a new Master Plan (Comprehensive Plan) for Larimer County, shall require an affirmative vote of not less than six (6) of the Planning Commission.

D. In cases where a quorum is not present, applications shall be rescheduled for hearing at the next regular Planning Commission meeting, or at a special meeting set by the Chair of the Commission.

III. OFFICERS

A. The Planning Commission, at the end of their regular meeting in July of each year, shall elect a Chair, Vice- Chair, and a Secretary. The Director of Planning shall designate a Recording Secretary.

B. The duties and powers of the officers of the Planning Commission shall be as follows:

The Chair shall:

1. Preside at all meetings of the Planning Commission and maintain proper decorum by controlling the meeting, avoiding duplication of testimony, and avoiding demonstration(s). In cases where decorum cannot be maintained, any commissioner may request the Chair to recess, continue the agenda item, or adjourn.
2. Call special meetings of the Planning commission in accordance with the by-laws.
3. Sign the documents of the Planning Commission.
4. Insure that all actions of the Planning Commission are properly taken.

The Vice-Chair shall:

1. During the absence, disability, recusal, or disqualification of the Chair, exercise and perform all of the duties and be subject to all the responsibilities of the Chair.

The Secretary shall:

1. Sign or attest to the signature of the Chair or Vice-Chair on the documents of the Planning Commission.

The Designated Recording Secretary shall:

1. Keep the minutes of all meetings of the Planning Commission in an appropriate and designated file.
2. Give and serve all notices required by State Statute, regulations or by the by-laws.
3. Prepare the agenda for all meetings of the Planning Commission.
4. Be custodian of Planning Commission records.
5. Inform the Planning Commission of correspondence relating to business of the Planning Commission and attend to such correspondence.

IV. ATTENDANCE

A. Regular attendance by members of the Planning Commission is expected. Field trips are taken monthly to visit the sites scheduled for hearing. Site visits are encouraged, either with the group or separately by the Commissioners if they are unable to join the group

B. Any Commissioner who has been absent from three consecutive regular monthly hearings, without a leave of absence or having advised the Chair of the circumstance of the absence, shall be reported to the Board of County Commissioners by the Recording Secretary. Leaves of absence shall be submitted to the Chair and the Recording Secretary 2 days in advance when possible, noting the reason for the leave and how long the Commissioner will be gone. The Recording Secretary shall forward this information to the entire Commission.

C. When necessary because a member of the board is unable to to attend in person, one or more members the board may participate in such meetings and may vote through the use of telecommunications devices. Such participation may include but not be limited to the use of a conference telephone, video conferencing or similar communications equipment. Such participation through telecommunications devices shall constitute presence in person at such meeting.

V. PROCEDURE FOR CONSIDERATION OF AGENDA ITEMS

A. The following procedure will generally be followed by the Planning Commission when considering agenda items:

1. Introduction of the item by the Chair.
2. County Staff presentation.
3. Applicant presentation.
4. Testimony from the audience relating to the agenda item. The Chair may set a reasonable time limit per individual and group presentations and may establish an order of testimony in support of or in opposition to the application.
5. Applicant's rebuttal, limited to points of opposition. The Chair may set a reasonable time limit.
6. Inquiry by the Commissioners of the applicant and staff.
7. Final staff comments.
8. Discussion among the Commissioners.
9. Motion and second by the Commissioners.
10. Discussion by the Commissioners on the motion.
11. Roll Call Vote.

B. The Chair may modify the above procedure for individual items if necessary for expeditious conduct of business.

C. Agendas for items to be considered by the Planning Commission will be available to the public at the meeting.

VI. CONSENT AGENDA

A. An item is placed on the consent agenda if it is non-controversial and Staff and Applicant agree on the findings and conditions of approval.

B. The following procedure will generally be followed by the Planning Commission when considering consent agenda items:

1. Introduction of the consent item by the Chair.
2. Any Commissioner or member of the public may request that an item be removed from the consent agenda. The reason for the request should be stated.
3. An application pulled from the consent agenda will normally be placed at the end of the regular hearing agenda. The Chair may determine if the matter removed from the consent agenda can be expeditiously resolved or should be placed at the end of the agenda.
4. The Chair may call for staff to provide a brief report on any item remaining on the consent agenda.
5. The Chair may call for a motion to approve the item(s) remaining on the consent agenda.

Only one motion is required for all consent items. After being duly seconded, the consent agenda shall be voted on by a roll call vote of the Commissioners.

VII. GENERAL

A. All maps, plats, correspondence, and other documentation shall be filed in the office of the Planning Department. The staff will make every effort to provide the Commissioners with a staff report and adequate documentation, including maps and comments of referral agencies approximately one week before the scheduled meeting. Any materials presented at a hearing or meeting by the applicant or public shall become part of the official record, and at the discretion of the Chair, may not be returned.

B. Voting on all applications shall be by roll call. The order of voting will be alternated, except that the Chair shall vote last.

C. If a conflict of interest exists, any Commissioner shall depart from the dais and abstain from discussion and voting on the issue affected from the time such conflict of interest has been identified.

D. The Chair may allow "personal appearances" at the beginning of each meeting by any citizen desiring to speak on any planning matter not on the agenda. The Planning Commission shall not take action on items presented under personal appearances. Any statement made shall be relevant to land use matters and shall be not more than five minutes per person in duration.

E. In its' discretion, the Planning Commission may consider any material that may result in significant modification to a pending application even though the material has not been submitted to the staff planner assigned to that application at least ten (10) business days prior to the Planning Commission meeting at which the application is to be considered.

F. The by-laws may be amended at any meeting of the Planning Commission by a majority of the Commissioners; provided that notice of said proposed amendment

be given to each Commissioner in writing at least ten (10) days prior to said meeting.

G. Robert's Rules of Order shall govern the proceedings of the Planning Commission, although strict adherence is not required so long as the meetings are conducted to allow fundamental fairness to all participants

H. Commissioners are encouraged to involve themselves in discussion before presenting a Motion. Commissioners are encouraged to clearly state their viewpoints.

Adopted pursuant to Section 30-28-103(1) C.R.S. 1973 this 5TH day of MAY, 2020.

"Larimer County needs a practical, community-minded leader, not an extremist. Sean Dougherty's county government and small business experience make him the clear choice for Larimer County Commissioner." -Tom Donnelly, Larimer County Commissioner, District III . . . #tomdonnelly #larimercountycommissioner #fortcollins #fortcollinscolorado #loveland #lovelandcolorado #estespark #estesparkcolorado #greeley #greeleycolorado

4 0 2 Exactly Years Before

I am in full support of the Northern Integrated Supply Project, known as NISP. This plan only makes sense, as it will assure participating water providers in Northern Colorado a reliable supply of water for the future. This is integral not only for the health of irrigated farms and their crops, but for smart, attainable, growth. It's time we utilize a proper storage plan for our state's water supply. Like, comment, and share this post with your friends. I'd love to hear your thoughts. . . .

FORT COLLINS BUSINESS COMMUNITY
CANDIDATE ENDORSEMENT QUESTIONNAIRE
2018 COUNTY COMMISSIONER ELECTION

Questionnaires are due back to ahutchison@fcchamber.org
by noon on Monday, September 10, 2018

Please note that all questionnaire answers
will be shared with the business community.

Office Sought: County Commissioner	District (If Applicable): 1
Name: Sean M. Dougherty	
Home Address: 1344 Catalpa Drive, Fort Collins, CO 80521	
Daytime Phone: 970-402-5642	Evening Phone: 970-402-5642
Fax:	Email: SeanForLarimerCounty@Gmail.com
Employment: REALTOR®	
Length of Residence: In County: 19.5 Years In District: Same	

Please limit responses to approximately 200 words per section.

(1) Education:
Associate's Degree in Hotel & Restaurant Management, Paul Smith's College
Bachelor's Degree in Hospitality Management, Florida Int'l University

(2) Past and Present Community Service Including Offices Held:
- 8.5 years on the Larimer County Planning Commission (Past Chair)
- 3.5 years on the Red Feather Lakes Planning Advisory Committee
- 7 years on the BOD for the Fort Collins Board of REALTORS® (Past President)
- 5 years on the Colorado Association of REALTORS® Grievance Committee (Current Chair)
- 4 years on the Colorado Association of REALTORS® Legislative Policy

FORT COLLINS BUSINESS COMMUNITY
CANDIDATE ENDORSEMENT QUESTIONNAIRE
2018 COUNTY COMMISSIONER ELECTION

Committee (Current Chair)
- 7 years on the Fort Collins Chamber Local Legislative Affairs Committee
- 13 years volunteering with Realities for Children, currently an Ambassador
- 6 years as Assistant Scoutmaster for Troop 87, Boy Scouts of America
- 5 years as a partner with Neighbor to Neighbor Charities
- 4 years working with Disabled Resource Services

(3) Past and Present Employment/Business Experience:
Nearly 18 years as a successful REALTOR
Past small business co-owner, North College Discount Liquors
I was in Hotels for 8 years, mainly in Accounting. Last hotel job was Comptroller, working with financials, budgeting and forecasting.

(4) Current Employment and Responsibilities:
- Real Estate. I help families buy and sell property.
- I am also a mentor for newer agents in my office. Have helped many agents achieve Real Estate Success over the past 10 years.

(5) Specific Qualifications for This Office:
- Volunteering on, and leading, the Larimer County Planning Commission has enabled me to work directly with our County Commissioners, and to learn the roles and responsibilities of the position. Additionally, this position has taught me about Land Use, Master Plans, 1041 powers, Metro Districts, and other required knowledge that will allow me to be able to perform the job of County Commissioner.
- I have leadership experience, having been President of a 1,000 member organization, as well as leading multiple other local and state committees, commissions, and non-profit organizations.
- Real Estate has given me skills in negotiation, finding a way to Yes.
- My small business and hotel experience in Budgeting will help me to be fiscally responsible with your money.

(6) Why are you running for this office?
I'm running for Larimer County Commissioner because I believe that the business experience that I have gained over the past (nearly) 20 years in Larimer County, combined with the knowledge of land use, budgeting, Master Plans, facility infrastructure, and roads that I have learned from our County officials will allow

FORT COLLINS BUSINESS COMMUNITY
CANDIDATE ENDORSEMENT QUESTIONNAIRE
2018 COUNTY COMMISSIONER ELECTION

me to serve the residents of Larimer County well.

The years I've spent working directly with our Board of County Commissioners while on the Planning Commission have taught me the roles and responsibilities of a County Commissioner, while teaching me the duties they perform. Additionally, the leadership experience earned serving various business and charity organizations has given me the necessary skills to lead Larimer County in the direction laid out by our residents.

(7) What have you done to prepare for election to this office and how you will you conduct yourself if elected to this office? What experiences have you had that makes you qualified to serve in office?

- I have been working with my mentor, Lew Gaiter, our current District 1 County Commissioner, for 9 years to learn about the roles & responsibilities of the office. Plus, he and I have been working actively to prepare me to succeed him for about 2.5 years.
- I plan to conduct myself with the utmost professionalism, of course. My goal is to be fair, hear all sides of an application or request, and stick to my basic principles when making a decision.
- I know that what I learned while leading the Fort Collins Board of REALTORS has prepared me for the responsibilities of leading Larimer County.
- My time on the Planning Commission has very much prepared me for this position. The Planning Commission hearings are recommendations to the Board of County Commissioners.

(8) If you are elected, what are the top three accomplishments you want to have completed by the end of your term and how will you get them done?

- **Facilitating smart growth management with the eight municipalities in Larimer County.** To do this, we will need to be continue to cultivate our partnerships with all of the communities in the county. Our quarterly Municipal Leaders meetings are a good start, but we will need to talk with those leaders about the possibility of working together on a framework and goals so that all of NoCo can be smart about growth. This also includes working with Weld County.
- **Assisting with the planning and development of the future Behavioral Health Facility public/private partnership**. If approved by the public, we need to make sure that we not only abide by the requirements of the ballot language, but also that we abide by the desire of the people. We build the

FORT COLLINS BUSINESS COMMUNITY
CANDIDATE ENDORSEMENT QUESTIONNAIRE
2018 COUNTY COMMISSIONER ELECTION

facility, and private providers staff it. We want to be sure that there is transparency and accountability throughout the process, and for the future.

- **Prioritizing the maintenance, repair, and replacement of our County Infrastructure including our roads & bridges, as well as our facilities such as the Jail, Landfill, Court Buildings and Maintenance Sheds.** We have over $500 million of Infrastructure needs in the next 20 years, well over $300 million of that is needed in the next 5 years. The citizens have spoken, they want our roads fixed. Per statute, we need to have enough room in the Courts Building to house the Courts and Staff. We want a Jail that has the capacity and safety for our Deputies and the inmates. The Landfill will be full in the next 5 – 7 years. And we have six figure trucks that have to sit outside because our Maintenance Shed doors are not tall enough to house them. These all need to be handled in an efficient, cost-effective way. I will research every opportunity we have to get these items completed with the least pain for the residents.

(9) <u>What do you think are the top 3 economic priorities the county government should undertake during the next four years? What role should Larimer County have in economic development? How will you make the economy a County budget priority?</u>

While this is not about Economic Development, we do need to plan the budget around the likely reduction of the assessment rate by Gallagher. If there is a reduction in the residential assessment rate in 2019, to the expected 6.11%, that will end up being a 15% reduction in the property taxes received from residential properties, in one year (23% in 3 years). Now, this doesn't mean that we will have a reduction in tax revenues of 15%, as Commercial properties pay a significant amount of the property taxes. We need to plan for this, as this will be a significant portion of the County revenues. This is less to work towards economic development, and more to make sure we don't fall behind. (as for the burden Gallagher has put on business, while I wish I was able to make those changes, the best thing I can do is try to speak to the State Legislators and urge them to get Gallagher fixed or gone)

- Infrastructure. Water, roads, bridges. We need to make sure we can stay out of the way for the water projects that are on the books, as we need water if we're going to thrive in the future. We may have I-25 coming forward, but the County has to make sure that we stay up on our own roads and bridges, as well. Businesses won't come here if we're not maintaining our infrastructure.
- I want to make sure that Jacob Castillo, Economic and Workforce

FORT COLLINS BUSINESS COMMUNITY
CANDIDATE ENDORSEMENT QUESTIONNAIRE
2018 COUNTY COMMISSIONER ELECTION

Development Director, has the freedom to continue moving forward in the arena of Economic Development. He does a great job working with the other EcoDevo partners in Larimer County, and in light of recent disappointments in economic development, I want to make sure that we have the ability to move forward and to work with those already in EcoDevo

- I would like to make sure that we don't have any unnecessary regulations in place that raise the cost of either starting a business in Larimer County or relocating one here. We are already embracing Metro Districts, but I believe that we can do more. Having spent so much time on LLAC, I know how informed the Committee (as well as the Chamber) is when it comes to economic development, and I will be reaching out to you and your membership for thoughts in the future.

(10) <u>How will you make Larimer County a more Jobs Friendly community? Are you willing to engage with business leaders to discuss these solutions? Please explain how you will stay in touch with business leaders.</u>

- To be Jobs Friendly, we must be Business Friendly. When the County was recently looking at the Transportation Capital Expansion Fees, I was strongly in favor of reducing the fees to Commercial, Industrial, and Office, to keep them in line with other Counties. Residential TCEFs were changed by adding more tiers, and tacking on a larger TCEF fee for the larger homes, and reducing the TCEFs on some of the smaller home living spaces.
- I'd also want to look to the Chamber and our Economic Development partners for ideas for reducing unfriendly business habits at the County.
- As for keeping in touch with business leaders, my door will always be open for anyone who would like to meet to discuss how the County can help them. I have a great relationship with the Fort Collins Chamber, and would want to cultivate the same relationships with all of the other Chambers of Commerce in Larimer County.

(11) <u>What role should Larimer County have in the region? What do you believe are the top issues facing Northern Colorado in the next several years?</u>

- We should be the convener of municipalities in Larimer County, so that we can all work together towards common goals, making growth smarter and more managed.
- Top issues facing Northern Colorado include:
    - Housing – While Larimer County does not delve much into Housing, there may be tools that we can employ to allow developers to more

FORT COLLINS BUSINESS COMMUNITY
CANDIDATE ENDORSEMENT QUESTIONNAIRE
2018 COUNTY COMMISSIONER ELECTION

easily develop Attainable Housing, including density bonuses to developers who dedicate a portion of the project to housing that fits certain income levels.

- Water – NISP and the Windy Gap Firming Project need to be completed, so that the Northern Colorado water companies are able to hold onto the water that they own and are able to distribute it to their members.
- Infrastructure – Our major bridges in Larimer County will all be structurally sufficient by the end of 2019, which is great, but our roads need to be improved as well. Additionally, we will need to spend some time and money to improve the facilities that need updating, so we can continue to serve our residents.
- Jobs – A stagnant economy does not help Larimer County or her residents. We need to make sure that we are welcoming and inviting to new commerce.
- Broadband – Connectivity is becoming more essential to jobs, schooling, and life in general. While I do not support Larimer County starting their own Broadband Utility, I do support common sense in installing fiber optic cabling to allow private enterprise the opportunity to begin affordable high-speed internet to the more rural areas of the County.

(12) Colorado will continue to grow, including our area. How should Larimer County plan for growth, if at all?

- First and foremost, growth has been here, and will continue to be here. To try to say that it won't, or to try to stop it, is silly. The best thing that Larimer County can do is to be smart in our planning for this future growth.
- Working with our Municipalities, we have the opportunity to all plan together to achieve smart growth in the County. This would allow us to focus on the transportation and other needs at the same time.
- We need to make sure that we do not impede water storage.
- I am a supporter of Metro Districts, which allow for a developer to decide if he/she wants to put the burden for the costs for infrastructure on future residents, as this may impact the salability of the homes or commercial spaces. Additionally, it allows the Buyer to decide if he/she wants to live in a home with a higher property tax burden each year.
- We need to make sure that we do not impede attainable housing.

(13) What are the top two issues facing county government over the next 4 years

FORT COLLINS BUSINESS COMMUNITY
CANDIDATE ENDORSEMENT QUESTIONNAIRE
2018 COUNTY COMMISSIONER ELECTION

and why do you believe they are the most important?

- Over $300 million of necessary Infrastructure needs. We cannot just piece this together, or else it will end up costing more in the future. I'm not one for "kicking the can down the road," as this does not solve problems, just creates more.
- Housing and Jobs. These are really one issue, as we can't have great employees for new businesses if they can't find housing, and we can't support the growth of housing if we don't have jobs for those who want to move here. While we may now be in an era of extremely low unemployment, that will not always be the case. We need to make sure that we don't get in the way of those who are bringing smart growth to Larimer County.

(14) What economic tools should the County add to their "tool box" of resources to attract key employers?

- Probably the simplest tool is to not get in the way. Reduce unnecessary regulations, reduce redundant, and expensive requirements in order to build, and help commerce to move forward. I will cite "Fugitive Dust" as a prime example of an example of a municipality spending time and resources to implement a new regulation, which will cost developers and builders more money, due to very few complaints.
- We also need to protect our natural environment, and allow folks to use the open space we have.

(15) What are the top three transportation improvements Larimer County should accomplish? What is your position on the Fix North I-25 effort? Why?

- Finish bringing the remaining high-traffic bridges in the County up to a level of Structurally Sufficient, which is due to occur by the end of 2019.
- Maintain our roadways. Plan for future growth (Montava?) We should talk with the municipalities who may have developments coming and see what future-planning we can do so that when development comes, we may be ahead of the game, which could be an incentive.
- Build the necessary Maintenance Sheds. Bear with me for a minute – we have vehicles that cost in the hundreds of thousands of dollars each, yet many must sit outside, because the Maintenance Sheds we do have are not able to house them. These vehicles don't get cleaned often enough, either, which will lead to quicker deterioration of the rigs. We need to take care of our assets, so that they will be start and run when we need them for road

FORT COLLINS BUSINESS COMMUNITY
CANDIDATE ENDORSEMENT QUESTIONNAIRE
2018 COUNTY COMMISSIONER ELECTION

repairs, plowing, etc.

I absolutely support the Fix North I-25 effort. I applaud the County and Municipalities for all working together to get this road expanded. I will be anxiously awaiting this fall's vote on the two roadway efforts to see if there's any way we could leverage the work we're having done into either more lanes or at least getting the third lane up to Wellington.

(16) Why would a business person support your election to office?

- Simply, two things:
  - I've run my own business, and understand budgeting, income and expenses, and that you need to be responsible with your money. I strongly believe in having a "rainy day fund" for those unexpected needs (see fires and floods)
  - I have the experience and qualifications to do the job. You only hire someone who has the skills to do a job in your business, so you should elect someone who has not only been learning this job from his predecessors for the past 9 years, but has been honing his leadership skills for many years, as well. I can walk into the position and hit the ground running.

(17) If business groups endorse you, is there any significant information that could come out about you during a campaign that could potentially embarrass you (and them) publicly? (ex: bankruptcy, arrest, conviction, etc.)

I had been utilizing a cabin I own in Red Feather for a short-term rental until just over a year ago. As soon as I realized that there is a permit that I'm supposed to apply for and hold in order to legally do short-term rentals, I stopped renting out altogether. (I will say that I do want to make it easier for folks to use their investment properties for short-term rentals, but that's for after I get into office)

Littleton, CO 80128-6901

Dear Mr. Peter, 9/12/2008

I'm writing as chair of the Save The Poudre Coalition to offer comments on the Draft Environmental Impact Statement (DEIS) for the Northern Integrated Supply Project (NISP). I respectfully request that you add our comments as provided in this document into the legal record for this action.

The Save the Poudre Coalition is a partnership of twelve local, regional, statewide, and national organizations. Our partners are:

American Rivers
Cache la Poudre River Foundation
Citizen Planners
Clean Water Action
Colorado Environmental Coalition
Defenders of Wildlife
Earthjustice
Environment Colorado
Fort Collins Audubon Society
Friends of the Poudre
Poudre Paddlers
Sierra Club Rocky Mountain Chapter
Western Resource Advocates
Wolverine Farm Publishing/Matter Bookstore

We consulted with over 46 qualified professionals in the preparation of this letter and the attached documents. Fifteen have Ph.D.'s, fourteen have advanced degrees or certificates in their field, the remainder are degreed professionals with credentials and decades of experience in their respective fields, including this partial list:

- McCrystie Adams, J.D., Project Attorney, Earthjustice Legal Defense
- John Bartholow, M.S., Hydrologist retired from the USGS
- Brian Bledsoe, P.E, Ph.D., Dept of Civil and Environmental Engineering, Colorado State University
- Philip Cafaro, Ph.D., Associate Professor, Department of Philosophy, Colorado State University
- Kurt Fausch, Ph.D., Dept of Fish and Wildlife Biology, Colorado State University
- Jim Henriksen, M.S., Hydrologist
- Taryn Hutchins-Cabibi, M.A., Western Resource Advocates
- David Jones, M.S. Forest Ecology

- Nick Komar, Ph.D., Center for Disease Control
- Jason La Belle, Ph.D. Assistant Professor and Director of the Laboratory of Public Archeology, Department of Anthropology, Colorado State University
- Dan Luecke, Ph.D., Hydrologist in private practice
- Bart Miller, J.D., Director, Western Waters Program, Western Resource Advocates
- Drew Peternell, J.D., Colorado Director, Western Water Project, Trout Unlimited
- Robert T. Milhous, Ph.D. Hydrologist retired from the USGS
- William Miller, B.S., Retired Engineer and Ornithologist
- Doug Pflugh, M.S., Research Analyst, Earthjustice Legal Defense
- N. Leroy Poff, Ph.D., Professor of Biology, Colorado State University
- James Rose, Ph.D., Professor Emeritus, Department of Zoology and Physiology, University of Wyoming
- John Sanderson, Ph.D. Ecologist with the Nature Conservancy
- Stacy Tellinghuisen, Western Resource Advocates
- Gary Wockner, Ph.D., Natural Resource Ecology Laboratory, Colorado State University

We endorse the comments submitted by Western Resource Advocates, Trout Unlimited, Dr. Jason La Belle, Dr. James Rose, Dr. N. Leroy Poff, John Bartolow and the City of Fort Collins.

We are attaching a number of documents to this letter and request that you add them to the legal record for this action as well.

After reviewing the document and its accompanying technical reports in detail, we do not believe this DEIS meets the basic requirements of the Federal National Environmental Policy Act or the Federal Clean Water Act. These major deficiencies call for a rewrite of the DEIS that includes a new full Alternatives Analysis that must include:

1. Full analysis of the role water conservation and efficiency improvements play in demand side reduction.
2. An accurate analysis of existing populations and projected future growth that is based on science, land use planning, sound water policy, and the cumulative effects of regional development.
3. Careful examination of agricultural water transfers as a supply source, reviewed in the context of an accurate analysis of the environmental impacts of said transfers.
4. Rotating fallow agreements under current existing, realistic and manageable contract arrangements.
5. Realistic and accurate cost impact scenarios.
6. Cost/benefit analysis and comparison of the alternatives.
7. Full analysis of the potential water yield in the Cache la Poudre River watershed, which includes not just the recent climate record, but the full historic stream gage record and reconstructed historic climate records that take into account the full range of drought and wet year cycles.

The National Environmental Policy Act

The National Environmental Policy Act[1] requires federal agencies to prepare a detailed statement on the environmental impacts of a proposed "major federal action" and all of the reasonable alternatives thereto before authorizing any such action.[2] An agency proposal for major federal action exists for NEPA purposes "at that the stage . . . when an agency subject to [NEPA] has a goal and is actively preparing to make a decision on one or more alternative means of accomplishing that goal and the effects can be meaningfully evaluated."[3] NEPA's purpose is to promote efforts "which will prevent or eliminate damage to the environment",[4] to inform the public of environmental consequences,[5] and to "help public officials . . . take actions that protect, restore, and enhance the environment."[6]

Under NEPA, the NISP Draft EIS must analyze "connected", "cumulative", and "similar" actions and three types of impacts.[7] Connected actions are those which are "closely related," including those that "[c]annot or will not proceed unless other actions are taken", or those that "[a]re interdependent parts of a larger action and depend on the larger action for their justification."[8] Cumulative actions are those that "have cumulatively significant impacts and should therefore be discussed in the same impact statement."[9] Similar actions include those that have "common timing or geography."[10] In order to assess "significance," NEPA requires consideration of "[w]hether the action is related to other actions with individually insignificant but cumulatively significant impacts."[11]

The three types of impacts to be studied in an EIS are those that are "direct," "indirect," and "cumulative."[12] Direct effects are those that "are caused by the action and occur at the same time and place."[13] Indirect effects are those "which are caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable."[14] A project's "cumulative impact," is

> the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions . . . . Cumulative impacts can result from individually minor but

> collectively significant actions taking place over a period of time.[15]

NEPA's many policies and goals include:

- Encouraging a "productive and enjoyable harmony between man and his environment";[16]
- Promoting "efforts which will prevent or eliminate damage to the environment and biosphere";[17]
- Using "all practicable means and measures . . .to create and maintain conditions under which man and nature can exist in productive harmony";[18]
- Fulfilling "the responsibilities of each generation as trustee of the environment for succeeding generations";[19]
- Assuring "all Americans safe, healthful, productive, and esthetically and culturally pleasing surroundings";[20]
- Allowing beneficial use of the environment "without degradation . . . or other undesirable and unintended consequences";[21]
- Preserving "important historic, cultural, and natural aspects of our national heritage";[22]
- Achieving a "balance between population and resource use";[23] and
- Enhancing "the quality of renewable resources" and maximizing recycling of depletable resources.[24]

Mitigating Environmental Impacts

At the most fundamental level, NEPA is intended to help public officials make decisions that are based on an understanding of environmental consequences, and to take actions that protect, restore, and enhance the environment.[25] Federal agencies are required, to the fullest extent possible, use all practicable means consistent with the requirements of NEPA to "restore and enhance the quality of the human environment and avoid or minimize any possible adverse effects of their actions upon the quality of the human environment."[26] CEQ regulations further define mitigation as:

---

[15] *Id.* at § 1508.7. *See also* Neighbors of Cuddy Mountain v. U.S. Forest Serv., 137 F.3d 1372, 1379 (9th Cir. 1998) (stating that with respect to a cumulative impacts analysis, an agency must provide "some quantified or detailed information" because "[w]ithout such information, neither courts nor the public . . . can be assured that the [agency] provided the hard look that it is required to provide.").

[26] *Id.* at 1500.2(f).

- Avoiding the impact altogether by not taking a certain action or parts of an action.
- Minimizing impacts by limiting the degree or magnitude of the action and its implementation.
- Rectifying the impact by repairing, rehabilitating, or restoring the affected environment.
- Reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action.
- Compensating for the impact by replacing or providing substitute resources or environments.[27]

Effective mitigation therefore starts at the beginning of the NEPA process, not at the end, and must be included as an integral part of the alternatives development and analysis process.

We address these and other issues in the remainder of this letter.

Climate change and NISP projected firm yield

The NISP DEIS projects a firm yield of 40,000 acre-feet (AF) based on the climate record from 1951 to about year 2000. Though this period incorporated moderate drought and major wet periods, it did not capture the most significant droughts recorded for the watershed. A much longer climate and river flow record is available.

We examined the availability of the Grey Mountain right over the entire climate record, using measured data from the historic record (early 1900's through 2007) and reconstructed precipitation records from the tree-ring analysis and found that the NISP project,[28] when examined over this entire period, is unlikely to meet it's firm yield projections.

Using flow data from the 1951-1998 record, we built a linear model that incorporated the current year's total native flow with the previous four years' total native flows, in the following form:

$$y = \beta_0 \cdot f(t) + \beta_1 \cdot f(t-1) + \beta_2 \cdot f(t-2) + \beta_3 \cdot f(t-3) + \beta_4 \cdot f(t-4)$$

where
y is the volume of the Grey Mountain right for the current year, in acre-feet
f(t) is the total volume of native flow in the current year, in acre-feet
f(t-1), etc. is the total volume of native flow in the previous year, in acre feet, and so on.
β_0, β_1, β_2, β_3 and β_4 are regression parameters

[27] 40 C.F.R. § 1508.20.
[28] Connie A. Woodhouse and Jeffrey J. Lukas. 2006. Multi-Century Tree-Ring Reconstructions of Colorado Streamflow for Water Resource Planning. Climatic Change 78(2-4), 293-315. http://www.springerlink.com/content/c925656512300527/, viewed on 5/12/2008.

The basis for this model is the year-to-year availability of a junior right on the Poudre River like the Grey Mountain right. Junior rights are typically available based on current year's reservoir volumes as well as the current year's flows, and the current year's reservoir volumes are based on flows from previous years. Using this model, we were able to reconstruct the Grey Mountain right over the reconstructed and historic precipitation record, going back to 1618. All terms in the regression were statistically significant, and the model R^2 was 0.89. Total yearly system losses from the Glade Reservoir were conservatively estimated at 2,300 AF/year, though they could be much higher.

Our analysis indicates the following:

1. The NISP project firm yield is likely to be only 35,000 to 36,000 AF per year on average (12.5 - 15% lower than the projected 40,000 AF).
2. It would fail to deliver its projected yield one year out of every five.
3. Over the historic climate record from 1618 to 2007, there were five deep, extended droughts lasting two to three decades long during which the project would fail to deliver its projected yield in four out of five years.

The NISP DEIS requests operational flexibility allowing the Glade reservoir's managers to fill the reservoir with rented water in dry years. During extended droughts like those present in the historic and reconstructed climate record, it does not appear that sufficient rental water would be available to meet the needs of the project participants.

For these reasons, we do not believe that the NISP project will meet its projected firm yield projections. The firm yield and the project operations plan must be re-evaluated in the context of the entire climate record, incorporating major as well as minor droughts. Additionally, the operations plan and firm yield projections analysis must evaluate the project's operation using currently available climate change scenarios in order to assess the effects of future climate variability and shifts in precipitation patterns on the project's ability to meet its firm yield projections.

There are many other simple linear or nonlinear models that could be used in order to predict the Grey Mountain right and other aspects of the river's hydrology based on historic data and therefore provide insight into the effects of drought and whether the project could fulfill its projected purpose and need.[29,30] A useful analysis should not be limited to the example provided above.

NISP impacts on Agricultural Wetlands

On page ES-7 of the NISP DEIS we find the following statement:

> "The removal of irrigation from up to 69,200 acres of agricultural lands would result in a loss of about 1,384 acres of wetlands, which is substantially greater than any of the other alternatives."

[29] A.C. Davidson. 2003. Statistical Models. Cambridge University Press.
[30] G.A.F Seber and C.J. Wild. 1989. Nonlinear Regression. New York: John Wiley and Sons.

This estimate appears in nineteen other locations in the document. It is based on a transparently faulty analysis of the quantity of irrigation-associated wetlands in the region. The analysis was based on a visual estimate of just two farm fields, from which the authors of the analysis surmised that 2% of all land in the entire region served by Poudre River irrigation water consisted of wetlands providing wildlife habitat.

We consulted with seven independent Ph.D.- and M.S.-level experts in land use analysis, wetlands ecology, and vegetation surveys in Colorado. We surveyed them on the method and the findings of this analysis. The overwhelming consensus was that the survey method and analysis was completely inadequate. It would be very unlikely to pass peer review in any scientific or technical journal dealing with wetlands analysis, vegetation classification, or a related field. The findings are inconsistent with the Fish and Wildlife Service (FWS) wetlands inventory data for the region.[31] It grossly overstates the habitat values of irrigation-associated wetlands. It grossly overestimates irrigation-associated wetlands acreages by a factor of five to ten times.

As a proof of concept, in early August we drove a transect across agricultural lands irrigated with Poudre River water, in the region around Ault, Eaton, and Greeley, surveying from county roads South and West of those towns across the Poudre River. In our brief survey of twenty farm fields receiving irrigation water we estimated that areas with developed wetland vegetation constituted less than 0.2% (one-fifth of one percent) of the area. This is one-tenth of the area percentage used as the basis for the environmental analysis of the no-action alternative.

In short, the survey used as the basis for the environmental analysis in the NISP DEIS must be thrown out and be completely redone from scratch using accepted, rational, and accurate survey techniques that adequately rank and report the habitat quality of the wetlands. The survey must take into account the following factors:

1. Analyze vegetation composition and structure on any wetlands found in the survey to assess habitat quality.
2. Consider underlying soils and the timing of water applications to assess drainage and the longevity of surface water presence.
3. Randomly select survey sites from throughout the geographic region based on factors that influence the depth and size of irrigation-associated wetlands.
4. Consider the effects of slope and aspect on the formation and seasonal longevity irrigation-associated wetlands.
5. Consider the effects of irrigation methods (e.g. flood, furrow, pivot, other sprinkler types, drip, etc.) on the formation and seasonal longevity of irrigation-associated wetlands.
6. Consider the effects of the source of irrigation water (gravity fed, pumped from a well, pumped from a ditch).
7. Parcel size

[31] U.S. Fish and Wildife Service. National Wetlands Inventory. http://www.fws.gov/nwi/, viewed on 9/8/2008.

8. Survey replication among the above sources of variation.

Taking these various factors into account will likely mean the wetlands survey will have to examine at least forty-five (45) randomly-selected fields from the affected area in order to take into account the many sources of potential variation in the survey and include at least two sets of replicates.

Screening threshold of 30% used in the NISP DEIS Alternatives Analysis

Section 2.1.2.1 on page 2-5 of the NISP DEIS states the following regarding threshold cutoff values for the DEIS Alternatives Analysis:

> "**Firm Yield.** The firm yield screening criterion requires that viable water supply sources must be capable of providing a firm annual water yield. This screening criterion was only applied to concepts because concepts are defined as a source of potential water supplies able to meet a portion of the NISP Participants' request. To pass this criterion, concepts must be able to provide at least 30 percent of the total requested firm annual yield of 40,000 AF, which is 12,000 AF. Limiting the provisional percentages reduces the number of water supply sources to a maximum of four, which is logistically reasonable for a regional water supply project of this magnitude."

The DEIS and supporting documents claim to have cast a wide net, examining a variety of alternatives to meet the stated purpose and need of the NISP participants. It is unfortunate, however, that the Corps of Engineers consultants who considered the array of potential alternatives used the same method as the project proponents (the Northern Colorado Water Conservancy District), who had made their own examination of alternatives in prior documents. At the very least, this does not appear to fit the role of the Corps as independent arbiters of the proposed project.

The document provides no basis or justification for this cutoff value, or for limiting the sources of supply to a maximum of four. There are no surveys of other projects, or scenarios upon which they base the justification. In short, the DEIS offers no basis or justification for any screening threshold – it merely sets a screening threshold and applies it.

The 30% screening threshold cuts off one of the largest alternative sources of water (rotating fallow agreements). Rotating fallow agreements are in our view the most viable of the alternative water sources available. They present the greatest opportunity to partner with agricultural water users while meeting the needs of the NISP participants. Had the alternatives analysis used a smaller threshold value (even just one percent smaller) and evaluated rotating fallow agreements with the same contractual arrangements as is being used in other places in Colorado and the West, rather than the cumbersome, burdensome, and unlikely contractual arrangement proposed in the DEIS, they would have passed scrutiny and been incorporated into NISP at a much reduced cost compared with the construction of NISP. And, they would have likely made the existing NISP scenario unworkable.

The Northern District's initial analysis, and the subsequent COE analysis, applied an arbitrary screening threshold mandating that any alternative chosen must supply at least 30% of the stated water demand. Such an arbitrary threshold guaranteed that the applicant's "preferred" alternative would be a large, "regional" project under the presumption that overall costs would be lower and the affected environment would be better protected -- a project so large, in fact, that it must be constructed and operated by an organization such as the Northern District. However, such an arbitrary 30% threshold also guaranteed that a combination of small, flexible, less expensive, and incremental water supply projects would never be seriously considered. Being blind to small scale, appropriate development is a recipe for unsustainable water projects and, as our analysis shows, failed to identify a suitable alternative that would preserve what is left of the Cache la Poudre River.

In summary, we conclude that the NISP Alternatives Analysis must be redone with the screening threshold and limitation to just four water sources removed to allow for greater flexibility, a wider range of options, a less costly project, and less environmental impact.

Timeliness screen applied in the Alternatives Analysis

Page 2-5 of the DEIS describes a Timeline Screen applied in the alternatives analysis, eliminating any option that could not be completed within five years, 2005-2010. Obviously at this point no water would be provided from this project before 2010. If this screen was truly need driven in that the water must have been supplied before 2010, then the action alternatives no longer pass the timeliness screen. At this point the Corps must drop this timeliness screen and consider all available options for supply.

Purchasers ability to purchase and sell units in the project

Page 2-31, section 2.4.1.2 of the DEIS states the following:

> The NISP Participants would have the ability to sell their contract rights in NISP to other entities within the District boundaries or buy additional contract rights in NISP as they become available. The ability to purchase and sell contracts in NISP would not alter the size or operation of NISP. Once NISP becomes operational, it is anticipated that there would be a market for NISP contracts similar to the market that currently exists for C-BT units.

We see two major issues associated this clause. First, it casts significant doubt as to whether the project is necessary. If the participants' need projections are solid and the need is as firm, then why would they want to sell shares in the project? This casts serious doubt as to their actual need for the water. For that matter, it restricts the purchase and sale of project water to the boundaries of the Northern Colorado Water Conservancy District, which violates the free market. We are no fans of trans-basin water diversions, however developing a major publicly-funded project like NISP and then restricting the purchase and sale of the resources for the project to the boundaries of the NCWCD bureaucracy casts serious doubt as to the actual need for the project and whether it supports legal provisions that allow for the purchase and sale of water within Colorado.

Using other sources of water to fill the Glade Reservoir

On page 2-31, section 2.4.1.3, the proponents request the right to initially fill the reservoir with other sources of water. This would lead to the temporary dry up of tens of

thousands of acres irrigated agricultural lands, which were not accounted for in the impacts analysis.

If other water is available, then where is the actual need?

References to the EPA 303d list must be updated

Page 3-25, section 3.5.1 references the 303d list for 2006. The 2008 list was approved by EPA in May of 2008. It adds pH and Cu for the Monroe Canal to Shields Street reach (COSPCP10) below the North Fork and an aquatic life use impairment for Horsetooth Reservoir (COSPCP14).

TCE Plume modeling

Page 4-38, section 4.7.2 discusses the impacts of the Glade Reservoir on the TCE plume. The modeling work on the pollution plume predicted its future course based on current conditions. No modeling was apparently done to consider the role that reservoir leakage would have on the TCE plume direction or rate of travel via alteration of the subsurface hydrologic gradient. This is a very serious problem considering the great public health risk posed by the TCE plume. The impact of the proposed reservoir on the TCE plume direction and rate of travel must be modeled directly.

Biological Assessment used – is it the final or the draft?

The Biological Assessment is labeled in the footer throughout as "Predecisional Draft." There is no clear indication that the Corps used the final version of the Biological Assessment in its analysis.

Wetlands Screen Threshold

On pages 2-5 and 2-6, section 2.1.2.2, the DEIS describes a rationale for the 60 acre wetlands screen threshold. This threshold is based on a level "where the wetland area differential diminishes as screening tool," i.e., where the screen eliminates a certain number of projects, rather than be based on an acceptable level of wetland loss as determined through sound science. This screen is entirely arbitrary – there is no scientific justification provided related to the relationship between wetland size and biological function, water quality improvement, habitat value, recreational contributions, or direct relationship to the project. It must be removed entirely as a screen.

Outdated Topographic Maps

At 2-6, the waterways screen was based on stream classifications taken from USGS topo maps rather than on-the-ground inspections. This review was presumably conducted with USGS 7.5-minute series maps which are generally less than current. For example, the 7.5-minute map Laporte, which covers the Glade Reservoir site and the river as far east as Laporte, was most recently published in 1979 as a non-field checked photorevision of a 1962 map. The photos used for the revision were taken in 1975, and the revisions in the vicinity of the project appear to be limited to cultural features and mining operations. The original mapping, which appears to be the source of the hydrological data, was based on 1958 photos field checked in 1962. All of which is to say that the stream classifications used for this screen threshold were based on 45-year old data.

Similar data issues apply to all environmental analyses which were conducted from USGS topographic maps without additional field-checking; we call all of these inappropriate uses of the old data into question.

Hazardous Land Uses and Contaminants

On pages 2-6 through 2-7, there is discussion of eliminating from consideration all sites with "hazardous land uses...and various contaminants..." How then is the proposed site for the Glade Reservoir with its underlying TCE plume not excluded?

C-BT Transfers Eliminated from the Alternatives Analysis

On page 2-10, 2.1.3.1, the alternatives analysis eliminates C-BT transfers because one could only get 37,000 AF using a 0.5 AF per unit quota, the minimum quota ever allotted through C-BT. In the Healthy Rivers Alternative we discuss the reasons why the historic average of 0.7 AF per unit should be applied. If a factor of 0.7 AF per unit was applied, the amount of water available would go well above 40,000 AF.

Air Quality Issues

On page 3-127, section 3-25, the DEIS admits that the reservoirs sites are within a Federally-designated ozone non-attainment area but claim that "air quality is currently not an issue in these areas." This is entirely wrong. The State of Colorado is putting great efforts into developing and implementing ozone reduction actions to comply with Federal Standards. According to the State:[32]

> Colorado is in the midst of an effort to reduce ozone air pollution. High levels of ozone present health concerns both for healthy adults and for sensitive people, particularly the elderly, young children and those with asthma or other respiratory ailments. Symptoms include stinging eyes and throats, chest pains, coughing and breathing difficulty.
>
> Denver and North Front Range Area Violates Ozone Standard
>
> The Denver-metropolitan and North Front Range areas became "nonattainment" areas for the federal ozone standard on November 20, 2007, when a deferral by the U.S. Environmental Protection Agency expired.
>
> The nonattainment designation is a result of a violation of the federal 8-hour ozone standard. The standard is based on a three-year average of monitoring data. Air quality monitoring data for the 2005-2007 averaging period confirms a violation of the eight-hour health-based standard.
>
> A detailed plan to reduce ozone is being developed by the Colorado Air Pollution Control Division, along with the Regional Air Quality Council and the North Front Range Metropolitan Planning Organization. The

[32] http://www.cdphe.state.co.us/ap/ozone.html, viewed on 9/11/2008.

> resulting attainment plan will be submitted by the Regional Air Quality Council to the Colorado Air Quality Control Commission for approval by the end of 2008, with legislative review expected after that. Once all state approval processes have been completed, the plan ultimately will be submitted by the governor to the EPA.
>
> The plan will require further reductions in ozone levels beyond what was required through an earlier Ozone Early Action Compact. The Ozone Early Action Compact allowed EPA to defer classifying the Denver metropolitan area under the 8-hour ozone standard. That deferral expired on November 20, 2007.

This one paragraph dismissal of serious health concerns and absolutely no discussion of how the project might impact these ozone levels is a clear failure to meet both the letter and intent of NEPA. Potential impacts to ozone from the project include, but are not limited to: vehicle emissions from construction, emissions changes from the highway re-alignment, and changes to release of ozone precursors from changes in land use practices.

Recreation potential at the proposed Glade Reservoir

The NISP DEIS proposes that the Glade Reservoir will provide over $17 million in yearly economic benefits to Northern Colorado. This dramatic overstatement of the likely benefits of the project is based on a transparently faulty analysis. It ignores key factors that, if considered in the analysis, would greatly change the outcome:

1. The analysis largely ignores or grossly understates the impacts the project would have on downstream economic benefits, not just in Fort Collins but in Bellevue, Laporte, Timnath, Windsor, Greeley, and rural Larimer and Weld Counties.
2. The analysis assumes that use levels will immediately reach levels experienced at Horsetooth Reservoir and will remain constant every year.
3. It does not factor in the likelihood that the reservoir may take years to fill, possibly a decade or more.
4. It does not factor in fluctuating water levels as a factor that influences visitation. Our own analysis of Glade reservoir water use levels using the historic and reconstructed climate record indicates that about a third of the time the reservoir will be nearly empty, fluctuating between dead pool and very low water levels.
5. It assumes that fish concentrations and angling potential will remain constant over this time, ignoring the role that water quality, turbidity, fluctuating oxygen concentrations, and siltation have on sport fish biology and reproduction. Our own analysis indicates that, should Glade be built, fishing will be poor at least one third of the time, and water sports will not be viable due to safety concerns due to turbid water, underwater obstacles, and shallow water.

An accurate and viable economic benefit analysis would take into account the above factors and the following:

1. Survey the boating public and assess use levels based on the fraction of the public who utilize motorized recreation and who would travel to Glade for recreation, if the reservoir were built.
2. Take into account the impact of rising fuel prices on motorized recreation and visitor use at the reservoir if it were built.
3. Accurately assess how highly fluctuating reservoir levels and frequent dead pool conditions would influence visitation, using data from other reservoirs with similar conditions.

Geographic Scope of the Impacts Analysis

Since this project would severely restrict river flows on the entire lower Poudre River below the canyon mouth, and would significantly impact flows on the South Platte River, the entire stretch of the Cache la Poudre River to the confluence with the South Platte, and then the South Platte from the Poudre River downstream must be considered in the impacts analyses done for the DEIS.

Proposed Flow Mitigation in the Filter Plant Run

One of the mitigation options proposed in the DEIS is to increase flows by about 40 cfs during the month of August through the "Filter Plant Run" on the Poudre River, and make structural changes that would allow linking the "Filter Plant Run" and the "Bridges Run". The DEIS estimated that increasing flows through August would extend the rafting season through the month of August with whitewater sports use levels at the same levels as in May, June, and July. This highly speculative argument led to doubtful claims that it would increase the economic value to the rafting companies by about $186,000.

We surveyed whitewater sports companies operating on the river to investigate the economic value of this claim. The survey is being sent to the Corps of Engineers by Josh Metten under separate cover. We found the following:

1) The increase of ~40 cfs is very unlikely to extend the rafting season to any degree, except in the wettest of years, perhaps once per decade.

2) The major limiting factors for the rafting season in August are very low river flows and the start of the school year.[33, 34] The great majority of responses we received indicated that ~40 cfs would do very little to nothing to extend the rafting season on the filter plant run. The customer base during the week is largely gone as students go back to school and vacationing families return home. The flows are so low that exposed rocks and gravel bars make rafting and kayaking impractical.

Most companies end their season by the first of second season in August for the reasons cited in (2) above. Most do not use the filter plant run after the month of June. Therefore we do not believe that the estimate of an $186,000 economic gain is credible. It is grossly overstated, speculative, and must be revised downward. Based on the survey results, we believe it is overstated by a factor of at least ten.

Adaptive Management

In section 4.4.3 and in later sections, the NISP EIS proposes to use Adaptive Management as its primary means of mitigation for the project. The DEIS devotes relatively few pages in total to the entire concept, but places a great deal of its impact mitigation strategy on the concept.

The concept of Adaptive Management was first proposed as a means to assess the environmental impacts of construction projects when important environmental impacts are unknown or difficult to assess.[35, 36] For the NISP project, the likely impacts are well understood and straightforward to assess, due to the decades of environmental research.

We have a number of grave concerns about applying adaptive management to NISP, as follows:

1. Though the DEIS proposes a number of possible survey mechanisms and assessment techniques, it offers no basis or justification for utilizing adaptive management to deal with the expected impacts of the NISP project when the likely impacts are well understood and straightforward to model and assess. Using adaptive management must be justified using at least the following criteria:
    a. The similarities between the proposed NISP project and other projects employing adaptive management.
    b. Specific reasons why adaptive management should be chosen, when the expected impacts of the project are straightforward to predict and well understood.
    c. The merits of adaptive management must be presented, alongside the disadvantages.
    d. The desired outcomes of adaptive management, and why they could not be achieved with a formal mitigation plan.
2. No adaptive management plan was developed for the project, from which the merits of the adaptive management proposal could be assessed. The DEIS simply proposes that a plan be submitted to the Corps of Engineers at least 2.5 years prior to initiating diversions, with provisions for reviewing the plan every five years afterward. How can the decision makers and the affected public assess the adequacy of adaptive management in mitigating the impact of the project if no plan is presented until after the project is permitted and construction begins? We believe an adaptive management plan must be prepared as part of the DEIS for this project so that decision makers and the affected public may judge the merits of this proposal.
3. We could find no proposed budget for developing, implementing, and modifying adaptive management plans and techniques. There does not appear to be a budget in the project for mitigation measures after diversions begin.
4. No mechanisms are proposed for analyzing the results of data collection and making decisions regarding proposed mitigation measures other than submitting plans to the

[35] Holling, C.S., ed. 1978. Adaptive environmental assessment and management. New York: John Wiley and Sons, Inc. 377 p.
[36] Walters, C.J. 1986. Adaptive management of renewable resources. New York: McGraw Hill. 374 p.

Corps of Engineers and re-evaluating those plans every five years. There are no stakeholder groups or expert panels proposed. No decision-makers are identified as to who decides what mitigation measures would be necessary and how those decisions would be made.

5. Standards and goals for mitigation measures are not proposed in the DEIS. In order to judge the efficacy of the proposal and the seriousness of the project proponents, we must know what the very specific mitigation goals are that they seek to achieve, involving water quality, sustaining riparian forests, sustaining wetlands, the aquatic environment, and economic impacts.

Adaptive Management is wholly unsuited for this project, and we believe the concept must be dismissed.

Impacts on Riparian Vegetation

The final conclusion that ERO reached in its evaluation of the four alternative plans (associated with NISP) for the Cache La Poudre R was that "the reductions in streamflows on the Cache La Poudre (CLP) and South Plattte River associated with the action alternatives are not anticipated to cause a change in riparian and/or wetland vegetation." This conclusion is not supported by data or an objective framework for assessing possible changes in vegetation in response to the alternatives. This conclusion is based upon expected change in monthly average flows from "baseline condition". "Baseline condition" is mentioned for the first time in the conclusions on p. 56 of the report and is never defined. This is important because if "baseline condition" during a dry year is based upon an average low flow, plants are likely to be more sensitive to smaller changes than deviation from higher baseline condition. In other words, a reduction in stage by 0.5 feet at low flow should have a greater effect than the same reduction in flow at a higher flow.

Overall, the technical report is weak, does not use data relating flow to riparian vegetation to reach its conclusions, and fails to directly address the potential and likely effects of reductions in high flows on riparian vegetation. Changes in high flow are the basis of the proposed alternatives and high flows are a key component of the range of flows that riparian vegetation is responsive to and dependent upon. Although the main hydrologic impacts of the NISP proposal are to reduce the magnitude and frequency of high flows, the ecological effects of these reductions are de-emphasized and/or ignored in the conclusions. The report was difficult to technically evaluate because there is very little substantive content to the report, no data, no linkages of hydrology to vegetation, and unsubstantiated conclusions.

Several important points and considerations concerning the conclusions of this report follow:

1. The ERO report does not present any data relating riparian vegetation to streamflow. The conclusions of the report are strongly stated but not backed by evidence or findings from ERO or other studies (which are based upon a singe species at a single study site – Scott et al. studies).

2. All of the conclusions were made based upon "reviews of aerial photography and site visits" and some assumptions linking a few studies to the reaches of interest.
3. Site selection was based upon ERO's consideration of the "areas where the greatest changes in streamflow and potential for effects to riparian vegetation might occur". These "sensitive reaches" were restricted to natural areas, yet there are potential negative effects of altered flow regime along the entire river course. Although the channel through the city is heavily impacted and in a degraded state, streamflow still performs important ecological functions through the entire reach.
4. "assessment of potential effects to riparian and wetland vegetation … was based primarily on average monthly flows and stream stage associated with each alternative" (p. 35). Riparian vegetation responds to extreme flows (highs and lows) that are not well-represented by monthly averages, particularly in hydrologically variable months like April, May, and June.
5. Stage-discharge relationships vary along the course of the CLP. ERO's conclusions are based upon how stage will be affected at the gage locations with are likely more and less at different points along the river depending on cross sectional dimensions (channel geometry).
6. The role of peak flows in maintaining recruitment patterns, age-class structure, and sustainable riparian communities is mentioned in the report but when the proposed reductions in peak flows are evaluated a series of circular illogical steps are taken to diminish the importance of these reductions. For example, p. 56 "The NISP action alternatives would reduce the frequency of flows of 3,400 cfs from 17 to 5 days and flows of 1,600 cfs from 19 to 9 days for the 50 years of hydrologic record (Anderson 2008). Neither of these flows currently occurs at a frequency sufficient to provide hydrologic support for riparian vegetation. It is likely that most of the supportive hydrology comes from the lower more frequently occurring streamflows and supplemental sources such as the ditch and nearby ponds." Riparian plant species respond to a range of flows over a range of timescales. Large infrequent high flows are key to the maintenance of these systems as they are the flows that connect the river to the floodplain, create sites for regeneration of a range of riparian plant species, stimulate microbial activity and decomposition of organic material on the floodplain, nutrient release, flushing of floodplain soils, recharge of alluvial aquifers, and a range of other important ecological functions (I can provide citations). The absence of such flows will most certainly cause changes in the physical integrity of the floodplain and shifts in riparian plant population structure and community composition over time. Who is to say that because the effects may be expressed over a long period of time that they are not worth considering in evaluating the costs and benefits of NISP? Short and long term effects should be evaluated.
7. "Riparian vegetation on stream reaches with ground water elevations that are independent of streamflows are unlikely to be affected by changes in streamflow (p. 38)." Fails to recognize the importance of high flows in maintaining riparian vegetation. Typically reaches are gaining and losing at different times during the season. This statement is unsubstantiated.
8. "Although supportive hydrologic conditions are essential for the maintenance of wetlands, simple cause-and-effect relationships are difficult to establish (Mitsch and Gosselink 1993)" (p. 40). Difficulty in establishing such linkages does not justify

ignoring them. There seems to be confusion about the fact that riparian areas may contain jurisdictional wetlands, riparian areas also include a mosaic of other fluvially influenced areas that may not be "wetland" in the strict legal sense, but are uniquely riparian.

9. "Scouring and overbank flows can reduce vegetation encroachment and possibly help regenerate some types of riparian vegetation by scouring the floodplain and creating soil conditions favorable for regeneration (Stromberg et al. 1993)." (p. 42). This is a statement with widespread scientific support. Loss of such flows or reduction in the frequency of them would occur under alternatives 2, 3, and 4 of NISP. Why then are these facts not linked together in an evaluation of the possible effects of NISP. This seems to contradict the ERO conclusions for most of the reaches evaluated.
10. "Many of the riparian areas along the Cache la Poudre and South Platte rivers appear to be supported by water sources other than the rivers (e.g., ditches, return flows, and ponds)." (p. 46). This may be true, but does not diminish the fact that NISP is not likely to affect the low flows that these other water sources become important during. High flows would be affected by NISP and would not likley be replaced by other water sources. Again, ERO seems to confuse the role of high and low flows in providing different functions (high flows: floodplain connectivity, groundwater recharge, creation of habitat for recruitment and establishment; low flows: maintenance of established vegetation and preventing water stress and associated ills).
11. ERO seems to be confusing Army Corps of Engineers jurisdictional wetland criteria with vegetation associated with riparian areas. Whereas some areas associated, adjacent to, and influenced by rivers (riparian areas) may fall under jurisdictional wetland status, far more does not yet is still dependent upon and responsive to flow regime.
12. ERO considers 0.5 ft of stage change to be a conservative estimate of a stage change that herbaceous vegetation would respond to (p. 48). Assuming that this is a number that is meaningful to plants, over what time interval might one expect vegetation change to occur in response to altered flow? If plants might become water stressed after one day, five day or even ten days of a stage decline exceeding 0.5 ft, monthly averages would not enable one to determine if NISP flows might cause change in the herbaceous vegetation. The amount of variability in stage over the course of a month is not addressed. An average flow that varies by 0.5 ft might average to 0.5 ft while experiencing a range of flows from well outside (e.g., 0, 1.5, 3 ft or more) of this "conservative" value, which would likely result in altered herbaceous vegetation. A daily timestep would be more appropriate to examine possible effects of altered flows on vegetation.
13. "Nonwetland herbaceous vegetation likely would not be affected by changes in stream stage" (p. 48). One of the functions of flow in riparian areas is to support riparian communities but it is also to prevent "terrestrialization" or the encroachment of channels and riparian communities by upland vegetation. Riparian areas typically experience an "ebb and flow" of upland species into and out of riparian areas over the course of time. This ebb and flow is largely dictated by the frequency and duration of high flow events that exclude or disfavour upland species near the river. This is what distinguishes riparian areas from surrounding uplands and non-fluvial wetlands.

When high flows are removed, terrestrialization occurs and riparian areas narrow, become less distinctive, heterogeneous, species rich, and less "riparian".

14. "…woody vegetation , such as willow shrubs and cottonwood trees, likely would be unaffected by changes in stream stage of about 1.5 feet or less, because woody vegetation is more deeply rooted, and physiologically adapted to following the water table downward."(p. 48?) Whereas Populus and Salix seedlings can extend roots to track a falling water table, there is no literature suggesting that established plants (juveniles and adults) can respond to falling water tables through root extension. This is misconception that I have seen before in studies trying to justify lowering of water tables. Salix and Populus have very different root morphologies and maximum rooting depths so should not be considered together.
15. "Where water table declines are greater than 1.5 feet, it is possible that existing woody vegetation could be affected, but research shows that declines of up to 3 feet may not cause death of woody riparian vegetation. Establishment of woody vegetation would likely be more affected by changes in overbank and scouring flows (i.e., 25-year flows)…" (p. 48-49). This being stated, very little consideration of the influences of reduced peaks on vegetation is given in the conclusions. "Simply stated, high flows on the Poudre River below the canyon mouth would become a rarer event with NISP." (p. 53). Linking these two statements and then concluding that "The reductions in streamflows on the Poudre and South Platte rivers associated with the action alternatives are not anticipated to cause a loss of riparian and/or wetland vegetation" (p. 75) is contradictory.
16. ERO states that mean monthly stage would be reduced no more that 0.1 ft under each of the three alternatives (2, 3, and 4). No statement of the variability within a month is provided (p. 49). If this varies substantially, the conclusions made are irrelevant. Again, if the larges mean monthly changes in stage could be as high as 0.36 to 0.61 ft during June, what is the variability around this monthly mean? ERO fails to take any variability into account, yet earlier in the report cite Scott et al. 2000 as having concluded that "sustained declines of the water table of greater than 3.1 feet resulted in 88 percent mortality of plains cottonwood" at their study site. Although it is unlikely that reductions of stage of even 0.61 ft during high flows would not negatively affect maintenance of adult Populus over the short term (e.g., cause water stress), ERO seems to mix flows necessary for regeneration and maintenance, and fails to examine differential effects of different flow alterations on each.
17. There is no basis for the statement that stage reductions of "0.18 feet below baseline conditions in May and June … during dry years are small, and are unlikely to affect riparian and wetland vegetation." (p. 50) or "Based on ERO's analysis of stream stage at the Canyon gage, it is unlikely that stream stage would affect riparian and wetland vegetation in the vicinity of the Canyon gage." (p. 50).
18. "The high flows that would be most affected by NISP do not appear to be providing supportive hydrology for riparian and wetland vegetation in the McMurry Natural Area. Flows above about 2,000 cfs that exceed the stream banks may help with the habitat renewal process and the reductions in these overbank flows may reduce the opportunities to create new habitat for riparian vegetation establishment." (p. 55). This being said, the conclusion ERO makes is that NISP would not negatively affect

vegetation (?).

19. Martinez Natural Area reach: "It is likely that most of the supportive hydrology comes from the lower more frequently occurring streamflows and supplemental sources such as the ditch and nearby ponds."(p. 56) It is unclear what is meant by "supportive hydrology". It is assumed that this is low flow hydrology and how it might affect maintenance of riparian vegetation. No mention is made of the effects of altered high flow on vegetation through this reach. High flows are those most influenced by the alternatives in NISP.
20. Any conclusions that could have been made by logically linking many of the statements about the possible effects of reduced high flows are seemingly discounted in the final conclusions: "Without this disturbance and a substantial reduction in the frequency of this occurrence of overbank flows, it is likely that the woody riparian vegetation will become increasingly decadent. This would be a slow process that would be difficult to separate from current trends in riparian vegetation along the Poudre River." (p. 75).
21. General comment on non-riparian vegetation cover types section of the report: no clear criteria for assessing condition of vegetation cover types is provided, yet in most cases cover types are considered to be of low to moderate quality. Without clear assessment criteria, it is unclear if the rating of quality is simply the opinion of the observer (which is open to bias) or based on something more scientifically defensible.

22. Overall ERO has failed to: 1) link riparian vegetation to streamflow, 2) adequately distinguish between flows necessary to maintain channel integrity and facilitate regeneration of riparian vegetation and flows that maintain established plants, 3) consistently evaluate the role of high flows in maintaining vegetation, 4) to reach conclusions based upon any objective scientific criteria. NISP proposes to have an effect largely upon high flows, so the focus on low flow hydrology and alluvial water tables is a distraction from the real issue. Reductions in high flows will influence regeneration of many riparian species (facilitating encroachment of terrestrial species into riparian areas and suppressing processes necessary for regeneration and establishment of many riparian species - particularly fluvial disturbance adapted species). This will result in changes in population structure of many species over various periods of time ranging from years to decades. Change in population structure of many species results in changes in plant community composition. These factors are not evaluated by ERO, yet they are the crux of the issue. Because peak flows occur over a timescale of less than a month, monthly time steps in considering the effects of reduced peak flows on vegetation are inadequate. There is no stated reason for not taking advantage of daily average flows and examining the extreme flows that vegetation responds to rather than some monthly mean (which riparian plants are less responsive to).

General Concerns Regarding Language Use and Presentation Bias

We have discussed the NISP DEIS with dozens of individuals who have had a chance to read portions of or the entire document and who have professional experience with NEPA documents in general. Nearly all expressed serious reservations about the

persistent bias throughout the document for the action alternatives and against the no action alternative.

For example, there were two technical analyses done to evaluate the likely impacts of the no action alternative on irrigated agricultural lands. The first analysis concluded that up to 69,200 acres of farmland would be impacted. We analyzed the method used to derive this figure and found it faulty and spurious, and apparently the Corps of Engineers agreed because it ordered a separate analysis be done to correct the errors in the first analysis. The second analysis revised the first estimate to 33,637 acres, and clearly documented the errors in the first analysis. Yet, the document refers to this corrected figure only twice that we could find– once in section 4.2.2.1, and once as a footnote to Table 4-8 on page 4-47.

The faulty estimate of 69,200 appears thirty-four times elsewhere in the DEIS. It becomes the foundational figure for fundamental analyses and interpretation related to the economics of the project, environmental impacts, and socio-economic impacts. This faulty analysis weighs heavily in considering which alternative is the least environmentally damaging, skewing the analysis heavily (and wrongly) in favor of the action alternatives.

This situation gives the appearance that a transparently faulty analysis was widely used throughout the NISP DEIS in order to bolster support for the action alternatives.

There are numerous other examples where we find similar issues:

1. The economic analyses hold up speculative benefits of the proposed Glade Reservoir but downplay the economic impacts to river users downstream of the diversions.
2. The environmental impacts analysis excludes major portions of the affected riparian and aquatic corridor downstream of the diversion points, limiting the impact analyses only to the developed reservoir, infrastructure, and pipeline footprints.
3. Conclusions concerning environmental impacts in the DEIS frequently conflict with the supporting technical studies, particularly in the assessment of water quality and riparian forest impacts. Where the technical reports conclude significant impacts, the DEIS consistently overrules them and reports “minor impacts” or “no significant impact”, and in several cases concludes significant environmental benefits.
4. The water use analysis excluded major industrial water uses and excluded the highest water use years from the calculations, resulting in a per capita water use estimate approximately 13% lower than it actually was, and then attempted to compare this water use figure with other utility providers for whom industrial water uses were not removed.
5. Likely detrimental impacts are persistently couched using modifiers such as “…may cause…”, “…might effect…”, “…may occur…”.
6. Economic estimates that bolster the proposed alternative are described using terms like “There ***would be*** (emphasis added) an estimated gain of…”, when economic factors that bolster the no action alternative are described using language such as “…and a loss ranging from ***$0 to $700,000*** (emphasis added) annually…” when there

is no basis described for the lower bound of zero. For examples of this, see Table 4-1 on page 4-4.

7. From page D-4 of the DEIS: "The ***small flow decreases*** (emphasis added) predicted to occur in May and June are not expected to affect stream water quality." The flow decreases they describe during this period are in the hundreds of cubic feet per second (cfs), compared with the approximate increase of 40 cfs the DEIS proposes to provide in August as mitigation, which is described as "significant". As we saw in many places in the DEIS, no basis was provided for the judgement that it would not affect stream water quality, and it contradicts directly with the findings of the supporting water quality technical reports that predicted water quality would decrease directly with streamflow reductions.
8. On page 2-7 there is discussion of the need for storage elements to regional in nature to be considered. This suggests that even if an analysis found that it would be cheapest and least impactful for each participant to independently develop their own supplies, that smaller, localized options could not be considered. This undermines the objectivity and the scope of the alternatives analysis – along with other limitations placed on the alternatives analysis, it virtually assures that a large reservoir project be selected through the screening process.

There are dozens of examples of this throughout the document, and we would be happy to work with the Corps of Engineers to identify the places in the DEIS where it undermines the credibility of the analysis.

If you have any questions or need clarification on the issues presented in this letter, please contact me at the addresses and phone number below. Thank you for the opportunity to contribute to the analysis of the NISP DEIS.

On behalf of the Save The Poudre Coalition, respectfully yours,

Save the Poudre: Poudre Waterkeeper Comments on the Supplemental Draft Environmental Impact Statement for the Northern Integrated Supply Project, June 2015

September 3, 2015

Save the Poudre: Poudre Waterkeeper (STP) has prepared these comments and supporting materials for the US Army Corps of Engineers (Corps) in review of the Supplemental Draft Environmental Impact Statement (SDEIS) for the Northern Integrated Supply Project (NISP) released June 2015.

In general, STP finds that the SDEIS fails to meet the requirements of the National Environmental Policy Act (NEPA), the Clean Water Act (CWA) and the Endangered Species Act (ESA), under which the SDEIS was required.

STP presents these comments without reference to relevant materials that were requested through the Freedom of Information Act (FOIA) on July 19, 2015, but which were not provided by the Corps in a timely fashion. *See* "Freedom of Information Act Request," attached here in Appendix A (A04). STP requested an extension of the comment period to accommodate this request but that extension was not granted. *See* "Request to extend the deadline for the public comment period for the NISP SDEIS," attached here in Appendix A (A03). As this FOIA request was needed to trigger the disclosure of information that the Corps failed to properly disclose in the SDEIS, STP expects the Corps to give full consideration to any comments based on that material that supplement or revise these comments submitted in a timely fashion even if submitted after the close of the official comment period.

I. The SDEIS Fails to Meet the Requirements of NEPA and CWA

A. The SDEIS neither Considers a Full Range of Alternative nor Adequately Analyzes the Environmental Impacts of NISP

1. The SDEIS Fails to Objectively Consider the Benefits of Conservation for Reducing Projected Demand

The Corps appropriately retained an independent expert to review the project proponent's demand projection. SDEIS at 1-14. This expert took exception with the proponent's projections, stating "we are

concerned about the HE projections' implied increases in overall water requirements per capita for NISP participants, particularly in the 2030 through 2050 period." "Review of 2010-2011 'NISP Demand Projections from Harvey Economics and Recommendations for NISP Supplemental EIS'" (Demand Projection Review), attached here in Appendix E (E30), at 9. The expert subsequently proposes, and the Corps accepts in the SDEIS, two alternate demand curves, one of which is based on fixed rate "best guess" conservation scenario. Demand Projection Review at 9 ("The extent of future declines in water requirements per capita is very difficult to predict and somewhat speculative in nature").

The conservation scenario is, however, never given any weight in the analysis of the project's need and purpose. It is merely offered as a straw man argument that regardless of any efforts the demand for water more than justifies NSIP—the Corps assumes that because the projected water demands over the entire study period are still greater than the 40,000 acre-feet requested by the project proponent, there is still need for NISP. SDEIS at 1-15 ("Under any of the three demand scenarios, both NISP and additional supplies would be required to meet the NISP Participants' future water supply needs").

Further, the SDEIS asserts, without support, that "the timing of the future water supply needs can be delayed (but not avoided) through water conservation." SDEIS at 4-5. Such a statement is only true if the Corps assumes that the participants will continue infinitely increasing their water demands. The SDEIS clearly illustrates that the projected demand is <u>reduced, not just delayed</u> by the conservation scenario through the study period of this review. SDEIS at Figure 1-4. The Corps must not speculate about water demands beyond the range of their analysis. Within the time frame under consideration, the conservation scenario does reduce demand.

In fact, the SDEIS clearly demonstrates that even the limited conservation proposed under the conservation scenario reduces the projected long-term demand of the NISP participants by approximately 40,000 acre-feet – the desired firm yield from NISP. SDEIS at Figure 1-4. The projected increase in demand over 2010 is approximately 50,000 acre-feet, roughly equivalent to the unmet demand after NISP water is applied to the original demand projection. The Corps fails to objectively consider that reduced demand from the conservation scenario (or other conservation-based alternatives) may be meet by the project participants through the means with which they anticipate meeting their surplus water needs after NISP is implemented.

STP rejects the SDEIS's demand projections as deeply flawed and unrepresentative of the demand likely to be experienced by the participants, as well as the assumption that these demands must be met, but if

it continues to use these projections in its review of NISP it must do so in an objective and consistent manner. The Corps must reconsider its analysis of need by specifically addressing the ability of the participants to meet the reduced needs projected under the conservation scenario and any other practicable conservation-based approaches that are identified in the SDEIS review through the means with which they intend to meet their water demands that will be unmet by NISP under the original projections. The Corps must not rely on assumptions of demand beyond its designated study period. If the Corps determines that the participants cannot meet the full projected need under a conservation approach, the Corps must consider and disclose the ability of the participants to partially meet the need and how NISP alternatives could be re-configured to meet the lesser need. The Corps must fully refute the practicability of any approach as described here that could be a LEDPA to NISP before permitting NISP.

2. The SDEIS Incorporates an Assumption that Water Supply Demands must be Met that Unreasonably Constrains the Range of Alternatives

The SDEIS is entirely premised on the assertion that increased water supplies are <u>needed</u>.

> The project's purpose and need is stated as "*[t]o provide the Project Participants with approximately 40,000 acre-feet of new reliable municipal water supply annually through a regional project coordinated by the District, which will meet a portion of the Participants' current and reasonably projected future additional water supply needs*."

SDEIS at 1-3.

This "need" is based on estimates of water demand forecasts.

> HE was originally commissioned by the Northern District in June 2004 to evaluate and prepare water demand forecasts for each of the NISP Participants (Participants), along with a discussion of conservation practices employed by these Participants. Separately, the Northern District staff prepared an evaluation of water supplies for each Participant. These two work elements were then combined to assess potential future water shortages relevant to a determination of purpose and need for NISP. This study was provided to the U.S. Army Corps of Engineers for its use in considering NISP purpose and need and in preparing Chapter One of the NISP Environmental Impact Statement (EIS).

"Water Supplies and Demands for Participants in the Northern Integrated Supply Project" (Demand Projection), attached here in Appendix E (E53), at 1.

The Corps' fails, however, to establish that the "water demand forecasts" reflect an actual need. The SDEIS includes no discussion of the implications for the participants of not obtaining sufficient water supplies to meet the demand forecasts. On the contrary, the Corps considers such a scenario unconceivable and offers a purported "No Action Alternative" that undertakes the exact same action as the proposed action alternatives—development of 40,000 acre-feet of new water supply. SDEIS at 2-16.

By assuming that the water demand forecasts will be met one way or another and failing to consider and disclose the impacts of this not happening, the Corps fails to establish a level playing field for review of the action alternatives as required by NEPA and the Clean Water Act. The review in the SDEIS fails to consider and disclose any possible actions that might be undertaken by the participants to meet that shortfall. The Corps has inappropriately constrained the range of alternatives.

The Corps must reconsider its evaluation of the project's purpose and need and must specifically consider and disclose its analysis of the actual need for the participants to meet the estimated water demands forecasts. Such an analysis must independently assess the participants' potential responses to an unmet water demand shortfall and the likelihood that water scarcity, behavioral changes, and market forces would alleviate such a shortfall regardless of the participants' actions.

Unless the Corps can affirmatively establish the compelling need for additional water supplies, the Corps must further consider and disclose a range of alternatives that the participants could undertake in response to water supply shortfalls. Such alternatives might include, but must not be limited to, development regulations and infrastructure improvements, conservation, water use efficiency improvements, traditional agricultural transfers, alternative agricultural transfers, and water reuse.

3. The SDEIS "Regional Project" Screen for Alternative Selection is Arbitrary and Capricious and Improperly Restricts the Range of Alternatives

In the SDEIS, the Corps' continues its use of a "Regional Project" screen to determine the feasibility of alternatives. SDEIS at 2-3. The use of this screen is used to justify the elimination of any alternative that does not comprise a singular effort that meets the demanded firm yield in an integrated fashion. "Evaluation of the 'Healthy Rivers Alternative' Proposed by STP Using the NISP Alternatives Screening

Criteria" (HRA Tech Report), attached here in Appendix E (E31), at 5 ("To advance, alternatives must be able to meet the Participant's water supply need with a regional project, eliminating the need for Participants to pursue separate solutions to meet their individual needs"). The Corps fails to define in clear and unambiguous language what this screening criterion is. *See*, *in general*, SDEIS at Section 1.2.3. The "regional project" criterion is also used by the Corps to justify a "cutoff threshold" screen that eliminates alternatives that fail to provide "30 percent of the firm yield request for concepts and 15 percent of required storage capacity for elements"). HRA Tech Report at 4("Concepts and elements that fall below the cutoff thresholds […] are not considered because, below these levels, the regional nature of the project would be lost and would effectively operate as individual local water supplies"). STP objected to these 30%/15% thresholds in its comments on the DEIS (attached here in Appendix B (B13)) and incorporates those comments by reference, asserting that the thresholds are arbitrary and capricious as the Corps fails to provide meaningful support for their values or applications.

The Corps justifies the "regional project" screen by stating that "[t]he District is a regional water supply entity with responsibilities for water supply planning and management for the region and what it is proposing is a regional water supply project to meet the water supply needs of 15 Participants providing water to an area of about 945 square miles." SDEIS at 2-3. STP does not dispute this characterization of the facts—the applicant is clearly Northern Colorado Water Conservancy District and the project participants are interchangeable components that have, and likely will continue to, change over time. SDEIS at S-1 ("The Town of Berthoud withdrew as a Participant in NISP in April 2008 as the DEIS was being released to the public. Frederick requested the project yield previously allocated to Berthoud"). STP does, however, dispute the conclusion that the Corps draws from this factual situation—that only a singular, large reservoir-based project can fulfill the proponent's need. This assertion is arbitrary and capricious, contrary to fact, and the Corps' must be seen as having improperly restricted the range of alterative available for consideration in the SDEIS.

The Corps can give great weight to the project proponent's request, but the Corps must still exercise independent judgement when crafting the statement of purpose after considering both the proponent's stated need and the public's perspective. The Corps cannot simply adopt the project proponent's purposes and it cannot construct the purpose so narrowly so as to unreasonably limit the range of alternatives available for consideration. Additionally, the Corps cannot assume that common needs require a common solution and must address the merits of differing approaches in the impact analysis rather than preemptively through the alternatives screening. *Colorado Environmental Coalition v.*

Dombeck, 185 F.3d 1162 (10th Cir. 1999), *Simmons v. Corps of Engineers*¸ 120 F.3d 664 (7th Cir. 1997) (the Corps has a "duty under NEPA to exercise a degree of skepticism in dealing with self-serving statements from a prime beneficiary of the project").

The Corps, in deferring to the project proponent's desires, fails to demonstrate why multiple small projects operated or coordinated by the project proponent and serving the participants in a regionally coordinated fashion does not constitute a "regional project." Although a singular project may be simpler for the proponent, that is not a sufficient reason for the Corps to rule out a more diversified approach. The Corps fails to determine if the public good would best be served by the proponent's preferred concept of by a distributed source approach to providing the demanded firm yield. The Corps also fails to provide any support for the particular "cutoff threshold" values (30 percent for concepts and 15 percent for elements) that are used in the screening analysis and fails to disclose how those values were determined.

The Corps must re-consider its alternative screening process by re-applying the "regional project" and cutoff threshold criterion after:

1. Clearly and unambiguously defining its "regional project" criterion;
2. Disclosing the analysis and supporting material for the development of this definition specifically addressing how the individual participants can be served by a variety of approaches;
3. Disclosing how the number and location of participants affects the possible configurations of a "regional project" and how changes in the participant makeup may change those possible configurations prior to, during, and after project implementation; and
4. Disclosing the analysis and supporting material for the development of any threshold values that derive from the "regional project" criterion.

4. The SDEIS 40,000 Acre-foot Screen for Alternative Selection is Arbitrary and Capricious and Improperly Restricts the Range of Alternatives

The SDEIS states that the purpose and need of the proposed project is "[t]o provide the Project Participants with approximately 40,000 acre-feet of new reliable municipal water supply annually[.]" SDEIS at 1-3. The Corps asserts that this "need" is justified by projected population growth in the

participants' service areas. SDEIS at 1-8. The Corps also asserts that "[t]he NISP Participants' water supply needs during the planning period (through 2060) is at least 40,000 acre-feet." SDEIS at 1-15.

The Corps uses these assertions of need to establish a threshold of 40,000 acre-feet under its "Purpose and Need Screening Category" for alternative screening and eliminates potential alternatives that do not provide this amount of firm yield. SDEIS at 2-3. The Corps' only support for this threshold is the statement that it "reviewed these 2011 demand projections in connection with the validity of the need (BBC 2011) and found that 40,000 acre-feet of firm annual yield is still valid for NISP." SDEIS at 2-3.

The Corps utterly fails to support these assertions that 40,000 acre-feet is a valid statement of need for this project. STP disputes the demand analysis that the Corps incorporates into the SDEIS for a number of reasons and asserts that the SDEIS dramatically overstates the need for additional firm yield within the participants' service areas. However, if the Corps insists on using this deeply flawed demand analysis, it must accurately and consistently apply the results.

The Corps' analyses project the "need" that the proponent and participants seek to meet with NISP as 84,000 acre-feet. SDEIS at 1-17. The Corps fails to provide any support for its use of the lesser 40,000 acre-feet figure other than that was the amount that the application requested. SDEIS at Table 1-1. The participants' desire for 40,000 acre-feet is alternately stated as their "firm yield goal" (SDEIS at Table 1-1), a "request" (SDEIS at 1-5), and "a portion of their projected demand" (SDEIS at 1-5).

The Corps can give great weight to the project proponent's request, but the Corps must still exercise independent judgement when crafting the statement of purpose after considering both the proponent's stated need and the public's perspective. The Corps cannot simply adopt the project proponent's purposes and it cannot give construct the purpose so narrowly so as to unreasonably limit the range of alternatives available for consideration. *Colorado Environmental Coalition v. Dombeck*, 185 F.3d 1162 (10th Cir. 1999); *see also Simmons v. Corps of Engineers*¸ 120 F.3d 664 (7th Cir. 1997).

The Corps failed its duties by applying the 40,000 acre-feet figure, a value that was chosen arbitrarily and capriciously from a range of possible values that would have been equally valid in partially meeting what the SDEIS purports to document as the need of the participants. The Corps assertion that "[t]he NISP Participants' water supply needs during the planning period (through 2060) is at least 40,000 AF" (SDEIS at 1-15), could have as easily read "at least 5,000 AF" or "at least 60,000 AF." A review of the analysis in "Review of 2010-2011 NISP Demand Projections from Harvey Economics and

Recommendations for NISP Supplemental EIS" (referenced in the SDEIS as "BBC 2011" and attached here in Appendix E (E30)) as cited at SDEIS 2-3, could have equally found that "20,000 AF of firm annual yield is still valid for NISP" or "1,000 AF of firm yield is still valid for NISP." While, the proponent is free to propose whatever yield they desire, there is absolutely no defensible reason for 40,000 acre-feet to have been considered the appropriate threshold value for the Corps analysis.

If the Corps chooses to adopt a purpose and need that only partially meets its projections of actual need, the Corps must independently and objectively balance the proponent's desires with the public interest. By arbitrarily applying the 40,000 acre-foot figure to the alterative screening process, the Corps has unreasonably eliminated alternatives that may have contributed to meeting the participants' needs in a meaningful fashion. *Natural Resources Defense Council v. Callaway*, 524 F.2d 79, 93 (2d Cir. 1975) ("The EIS must nevertheless consider such alternatives to the proposed action as may partially or completely meet the proposal's goal and it must evaluate their comparative merits"). The Corps developed and applies a "cutoff threshold" screen that eliminates alternatives that fail to provide "30 percent of the firm yield request for concepts and 15 percent of required storage capacity for elements" based on this arbitrary 40,000 acre-foot figure. HRA Tech Report at 4("Concepts and elements that fall below the cutoff thresholds […] are not considered because, below these levels, the regional nature of the project would be lost and would effectively operate as individual local water supplies"). STP disputes these thresholds in principle (*see* Appendix B (B13)) as well as in their application. By using these "cutoffs," the Corps has eliminated alternatives that failed to meet an arbitrary percentage of an arbitrary value.

As the NISP process currently stands, the Corps has failed to provide a meaningful and defensible purpose and need for the proposed project. Until this defect is remedied, the Corps cannot develop a competent range of alternatives for consideration under NEPA or the Clean Water Act.

The Corps must re-consider its development of the project purpose and need statement and the screening analysis that defines the range of alternatives. This reconsideration must:

1. Either consider and disclose a range of firm yields that meet the demand projections developed and endorsed by the Corps or reconsider the demand projections;
2. Disclose the analysis and supporting material for the development of any value or range of values for firm yield that is adopted as the project's purpose and need;

3. Demonstrate that the firm yield value or range of values that the Corps adopts considers the public's perspective and potential benefits and impacts; and,
4. Disclose the analysis and supporting material for the development of any threshold values that are applied under the purpose and need screening category.

If the Corps proceeds with its use of 40,000 acre-feet against these claims, the Corps must quantitatively define what "approximately 40,000 AF" includes. SDEIS at 1-3. The Merriam-Webster Dictionary defines approximately as "nearly correct or exact", and defines "approximate" as "to be very nearly to but not exactly like (something)". It provides no quantitative definition of "approximately". The Corps must provide clear guidance about what it considers as "approximately 40,000 AF" before it applies this as a screening threshold.

5. The SDEIS Improperly Applies Historical Water Use Rates in the Demand Projections

The demand projections developed for the SDEIS, and used to support the project purpose and need, reflect an unsupported assumption that past water use is a valid indication of future use. With two exceptions, the demand projections describe future water use rates based on a fixed rate derived from historical rates. Demand Projection at A-5, B-6, D-6, E-7, F-6, G-6, H-5, I-6, J-6, K-6, L-5, M-7, N-6. In one instance, this is explicitly stated as "[w]ater usage is expected to track population growth." Demand Projection at J-6. One of the exceptions does not clearly state the method by which future water rates were determined. *See* Demand Projection at Appendix C. The other exception uses a split system, one figure based on historical use, the other not, but both are static moving forward. Demand Projection at O-8.

The Corps fails to provide any support for the assumption that average historical rates are appropriate indicators of future use. Rather, the demand projection analysis itself supports an entirely different case by documenting that water use rates change over time and in many of the participants' service areas are generally trending downward. Demand Projection at Exhibit A-3, Exhibit B-4, Exhibit C-3, Exhibit L-3, Exhibit N-3, Exhibit O-4. The six providers reflecting this consistently downward trend represent 15,300 acre-feet (38%) of the "new permitted firm yield from NISP sought by participants." Demand Projection at Table I-1. Another four providers, representing 12,200 acre-feet (30%) of the requested firm yield, have demand curves that peaked earlier in the 2000s and have subsequently declined. For all of these

10 providers, use of historic average water use rate overstates demand for Year 0 of the projection; i.e., the projection fails to accurately capture the starting point of a future demand curve.

The trends of water use change through time and a general decline in water consumption through the 2000s is also demonstrated by the average water use rates for the combined NISP participants. Demand Projection at Table III-1.

Overall, the data documented in the demand projection do not support the use of an historical average rate as a good predictor of future water use rates. The Corps fails to incorporate the principle of decoupling of population growth and water demand that is being witnessed throughout the western United States. *See* "Decoupling water use from growth: the New Mexico example," attached here in Appendix E (E13).The Corps instead dismisses declines in water use as the low-hanging fruit of conservation efforts and assumes, without an analysis or meaningful supporting documentation, that future declines will be more difficult. The extent of the SDEIS discussion of this issue is:

> "[reductions to date] also suggests that additional savings will be more difficult and costly to achieve as described below.
>
> Typically, water providers and their customers are motivated to take the first steps in conservation programs that achieve the largest savings at the least incremental cost. The Participants have reduced use by implementing relatively inexpensive water-saving measures such as public education, watering restrictions, low-flow fixture requirements, and landscaping regulation for new construction (HE 2011)."

SDEIS at 1-11.

The Corps must re-consider its water demand projections and must utilize a demand projection model that incorporates trends and reasonable assumptions about future use. The token conservation scenario, which incorporates a fixed rate decline as a straw man for discussion, does not accurately capture such a demand projection.

6. The SDEIS Fails to Incorporate Current Water Supply Availability into Water Supply Need Projections

The SDEIS projects future water supplies by comparing projected demand with "current" supply. The SDEIS relies on estimates of the participants' water supply holdings in 2010. Demand Projection at 31 ("Additional water needs of the Participants are determined by the difference between their projected future water demands and their firm annual water supplies or yields that were owned or controlled by the Participants in 2010").

By relying on a 2010 water supply accounting, the Corps fails to accurately reflect the current situation in the SDEIS released in 2015. This is dramatically illustrated by the change in water supply held by the participants from 2005 to 2010:

> "The supply evaluation in the [Demand Projection] indicates that NISP participants currently have supplies totaling about 59,400 acre-feet in terms of firm yield. This figure suggests that participants have continued to add to their portfolios of water supplies since the 2005 report, when their collective firm yield was estimated at about 48,000 acre-feet."

Demand Projection Review at 6.

A similar growth in holdings from 2010 to the present would offset the projected "need" for NISP by over 10,000 acre-feet, reducing the "requested firm yield" by at least 25%. Importantly, it would negate the Corps dismissal of the Healthy Rivers Alternative on the grounds that it fell 5,000 acre-feet short of the Corps' arbitrary 40,000 acre-foot screening threshold. SDEIS at 2-9. The Corps fails to properly consider the full range of alternatives due to its use of outdated data for water supply holdings.

The Corps must re-consider its water supply demand projections using the most current data available for the current water supply holdings of participants. The Corps must disclose its rationale for using data more than one year old. The Corps must also re-consider all analyses that were conducted in a manner that was dependent on the results of the water supply need projections, and must disclose and provide for meaningful public review of all revisions of the projections and dependent analyses.

7. The SDEIS Fails to Fully Consider Alternatives Incorporating Traditional Transfer Methods

Colorado has a long and successful history of providing water to growing municipalities by transferring water from farms to cities. This "Traditional Transfer Method" (TTM) is often pejoratively called "buy and dry" as towns and cities buy water from farmers to meet municipal needs. In fact, over the last

decade, water from approximately 400,000 acres of farms has been transferred from farms to cities in Colorado (*see* "Why Colorado's producers must adapt to a more tenuous water supply and how they're making it work," attached here in Appendix E (E58)) – TTMs is often the easiest, fastest, and most practicable method for municipalities to get more water. In northern Colorado over the last 25 years, water from approximately 420,000 acres of farm has been transferred to cities via TTMs. Unpublished public testimony, Weld County Commissioner Sean Conway at Fort Collins City Council meeting, September 1, 2015. Further, the Colorado Water Plan indicates that Colorado farmers will transfer water from 500,000 – 700,000 acres of farms by the year 2050. "Colorado's Water Plan, Second Draft" (July 2015) available at: https://www.colorado.gov/pacific/sites/default/files/FINAL-2ndDraftClean-Appendices-2015%20Revised.pdf and last viewed September 3, 2015, at 208. Moreover, the SDEIS states that communities within the NISP project area are using and will likely continue to use TTMs to get water to meet their needs in the future. SDEIS at 2-11, SDEIS at 5-13.

TTM transfers have occurred over the history of Colorado involving hundreds of thousands of acre feet of water with little or no federal or state environmental-regulatory action required (including under the Clean Water Act) because little or no environmental damage occurs. Moreover, these TTMs occur between a willing buyer and a willing seller, and often the sellers (farmers) reap substantial profits from the business transaction.

If none of the proposed action alternatives are approved in the Record of Decision, then the NISP participants and farmers in northern Colorado are likely to undertake a variety of TTMs to meet all of the NISP participants' water needs including the 40,000 acre feet described in the Purpose and Need in the SDEIS. Such a no action alternative could move forward in multiple ways:

- The NISP participants may work together to develop a "regional project" somewhat like the one described in the SDEIS. The NISP participants cooperatively facilitate business interactions with farmers to buy water and have it transferred into a regional reservoir. STP believes that such a regional project would be most practicable if the water was diverted at the same head gates from which it is diverted now, and that the water must be piped or pumped to the regional reservoir, thus avoiding new environmental damage to the Cache la Poudre River. A regional project using TTMs without changes of diversion points would allow the participants to meet their water supply objectives in a less environmentally damaging fashion than any of the action

alternatives. The Corps' must not permit any of the action alternatives when this approach represents a Least Environmentally Damaging Practicable Alternative (LEDPA) for NISP.

- The NISP participants may also undertake a series of separate projects like those described in the No Action Alternative in the NISP Draft Environmental Impact Statement whereby NISP participants do not engage in a regional project, but rather go it alone or join together with fewer neighboring NISP participants. If this were to occur in a manner similar to that described in the 2008 DEIS "No Action Alternative," STP believes that that water coming from the Cache la Poudre River must be diverted at the same headgate from which it is diverted now, and that water must be piped or pumped to the separate municipalities' (or groups of municipalities') reservoir (or reservoirs), thus avoiding new environmental damage to the Cache la Poudre River. The Corps' must not permit any of the action alternatives when this approach represents a Least Environmentally Damaging Practicable Alternative (LEDPA) for NISP.

8. The SDEIS Fails to Incorporate the Firm Yield from the Windy Gap Firming Project into the Water Supply Need Projections

The SDEIS discloses that five NISP participants are also participants in the Windy Gap Project. SDEIS at 1-16, Table 1-7, 1-18. Firm yield from the Windy Gap project is currently considered to be zero. This is the primary rationale for pursuing the Windy Gap Firming Project, an action that is currently in the permitting process. *See* "Record of Decision Windy Gap Firming Project Final Environmental Impact Statement" (2014), available http://www.usbr.gov/gp/ecao/wgfp_feis/wgfp_rod.pdf and last viewed September 3, 2015, at 6. Although the SDEIS does not explicitly state that the Windy Gap units held by the five NISP participants contribute no water to the estimates of the water supply holdings of these participants, this is a reasonable assumption.

The SDEIS calculates the water supply need projections by comparing the demand projections with current water supply estimates. SDEIS at 1-17. As the water supply estimates are held constant at 2010 levels during modeling, the Corps fails to incorporate the reasonable foreseeable gains in firm yield from the Windy Gap Firming Project into the projections of the water supply need.

STP opposes the Windy Gap Firming Project. That opposition, however, does not excuse the Corps from properly incorporating the impacts of the implementation of Windy Gap Firming Project into its analyses of NISP.

This failure to incorporate water supply gains from the Windy Gap Firming Project into the water supply need projections is inconsistent with how the SDEIS treats the project in its hydrologic modeling. SDEIS at 5-6 ("The CTP modeling of Future Conditions hydrology assumes that the Windy Gap Firming Project (WGFP) is successfully completed, and the projected WGFP yield is factored into the inputs developed for the Greeley System Model for Future Conditions model runs").

The Corps must re-consider its water supply need projections using the anticipated firm yield from the Windy Gap Firming Project, a project that the SDEIS otherwise assumes will be completed. The Corps must disclose its rationale for using any projected firm yields that differ from those disclosed in the "Record of Decision Windy Gap Firming Project Final Environmental Impact Statement" (2014). The Corps must also re-consider all analyses that were conducted dependent on the results of the water supply need projections and disclose and provide for meaningful public of all revisions of the projections and dependent analyses.

9. The SDEIS Fails to Consider Water Pricing in the Demand Analysis

The SDEIS describes water pricing projections based on the estimated costs of each alternative. *See*, *e.g.*, SDEIS at 4-384 – 4-385 (Alternative 1), SDEIS at 4-387 – 4-388 (Alternative 2). These analyses appear to have been conducted after and independently of the demand analyses that inform the proposed project's purpose and need. The SDEIS only discuss water price increases as a function of environmental impacts from the alternatives. *See*, SDEIS at 3-219 – 3-220, *in general*, SDEIS at Section 4.20.

One of the Corps' consultants dismisses—entirely without support—the potential impact of water price increases on water use. Demand Projection at 35 ("Since almost all water costs along the Front Range of Colorado are increasing, it is unlikely that growth or water use will be affected significantly by increases in the cost of water for the Participants"). The SDEIS merely accepts the demand projections generated based on population growth projections and assumed water use. Demand Projection Review at 1 ("HE gathered or developed projections of future demographic growth for each participant, then combined projected growth in population (or accounts) with assumptions regarding water use per resident (or per account) specific to each participant"). The unspecified "Conservation Scenario," presented as a token nod to unconstrained demand, does not quantitatively address water rate structures as tools for reducing demand and there is no documentation that the assumed prices would adequately capture the potential demand reductions from appropriate water rate structures. SDEIS at 1-14. The conservation scenario contemplates "future rate increases" but neither the Corps nor its expert attempt any

quantitative analysis of what those might be. Demand Projection Review at 9. On the contrary, the SDEIS discloses the opposite, demonstrating that water prices are expected to drop below pre-NISP levels by the end of the project. SDEIS at 4-388 ("the average cost of household water service would increase only slightly by 2020, to about $560 per year (4% higher than in 2010) before declining to levels below 2010 in 2030 and 2040").

This failure to consider water rate structures as a demand management tool is contrary to the well-established principle in water planning that municipal water prices directly affect water use. *See*, *e.g.*, "Pricing Structure" Appendix E (E32). The Corps failed to implement this basic principle into its demand forecast models, despite the recommendation of its other consultant, who takes a more informed view of the role of water prices on demand. Demand Projection Review at 9 ("We also believe the EIS should consider the possibility that water requirements per capita among the NISP participants will continue to decline to at least some degree due to […], the likelihood of future rate increases to pay for new water supplies from the proposed NISP project and/or other sources").

The disclosure that the alternatives would result in water price increases coupled with the failure to consider what impact those increases, in addition to other rate structures imposed with the intent of curtailing demand, is a fatal flaw in the Corps' analysis. The Corps must reconsider its demand analysis and incorporate specific, quantitative review of the effects of various pricing structures on projected demand.

10. The SDEIS Confirms the Intention of the Project Proponent to Allow Participants to Sell Their Shares in NISP

In our comment letter on the DEIS (submitted September 12, 2008, and attached here in Appendix B (B13)), STP expressed concerns that the project was structured to allow participants to sell their shares in NISP to other parties. As the SDEIS does not respond to those concerns, we hereby incorporate them into these comments by reference.

11. The SDEIS Inappropriately Constrains the Range of Alternatives by Dropping the Healthy Rivers Alternative from Consideration

STP rejects the Corps' use of a 40,000 acre-foot screening threshold. *See* "The SDEIS 40,000 Acre-foot Screen for Alternative Selection is Arbitrary and Capricious and Improperly Restricts the Range of

Alternatives." STP also rejects the Corps' use of unspecified water sources under the concept of operational flexibility in Alternative 2 to buttress the yield of that alternative when climatic conditions constrain the specified water sources. *See* "The SDEIS Fails to Analyze Any of the Environmental Impacts of the Requested Operational Flexibility." If the Corps' persists in using this threshold and applying unspecified supplemental water sources, it must do so in consistent fashion across all of the alternatives, including the No Action Alternative. Where options exist to approximately meet the desired firm yield (as Alternative 2 does with operational flexibility), the Corps must consider those options with an equivalent flexibility.

The SDEIS acknowledges that Alternative 2 would not meet its firm yield requirements during dry periods, during which project participants would be required to acquire additional water rights to be stored in the proposed Glade reservoir. SDEIS at 2-47. In its comments on the NISP DEIS, STP submitted comments on the historic flow regime and analyzed a reconstructed flow regime based on tree ring records from the Cache la Poudre watershed, and we are providing those comments again here. *See* Appendix B (B13). The tree ring record analysis reveals that it is likely, due to the junior priority of the Grey Mountain right, that there would be multiple several-year periods in the near future during which NISP would fall short of its firm yield water delivery requirements by at least 18,000 acre feet. The project would only be able to deliver less than 25,000 acre feet per year during those dry periods, assuming the senior water rights exchanged in the Galeton water trade would still remain in priority during such extended droughts. A 22,000 acre foot firm yield delivery is definitely not "approximately 40,000 acre feet" of firm yield.

Although the Healthy River Alternative was rejected by the Corps for failing to provide a full 40,000 acre-feet of firm yield (SDEIS at 2-9), the various water supply methods described in the Healthy Rivers Alternative could be flexibly augmented by 5,000 acre feet or more in a relatively straightforward way, including the following:

1) Traditional purchases of water rights stored in existing reservoirs. Where storage may be an issue, numerous alternative storage options have emerged, including groundwater storage and utilizing gravel pits, as described in the STP comments on the NISP DEIS. *See* Appendix B (B13).
2) Purchases of water rights from the Colorado-Big Thompson Project.
3) Increasing the firm yield portion of water yield through alternative agricultural transfers, such as rotational fallowing agreements, interruptible supply agreements, agricultural-municipal water

sharing agreements, water cooperatives, water banks, and Flex markets. These methods are described in the Colorado Water Plan, which cites a need to develop more than 50,000 acre-feet of supply through these methods. *See* "Colorado's Water Plan, Second Draft."

4) Pursuing conservation and water use efficiency more aggressively.
5) Utilizing reverse osmosis like the city of Aurora, CO is doing (as well as many other communities) to augment existing water supplies. Water secured through the South Platte Water Conservation Program or other downstream water rights could be treated through reverse osmosis to augment supplies within the region, as long as the brine waste is disposed of safely and securely. In cases where it can be demonstrated that water reuse will not affect return flows, a water reuse program may be utilized as supply for a reverse osmosis system.

The Corps inappropriately constrained the range of options by dropping the Healthy River Alternatives from further consideration while retaining Alternative 2 (as well as the other action alternatives). There is no support for the assertion that the Healthy Rivers Alternative fails the screening criteria while the others do not.

12. The SDEIS Fails to Consider the Full Range of Water Available for Transfer to Municipal Needs

The municipal and industrial water use policy cap, a policy on water use from the Colorado-Big Thompson system set by the Northern Colorado Water Conservancy District, is capricious and arbitrary and should not have been applied by the Corps to consideration of the Healthy Rivers Alternative. HRA Tech Report at 50-51. The cap is a limit on existing water supplies and storage infrastructure in the Colorado-Big Thompson system that could be utilized to meet current and future water needs. Such a policy unnecessarily limits water supplies that could be legally purchased and dedicated for municipal and industrial water uses like those desired by the NISP subscribers.

13. The SDEIS Fails to Consider a Meaningful Range of Alternatives, Again

The Corps has fundamentally failed its duty to provide the reviewer with a meaningful range of alternatives for consideration. All of the alternatives under consideration, including the No Action Alternative, are comprised of large reservoirs. If the Corps was correct in constructing the purpose and need, which it is assuredly not, the legal standard for "range of alternatives" requires contemplation of something other than minor variations of the preferred alternative. STP objects to this violation of the

intent of NEPA (40 C.F.R. 1500) and outlines specific issues with the Corps process that lead to this outcome throughout this document.

14. The SDEIS Fails to Establish the Reasonableness and Feasibility of the No Action Alternative

NEPA requires a No Action Alternative, a status quo scenario indicating what would happen if the permit was denied that functions as an environmental baseline facilitating a meaningful evaluation of project impacts. *Half Moon Bay Fisherman's Marketing Association v. Carlucci*, 857 F.2d 505, 510 (9th Cir. 1988). The No Action Alternative must incorporate actions if they are "predictable" results of the permit denial. "Forty Most Asked Questions Concerning CEQ's National Environmental Policy Act Regulations," Question 3, 46 Fed. Reg. 18,026, 18,027 (March 23, 1981). The development of a No Action Alternative should be a straightforward process that requires an understanding of current conditions.

The SDEIS and supporting documents disclose that the Corps undertook an elaborate process, driven by the project participants, to identify a No Action Alternative for NISP. SDEIS at 2-16, 2-19; "Northern Integrated Supply Project No Action Alternative Evaluation" (NAA Evaluation) attached here as Appendix E (E52) *generally*. The Corps sought to determine what the participants would do in lieu of NISP; unfortunately, they instead determined what the participants would like to do. The Corps utterly fails to establish that the No Action Alternative has described represent either a reasonable or feasible outcome of the denial of the NISP application, relying on speculative planning rather than an analysis of predictable actions..

The Corps contracted a process to develop the No Action Alternative that was similar to that undertaken during action alternative development. The result is similarly indistinguishable from an action item and only differs from the NISP by its purported lack of need for a Corps permit. The Cactus Hill Reservoir is a component of both the No Action Alternative and the no-Glade Reservoir action alternatives (Alternatives 3 and 4). SDEIS at Table 2-3. The Corps failed to independently develop the No Action Alternative and instead accepted what the participants proposed. SDEIS at 2-19. Consequently, the design of the project and the underlying assumptions reflect the participants' preferences and assertions rather than a rigorous review.

Key among these assumptions is the belief that the 15 participants would undertake a "regional project" meeting all of their needs concurrently. SDEIS at 2-16. Although the SDEIS provides justification for this

choice of approach, the Corps and its consultant fail to provide any indication of its reasonableness. NAA Evaluation at 7 – 9. That is, although the "regional project" approach might be desirable (it is clear that the participants have "expressed interest" in such a project and might even take the first steps "pursue" one), there is no support for the concept that the assertion that might actually be possible. The consultant report states that the region has "a history of successfully developing regional projects" but of the seven examples that it cites, five are Northern Colorado Water Conservancy District projects (including NISP which has yet to be *See*n as successfully developed) and the other two, both filter plants, are operated by two and three entities respectively—exactly the small scale project that this No Action Alternative proposes to avoid. NAA Evaluation at 7. There is no evidence of a project on anywhere the scale and complexity of this one being undertaken without a central managing entity.

A basic tenant of NEPA is that an alternative must be non-speculative if it is to be considered reasonable. *Utahns for Better Transportation v. U.S. Department of Transportation*, 305 F.3d 1152, 1172 (10th Cir. 2002). Despite the elaborate alternative development process, the SDEIS discloses that the Corps actually has no idea what the participants might do in lieu of NISP.

> "In the absence of NISP, the independent Participants must meet their future water demands and it is not possible to predict with certainty the actual future response of the Participants."

SDEIS at 2-19.

Further, the SDEIS discloses that there is little certainty that the No Action Alternative could be implemented if the action items are all denied.

> "It is not known with certainty if the Participants could acquire adequate agricultural water rights to meet a firm yield of future demands.

SDEIS at 2-19.

The SDEIS fails to document any ditch share acquisitions within even two orders of magnitude of that required to execute the No Action Alternative.

> "It should be noted that the cost information presented in this discussion is primarily for transactions of small amounts of water. The highest transaction amount found was for slightly more than 200 acre-feet of water."

NAA Evaluation at C2.

The SDEIS states that even if water were available to the participants, they would still face challenging and lengthy water court proceedings to acquire the change of diversions that are critical for the No Action Alternative as proposed. SDEIS at 3-26.

The SDEIS discloses that the proposed No Action Alternative would impact extensive wetlands. SDEIS at 4-217. Under the Corps regulations, the No Action Alternative occurs when the permit is denied and does not include activity which would require a Corps permit. The Corps fails to establish that the wetlands impacted by this alternative are non-jurisdictional.

The SDEIS fails to disclose that Cactus Hill Reservoir, an integral component of the No Action Alternative as well as Alternatives 3 and 4, is adjacent and down-gradient of a proposed uranium mine, the Centennial Uranium Project. *See* "Centennial Uranium Project," attached here in Appendix E (E07). Although progress on the mine has been limited over the last few years, the mine's proponents indicate that they intend on pursuing the project. Appendix E (E07) ("The Company has engaged an independent mining consultant to prepare development scenarios for the Centennial Uranium Project in order to maximize the value that can be extracted from this project").

Much of the complexity and environmental impact associated with the proposed No Action Alternative is associated with the desired approach of making the alternative a "regional project" that provides the same firm yield that is desired from the action alternatives. The Corps has improperly incorporated these assumptions as guiding principles in its acceptance of the proposed alternative. NEPA does not require that the No Action Alternative meet the stated purpose and need of the project and the Corps must reject these criteria as they reflect a desired outcome of the project participants rather than an objective assessment of the likely outcome of permit denial. *See* 40 C.F.R. 1502.14(d) (requiring a no action alternative but not indicating that it must meet the project's purpose and need). It is natural that the participants would want to get what they sought in the permit application but there is no assumed right that they will do so granted merely by proposing a large project.

The Corps fails to establish with any certainty that the No Action Alternative, if it were indeed pursued by the participants, could be implemented successfully. By proposing such a likely infeasible scenario as the No Action Alternative, the Corps has failed to meet the intent of NEPA to establish a meaningful

baseline for comparison with the action alternatives. It appears to be at best a "straw man" worse-case scenario set up to make the action alternatives look better when analyzed in the SDEIS.

The Corps must re-consider its development of the No Action Alternative. The Corps must undertake an independent process that objectively identifies what is likely to actually happen rather than what the participants would desire to happen. To do so, the Corps must consider existing practice and trends in water acquisition, and develop a scenario that is both likely and feasible. If the Corps retains the current No Action Alternative, it must refine the alternative by eliminating the proposed changes of diversion points. SDEIS at 2-21. The proposed diversion changes contribute significantly to the environmental impact and infeasibility of the alternative but are not essential to its function (the water could be piped from its current diversion points to the regional facilities). The Corps must establish that any wetlands potentially impacted by the alternative are either not jurisdictional or are otherwise exempt from a Corps permit; failing this, the Corps must reconsider the project to eliminate destruction of the identified wetlands. The Corps must also consider the potential impacts on the Cactus Hill reservoir and its stored water and operations from the proposed Centennial Uranium Project, as well as the impacts of the reservoir on the mine. The Corps must also consider No Action Alternative options that do not take the "regional project" approach and do not provide the desired firm yield but still partially meet the needs of the participants.

Critically, the project proponent itself has called into question the practicability of the Cactus Hill Reservoir that is the critical component of this alternative, allowing it to function as a "regional project." SDEIS at Table 2-3, 2-19.

> "While Cactus Hill was proposed as an alternative, additional studies through the EIS process have lead Northern Water to have serious concerns about the practicability of a Cactus Hill alternative[.]"

"Northern Water Response to City of Fort Collins Staff Comments," attached here in Appendix E (E20).

The SDEIS fails to disclose these concerns and offers the reservoir as a viable option. If Cactus Hill is not a practicable action, the Corps must withdraw it from consideration and reconsider the No Action Alternative as wells as Alternatives 3 and 4. If Alternative 2, the preferred alternative, is the only "practicable" alternative considered under the SDEIS, the Corps has failed at even the most basic duties under NEPA and the CWA.

15. The SDEIS Alternative 2 is Speculative as it Fails to Meet the Stated 40,000 Acre-foot Firm Yield Threshold

The SDEIS acknowledges that the water rights associated with NISP are insufficient to fill Glade and Galeton Reservoirs and to keep them operational under all foreseeable conditions:

> "Modeling indicates that there can be several years in a row of divertible flow followed by **as many as 8 years with no flow available**. Therefore, it is possible that divertible flows from the Poudre River may not be available under the Grey Mountain water right to fill Glade Reservoir at the start of NISP."

SDEIS at 2-47, emphasis added.

> "**The alternatives are not sized to meet full firm yield requirements during more severe droughts**, such as the recent drought of the early- through mid-2000s. For example, the most recent drought (2000–2005) was more severe than those experienced earlier in the modeled period. Based on model results, in severe droughts such as that of the early 2000s, it is anticipated that the NISP Participants—either as a group or individually—may pursue water supplies through any available options declared legal by the state."

SDEIS at 2-48, emphasis added.

The draft operations plan is equally explicit:

> "The project is not sized, however, to meet full firm yield requirements during more severe droughts such as the recent drought of the early- through mid-2000s. **The Grey Mountain water rights on the Poudre River would have very rarely been in priority during the early- to mid-2000s**. Moreover, the historically more frequent SPWCP water rights on the South Platte River would have been in priority much less than typical during the recent drought period (IY 2000-2005) and would therefore have yielded much less water during the drought compared to the long-term average (IY 1950-2005)."

"Final Draft Report, Northern Integrated Supply Project Supplemental Draft Environmental Impact Statement Operations Plan Report" (Operations Plan Report), attached here in Appendix E (E56) at 7-2.

> "In [drought events such as those experienced in the 2000s which are likely to become more common with climate change] it is expected that NISP Participants would still require water supplies, even while curtailing their demands through aggressive drought-response measures. Additionally, because of the conservative nature of municipal water supply planning, it is unlikely that Participants would be willing to fully draw down their supply in Glade Reservoir or Cactus Hill Reservoir on the hope that supplies would be available the following year. This type of response to drought would be similar to actual operations of other major municipal water supply systems along the Front Range during the early 2000s drought"

Operations Plan Report at 7-3.

The SDEIS makes it clear that the proponent and the Corps have failed to successfully identify the necessary water sources to successfully implement NISP. Consequently, the SDEIS asks for "operational flexibility" for the initial fill and for anytime during droughts to operate NISP. That SDEIS states that operational flexibility is needed to allow the participants:

> "The ability to use sources of water other than the Grey Mountain water right—such as the Participants' own C-BT water—for the initial fill of the Glade Reservoir.
>
> - The ability to use out-of-priority storage to fill Galeton Reservoir when situations allow.
> - The ability to enter into dry-year leasing or interruptible supply contracts with agricultural irrigation users to meet project water needs during droughts similar to that which occurred in the early 2000s.
> - In addition to these three operational scenarios, which are discussed in the following sections, NISP Participants would have the ability to buy and sell their portion of NISP yield by contract."

SDEIS at 2-46 – 2-48.

Although the SDEIS for NISP proposes to use participants' already diverted Colorado-Big Thompson water and other sources for the initial fill and for anytime during droughts when operational flexibility is needed to store or deliver water for NISP, the Corps provides no explanation of how this would occur. Given the reasonable assumption that the participants are already using this Colorado-Big Thompson water—if they have surplus water then there is no need for NISP—this C-BT water is not actually

available. Further, in a drought, we would assume that there is no or little surplus C-BT water available from other sources to be purchased for NISP.

Operational flexibility is also invoked to allow the participants to acquire all water sources they can, even those that were previously eliminated from consideration as alternatives to meet the needs that NISP is designed to salve:

> "Dry-year leasing and water banking were previously evaluated as water supply concepts for NISP (HDR 2007, Appendix R and Appendix S), but the concepts were both eliminated because they did not meet the firm yield screening criterion defined for the EIS alternatives evaluation. However, in severe droughts such as that of the early 2000s, it is anticipated that the NISP Participants—either as a group or individually—may pursue water supplies through any available options declared legal by the state."

Operations Plan Report at 7-3.

The SDEIS fails to explain how Alternative 2, which by the Corps' own analysis will be unable to achieve full operations with its designated water sources, fulfills the alternative screening threshold that requires each alternative to provide 40,000 acre-feet of annual firm yield. STP disputes the validity of this threshold, but if the Corps insists on applying it, the Corps must do so consistently and competently. The SDEIS also fails to explain why other alternatives that failed the firm yield threshold, such as the Healthy Rivers Alternative, were not modified to invoke operational flexibility in terms of speculative additional water acquisition to pass the screen. Finally, the SDEIS fails to establish that the participants have any surplus Colorado-Big Thompson water or other sources of available water to use for "operational flexibility."

The SDEIS, in the mitigation plan, discloses that there is a risk that oil and gas development at the Galeton Reservoir site could lead to contamination of reservoir water. SDEIS Appendix F at 56 ("Develop protocols that would be followed in the event that a leaking oil and gas well is discovered after reservoir filling"). Such contamination potential is also addressed in STP's comments on the Galeton Reservoir site oil and gas wells. The SDEIS fails to consider how such contamination would impact the overall project's ability, as implemented through Alternative 2, to provide the designated firm yield. The SDEIS also fails to consider how the costs associated with the removal of oil and gas wells and acquisition of mineral

rights impacts the feasibility of the development of Galeton Reservoir. *See "*The SDEIS Fails to Adequately Consider the Impacts of Oil and Gas Wells at Galeton Reservoir Site."

The Corps also fails to consider and disclose how the inability of the project proponent to successfully execute the proposed water exchanges required for the SPWCP could impact the ability of all of the action alternatives, including Alternative 2, to provide the desired 40,000 acre-feet of firm yield. The loss of the water to be obtained through the SPWCP would undermine the feasibility of all of the action alternatives. The Corps must independently establish and disclose the likelihood of the success of these water exchanges before it can consider the ability of the action alternatives to meet the 40,000 acre-foot threshold.

The Corps must disclose the specific water sources that will be used by the project proponent under the concept of "operational flexibility," including for initial infill and ongoing operations, and must independently consider and disclose all environmental impacts associated with use of those water sources, including but not limited to any sources from Colorado's west slope such as tributaries to the Colorado River. The Corps must specifically address the feasibility of the acquisition of water from each source, considering cost, logistics, impacts, and legal availability. The Corps must also specifically consider the time frame for acquisition and implementation of those water sources, including, but not limited to, the burden of seeking approval for water right changes through water court. STP has previously submitted comments on this subject and attaches and incorporates those comments here as "Analysis needed in the SDEIS, the WGFP FEIS, and the Moffat Collection System Project FEIS of impacts of the Northern Integrated Supply Project on the Upper Colorado River, including cumulative impacts" (letter from Gary Wockner to Chandler Peter, April 10, 2011), attached here in Appendix E (E33).

16. The SDEIS Alternative 2 is Speculative as There is No Reliably Available Undiverted Water in the Cache la Poudre

In an over-appropriated system like the Poudre (SDEIS at 3-28, average annual diversions are 101% of the flow measured at the canyon mouth), the possession of a water right is less important than the presence of physical water – the paper right is only meaningful if the water is actually there. Agricultural water rights along the Poudre are very senior while the conditional Grey Mountain right is very junior. "Water Administration in the Cache la Poudre River Basin Technical Memorandum" (SDEIS technical report) at 6. As described above, the SDEIS demonstrates that the junior priority of the conditional Grey Mountain right coupled with the small amounts of actually available "new water" in the Cache la Poudre

leave the project participants at significant risk of falling short of their alleged water supply needs. Similarly, the proposed No Action Alternative (Alternative 1) is described as including a new junior right that would yield 750 acre-feet—but only in the two wettest year in the historical record. SDEIS at 2-22. Presumably, the project participants would utilize new diversions to the full extent possible and we can only assume, as the SDEIS provides no proof to the opposite, that this poor yield represents the state of available water in the Poudre.

It is clear from the SDEIS' own analysis that new diversions from the Poudre, conducted under junior water rights, are incapable of supplying a meaningful amount of firm yield to address the proponent's stated needs. In order for a water provider to generate true firm yield, the provider must seek out water sources that can deliver reliable water under all climatic conditions. In an over-appropriated basin like the Cache la Poudre basin, water providers should be focusing on established senior rights, not conditional junior.

The SDEIS fails to address this reality or to adequately weight the consistency of water sources when evaluating each alternatives "firm yield." STP rejects the Corps use of a 40,000 acre-feet threshold for alterative selection, but if the Corps is going to apply such a screen, the Corps must revisit its process and eliminate components of alternatives, such as those of the action alternatives, that rely on new diversions from the Poudre and consequently do not contribute a significant portion of this firm yield threshold.

17. The SDEIS Alternative 2 Is Speculative As It Relies on Water Exchanges That May Not Be Feasible

All of the action alternatives, including Alternative 2, rely on the South Platte Water Conservation Project (SPWCP) for a significant portion of their water supply through exchanges with irrigation companies that require substitution of newly diverted South Platte water for the companies' existing Cache la Poudre diversions. SDEIS at 2-31. The SDEIS states that the South Platte diversions would provide an average of 28,400 acre-feet and a maximum of 63,500 acre-feet annually to NISP, while the Poudre River diversions under Alternative 2, for example, are stated as an average of 35,100 acre-feet and a maximum of 92,300 acre-feet annually. SDEIS at 2-31, Operations Plan Report at Table 3.1.

Unfortunately, the SDEIS fails to establish that these water exchanges are practicable. Although the Corps asserts that the water sources have been acquired (SDEIS at 2-48, "The District owns the water

rights with the necessary points of diversion and storage for Alternative 2") this assertion fails to recognize that the proposed actions are not fully under the control of the project proponent and that the South Platte water controlled under those rights will not be directly conveyed to the participants:

> "**The District is presently negotiating** with the Larimer-Weld and New Cache Canal companies regarding the compensatory measures that the ditch companies may require for allowing NISP to exchange on irrigation water delivered by the ditch companies. **These measures would address concerns expressed in discussions with the ditch companies related to the requested change in their historical ditch operations and their perceived receipt of lesser quality water**. **The specific measures** to be provided under agreements reached by Northern Water and the ditch companies **may include a range of options**, such as monetary compensation and/or the District providing the ditch companies water and storage from NISP or another facility. The **Corps will analyze effects associated with these measures and determine whether additional NEPA evaluation is needed**."

SDEIS at 2-36, emphasis added.

Although the Corps discloses that an agreement with the irrigation companies is still pending, it fails to provide any details on those negotiations or acknowledge or consider the implications to the action alternatives if these negotiations were to fail and the exchange water for SPWCP were to not be available. The irrigation companies clearly have concerns about the quality of the water that would be available to them and consequently that water may not be acceptable regardless of the conditions proposed. SDEIS at 4-150 ("Elevated salinity and selenium concentrations in Galeton Reservoir releases to the canals are expected to result in a decrease in crop yields where the water is used for irrigation"). As the Corps has failed to fully disclose the risks of oil and gas contamination to Galeton Reservoir water (*see* "The SDEIS Fails to Adequately Consider the Impacts of Oil and Gas Wells at Galeton Reservoir Site"), the irrigation companies may not have a full understanding of consequences they may face from the exchange. Further, if the companies are the willing to accept the water, they may require conditions, monetary or otherwise, that either undermine the functionality of NISP or pose too great of a burden on the project proponent. As the Corps fails to disclose more than superficial information regarding the negotiations, however, the public is unable to provide meaningful review of the likelihood of the exchanges or the dependent alternatives.

NEPA requires that alternatives be feasible and not be speculative. *Utahns for Better Transportation v. U.S. Departent of Transportation*, 305 F.3d 1152, 1172 (10th Cir. 2002). Without the SPWCP water, none of the action alternatives, including Alternative 2, can acquire more than half of its intended water and cannot be seen as feasible. The Corps must independently establish and disclose, rather than accept on faith, the likelihood of the project proponent's success in establishing and maintaining the needed water exchanges. The Corps must ensure that the irrigation companies are fully informed of the risks Galeton Reservoir water from potential oil and gas contamination. If the exchanges cannot be reasonably assured, the Corps must reject further consideration of these alternatives. The Corps must also consider the likelihood of, and independently review the environmental impacts of, the refusal of the irrigation companies to accept the water exchange and the subsequent possibility that the project proponent would outright purchase the water.

Further, the Corps must not pass off review of the environmental impacts of the "range of options" that may be imposed by the irrigation companies to an unspecified future date and review process while continuing with the review of the action alternatives. These conditions may have significant impact on the environment and the feasibility of the alternative. If the Corps does not have sufficient information to competently evaluate these alternatives, it must halt the review process pending availability of that information.

The SDEIS acknowledges that there is a risk to the ongoing implementation of the water exchanges from the anticipated conversion of agricultural water rights to municipal use. SDEIS at 2-38 ("The District assessed the risk of the purchase of shares in the two ditch companies by others and the subsequent conversion of agricultural water to municipal use"). The Corps fails, however, to disclose the extent of that risk. The SDEIS cites a document ("Brouwer, C. 2013[,] Risk Associated with the South Platte Water Conservation Project Exchange[,] Submitted to U.S. Army Corps of Engineers[,] January 10") as a source for that risk assessment but that document does not appear to have been made available with the SDEIS. The Corps instead states that "[a] variety of techniques are available to ensure long-term reliability of exchange operations[.]" SDEIS at 2-38. This list appears to outline potential mitigation concepts rather than describe specific implementation techniques and fails to disclose which, if any, of these are to be incorporated into the action items and what the outcome of such incorporation would be.

The Corps must analyze and disclose the risks to the proposed water exchanges posed by sales of shares of the irrigation companies to non-agricultural uses. Such an analysis must include both the likelihood and the magnitude of the impacts of such sales, and must independently establish the likelihood of the long-term success of the exchanges. If the "variety of techniques" identified above are to be incorporated into the action alternatives, the Corps must describe them in adequate detail for the public to provide meaningful review and must consider and disclose their impacts on the feasibility of the action alternatives.

18. The SDEIS Alternative 2 is Speculative as It Relies on Galeton Reservoir Which May Not Be Filled Legally

All of the action alternatives, including Alternative 2, rely on the SPWCP for a significant portion of their water supply through exchanges with irrigation companies that require substitution of newly diverted South Platte water for the companies' existing Cache la Poudre diversions. SDEIS at 2-31. The South Platte water required for these exchanges would be stored in the proposed Galeton Reservoir. SDEIS at 2-31, 2-34.

The SDEIS states that it is likely that Galeton Reservoir will violate state water quality standards as soon as it is filled. SDEIS at 101, 102 ("Galeton Reservoir may need to be listed on the State's 303(d) List and/or the Monitoring and Evaluation List for some of the constituents listed above (*e.g.*, nutrients, chlorophyll a, and pH), due to anticipated high concentrations"). The SDEIS attributes this poor water quality to the composition of the source water from the South Platte River and the reservoir itself. SDEIS at 4-101. The Conceptual Mitigation Plan fails to present any concrete mechanism to avoid these exceedances. *See*, *in general*, SDEIS Appendix F.

The Corps' guidelines prohibit a discharge that causes or contributes to violations of any state water quality standards. *See* 40 C.F.R. 230.10(b)(1). The Corps cannot permit the construction and operation of Galeton Reservoir unless specific measures to avoid these exceedances are identified and mandated. The Corps must independently consider and disclose the feasibility of such measures and, if the exceedances cannot be successfully avoided, the Corps must strike the implementation of Galeton Reservoir from the action alternatives including Alternative 2.

19. The SDEIS Fails to Analyze Any of the Environmental Impacts of the Requested Operational Flexibility

The SDEIS acknowledges that the designated water sources are likely insufficient to meet the desired firm yield and invokes the concept of "operational flexibility" to disclose that the participants intend on using any water they can get their hands on to operate NISP. Unlike the DEIS, the SDEIS no longer explicitly proposes to use new Windy Gap, Laramie River, or Grand River Ditch water for the initial fill of Glade or Galeton, or for operational flexibility. However:

- Colorado-Big Thompson water is Colorado River water.
- The additional agricultural water that the SDEIS proposes to use for the initial fill or during drought could be from any source including Colorado River water that already is diverted through the C-BT, Windy Gap, Laramie River, or Grand River Ditch system.

The SDEIS for NISP proposes to use participants' "surplus water" or to buy or lease water from farmers for the initial fill and for anytime during droughts when operation flexibility is needed to store or deliver water for NISP.

In its discussion of operational flexibility, the SDEIS explicitly acknowledges that, "[t]his type of temporary alternate source of water supply is not captured in the modeling for the SDEIS but would be operated in compliance with all state regulations in order to prevent injury to other water users." Operations Plan Report at 7-4.

The SDEIS fails to analyze the impact on participants' existing water supplies of using this Colorado-Big Thompson water or how any Colorado-Big Thompson water would be available for the initial fill or ongoing operation flexibility of NISP especially during droughts.

The SDEIS fails to analyze the environmental and socio-economic impacts to farms of buying and leasing water for the initial fill or for ongoing operational flexibility for NISP, which could be in the tens-of-thousands of acre feet per year during the initial fill, during droughts, or at any other time NISP needed water. The SDEIS fails to analyze the environmental or socio-economic on farms of using "out of priority" storage to fill Galeton Reservoir. The SDEIS also fails to analyze the environmental impacts to the South Platte River of using "out of priority" storage to fill Galeton Reservoir.

The SDEIS fails to offer or discuss the source of this water, the diversion point, or amount, and thus fails to analyze the environmental or economic impacts of diverting this water from any river, including the Cache la Poudre River when, for example, the diversion point or amount is upstream of a current diversion point, which would likely be necessary to fill or operate Glade Reservoir.

In summary, the SDEIS discloses that NISP may utilize entirely different water sources than are described in the alternatives discussion in the document but utterly fails to analyze any of the impacts associated with the use of those sources. It is difficult to conceive of a more naked disregard of the requirements of NEPA or of the Corps' duty to the public in the environmental process review.

The Corps must re-consider and disclose its environmental impact analysis of Alternative 2 including the impacts associated with differing water sources that may be incorporated under the concept of operational flexibility as described here. The Corps must specifically include analysis of wetlands dry up that may result from diversion of water sources. If water sources under consideration are located or impact resources outside of the NISP study area, the Corps must revise the study area to fully cover the associated impacts.

20. The SDEIS Improperly Considers the Proposed Augmentation Flows under Alternative 2

The SDEIS describes winter "augmentation flows" as a component of Alternative 2. SDEIS at 2-42. The SDEIS also presents these augmentation flows as a key part of the Conceptual Mitigation Plan. SDEIS Appendix F at 37-42. This duplication allows the Corps to in effect double count the benefits of the augmentation flows. The SDEIS cites several occasions where these augmentation flows have a direct effect on the impact analysis. *See*, *e.g.*, SDEIS at 4-55 ("With the proposed flow augmentation program in place under Alternative 2, flows would improve to greater than 10 cfs about 93% of the time"). As the SDEIS is written, the Corps has failed in its duty to clearly describe the impacts and potential mitigation of the project. The Corps must determine if the augmentation flows are a component of Alternative 2 or mitigation for Alternative 2 and correct its documentation to reflect this decision.

While the concept of increasing flows during the winter is admirable, Alternative 2 proposes to accomplish this with water diverted during the peak flow periods. STP maintains that the peak flows are critical to river health. STP would like to see flow improvements in the winter months but not at the cost of the peak flows.

These voluntary releases from Glade Reservoir do not contribute to meeting the project's purpose and need. The flows are intended "to improve Poudre River streamflows, primarily during winter months when flows are low and NISP would generally not be diverting, in Alternative 2." SDEIS at 2-42. The purpose and need of NISP is to provide "new reliable municipal water supply" to the project participants. If the Corps determines that the augmentation flows are a component of Alternative 2, the Corps must disclose the rationale for including the augmentation flows into Alterative 2 and how they are relevant to the project's purpose and need.

The augmentation flows do not appear to avoid, minimize, rectify, or reduce the impacts of Alternative 2. 40 C.F.R. 1508.20. On the contrary, it is reasonable to assume that the augmentation flows will increase the impacts of the project by increasing the amount of water diverted during peak flow periods. The SDEIS indicates that the 3,600 acre-feet pool to be designated in Glade Reservoir for these flows were not incorporated in the demand modeling (Draft Operations Plan at 1-1) but the Corps does not indicate if the diversions to fill this pool were considered in the impact analysis in any form. Although the project proponent proposes that these augmentation flows would be "recaptured and reused," the Corps fails to disclose if that reuse, and an effective double counting of the available water, was incorporated into the impact analysis. Draft Operations Plan at 1-1. Further, reuse of the augmentation flow water is not supported in the SDEIS as a necessarily feasible action. *See*, *e.g.*, SDIES at 4-17 ("The exact method to return the water to Glade Reservoir will be determined between the SDEIS and the FEIS, but possible options include water exchanges").

The SDEIS states that the augmentation flows will not be maintained under all climatic conditions. SDEIS at 2-44, 4-17 ("Curtailment of streamflow augmentation releases may be required under extreme drought conditions when reservoir levels are low"). The SDEIS fails to disclose if that restriction is based on a lack of any active water storage within Glade Reservoir, the inability of Glade Reservoir storage to provide firm yield for project participants, or some other criteria. The Corps also fails to explain why the augmentation flow releases would have a lower priority than water supply provision, if that is the case, given that these flows are intended as mitigation for ongoing impacts. *See* SDEIS at 2-44. The Corps must quantitatively define the conditions (*e.g.* "extreme drought") under which mitigation requirements could not be met.

If the Corps determines that the augmentation flows are mitigation, the Corps must consider and disclose how the augmentation flows provide mitigation under NEPA and/or CWA. This analysis must

specify which impacts will be mitigated and the extent to which these flows will effectively mitigate those impacts. The analysis must also disclose the effect of the proposed mitigation if the augmentation flows are reduced or eliminated in unfavorable climatic conditions, and what the criteria for such reductions and/or eliminations would be. If the Corps determines that the augmentation flows are compensatory mitigation, the Corps must prepare and disclose an analysis documenting how the benefit of the augmentation flows outweigh the impacts that they cause.

The Corps must conduct an independent analysis of the project proponent's claims as to the legality and feasibility of the augmentation flows raised by the City of Fort Collins.

21. The SDEIS Fails to Adequately Consider the Difficulty of Arranging the Needed Water Exchanges

The viability of transferring 20kaf+ from Weld County up to a diversion point at the canyon remains in question, considering the extremely complicated legal process and the cost. In order to make this trade, the diversion point for more than 20,000 acre feet of water currently diverted at the Larimer Weld and New Cache canals would have be moved upstream to the Glade Reservoir diversion point at the canyon mouth. Such large water diversion point changes are rare, and they can take more than a decade to work through water court, if ever. It is unusual for trades like this to be executed without executing additional water exchanges with other water providers. STP questions whether this water trade can be executed efficiently or cost-effectively.

No public records appear to be available indicating that the project applicant has secured agreements with the affected ditch companies to support the proposed water transfers.

22. The SDEIS Fails to Establish the Feasibility of Siting Glade Reservoir upon Karst Formations

In a December 7, 2012, letter to the Corps, STP called the presence of Karst formations at the Glade Reservoir site to the attention of the Corps and requested that the Corps assess the hazards associated with the karst and the potential impacts of this situation on the cost of implementing Alternative 2. "Potential soil subsidence hazard at or near the proposed NISP Glade Reservoir dam site" (letter from John Bartholow and Gary Wockner to Chandler Peter, November 7, 2012), attached here in Appenidx E

(E34). The Corps failed to adequately address this issue in the SDEIS, merely noting the presence of the karst soils and deferring analysis of the implications to a later date.

> "The potential for karst features (solution cavities) in the Lower Ingleside Formation, which has been mapped in the lower right abutment area of the proposed Glade Reservoir Dam, **would be evaluated by future geotechnical studies** for the reservoir. Mitigation of solution cavities would be addressed in the final design, including a grouting program and other foundation treatment precautions."

SDEIS at 4-189, emphasis added.

The Corps must complete its analysis of the situation, including the implications for reservoir design and operations and project cost, before it can determine the feasibility of Glade Reservoir and Alternative 2. The Corps must disclose this information to the public in a manner that will allow for meaningful public review.

23. The SDEIS Fails to Consider the Impacts of the Pipeline Serving Eaton, Severance, and Windsor

The SDEIS states that water provided to Eaton, Severance, and Windsor "would be [delivered] by direct pipeline connection from Glade Reservoir to the Soldier Canyon Filter Plant" under Alternative 2. SDEIS at 2-42. The Corps, however, fails to provide any information on that pipeline, including alignment, size, cost, and environmental impacts. *See*, *e.g.*, SDEIS at Table 2-4 (listing zero miles of pipeline for conveying treated or untreated water to participants under Alternative 2). The Corps must describe the pipeline and independently consider and disclose the environmental impacts of its construction and operation if Alternative 2 is to be considered for permitting.

24. The SDEIS Fails to Take a "Hard Look" at the Impacts of Meeting the Project Participants' Full Needs

STP disputes the project purpose and need as identified in the SDEIS. However, if the Corps adopts their erroneous calculations of need, the Corps must incorporate that information into its review of the environmental impact of NISP. Specifically, the Corps must fully consider the projected needs in its cumulative impact analysis.

The Corps considers as Reasonably Foreseeable Future Actions those that would occur by 2050 and:

- The action would occur within the same geographic area where effects from the NISP alternatives are expected to occur (the cumulative effects study area is shown in Figure 5-1, and includes the District boundaries, outside of which, impacts from NISP are not expected to occur).
- The action would affect the same environmental resources as the NISP alternatives, and measurably contribute to the total resource impact.
- There is reasonable certainty as to the likelihood of the future action occurring; the future action is not speculative.
- There is sufficient information available to define the future action and conduct a meaningful analysis.

SDEIS at 5-2 – 5-3.

Clearly, future water supply development will meet the first two criteria. If the Corps is confident enough in its erroneous demand calculations to use them to inform the project's purpose and need, then the Corps must have "reasonable certainty" that the participants will undertake means to get their desired water. And, although it is difficult to know the exact source of water that will be used, the SDEIS establishes that there is no water available for new diversions from the Cache la Poudre.

The SDEIS documents demand curves showing that NISP will not curtail future demand. Compare Figure 1-3 and Figure 1-4 (Figure 1-4 illustrates NISP water online but not altering the demand curve); SDEIS 2-46 ("even conservation, which significantly reduces the demand curve should only be seen as delaying not avoiding demand"). The SDEIS is clear that the project proponent and participants will pursue all water legally available when they perceive a need. SDEIS at 2-48 ("in severe droughts such as that of the early 2000s, it is anticipated that the NISP Participants—either as a group or individually—may pursue water supplies through any available options declared legal by the state"). The SDEIS also explicitly states that participants continue and may continue to acquire agricultural water independent of NISP. SDEIS at 2-10, 2-11.

Consequently, the Corps must acknowledge that even if NISP is built participants will meet their water supply desires by acquiring agricultural water rights. The Corps must, for all action alternatives and the

No Action Alterative, give full consideration to the cumulative environmental impacts of the transfer agricultural water rights equivalent to the "surplus demand" identified.

25. The SDEIS Fails to Adequately Consider the Contribution of Peak Flows to the Health of the Cache la Poudre

The SDEIS completely fails to acknowledge the critical importance of peak flows in the Cache la Poudre River. These flows are of critical importance to the maintenance of a healthy ecosystem and water quality in virtually all Colorado Front Range rivers. *See* Appendix E (E35, E02, E26, E36, E29, E37, E04), Wohl 2001, Wohl 2014, Wohl 2004, Rosgen 1996. The body of peer-reviewed, scientific literature establishing this fundamental principal is vast and irrefutable. It extends far beyond the citations provided with these comments.

The NISP DEIS made the same critical, fundamental errors. The SDEIS does not appear to have been informed in any way by the public's comments on the NISP DEIS with regards to the importance of peak flows within the native hydrograph of the Cache la Poudre River.

The deficiencies of this analysis apply to nearly the entire SDEIS. The incidents where it appears are simply too numerous to mention. The SDEIS and its supporting technical reports consistently and routinely fails to address the role of peak flows in critical areas, or argues against their importance using arguments that are specious, illogical, and contrary to known principals of ecology, biology, physics and water chemistry as they apply to aquatic systems.

For these reasons, the SDEIS' complete failure to acknowledge the impact of these flows is a fatal flaw in the document, and violates the National Environmental Policy Act's requirements for accurate and full disclosure of a proposed project's impacts. The analysis is scientifically incompetent and it must be revised completely in a supplemental draft environmental impact statement.

STP discusses these deficiencies in the SDEIS in the appendix to this letter titled "NISP SDEIS Wetland and Riparian Review," attached here in Appendix D (D04). The City of Fort Collins identifies these deficiencies in their analysis of the SDEIS, and we endorse those comments. John Bartholow addresses this issue in his comments on the SDEIS provided to the Corps on August 26, 2015 (untitled, attached here in Appendix E (E03)), and we endorse those comments. Dr. Leroy Poff and multiple other commenters address these issues in their comments to the Corps on the NISP DEIS.

Bartholow's paper on minimum restoration flows for the Cache la Poudre River ("Constructing an Interdisciplinary Flow Regime Recommendation," attached here in Appendix E (E04)) was submitted to the Corps as a comment on the NISP DEIS on May 8, 2011. No reference to that paper or his comments appears to have been made in the SDEIS, and so we are providing that letter again for the public record along with the subject citation ("Recommended flow regime for the Cache la Poudre River and NISP permit," attached here in Appendix E (E38)).

In addition to these issues, the SDEIS failed to disclose and address the economic and environmental impacts of the project on the users of water rights junior to the Grey Mountain right in the South Platte watershed. At a minimum, the Corps must address the economic and environmental impact of the loss of these flows within the watershed. STP addressed those issues in their submittal of comments on the NISP DEIS to the Corps on March 16, 2011 (at E39). STP provides that letter again for the public record along with the subject citation (at E05).

Section 2.5.6, page2-44 of the SDEIS states the following: "Curtailment of streamflow augmentation releases may be required under extreme drought conditions when reservoir levels are low." What quantitative measure is proposed for what defines "extreme drought conditions"? Specifically, what reservoir volume would trigger a curtailment of augmentation flows for winter flow mitigation or mitigating water quality issues at water treatment plant outflows? Without such a proposed quantitative measure, the public cannot verify the veracity and practicability of proposed mitigation measures.

The Corps must develop and adopt a mitigation plan that incorporates the absolutely critical, fundamental, and inviolate importance of peak flows, as cited in this document, and which protects those flows. STP endorses the flow regime standards developed by Bartholow (2010) (at E38, E04) as the absolutely bare minimum flows required to keep the Cache la Poudre River healthy and functioning.

26. The SDEIS Fails to Establish the Validity of the Evaporation and Loss Rates Incorporated into Hydrologic Modeling

The SDEIS incorporates a very low evaporation for Glade Reservoir of 2.2-2.3%. SDEIS at Table 2-8 and Table 4-11, Draft Operations Plan at 3-30. The SDEIS uses a general loss rate of 5% for all alternatives. SDEIS at 2-52, 5-18. The SDEIS appears to incorporate higher rates for Alternatives 3 and 4 but fails to quantify what these rates might be. SDEIS at 4-77 ("Alternatives 3 and 4 would have greater net

diversions from both the Poudre River and the South Platte River compared to Alternative 2. This is due to the need to accommodate increased transit and storage losses (i.e., *See*page and evaporation) associated with Cactus Hill Reservoir, while still delivering full project firm yield to the Participants"). The SDEIS discloses that long-term average diversions for Alternative 2 are projected to be 43,300 acre-feet. This represents an 8.25% "surplus" for transit and storage losses over the 40,000 acre-feet firm yield demanded by the project.

The SDEIS fails to provide clear, quantitative support, based on local condition and proposed project design, for the loss rates incorporated into the analysis. The Corps must document its determination of rates incorporated into the modeling, must explain why they deviate from common practice if they do, and must disclose this information to the public in a manner that will allow for meaningful public review.

27. The SDEIS Fails to Present a Complete Water Quality Analysis

The SDEIS, at D-28, states the following (emphasis added):

> "Alternative 2 is the Proposed Action and the District's Preferred Alternative. This alternative meets the overall project purpose, existing technology, and logistics criteria and, therefore, is practicable. However, until the Phase II water quality modeling has been completed it cannot be determined whether this alternative would result in greater impacts to the aquatic environment than the other alternatives analyzed in the SDEIS. Whether this alternative is the LEDPA as defined by the Guidelines is unknown at this time."

The Corps reports in the SDEIS, at S-13 that it plans to complete a Phase II water quality and water temperature analysis.

Failing to prepare numerical water quality and temperature models does not allow for complete public comment during the SDEIS. It is critical for the public to evaluate the methods and assumptions made in creating a numeric water quality model. The environmental impact of the proposed reservoirs cannot be fully understood without a complete analysis. The SDEIS is incomplete due to this oversight.

The Corps must complete the Phase II water quality and water temperature analysis and provide for meaningful public comment before issuing a Record of Decision on NISP through another supplemental draft environmental impact statement.

STP endorses the Fort Collins comments on the SDEIS referring to water quality modeling as they come to similar findings.

The Phase II water quality and water temperature analysis must address the following issues:

- The SDEIS indicates that the proposed Galeton reservoir, when initially filled, would immediately qualify for the state's 303(d) list for exceeding water quality standards. No mitigation or other measures are proposed to address this public health risk.
- All of the action alternatives will reduce flows significantly. This means less dilution, so pollution problems will be exacerbated at water treatment plant discharge points along the river. Diverting water doesn't immediately change pollutant concentrations. However, downstream of diversions, an existing pollutant input will cause the concentration to increase more dramatically, since there will be less water to dilute it. This will be a problem for all of the State of Colorado 303 list pollutants for the Poudre River. The proposed diversions will ultimately cause standard exceedances, which means the project should not be completed according to the 404(b)(1) Guidelines at 40 C.F.R. 230.10(b).
- The 404(b)(1) Guidelines at 40 C.F.R. 230.10(b) specify that no discharge of dredged or fill material may be permitted if it will cause or contribute to violations of any applicable State water quality standard.
- The WQCC also has designated a narrative temperature standard (CDPHE 2013): Temperature shall maintain a normal pattern of diel and seasonal fluctuations and spatial diversity with no abrupt changes and shall have no increase in temperature of a magnitude, rate, and duration deleterious to the resident aquatic life.
- Section 4.12.3.3.1 states that "There could be a minor to moderate increase in summer temperatures that, if unmitigated, could have an adverse impact on trout."
- Excerpts from the SDEIS confirm that current diversions create an "abrupt change" in water temperature. A new diversion will violate the narrative temperature standard. Section 3.3.2.5 states the following: "Overall, these inflows and outflows result in fluctuating river temperatures, with inflows providing both cooler and warmer water and outflows allowing greater warming of the river with reduced water depth." Later in the section it says this: "Downstream of the fossil Creek diversion, temperatures increase sharply due to reduced flow rates."

- Of the action alternatives, the SDEIS indicates that alternative 4 has the least overall impact on dissolved oxygen and water temperatures, and alternative 1 is likely to have the least overall impact on overall water quality. In the technical report titled "Stream Temperature and Dissolved Oxygen Analysis for NISP Supplemental Draft EIS" (Hydros) concluded the following "Of all the alternatives evaluated, Alternative 1 is predicted to have the least effect to the water quality of the Poudre River." Unfortunately, the SDEIS treatment of water quality issues frequently uses double-negatives combined with obtuse and confusing language that has the appearance, at least, of attempting to conceal potential impacts of the project on water quality. Here is just one example of many, from section 4.3.9.2: "Generally, the anticipated adverse effects on stream temperature for Alternative 2 are expected to be less than those for Alternative 3 and greater than those for Alternative 4." This says that alternative 4 would have less of an impact on water temperature than alternative 2. As a result, the analysis of least environmentally damaging alternatives (LEDPA) must acknowledge these realities clearly and directly.

28. The SDEIS Fails to Adequately Consider the Impacts of the Alternatives on Wetlands and Riparian Vegetation

Like its various analyses of the importance of peak flows, the SDEIS analysis of wetlands and riparian vegetation is fatally flawed. Much of the reason for deficiencies is related to the failure of the document to acknowledge the importance of peak flows, however there are multiple contributing factors that lead STP to overall reject the findings of the SDEIS analysis of wetlands and riparian vegetation, sections 3.9, 4.9, and 5.9, and the associated technical reports on the topic.

STP completed its own analysis of the impacts of potential water development in the Cache la Poudre Basin on wetlands and riparian vegetation. STP provided this analysis to the Corps on December 17, 2012 ("NISP's impacts on riparian areas including wetlands along the Cache la Poudre River," attached here in Appendix E (E24)). STP is inserting these documents into the public record again as we see no acknowledgement of that work in the body of the SDEIS or the supporting technical reports ("Wetlands Impacts caused by the Northern Integrated Supply Project," attached here in Appendix E (E41)).

In section 3.9.5.1 the SDEIS explains they rejected the National Wetlands Inventory (NWI) maps (*see* "National Wetlands Inventory," available at http://www.fws.gov/wetlands/ and last viewed on August 30, 2015) for the Cache la Poudre Watershed because it uses the Cowardin Classification system,

whereas the Corps uses a different classification system. The Cowardin classification system is the most current classification system available and is accepted by the U.S. Fish and Wildlife Service in the National Wetlands Inventory. The Corps wetlands classification system has not been updated since 1987. There is an abundant number of suitable and well-documented cross-walk algorithms published to allow translating between the Cowardin and USACE Classification Systems (see, *e.g.*, "Supplemental Guidance for the Classification of Wetlands for the Update of the National Wetland Inventory for Minnesota," attached here in Appendix E (E42)). Instead, the SDEIS uses the Colorado Division of Wildlife (CDOW) (sic) riparian vegetation maps. The CDOW riparian vegetation maps are outdated and have a resolution of ½ acre, whereas the NWI imagery has a resolution of 1 meter, more than 2,000 times better resolution. The CDOW maps were developed from imagery collected well before the year 2000, whereas the NWI Inventory utilized the most current photograph imagery available in 2011. The NWI maps are more current, the resolution is better, accepted wetlands classification transfer functions are readily available. The NWI imagery indicates that the majority of wetland and riparian vegetation features have a resolution smaller than ½ acre. The decision to utilize the CDOW maps led to an analysis bias that incorrectly concluded a radically smaller impact on riparian vegetation than would have been concluded from using a more current classification method applied with more current, accurate, finely-scaled maps. The decision to utilize the CDOW riparian vegetation maps was capricious and arbitrary.

STP addresses the wetlands and riparian vegetation analysis in detail in reports titled "NISP SDEIS Wetland and Riparian Review" and "Supplemental Notes on the NISP DEIS and SDEIS analysis of Wetlands and Riparian Vegetation" (attached here in Appendix D (D04, D06)). The City of Fort Collins addresses wetland and riparian vegetation issues their comments on the SDEIS, which we endorse.

Before we summarize the details, we wish to address a larger issue indicating a clear bias by the Corps towards permitting large, damaging water projects and ignoring the cumulative impacts of those projects. This bias is perhaps most clear in the how the SDEIS analyzes wetlands and riparian vegetation. The SDEIS accepts a downward decline of these fundamental native ecosystems as inevitable and unstoppable in the face of past history and the long list of additional water diversions proposed for the Cache la Poudre Watershed. The background premise that there is no question that all of these projects will be permitted and their impacts will be felt throughout the watershed is fundamental to the structure of the SDEIS and its supporting technical reports. The documents systematically ignore the ecosystem services provided by wetlands and riparian vegetation and the long-term effects these systems have on water quality. Moreover, it seems to indicate that the Corps, as head agency charged

with managing and protecting our nation's waterways, is prepared to effectively abdicate its legally-defined role as impartial judge and simply accept the premise that any and all water project applications will be approved. That bias is in direct contradiction with the spirit and the intent of our nation's landmark environmental protection laws, including but not limited to the National Environmental Policy Act of 1969, the Federal Water Pollution Control Act Amendments of 1972, the Clean Water Act of 1977, the Water Quality Act of 1987, and the Endangered Species Act of 1973. These are the laws that the Corps is entrusted (and legally obligated) to uphold. It effectively kicks the can down the road into the legal system and shifts the burden of proof of environmental damage off of the backs of the project applicants, and onto the backs of the public. The Corps must instead shift the burden onto the project applicants, as the law clearly requires, to reveal the actual environmental damage attributable to projects, if built, and to and to demonstrate that the applicants have done everything that can reasonably be expected of them to minimize the consequences of a project if built. To date, the Corps has failed to do so.

Following is a summary of the details from our supporting technical review:

The SDEIS defines the resource trajectory of cottonwood forests as inevitably downward, effectively in a death spiral to a permanently degraded condition. This is contrary to evidence provided in our report on this issue and evidence provided by the city of Fort Collins. Evidence supporting the effectiveness of restorative and regenerative flows is abundantly clear (attached here in Appendix E (E02, E36, E26, E29)). In their analysis, the City of Fort Collins arrived at the same conclusion as us, and in a letter to the City of Fort Collins by the project applicant dated August 28, 2015, the Northern Colorado Water Conservancy District (Appendix E (E20)) indicated they agreed with this assessment.

The SDEIS and supporting technical reports dismiss the importance of native vegetation regeneration following 2013 floods, despite clear and unequivocal evidence to the contrary. Riparian cottonwood forests are the most common and most valuable riparian vegetation type in the Cache la Poudre watershed and it must be protected. Additionally, the SDEIS makes claims completely unsupported by the literature that pond shores are effectively replacement habitat for riparian cottonwood forests.

The SDEIS omits any discussion on restoration potential with environmental flows. Improved wetland and riparian habitat on similar rivers shows that degraded conditions can be reversed with flow management.

The SDEIS attempts to claim that wetland functions are achieved equally through open water (man-made ponds) compared with riverine wetland functions. With regards to water quality and habitat functions, open water is simply no replacement for riverine wetlands.

The document does not address the synergistic effects of climate change combined with the project's impacts on potential long-term environmental degradation in the watershed associated with loss of peak flows.

The SDEIS analysis depends upon return flows and agricultural nutrient mitigation to partially limit the negative effects of alternative 2. This is irresponsible, considering that the project applicant has no influence over the availability, timing, placement, and amount of return flows in mitigating project impacts.

Changing the hydrology of the floodplain could endanger nutrient cycling that mitigates non-point source pollution.

STP requested information on the irrigation-associated wetlands affected by the No Action Alternative. Appendix A (A04). STP did not receive that locational information before the close of the comment period, and therefore reserves the right to comment on the SDEIS regarding the location and extent of action wetlands losses associated with the No Action Alternative.

In addition to STP's analysis of the wetlands and riparian vegetation analyses, we reviewed the technical report treatment of the data on groundwater and surface water support for riverine vegetation in the watershed. The technical reports for the SDEIS rely on six groundwater monitoring transects, one transect located in each section of the river. From this analysis the SDEIS concluded that the Cache la Poudre River is a "gaining" river throughout its entire reach, and that nearly all riverine wetlands within the watershed are supported almost solely by irrigation return flows, with little or no support from peak flows from the Cache la Poudre River. The well locations and transects used to derive these findings are not a representative sample of the groundwater conditions within the watershed. STP conducted a stratified random sample of points in the riverbed center at one mile intervals from the canyon mouth to the confluence with the South Platte River. STP measured the proximity from river center at each of the 53 points to a nearby water impoundment, irrigation ditch or irrigated farm field or pasture. Five of the six transects sampled for the technical reports run directly towards and terminate adjacent to a water impoundment, or they run directly through a wetlands complex with a high water table. The

conditions at these limited, unrepresentative samples lead to the incorrect, unbalanced and statistically indefensible conclusion about the role return flows play in supporting wetlands and riparian vegetation in the watershed. According to our stratified sample analysis, the likelihood that the transects sampled for the NISP SDIES represents the groundwater conditions in the watershed are less than 10%. In all likelihood, the Cache la Poudre River is a "gaining river" and a "losing river" at intervals throughout its reach, and to use the findings from the groundwater transects to claim that peak flows have little or no role in maintaining wetlands and riparian vegetation violates scientific convention and is wholly indefensible.

The technical reports on wetlands and riparian areas indicate that wetland loss resulting from Alternative 2 would be 10 acres. Frankly, this is in irrationally low number, considering that STP's analysis indicates that at least 1,700 acres of riparian habitat, including 700 acres of wetlands would be negatively affected, and considering the consistent bias present in the analysis towards valuing the habitat value and fragility of irrigation-associated wetlands compared with riverine wetlands. Be that as it may, we were surprised to see that the SDEIS reported the loss as 9 acres of riverine wetlands, not the 10 acres reported in the technical reports. There does not appear to be any evidence of a rounding error. It leads us to wonder if this change is simply an error, or is another artifact of analysis bias, somehow related to the fact that the SDEIS threshold between classifying an affect as being minor and major is set at 10 acres.

The screening criterion for impacts on wetlands was set at 60 acres. As with the DEIS, no basis for this threshold was provided, and no explanation was provided in response to comments questioning this threshold value in the NISP DEIS. What is the basis for this threshold? It is capricious and arbitrary.

The DEIS and SDEIS have ignored a significant component of the terrestrial and aquatic biota, viz. bryophytes (mosses, liverworts and hornworts), fungi and lichenized fungi (lichens).

There is no assessment of the effects on the ecology of the vegetation and wetlands that will be affected. Effects are couched solely in terms of degree of effect (major, moderate, etc.) and area affected permanently or temporarily. Thus there is no connection made between the loss of grassland habitat and the effects this might have on fauna.

The Technical Report Supplement downplays the potential loss of thousands of acres of grasslands as 'negligible' in regional terms, yet the incremental loss of habitat is clearly of concern to the Corps (as demonstrated by the withdrawal of NWP 26 in 2000).

'Temporary effects' are treated in the DEIS and SDEIS as if they are always short-term effects that are expected to be ameliorated within approximately 5 years, when in fact they may occur over decades.

The DEIS and SDEIS are silent on the practicality of complete restoration of disturbed vegetation and wetlands, and say nothing about how restoration is to monitored and its success assessed.

Because the definition of wetlands has a regulatory purpose, some habitats that may be defined at wetlands in an ecological sense (*e.g.* using the FWS guidelines) may not be included in the delineation of wetlands.

Baseline data is referred to the existing naturalized condition, rather than potential or desirable condition. This precludes the consideration of opportunities to rehabilitate degraded habitats and reverse historical declines. It has also led to a chain of 'could do' statements in the SDEIS about what might be possible in terms of mitigation strategies after the completion of the project, instead of a consideration of mitigation and adaptive management as a fundamental part of the project proposal.

Edge effects and cumulative (i.e. knock-on) effects of habitat loss and degradation are not taken into account. Instead, the effect on a vegetation community or wetland is considered to be localized to that community or wetland and assumes that there will be no further effect on any other community of wetland.

The Corps must re-consider its wetlands and riparian vegetation analysis in compliance with these comments. The new analysis must be disclosed in a manner that provides for meaningful public review before the Corps makes any decisions on this project.

29. The SDEIS Fails to Adequately Consider Farmland Loss under the Alternatives

The SDEIS projects that 64,200 acres of irrigated farmland would no longer be irrigated under Alternative 1. The analysis begins in SDEIS section 2.4.2 and there are at least 46 references to this figure of 64,200 acres that follow. There is relatively little in the SDEIS analysis of this issue of farmland loss that has substantively changed from that in the DEIS, and we believe the analysis done for the DEIS

still applies ("A Review of the Likely Agricultural Impacts from the Northern Integrated Supply Project," attached here in Appendix B (B03)). A subsequent document, also previously provided to the Corps, ("The Farm Facts about NISP," attached here in Appendix C (C25)) applies as well, with the following additions to these documents:

1. The SDEIS projects that under operational flexibility for alternative 2 during dry years and for the initial fill of Glade Reservoir, an unspecified amount of additional agricultural water rights would be acquired by purchase or lease, and would be used to meet the project's firm yield delivery requirements. Yet, no projections are provided in the SDEIS of the irrigated farmland losses associated with either this initial fill or agricultural water transfers to NISP during the dry periods when the project could not meet its firm yield requirements. It does not appear to be clearly stated that the planned "operational flexibility" would extend to all of the project alternatives except for the "No Action Alternative", however we assume that it would considering the same weather-related streamflow limitations would apply to the Alternatives 2-4, and therefore it would be necessary to analyze the irrigated farmland loss projections to Alternatives 2-4.
2. The SDEIS analysis of the impacts of applying saline water to salt-affected soils in the Poudre and South Platte watersheds continues to be qualitative, as was the similar analysis in the DEIS analysis. No substantive quantitative analysis was done. This is a flaw in the SDEIS that must be corrected. The SDEIS fails to inform the public adequately about the actual impacts of the project on crop production and cropland soils.
3. The SDEIS ruled out rotational fallowing as a substantive alternative to permanent "buy and dry" and farmland loss. The SDEIS states that it is not a "proven technology" or method, despite the fact that hundreds of thousands of acre feet annually are being shared between municipal water users in Southern California and several California irrigation districts through this method. Rotational fallowing programs are being developed in at least two locations in Colorado – one in the Arkansas Valley, and another in the Cache la Poudre Basin. Rotational fallowing programs are a reasonably foreseeable future action in the Cache la Poudre River basin, have been proposed and discussed in lengthy detail in "Colorado's Water Plan (Draft 2, July 2015)," and will likely become one of the major sources of water for growing communities in Colorado. The SDEIS' failure to consider

rotational fallowing programs is a serious flaw that must be corrected in order to comply with NEPA and the CWA.

The Corps must address these concerns in a re-consideration of its analysis of farmland loss. The new analysis must be provided for meaningful public review prior to any decision making on this project.

30. The SDEIS Fails to Adequately Consider the Impacts on Air Quality from the Alternatives

The SDEIS noise impact analysis fails to address the cumulative impacts to those living to the east of the Hogback ridge, where Highway 287 would be moved if the project were permitted and built. The ridge provides a natural noise barrier for those who reside on the east side of the Hogback ridge. Without this barrier, these residents will be exposed not only to construction noise during the initial phase of the project, but also to non-dampened highway noise after the project is completed. With no major topographic features between the new Highway 287 and Interstate 25, this area will be flanked by two major highways, and the residents left to live with the noise and air pollution that accompanies them.

The EPA mobile emissions model for both on-road and non-road sources was officially changed during 2014 to now be MOVES2014 from MOVES2010. The work done in the SDEIS is both out of date and does not apparently use the official EPA mobile emissions model used in air quality modeling for both NEPA conformity and attainment planning. It is important that the project comprehensively estimate all direct and indirect mobile emissions associated with the life of the project using this new tool, and not rely upon: "Emission load factors were developed based on Median Life, Annual Activity, and Load Factor Values for Nonroad Engine Emissions Modeling, EPA-420-P-04-005 and AP-42 (EPA 2004)." The combined direct (on-site) and indirect (off-site but directly caused by the project including the highway and road re-locations) emissions will be much larger than presented in the SDEIS.

On August 27, 2015, the EPA published a proposed rule in the Federal Register: "Determinations of Attainment by the Attainment Date, Extensions of the Attainment Date, and Reclassification of Several Areas Classified as Marginal for the 2008 Ozone National Ambient Air Quality Standards" (available at: http://www.gpo.gov/fdsys/pkg/FR-2015-08-27/html/2015-21196.htm and last viewed September 3, 2015). The current Denver/Northern Front Range ozone nonattainment area will be "bumped up" to Moderate nonattainment status, requiring a new nonattainment plan and adding additional control requirements. This plan must demonstrate attainment or reasonable further progress toward attaining

the 2008 Ozone standard of 75 ppb by 2017. Any additional NOx emissions in 2017 or later will contribute to forming additional ozone and the potential for continuing nonattainment, and must be addressed in the SDEIS. The project must not contribute to continuing nonattainment, or prevent attainment by the statutory deadline.

In December of 2014 EPA proposed a revision to the current Ozone standard, to lower the level to somewhere in the range of 65 to 70 ppb. By federal court order, the EPA must decide to keep the standard at 75 or change it to a lower number in the 65 to 70 ppb range by October 1, 2015. This means that in the autumn of 2017, the area around the proposed Glade and Galeton reservoirs will continue to be nonattainment or may have to achieve a more stringent standard. The NISP project will be required to produce a plan to achieve nonattainment status for their activities, due in late 2020 or early 2021. Any additional NOx emissions in 2017 or later will contribute to forming additional ozone and the potential for continuing nonattainment. The project must not contribute to continuing nonattainment, or prevent attainment of the "2015 Ozone standard" by the statutory deadline.

The Corps must re-consider its air quality analysis and disclose its results in a manner that provides for meaningful public review prior to any decision making on NISP.

31. The SDEIS Fails to Adequately Consider the Impacts on Recreation from the Alternatives

In sections 3.16.7.2, 4.20.3.3.1 and 5.20.2.3, the SDEIS claims annual value of recreation at Glade Reservoir, at full development, to be approximately $13.2 million dollars. There are numerous fatal flaws associated with this estimate, which are detailed in the attached report titled "Review and Analysis of Effects on Recreation-related Economy: NISP SDEIS," attached here in Appendix D (D05). These issues are summarized as follows:

Using visitor data from lakes in surrounding States, a linear regression model with one dependent variable (surface area of reservoir) was used to estimate annual visitor days for Glade Reservoir, thus not accounting for substitute sites, travel time, or other significant variables. No statistical analysis was offered to verify the utility of the model, and none of the raw data from the study sites used to drive the model were made available. The model could be completely wrong, or it could have no statistical significance, and the public would have no way of knowing if that was the case and therefore could not verify whether the analysis was sound.

Furthermore, the SDEIS made fundamentally incorrect theoretical assumptions that led to inaccurate results.

The SDEIS assumes that changes in the flow levels of the Poudre River resulting in changes to aesthetic quality will have negligible or minor impacts on the recreational value of natural areas and SWAs along the Poudre River. Aesthetic quality is a determinant of demand for recreation, having a positive relationship with demand. Therefore, assuming that a change in aesthetic quality does not affect recreational quality results in understated negative impacts of Alternative 2. No existing studies, communications, new data or new analyses were offered to back up the assumption that changing flow levels would have minor impacts on the recreational value of these areas.

The SDEIS fails to account for the loss in recreation benefits caused by Alternative 2 with respect to the potential whitewater park. Although the SDEIS estimates that Alternative 2 would negatively impact boating on the Poudre River and decrease economic benefits $241,000 annually, it fails to update the economic value to 2011 dollars, and it fails to estimate the additional decrease in economic benefits associated with the potential whitewater park, ranging from a loss of $615,000 to $1,438,000 annually.

Finally this – the economic analysis projects the economic benefits would begin accruing at maximum value ($13.2 million) once the reservoir is filled and park resources are developed, however it provides no benefit-cost analysis to calculate the net present value of that economic activity, and it does not take into account the economic costs to the citizens of Larimer County involved with developing, maintaining and operating the park infrastructure.

In the end, the projected economic benefit of $13.2 million cannot be verified by the public, it fails to account for critical factors (such as cost and net present value) that any astute business person or economic development professional conducting a due diligence analysis would demand, and it is based on highly questionable assumptions that recreation at the reservoir, once complete, would operate at capacity immediately after construction is complete, when no basis for that assumption is provided.

The Corps must re-consider its recreation economics analysis and disclose the results in a manner that provides for meaningful public review prior to any decision making on NISP.

32. The SDEIS Fails to Adequately Consider the Impacts on Threatened & Endangered Species from the Alternatives

Economic growth and development, when un-tempered by adequate conservation measures, is a leading cause of the decline and extinction of threatened and endangered species. Baur and Irvin 2010. Fortunately, Congress enacted the Endangered Species Act in 1973 to conserve and protect such imperiled plants and animals. By law, an environmental impact statement (EIS) must thoroughly and honestly consider any potential impacts to federally-listed threatened and endangered species. 40 C.F.R. 1508.8, 40 C.F.R. 1508.25. The NISP DEIS and SDEIS fail to do this regarding the Preble's meadow jumping mouse (PMJM), a federally-listed threatened species. Thus the DEIS and SDEIS fail to meet the minimum legal requirements for an adequate EIS.

The NISP DEIS and SDEIS fail to provide adequate disclosure regarding mitigation measures for the PMJM, should any of the four alternatives analyzed in detail be pursued. They thus fail to provide necessary information for an informed judgment about whether pursuing NISP (or the other alternatives discussed) would violate the Endangered Species Act in this particular.

The DEIS and SDEIS also fail to properly consider viable alternative water supply proposals that not only would not adversely affect this small rodent, but that could actually benefit it by creating new mouse habitat and enhancing degraded habitat: specifically, the "Healthy Rivers Alternative" developed by Save the Poudre (2008) and "A Better Future for the Poudre River" developed by Western Resource Advocates (2012). Because the DEIS and SDEIS systematically ignore viable alternatives to an unnecessary "taking" of this threatened species, the building of NISP (or pursuit of the other three alternatives analyzed) would, in our opinion, constitute a clear violation of the Endangered Species Act.

Previous comments from Save the Poudre (Appendix B (B02)) on the DEIS's inadequate treatment of the PMJM were written by Robert Schorr, a scientific expert on the mouse. Those comments were based on a thorough review of the scientific literature and addressed critical problems with the proposed mitigation in the DEIS. None of our earlier concerns have been addressed in this SDEIS. Hence we reiterate our previous comments (Appendix B (B02)) in their entirety, including the "Addendum: further comments based on the 'Revised Proposed Rule to Amend the Listing for the Preble's Meadow Jumping Mouse.'" STP reinserts those comments into the record here (*see* attached) and provide additional comments in the document titled "STP Comments on NISP SDEIS Treatment of the Threatened Preble's Meadow Jumping Mouse" (attached here in Appendix D (D02)).

The proponent admits (SDEIS at S-1) that the project, if built, will also harm four threatened and endangered species of Central Nebraska: the whooping crane (*Grus americana*), the least tern (*Sterna*

antillarum athalassos), the piping plover (*Charadrius melodus*) and the pallid sturgeon (*Scaphirhynchus albus*) (hereafter "the Nebraska target species"). In their "Biological Opinion" on NISP, received by the U.S. Army Corps of Engineers October 5, 2007, the U.S. Fish and Wildlife Service concurs, stating that the water depletions associated with NISP are likely to reduce flows on the Platte River through Nebraska and that therefore NISP will adversely affect the Nebraska target species. DEIS page 21.

According to USFWS, the continued existence and recovery of these four threatened and endangered species depends on protecting and restoring water flows to the central and lower Platte River ecosystems. The survival of these species cannot be ensured without significant changes made to improve current environmental conditions. Committee on Endangered and Threatened Species in the Platte River Basin 2004; USFWS 2006a at 11). If built, NISP will instead degrade current environmental conditions, causing water depletions and decreasing peak flows along the Platte River in central Nebraska. For this reason, the U.S. Army Corps of Engineers must deny a permit for NISP under the Clean Water Act.

By law, an environmental impact statement (EIS) must thoroughly consider proposed projects' potential impacts on federally-listed threatened and endangered species. 40 C.F.R. 1505.8, 40 C.F.R. 1508.25. The DEIS and SDEIS fail to do so regarding the Nebraska target species, as documented below and in the Save the Poudre Coalition's earlier (2008a) comments. Thus the DEIS and SDEIS fail to meet the minimum legal requirements for an adequate EIS under NEPA.

By law, an EIS also must consider reasonable alternatives to projects that have the potential to harm threatened and endangered species. Despite the development of two such alternatives to NISP—the "Healthy Rivers Alternative" developed by the Save the Poudre Coalition (attached here in Appendix B (B07)) and "A Better Future for the Poudre River" developed by Western Resource Advocates (attached here at E51)—both the DEIS and SDEIS fail to seriously consider these and other alternative supply possibilities that could meet the water needs of affected communities while securing increased flows for the Nebraska target species, or at least not further harming them. In this way, too, the DEIS and SDEIS fail to meet the minimum legal requirements for an adequate EIS under NEPA.

These comments are explained in more detail in an attachment titled "STP Comments on NISP SDEIS Treatment of Threatened and Endangered Species in Nebraska" (attached here in Appendix D (D03)).

33. The SDEIS Fails to Adequately Consider the Impacts on Greenhouse Gas Emissions and Climate Change from Project Operations and

The SDEIS acknowledges that its analysis of greenhouse gas emissions is incomplete. The SDEIS analyzes the emissions from pumping water for the project, however it fails to address the direct emissions from reservoir construction, including fuels burned in construction equipment, emissions from the mining, manufacture, and transport of the cement, rock and aggregate materials used in reservoir construction. It does not take into account emissions from decaying vegetation and the decomposition of carbon in wetlands soils affected by the altered flow regime resulting from the project.

To address this deficiency, the Corps must prepare a supplemental draft environmental impact statement with a public comment period adequate for public review.

The total yearly emissions for NISP as proposed in the project's Draft Environmental Impact Statement would be at least 43,751 – 84,236 metric tons CO2-equivalent per year, depending on the action alternative chosen. These include energy required to pump water as well as CO2 emissions from soils and decaying vegetation associated with degraded wetlands and riparian vegetation. This estimate is highly conservative, as it does not include methane, carbon dioxide and nitrous oxide emissions directly from the reservoir surface and footprint, spillway or outlet, all of which have been shown to be significant source of emissions from reservoir operations worldwide.

In addition to these yearly emissions, the total emissions produced during the construction of the project would be at least 218,000 metric tons CO2-equivalents. These legacy emissions or "embodied emissions" for the project would represent at least 5 metric tons CO2-equivalents per acre-foot of water proposed to be delivered under the project, with at least 1 metric ton CO2-equivalents per acre foot of water proposed to be delivered each year. These are major greenhouse gas emissions at a time when we should be doing absolutely everything we can do to reduce greenhouse gas emissions in every aspect of our lives. STP provides a detailed analysis of the likely Greenhouse Gas Emissions from alternative 2 of the NISP project as "NISP SDEIS Comments on Greenhouse Gas Emissions from Project Operations and Construction" (attached here in Appendix D (D01)).

34. The SDEIS Fails to Adequately Consider the Impacts of Oil and Gas Wells at Galeton Reservoir Site

STP presented relevant information to the Corps in letters dated March 8, 2011 ("Oil and gas development under and near the proposed Northern Integrated Supply Project's Galeton Reservoir and required analysis under NEPA", attached here in Appendix E (E43)) and November 18, 2012 (*untitled*, attached here in Appendix E (E44)). All information included and requested analyses noted in those letters are hereby incorporated into these comments.

In an improvement to the DEIS, the SDEIS acknowledges the presence of current and historic oil and gas wells at the Galeton Reservoir site (*See*, *e.g.*, sections 2.5.8, 3.6.2.2, and 3.21.2.2). This information is primarily attributed to the document "Oil and Gas Development at the Proposed Galeton Reservoir Site Technical Memorandum" (January 2012). SDEIS at 3-4, 4-9. This analysis was apparently supplemented by a review of Colorado Oil and Gas Conservation Commission (COGCC) records in 2013 and 2014. SDEIS at 2-46, 3-226.

The SDEIS cites various and conflicting figures for the number of wells impacted by the proposed Galeton Reservoir that were apparently derived from inventories at different dates and for different geographic scopes. SDEIS at 2-46 ("Sixteen wells are within the reservoir footprint and three wells are within 500 feet of the footprint"), SDEIS at 3-91 ("39 producing wells and an additional 33 proposed wells on and within 0.5 mile of the proposed Galeton Reservoir site"), SDEIS at 3-226 ("31 producing oil and gas wells, 8 shut-in wells, and 11 plugged and abandoned wells are in the proposed Galeton Reservoir study area"). Note that STP was unable to find any competent definition of the "Galeton Reservoir study area" in either the DEIS or SDEIS.

The SDEIS states that the past and current wells have had satisfactory and unsatisfactory inspections, including multiple crude oil spills on the ground that have been cleaned up to COGCC standards. SDEIS at 3-226. The SDEIS discusses the wells from the perspective of potential hazardous materials resulting from drilling and operation-related spills, and concludes from a review of COGCC records—but no on-the-ground survey—that no risk exists. SDEIS at 3-226, 3-227. No other discussion of the impact of the presence of these wells is presented except the unsupported statement that "[t]he District anticipates that all of the wells would be abandoned by the operator before Galeton Reservoir was built. The District would relocate any well that would interfere with reservoir operations." SDEIS at 2-46.

The Conceptual Mitigation Plan also gives scant notice to the oil and gas wells, relying on a discussion of "a plan" and "protocols" to be developed to deal with potential issues with mechanical integrity of well bores, excavation, leaks and groundwater levels but committing to no mitigation activities. SDEIS Appendix F at 55-57. Rather than providing any transparency concerning the actual properties of and risks from the wells, the Corp makes the unsupported statement that "Northern Water has cooperated with and reviewed plans by the well operators to ensure that the operator's oil and gas development plans are consistent with the construction of Galeton Reservoir. Northern Water will remain in contact and coordinate with the operator as these activities progress." SDEIS Appendix F at 55.

The SDEIS explicitly identifies the analysis of oil and gas development at the Galeton site as one of the incomplete elements of the document that must be updated before the FEIS is issued. SDEIS at S-12, S-13 ("Before FEIS issuance, the Corps anticipates the District will complete the following activities", "Update the description and potential effect of oil and gas well drilling activities at the Galeton Reservoir site", "Perform additional hydrological assessments at the proposed Galeton Reservoir site to determine if fluctuating reservoir levels at Galeton Reservoir have the potential to mobilize any future contaminant plumes from oil and gas development in the area"), SDEIS at 3-91 ("Information on oil and gas well drilling activities at Galeton will be updated for the FEIS"). The SDEIS must therefore be seen as failing to take a "hard look" at the impacts of oil and gas wells at the Galeton Reservoir site.

The Corps must present a complete analysis with adequate public comment opportunity prior to completing the Final EIS. Although the comments here are directed at Alternative 2 and the proposed Galeton Reservoir, a similar analysis must also be conducted for the proposed Cactus Hill Reservoir.

A complete analysis of oil and gas development activity at the Galeton Reservoir site will include, but not be limited to:

Current Inventory of Existing Wells and Historic Well Sites

As discussed above, the SDEIS fails to provide a consistent inventory of the number of existing oil and gas wells and historic well sites that would be impacted by the proposed Galeton Reservoir. Current, geographically-attributed data is updated daily and readily available from COGCC. *See* http://cogcc.state.co.us/data2.html#/downloads. Any future analysis by the Corps must utilize the most current data available at the time of the analysis and must explicitly cite the download date for the data.

The Corps must also clearly define the geographic scope of its analysis. Accurate source data date and geographic scope are essential for the public to competently review the analysis.

On August 4, 2015, STP completed an inventory of oil and gas well permits within the vicinity of the proposed Galeton Reservoir. This inventory identified extensive changes from the inventory presented in the Technical Memorandum and illustrates the fluidity of the oil and gas development situation and the importance of current data: all of the wells listed as "planned" in the Technical Memorandum except for one have been abandoned; six producing, one shut-in, and eight planned wells were identified that were not included in the Technical Memorandum.

Importantly, the STP inventory also identified 11 producing and planned wells that appear to be located either within or immediately adjacent to the dam footprint as indicated in Figure 2-6 of the SDEIS. These well sites could pose additional difficulties for safe abandonment and/or dam maintenance. The Corps must explicitly identify all well located either within or immediately adjacent to the dam footprint in any future inventories.

The STP inventory also revealed that the majority of the wells in the Galeton Reservoir vicinity are developed on spilt estate lands, i.e., lands where the mineral ownership is held separately from the surface ownership. Split estate lands pose additional difficulties for acquisition activities. The Corps must explicitly identify all wells that occur on split estate lands in any future inventories.

Expanded Hazardous Materials Analysis

The Corps must complete a thorough review of the both the surface and sub-surface risk of hazardous material contamination associated with abandoned, current, and planned well at the proposed Galeton Reservoir site rather than relying on a review of COGCC records of surface spills.

The Corps' analysis of potential hazardous material contamination must be updated to reflect the current understanding of oil and gas development contamination risk as presented in the studies "A Public Health Review of High Volume Hydraulic Fracturing for Shale Gas Development," attached here in Appendix E (E45), and "Assessment of the Potential Impacts of Hydraulic Fracturing for Oil and Gas on Drinking Water Resources—External Review Draft," attached here in Appendix E (E46). Both of these studies indicate that hazardous material contamination occurs, and may be more likely to occur, than is indicated by the SDEIS analysis due to fluid migration in areas surrounding oil and gas wells.

The Corps must consider that a high potential for well casing failure may exist, even after abandonment, especially with the added pressure from the water in the proposed Galeton reservoir. If well bore integrity were to fail, hydraulic fracturing chemicals as well as oil and gas, brine, and naturally occurring radioactive materials (NORM) from the shale formation could leak into the reservoir. A 2014 study (Darrah et. al, 2014, attached here in Appendix E (E12)) documented contamination in drinking water wells near oil and gas wells. They determined the contamination was a result of well failures from poor cementation, improper, faulty, and failing production casings and one documented underground well failure. This shows that even if the wells are properly abandoned, the initial well construction may have issues that result in well failure and contamination of the well. A 2003 study (Brufatto, et. al, 2003, viewed at http://www.slb.com/~/media/Files/resources/oilfield_review/ors03/aut03/p62_76.ashx on 8/1/2015) showed that the majority of wells fail by maturity (60% of wells failed in 30 years in their study). The wells in this study were located in the Gulf of Mexico, so they were subjected to higher water pressures, as will the wells under the proposed Galeton reservoir.

Although the oil and gas industry prefers to cite studies that have shown that well casing failures are rare, the wells surveyed for these studies were all located on dry land and are not representative of the Galeton Reservoir situation. Wells within the proposed Galeton Reservoir footprint will be under water and therefore subjected to elevated pressure, as a result of the water on top of them. The Corps must consider the post-impoundment geologic impacts resulting from large and fluctuating weight of the proposed reservoir. The Corps must do so by consulting with a qualified expert who can provide expert advice on the post-impoundment landscape.

The Corps must consult with qualified experts and fully consider any special issues related to abandoned and/or sealed wells in an underwater environment. In particular, they must consider impact of the substantial weight that will be experienced at well sites from the impoundment as well as the unique weathering forces that will occur with fluctuating water levels, and the potential impacts of those forces on sealed well and well bore integrity.

The Technical Memorandum discloses that impounded water could cause a hydraulic gradient away from the reservoir, citing this as a rationale to not be concerned about adjacent wells contaminating the proposed reservoir. Oil and Gas Development at the Proposed Galeton Reservoir Site Technical Memorandum (an SDEIS technical report) at 8. There is, however, no discussion of the potential impacts resulting from the new hydraulic gradient carrying contaminates from well bores located under the

proposed reservoir footprint to nearby and adjacent water wells and/or surface seeps. A hydraulic analysis of the post-impoundment groundwater flow must be conducted with attention given to potential contamination off-site from spills or failed well integrity originating from abandoned, current, and planned wells located within the proposed Galeton Reservoir footprint.

The SDEIS states that hydraulic fracturing ("fracking") has occurred at the proposed Galeton Reservoir site. SDEIS at 3-91. Only about 30% of fracking fluid that is injected into a well during completion is recovered during the job. Studies have shown that over 75% of the chemicals used in fracking can affect skin, eyes and other sensory organs including respiratory and gastrointestinal systems. About 40-50% of the chemicals could affect the brain and nervous system, immune system, cardiovascular system or kidneys. About 37% affect the endocrine system and 25% of the chemicals have the potential to cause cancer or mutations. Colborn, et al., 2001, attached here in Appendix E (E10). There is also danger from high levels of salts (25-180 g/L) and naturally occurring radioactive materials and oil and gas. Vengosh, 2014, attached here in Appendix E (E28) and Abualfaraj, Gurian, and Olson, 2014, attached here in Appendix E (E01). The Corps must consult with qualified experts and consider the potential for contamination from lost fracking fluid.

Cost of Mineral Right Buy-out and Well Closure and/or Relocation Analysis

Although the SDEIS identifies numerous active and planned wells at the reservoir site and acknowledges that some or all of the wells may require relocation (SDEIS at 2-46, "The District would relocate any well that would interfere with reservoir operations"), the Corps undertakes no analysis of impact of these wells on the cost of the project. The only justifications for this omission are the unsupported statements of the project proponent that the wells will be abandoned prior to development of the reservoir. SDEIS at 2-46, "The District anticipates that all of the wells would be abandoned by the operator before Galeton Reservoir was built", SDEIS Appendix F at 55 "Northern Water has cooperated with and reviewed plans by the well operators to ensure that the operator's oil and gas development plans are consistent with the construction of Galeton Reservoir"). The SDEIS provides no meaningful data to support the conclusion that the wells will be abandoned at the time of reservoir construction and therefore fails to meet the "hard look" requirements of NEPA. As discussed above, the on-the-ground situation in the oil patch changes rapidly and there is no reason to take on faith that the wells will be abandoned and the minerals will be depleted in the time frame that the project proponent outlines for NISP. Recent developments in technology and techniques have extended the utility of wells that were

previously considered to be at the end of their productive lifespans. *See* "Refracking is the new fracking," attached here in Appendix E (E22).

The Corps must either: 1) provide a detailed cost analysis for the buy-out of mineral rights that would be impacted by construction and/or operation of the proposed Galeton Reservoir and well closures and/or relocations, or 2) a competently documented analysis of the life-span of the oil and gas field underlying of the proposed Galeton Reservoir that objectively supports the conclusion that all existing and planned wells as well as underlying mineral rights will be abandoned prior to the proposed reservoir construction.

A detailed cost analysis must include, but is not limited to:

1. An estimate of the cost of "abandoning" active and planned oil and gas wells that would be impacted by the proposed Galeton Reservoir. A recent University of Colorado study, "Assessment of Oil and Gas Industry Economic and Fiscal Impacts in Colorado in 2010" (2011, attached here in Appendix E (E48)), estimated that each oil and gas well generates an average $1.76 million/year in Colorado, and approximately $20 million over a well's lifetime. Any costs analysis must consider the full net present value of wells drilled at the time of inundation, as well as any industry infrastructure development costs that would be lost due to abandonment of the site, as re-location of the wellheads may not be possible. This estimate must explicitly address split estate lands and the possibility of acquisition costs for separate mineral rights and surface ownership and must document ownership records.

2. An analysis of the possibility of relocating wells in the affected oil and gas field and an estimate of the cost of relocating active and planned oil and gas wells that would be impacted by the proposed Galeton Reservoir. A 2014 Denver Post newspaper article, "Falling oil prices aren't dampening Colorado drilling" (attached here in Appendix E (E57)), estimates that the average cost of drilling an oil or gas well in Colorado is $4 million. This estimate must explicitly address split estate lands and the possibility of acquisition costs for separate mineral rights and surface ownership and must document ownership records.

3. An analysis of the impact of development of the proposed Galeton Reservoir on owners of currently undeveloped or not fully developed mineral rights on underlying lands and an estimate of the cost to buy-out all of the rights that would be negatively impacted. The Corps

must consult qualified experts and determine the lost net present value of mineral rights whose values will be reduced or eliminated. Current development reflects current market conditions rather than the true value of the minerals that might be impacted. Mineral right holders have extensive rights of access under Colorado law that could be compromised by development of the reservoir. This estimate must explicitly address split estate lands and the possibility of acquisition costs for separate mineral rights and surface ownership and must document ownership records.

Subsequent to developing the detailed cost analysis for the buy-out of mineral rights that would be impacted by construction and/or operation of the proposed Galeton Reservoir and well closures and/or relocations, the Corps must explicitly review the feasibility of all of the action alternatives that depend upon the proposed reservoir for their implementation. The Corps must reassess the overall project cost estimates and timelines and determine if each of the action alternatives continues to meet the alternative screening criteria.

Consideration of Flooding and Fracking Fluid Spills

The Corps must consider the potential for flooding upstream of the proposed Galeton Reservoir and the potential for fracking fluid spills into and near the reservoir. During the Colorado Front Range floods of 2013, there were 50 spills of fracking fluid and oil and gas development-associated wastewater in less than a week. The chemicals that are used in fracking fluids are often stored on site so there is potential for high concentrations of chemicals to be released into or near the proposed reservoir during a flood event. Colorado Oil and Gas Conservation Commission 2014 Annual Report, 2014, attached here in Appendix E (E49)). If the Corps permits NISP, the Corps also must develop as mitigation a specific emergency action plan for flood response.

Consideration of Surface Excavation on Well Sites

The Technical Memorandum states that the surface of the reservoir site will be scraped of unconsolidated material, potentially to a depth of the groundwater table (suggested at 18-35 feet depth within the reservoir site). Oil and Gas Development at the Proposed Galeton Reservoir Site Technical Memorandum at 7. The Corps must consider how such excavation will impact previously abandoned wells and how the excavation will impact the proposed reservoir-related well abandonment.

Transparency of Cooperation and Coordination between the Project Proponent and Well Operators

The Corps must not rely on blanket assurances about cooperation and coordination between the project proponent and well operators concerning the future longevity of the existing wells, future development, and the impact of the development of Galeton reservoir on oil and gas operations and vice versa. The Corps' reliance on these unsupported statements in the SDEIS (SDEIS at 2-46, SDEIS Appendix F at 55) utterly fails to meet NEPA's requirement for full disclosure and make it impossible for the public to meaningfully engage in the review of the NISP proposal. The Corps must provide documentation for, and critical review of, any such statements.

35. The SDEIS Fails to Adequately Consider the Impacts on the Local Economy of the Alternatives

The Corps fails to consider the economic impact on junior water rights holders whose water use would be displaced by the diversion of the Grey Mountain right under Alternative 2. Although it is a valid conditional right, no water has been diverted under Grey Mountain to date. The over-appropriated nature of the Cache la Poudre suggests that junior water rights are currently used to divert water that would be captured by the Grey Mountain right. The Corps must identify those water rights and independently analysis the economic impact of the loss of use of water under those rights.

The SDEIS states the recreational use of Glade Reservoir would be implemented by a "qualified vendor or lessee," likely Larimer County or Colorado State Parks. SDEIS at 2-34. The Corps fails to consider the costs of construction, maintenance and ongoing operations that would be incurred by the operator and the impact of those costs on the regional economy and taxpayers. The Corps must conduct an analysis of the costs associated with ongoing operations at the proposed reservoir and the impact of those costs on public entities and the regional economy.

36. The SDEIS Fails to Present a Reasonably Complete Environmental Analysis of NISP

In addition to the many shortcomings details above, the SDEIS itself acknowledges that numerous elements of the required environmental impact analysis are incomplete. SDEIS at S-12 – S-13. The SDEIS describes five activities to be undertaken by the proponent and 13 activities to be undertaken by the

Corps "before FEIS issuance." SDEIS at S-12 – S-13. Importantly, the Corps indicates that it "indicates" that these activities will be completed before the FEIS is issued; the Corps fails to assert that they will.

The activities that the Corps identifies at SDEIS at S-12 – S-13 are critical, although not internally sufficient, to the completion of a competent environmental impact analysis of NISP. The Corps must complete all of these actions and provide for meaningful public review of the results before any decision making on NISP. Such consideration and disclosure must be consistent with, and in addition to, the other actions called for by STP in these comments.

37. The SDEIS Unreasonably Portrays the Cache la Poudre as Suffering from Inevitable Decline

The SDEIS makes numerous references to the environmental conditions of the Cache La Poudre being on projected "trajectory" or trend SDEIS at 3-74 ("These consequences of past development are reflected in the current trajectory of the morphologic and sediment transport conditions of the mainstem"); *See*, *e.g.*, SDEIS at 3-77 ("The trajectory for the channel upstream of I-25 under current conditions is a continuation of spatially discrete episodes of alignment and profile instability during short periods of unusually high flow with prolonged periods of relative stability at other times"), SDEIS at 3-79 ("There are two main reasons why the trajectory for the river downstream of I-25 is different from the trajectory for the river upstream"), SDEIS at 3-118 ("The Martinez Park site demonstrates the trajectory of the riparian woodlands associated with the Poudre River from about Fort Collins to the confluence with the South Platte River"). The SDEIS cites this trajectory as a baseline for comparison of the environmental impacts of the alternatives. *See*, *e.g.*, SDEIS at 4-154 ("the predicted river response is presented and discussed in light of the current trajectory of river condition"), SDEIS at 4-213 ("For the assessment of indirect effects, first the trajectory of the riparian and wetland resources along the Poudre River was estimated to determine context for how changes in streamflow would potentially affect the future of the resources."). In general, the trajectory is described as a decline in river health. *See*, *e.g.*, SDEIS at 4-154 ("the trajectory of the river is expected to continue under Current Conditions hydrology as the result of ongoing channel contraction, fining of surficial material, and loss of channel complexity").

By invoking the inevitably of the projected trajectory, the Corps fails to conduct an objective "hard look" at the impacts of the alternatives. The Corp's use of "trajectory" and projected trends in the impacts analysis improperly minimize the impacts of the alternatives by characterizing those impacts on river health as a continuation of the status quo. *See*, *e.g.*, SDEIS at 4-157 ("Assessments of the effects of

Alternative 2 compared to the Current Conditions confirm an amplified trajectory of the river conditions"), SDEIS at 4-158 ("the ongoing trend associated with channel contraction downstream of I-25 would likely lead to an increase in overbank flooding"), SDEIS at 4-161 ("The result would be expected to reinforce the current net depositional trend"), SDEIS at 4-162 ("the river downstream of I-25 had crossed a bio-geomorphic threshold and is on a trajectory leading to a shallower and narrower channel"), SDEIS at Table 4-69 ("Changes in flows associated with Alternative 2 are predicted to accelerate and/or reinforce the well-established trajectory"). The Corps' approach also fails to properly document the significance of the incremental effects from Alternative 2 that would exacerbate impaired or degraded conditions.

NEPA requires a review of an alternative's impacts in comparison to current conditions not in relation to historic changes. STP and other commentators (Appendix E (E03, E08)) assert that the continued decline of the Poudre is not an inevitable outcome. The NISP review process must focus on the impacts of the NISP alternatives and not on what has occurred in the past.

The Corps must reconsider its environmental impact analysis and properly disclose the environmental impacts of each alternative as a function of the environmental change that the alternative generates in relation to the current conditions. The Corps must fully consider the contribution of Alternative 2 even if there are existing or projected impacts not caused by NISP.

B. The SDEIS Fails to Establish Alternative 2 as the LEDPA under the Clean Water Act

The Corps can only permit Alternative 2 (or any other action alternative) if it affirmatively establishes that there are no practicable options that have less adverse environmental impact than the action to be permitted. *See* 40 C.F.R. 230.10(a) ("[N]o discharge of dredged or fill material shall be permitted if there is a practicable alternative to the proposed discharge which would have less adverse impact on the aquatic ecosystem …"). The SDEIS fails to do this. Two of the project alternatives (3 and 4) have demonstrably less adverse impact on stream hydrology, water quality, aquatic habitats and wetlands and riparian vegetation.

The No Action Alternative analyzed in the SDEIS fails to represent the actual steps communities in the region are taking today to meet their water supply needs. *See* "The SDEIS Fails to Establish the Reasonableness and Feasibility of the No Action Alternative." The Corps has failed to refute that a No

Action Alternative that accurately reflects the outcome of a permit denial would also have less impact than Alternative 2.

Alternatives 2, 3 and 4 described in the SDEIS all have greater adverse environmental impacts on aquatic resources than the water supply initiatives the project participants are already pursuing and are likely to continue pursuing in the future. SDEIS at 5-13. These initiatives include traditional water purchases, conservation, water use efficiency improvements, alternative agricultural transfers (rotational fallowing agreements, interruptible supply agreements, water cooperatives, municipal-agricultural water use sharing, water banks, flex markets), water reuse, and reverse osmosis. They serve a critical role in meeting the region's water needs without requiring new diversions from the Cache la Poudre River and therefore not requiring a NEPA process or a 404 permit. These actions, by virtue of not impacting special aquatic resources, muse be assumed to have less adverse environmental impact unless shown otherwise. 40 C.F.R. 230.1 ("the degradation or destruction of special aquatic sites, such as filling operations in wetlands, is considered to be among the most severe environmental impacts ").

As there are practicable alternatives which would have less adverse environmental impact on aquatic resources, NISP must not be permitted.

C. The Conceptual Mitigation Plan Fails to Provide a Clear Assessment of Mitigation Measures Practicable for NISP

The Corps' regulations require that "mitigation measures will be clearly assessed" in an Environmental Impact Statement. 32 C.F.R. 651.15(b). Such an assessment requires a clear disclosure of potential mitigation measures and a thorough review of their practicability, coupled with details on monitoring and enforcement to ensure implementation 32 C.F.R. 651.15(b), 32 C.F.R. 651.15(h). The proposed Conceptual Mitigation Plan (CMP) fails to meet those standards.

In fact, the CMP cannot possibly provide a clear assessment of mitigation for impacts that are not understood. . *Ohio Valley Envtl. Coalition v. United States Army Corps of Eng'rs*, 479 F. Supp. 2d 607, 627 (S.D. W. Va. 2007). Until the Corps completes a competent environmental impact analysis, addressing the concerns raised by STP and many others, any consideration of mitigation must be seen as hypothetical at best. The vague measures presented in the CMP do little to advance a meaningful review of NISP.

The CMP does however alert reviewers to a bias towards project implementation with unsupported statements that seem intended to provide justification for Alternative 2.

> "Typically, aquatic resource mitigation efforts that address low flow conditions would be more beneficial than high flow periods (both enhancement of low-flow and low-flow channel improvements)."

SDEIS Appendix F at 17.

Absolutely no analysis or documentation is provided in the CMP to support this significant claim that goes to the heart of what mitigation for this project must address. The only apparent support for the claim is the following sentence,

> "Glade Reservoir provides an opportunity for low-flow aquatic resources mitigation."

SDEIS Appendix F at 17.

The logic appears to be that Alternative 2 would allow for low-flow augmentation, as has been proposed, so this should be our mitigation approach. Such an assumption utterly fails to provide a clear and objective analysis of mitigation potential and needs.

(Concerns with the use of augmentation flows as both project components and mitigation are discussed in "The SDEIS Improperly Considers the Proposed Augmentation Flows under Alternative 2" above.)

The most definite proposals in the CMP involve distribution of funds for various projects. *See*, *e.g.*, SDEIS Appendix F at 68 (Steam channel improvement plan, $1 million commitment), SDEIS Appendix F at 77 (channel structures, $200,000), SDEIS Appendix F at 85 (adaptive management program, $50,000 per year for 20 years; escrow account to implement actions developed in the stream channel habitat and improvement plan, $5 million), summary table at 239. Although specific numbers are presented in the document, there is no support for the funds proposed; no indication of how adequately they would address any of the yet-to-be-determined impacts or anyway mitigate the project's implementation. It is reckless and contrary to the intent of our environmental laws, which require objective consideration of the net impacts and benefits of a proposal, to offer up funds in a fashion that appears to *See*k to facilitate approval of the project.

Importantly, the CMP fails to address the most significant impact that would result from implementation of the Alternative 2 as we current understand it—the loss of the peak flows that are critical to river health. *See* "The SDEIS Fails to Adequately Consider the Contribution of Peak Flows to the Health of the Cache la Poudre." The CMP fails to provide any meaningful mitigation for these impacts even though there is no controversy that Alternative 2 will significantly curtail these flows.

Seemingly without a sense of irony, the CMP claims as "avoidance" mitigation components of the project that have been removed from the consideration by the applicant prior to development of the CMP.

> "Two of the most significant changes in the NISP/Glade Reservoir that avoid environmental effects are the movement of the proposed reservoir from an on-channel reservoir site to an off-channel reservoir site, and the elimination of a potential point-of-diversion that would have been upstream of the North Fork confluence with the Poudre River."

SDEIS Appendix F at 28.

The proponent gave up on the in-channel reservoir, for its own purposes, two decades ago. SDEIS Appendix F at 28-29 ("Through these processes, Northern Water determined that an on-channel reservoir was not environmentally or publically acceptable, and moved its preferred alternative to its current location at Glade Reservoir"). Further, an in-channel reservoir apparently would not have passed the Corps' own screening analysis. SDEIS Appendix F at 29 ("All on-channel reservoirs were eliminated through the NISP screening process"). The diversion point change was voluntarily discarded by the proponent between the DEIS and SDEIS and does appear to have been under serious consideration by the proponent. SDEIS Appendix F at 29 ("Another feature of the NISP project that has been informally studied by Northern Water"). The CMP fails to meet the intent and application of mitigation by seeking to claim that actions taken before the project has been proposed or approved can be considered as "avoidance" of impacts that will result from NISP.

Similarly, the CMP cites the proponent's willingness to comply with water court decrees on its water rights and curtail diversions when required to do so. SDEIS Appendix F at 35. Such compliance, fundamental to its implementation of the Grey Mountain right to NISP, fails to qualify as meaningful mitigation of the impacts from the diversions that <u>are allowed</u> under the Grey Mountain right.

The Corps must develop a competent mitigation plan through a clear assessment of practicable mitigation measures, and ensure the monitoring and enforcement of any adopted measures, if any of the NISP action alternatives are permitted. The Corps must base such a plan on a thorough environmental impact analysis and must complete and implement the plan in a manner that provides for meaningful public review.

D. The Corps Failed to Provide for Adequate Public Scrutiny of the Impacts Associated with NISP

1. The Corps has Failed to Provide Adequate Opportunity for Meaningful Public Review of the SDEIS

The SDEIS is nearly 1,500 pages long and is accompanied by dozens of technical reports. Its release comes seven years after the SDEIS and comes at a cost of "nearly $10 million." Appendix E (E20). Clearly, a massive amount of effort went into generating this unfortunately incomplete document.

Despite a thorough understanding of the effort that was required to generate this analysis and the scope of the final product, the Corps has only granted the public 75 days to acquire, review, and comment on the SDEIS. "NWO-2003-80509-DEN" attached here in Appendix E (E21). The Corps' action in this regard is a clear rebuke of the intent of NEPA.

> "NEPA **procedures must insure that environmental information is available to public officials and citizens** before decisions are made and before actions are taken. The information must be of high quality. Accurate scientific analysis, expert agency comments, and **public scrutiny are essential to implementing NEPA**.

32 C.F.R. 1500.1 (emphasis added).

Further, despite the volumes submitted for public review, the Corps has failed to make all of the information necessary to fully review the SDEIS publicly available. After an initial review of the SDEIS, STP submitted, on July 19, 2015, a Freedom of Information Act (FOIA) request for the Corps documents necessary for the public to fully understand several elements of the SDEIS including:

1. The alternative development and screening process, including the newly developed No Action Alternative;
2. Project cost estimation;

3. The water exchanges essential for a key component of NISP – the South Platte Water Conservation Project – to function;
4. The ability of the preferred alternative to meet the SDEIS' own firm yield criteria;
5. Data used to develop the critical irrigation-associated wetlands loss analysis; and
6. The failure by the Corps to respond to several relevant documents submitted by STP in a timely fashion for incorporation into the SDEIS analyses.

Appendix A (A04).

This request includes at least one document explicitly referenced by the SDEIS that does not appear to be publicly available.

STP did not receive a response its request until August 18, 2015, a date after the expiration of the 20-day response period that the Corps is allowed under FOIA (5 U.S.C. 552(a)(6)(A)(i)), which expired on or about August 10, 2015. The response indicated that the Corps "are trying to determine the volume of records we have responsive to your request and how long we will need to gather these records."

The day after STP received the response, believing that they would not receive the essential information in a timely fashion to incorporate the material into these comments, STP submitted a request to the Corps for an extension to the comment period. *See* Appendix A (A03). STP has received an acknowledgement of the receipt of that request but no acceptance or denial of the request. *See* Appendix A (A02).

The Corps has failed to provide the information needed to thoroughly review the SDEIS within the time that it has provided for that review. The Corps has also failed to provide a timely response to a reasonable and properly submitted extension request.

STP is unable to provide meaningful comments on the SDEIS issues cited above without the additional documents that have been requested. The Corps has failed to provide adequate opportunity for public review of the SDEIS, contrary to both the intent and implementation of NEPA.

2. The SDEIS Fails to Provide Information in a Clear and Readily Accessible Manner

The volume of information contained in the SDEIS can only be meaningfully reviewed if it is presented in a clear and readily accessible manner. The Corps has failed to do that and consequently fails to meet the

intent of NEPA. 40 C.F.R. 1502.1 ("Statements shall be concise, clear, and to the point, and shall be supported by evidence that the agency has made the necessary environmental analyses").

The sheer volume of the SDEIS (coupled with the unreasonably short review period granted to the public) makes it critical that the summary information presented in the main document be competent. Unfortunately, the Corps imposes qualitative classes on its impact descriptions. SDEIS at 4-3. The SDEIS defines these terms but does so with ambiguous, unquantifiable standards such as "slight" and "readily apparent." SDEIS at 4-3. The terms are then used for comparison of the impacts of the various alternatives. *See*, *e.g.*, SDEIS at Table 4-50, Table 4-53. By using these qualitative terms rather than the quantitative data determine during the impact analysis, the Corps fails to provide for a concise and clear comparisons in summaries. The Corps must reconsider and disclose its environmental impact analysis without the use of ambiguous impact classifications and must instead rely on quantitative measures or fully defined and quantifiable impact classes that meaningfully convey the differences between impacts.

II. The Corps Must Allow for Additional Meaningful Public Input

NEPA requires a "hard look" at the environmental impacts associated with a project. *Robertson v. Methow Valley Citizens Council*, 490 U.S. 332, 350 (1985). The Corps must complete numerous additional analyses in response to the Corps' failure to present a complete and adequate disclosure of both the environmental impacts associated with NISP and the potential mitigation. 40 C.F.R. 1502.22 ("If the incomplete information relevant to reasonably foreseeable significant adverse impacts is essential to a reasoned choice among alternatives and the overall costs of obtaining it are not exorbitant, the agency shall include the information in the environmental impact statement"). The Corps must provide for meaningful public review of these analyses before undertaking any decision making concerning NISP. *Colorado Envtl. Coal. v. Dombeck*, 185 F.3d 1162, 1172 (10th Cir. 1999) (A document prepared under NEPA must "foster both informed decision-making and informed public participation"). Failure to provide for such public review would clearly fall short of both the intent and implementation of NEPA and the Clean Water Act.

The Corps must not wait for the issuance of a Final Environmental Impact Statement to make these disclosures. 40 C.F.R. 1502.9(a) ("The draft statement must fulfill and satisfy to the fullest extent possible the requirements established for final statements"). The required disclosures must be made through either a revision to the SDEIS or another Supplemental Draft Environmental Impact Statement.

40 C.F.R. 1502.9(a) ("If a draft statement is so inadequate as to preclude meaningful analysis, the agency shall prepare and circulate a revised draft of the appropriate portion"), 40 C.F.R. 1502.9(c)(2) (The agency "[m]ay also prepare supplements when the agency determines that the purposes of the Act will be furthered by doing so").

The Corps' Project Manager for NISP, John Urbanic, has made a statement in an email that,

> The Corps has "not made a determination regarding how that additional information will be presented to the public prior to the Final EIS. At this time we do not anticipate having a formal comment period when the FEIS is released."

"RE: FW: Fort Collins/Larimer County NISP concerns," attached here in Appendix E (E50).

If the Corps will not offer public comment on the FEIS, as is indicated by this statement, the Corp must present any and all required additional analyses in either a revision to the SDEIS or in an additional Supplemental Draft Environmental Impact Statement. If the Corps fails in this duty, it must provide a meaningful opportunity for public review of the FEIS.

Re: Comments on the U.S. Army Corps of Engineers' Final EIS for the Northern Integrated Supply Project in Colorado

On behalf of several national, regional, and local non-profit conservation organizations including Save The Poudre: Poudre Waterkeeper ("STP"); Sierra Club, Save the Colorado, Waterkeeper Alliance, WildEarth Guardians, and Fort Collins Audubon Society ("Conservation Organizations"), we hereby submit comments on the U.S. Army Corps of Engineers' ("Corps") Final Environmental Impact Statement ("FEIS") for the Northern Integrated Supply Project ("NISP" or "the Project"). These comments incorporate by reference all previous comments individually and collectively submitted by Conservation Organizations and their officers. Although the Conservation Organizations continue to view the length of the comment period as highly inadequate to allow the public and topical experts to fully engage in the many new issues raised in the Corps' FEIS—let alone to sufficiently analyze them under federal law and the best available scientific evidence—these comments provide a general overview of the organizations' primary concerns with the FEIS. Towards that effort, the Conservation Organizations incorporate by reference the following expert reports addressing specific aspects of the FEIS and other relevant materials:

- Attachment A: Water Demand Analysis Report (LRB Hydrology & Analytics)
- Attachment B: CV of Lisa Buchanan (LRB Hydrology & Analytics)
- Attachment C: Alternatives Analysis Report (Gordon McCurry)
- Attachment D: CV of Dr. Gordon McCurry, P.G. (McCurry Hydrology LLC)
- Attachment E: Water Quality Report (Woodling Aquatics)
- Attachment F: CV of Dr. John Woodling, Ph.D.

- Attachment G: Analysis of Agricultural Water Supplies Projected to be Displaced by Development Processes on Colorado's Northern Front Range (STP)
- Attachment H: Fort Collins Whitewater Park Economic Assessment (Dr. John Loomis)
- Attachment I: Decoupling Article (John Fleck)
- Attachment J: Moffat Decoupling Comments (STP)
- Attachment K: FWMEP Comments (STP)
- Attachment L: Alternative Water Transfers in CO (EDF and WestWater)
- Attachment M: Larimer County Environmental and Science Advisory Board Comments

As discussed below, the FEIS is woefully inadequate to support the issuance of a Section 404 permit for the Project. It fails to demonstrate compliance with the criteria set forth in Section 404 of the Clean Water Act ("CWA") and its implementing regulations. To the contrary, the FEIS and other materials available to Conservation Organizations establish that, based on the existing record, NISP cannot satisfy the relevant permitting standards under the CWA. In addition, the FEIS fails to adequately analyze a full range of reasonable alternatives, as mandated by the National Environmental Policy Act ("NEPA"), 42 U.S.C. §§ 4321-4370m. Further, the Corps has failed to fully comply with the Endangered Species Act ("ESA") and the Bald and Golden Eagle Protection Act ("BGEPA"), 16 U.S.C. §§ 668-668d ("BGEPA"). Until compliance can be assured, the permit cannot be issued.

DISCUSSION

A. The Purpose and Need Statement is Too Restrictive, and Impermissibly Constrains the Range of Reasonable Alternatives, in Violation of NEPA.

An Environmental Impact Statement ("EIS") must "briefly specify the underlying purpose and need to which the agency is responding in proposing the alternatives." 40 C.F.R. § 1502.13. The purpose and need statement necessarily dictates the range of "reasonable" alternatives that the agency must consider in evaluating the environmental impacts of a proposed action. Therefore, an agency cannot define its objectives in unreasonably narrow terms. *See, e.g.*, *Colo. Envtl. Coal. v. Dombeck*, 185 F.3d 1162, 1175 (10th Cir. 1999) (providing that "the statements of purpose and need drafted to guide the environmental review process" may not be "unreasonably narrow"). Moreover, while an agency must take a private applicant's objectives into account when developing the purpose and need statement, it is the agency's responsibility to "defin[e] the objectives of an action." *Id.*

The Corps defined the project purpose and need in the Draft EIS ("DEIS"): "To provide the Project Participants with approximately 40,000 acre-feet of new reliable municipal water

supply annually through a regional project . . . which will meet a portion of the Participants' current and reasonably projected future additional water supply needs." FEIS at 1-5. The 40,000 acre-feet figure was based upon requests for additional firm yield submitted by the Participants. The Corps reported in the Supplemental DEIS ("SDEIS") that it "reviewed these 2011 demand projections . . . and found that 40,000 acre-feet of firm annual yield is still valid for NISP." SDEIS at 2-3. This figure was carried forward into the FEIS, and the Corps relied upon it to dismiss alternative water sources that would generate less than 40,000 acre-feet of annual firm yield.

While the Corps has "a duty to consider the applicant's purpose," it cannot define its purpose so narrowly to preclude the existence of reasonable alternatives. *Cf. Sylvester v. U.S. Army Corps of Eng'rs*, 882 F.2d 407, 409 (9th Cir. 1989) ("[A]n applicant cannot define a project in order to preclude the existence of any alternative sites."). Nor can the Corps formulate its purpose and need such that NISP is rendered a foregone conclusion under NEPA. *See New Mexico ex rel. Richardson v. Bureau of Land Mgmt.*, 565 F.3d 683, 710-11 (10th Cir. 2009) (finding that a project purpose "to determine which lands . . . are suitable for leasing and subsequent development" did not "take development . . . as a foregone conclusion"). The CWA and its implementing regulations give the Corps considerable discretion to regulate discharges into jurisdictional waters under Section 404 of the CWA. Accordingly, the Corps' consideration of NISP necessarily leaves open the question of whether a regional project was indeed the "least environmentally damaging practicable alternative" to meet the Participants' future water demands. Yet, the Corps framed the purpose and need so narrowly as to exclude project components that were not "regional" from detailed consideration. In so doing, the Corps ensured that a regional project was the *only* solution to meeting the Participants' alleged future water supply shortfalls, thus rendering a regional project a "foregone conclusion" in violation of NEPA.[1] *See Richardson*, 565 F.3d at 710-11.

The Tenth Circuit has previously rejected purpose and need statements that narrowly express the project's objectives as requiring the agency to adopt a particular alternative. For example, in *Davis v. Mineta*, 302 F.3d 1104, 1119 (10th Cir. 2002), the court evaluated a purpose and need statement for a traffic project that sought to improve traffic flow in part by building an additional river crossing. *Id.* The court rejected this reading, noting that "[a]lthough the scope of the Project certainly contemplates additional road capacity across the Jordan River, [it] d[id] not believe that a fair reading of the Project purposes and needs requires that this additional capacity necessarily be achieved by" construction of the additional crossing. The court further stated that "if the Project did narrowly express its purposes and needs as requiring a new crossing . . . [it] would conclude that such a narrow definition of Project needs would violate NEPA given the more general overarching objective of improving traffic flow in the area." *Id.* Similarly, the Corps cannot define NISP's purpose so narrowly as to require that the project's objectives be met by a major regional reservoir project. Rather, the "more general overarching

[1] As reported by the EPA, Conservation Organizations, and others in comments on the DEIS and SDEIS, a regional project is not the least practicable—or even the most *efficient*—option to meet future demand. Indeed, the EPA suggested water supply options that it believes "could assist in meeting a greater portion of the future demand, or might enable a smaller NISP project with fewer impacts." FEIS at A-112.

objective," *see id.*, of NISP is "to provide water," *see* FEIS at 1-5 (reporting the "basic project purpose" of NISP). To read NISP's objectives more narrowly violates NEPA.

Throughout the NEPA process, the Environmental Protection Agency ("EPA"), Conservation Organizations, and others repeatedly criticized the Corps' purpose and need statement and expressed concern that the statement impermissibly constrains the range of reasonable alternatives. *See Davis*, 302 F.3d at 1119 (explaining that an agency cannot "define the project so narrowly that it foreclose[s] a reasonable consideration of alternatives"). Significantly, in its comments on the DEIS, the EPA—which reviews and comments on all Section 404 permit applications and has the authority under the CWA to veto an individual permit, *see* 33 U.S.C. § 1344(c)—stated that NISP's purpose and need statement "artificially constrained" the alternatives analysis. FEIS at A-81. The EPA repeated this concern in comments on the SDEIS, reporting that it "remained concerned that . . . a narrow purpose and need statement in the SDEIS appear[s] to constrain the alternatives available to meet demand." FEIS A-112. The EPA suggested that the "basic" project purpose—i.e., "to provide water"—would be a more "appropriate" purpose and need statement for "this type of project." FEIS at A-111.

Despite the objections of the EPA and many other commenters, the Corps carried the purpose and need statement forward into the FEIS without alteration. Moreover, the Corps failed to give any meaningful response to the concerns raised by commenters, including its sister agency. In its response to the EPA's comments on the SDEIS, the Corps reaffirmed its decision to retain the 40,000 acre-feet and regional project requirements in the purpose and need statement, asserting that it "independently verified the purpose and need for NISP and exercised independent judgment in defining the purpose and need for the project from both the applicant's and public's perspective." *Id.* The Corps went on to state that it "determined the 'regional project' criterion was appropriately formulated and applied." *Id.* However, these conclusory statements fall far short of a "reasoned explanation" for the agency's decision. *Motor Vehicle Mfr. Ass'n v. State Farm Mut. Auto. Ins. Co.*, 463 U.S. 29, 43 (1983) (providing that agencies must articulate a satisfactory explanation establishing a "rational connection between the facts found and the choice made"); *Olenhouse v. Commodity Credit Corp.*, 42 F.3d 1560, 1575 (10th Cir.1994) (requiring that agencies articulate a "reasoned basis for agency action"). Nor does the Corps provide such an explanation anywhere in the DEIS, SDEIS, FEIS, or supporting documentation.

Instead, the Corps conflates the alleged need for additional water supply generally with the need for obtaining that additional water supply *from NISP* specifically. Based on the report commissioned by the Corps to review the Participants' water demand projections, the Participants will require more than 40,000 acre-feet of additional water by 2060 to avoid shortfalls. BBC Research & Consulting, *Review of 2017 Demand Projections for NISP Participants Produced by Harvey Economics* 14 (Aug. 2, 2017). The Corps insists that it independently reviewed those projections and found them to be reasonable. However, there is a major difference between assessing the reasonableness of the Participants' demand projections (which themselves are suspect), and evaluating the reasonableness of the Participants' insistence that the additional demand needs be fulfilled by NISP. As noted by the EPA and other commenters, there is no reason that the additional water to meet future supply needs must come

from a large regional project. Other supply sources, storage solutions, and conservation methods to reduce the overall shortfall are available, yet were excluded from detailed analysis due to the impermissibly narrow purpose and need.[2]

Indeed, the EPA urged the Corps to explore specific components (several of which were also suggested by Conservation Organizations)—including alternative agricultural transfer methods (e.g., rotational fallowing, agricultural leasing),[3] purchasing additional units from the Colorado-Big Thompson Project ("C-BT Project"), and developing displaced water ("DDW")—that would reduce or eliminate the need to obtain the full requested amount of annual firm yield from NISP. The Corps relied on the screening criteria developed from its narrow purpose and need statement to dismiss these components out of hand, essentially rendering a regional project such as NISP a foregone conclusion, in violation of NEPA. *See Richardson*, 565 F.3d at 710-11.[4]

---

[2] For example, Conservation Organizations submitted an alternative called the Healthy Rivers Alternative ("HRA"), which would have relied primarily on agricultural transfer components to supply 35,000 acre-feet of annual firm yield. The Corps dismissed this alternative because it fell 5000 acre-feet short of the arbitrary floor set by the narrow purpose and need statement. The Corps did not consider whether, as Conservation Organizations report, the annual firm yield of the HRA could be flexibly augmented by other water supply methods readily available to Participants. Nor did it consider whether the 40,000 acre-feet annual firm yield requirement was reasonable. Therefore, its basis for rejecting the alternative out of hand was unsupported and arbitrary.

[3] Alternative agricultural transfer methods were also excluded based on the Corps' screening for proven technology. However, both the EPA and Conservation Organizations vigorously dispute the Corps' assertions as to the feasibility of this component. As reported by the EPA, "[c]onsiderable efforts to facilitate the development and implementation of [alternative agricultural transfer methods] in Colorado have continued since . . . 2007." FEIS at A-115. Other states have implemented similar programs, "demonstrat[ing] that agricultural leasing is a proven method that may be a less environmentally damaging practicable alternative for this project, unless demonstrated otherwise by the project proponent." *Id.* Additionally, a recent economic study conducted by the Environmental Defense Fund and WestWater Research examining alternative water transfer methods *in Colorado* demonstrates that alternative agricultural transfer methods are cost competitive with traditional water acquisition methods, challenging the conventional wisdom in Colorado that it is too expensive and risky to lease water, and further demonstrating that these methods are viable and practicable water supply sources. *See* Attachment L. Neither the Corps, nor Northern Water have provided adequate justification demonstrating that agricultural transfer methods are impracticable under the CWA. *Accord* FEIS at A-115 (EPA comments stating same). Therefore, the Corps must give this component serious consideration before it can issue any permit authorizing the construction of NISP.

[4] In response to concerns about impacts to the headwaters of the Colorado River that might arise from use of West Slope Colorado water in the NISP system, the FEIS states that due to changes to planned operations, the only West Slope water under consideration would be from the C-BT project: "C-BT water was only retained to the extent that a portion of the Participants' C-BT water could potentially be used for reservoir first fill and State Engineer Office dam testing."

The fact that NISP was never intended to meet *all* of the Participants' future water needs only further illustrates the absurdity of the Corps' position. The Participants will already have to develop plans to obtain water to meet their remaining needs from other sources. Yet, the Corps never discussed why those other sources could not provide additional annual firm yield so as to allow some flexibility in the 40,000 acre-feet annual firm yield "need" for NISP. In fact, the record demonstrates that Participants will need to develop alternative water supply sources *during NISP's construction*, presumably introducing flexibility into the 40,000 acre-feet figure, and deferring the "need" for NISP. The Corps alleges that "Participants will need the yield from NISP no later than 2020, and these Participants will need additional supplies from that time forward." Harvey Economics Rep. at 46. Even assuming *arguendo* that the Corps' projections are accurate, it will be *more than a decade* before the main reservoir is constructed. *See* FEIS at 2-100 (reporting that "[i]n total, the period activity from detailed design of the main reservoir to completion of the entire project is estimated to take about 13 years"). Therefore, it is illogical to maintain that Participants require NISP to meet demand needs after 2020 when NISP will not be constructed until 2031 at the absolute earliest. Thus, the Corps' projected "need" for a regional project is unexplained and contradicted by the Corps' own statements, and as a result, is arbitrary and capricious under NEPA and the Administrative Procedure Act ("APA"). *See Olenhouse*, 42 F.3d at 1575.

Finally, as a practical matter, serious flaws in the Corps' population analysis and demand projections undermine the Corps' position that there is even a "need" for NISP. In comments on the DEIS and SDEIS, experts voiced serious concerns with the Corps' arbitrary selection of 40,000 acre-feet of projected need. In fact, the EPA criticized the fact that the screening criteria for alternatives were based on this figure, stating that the "alternatives analysis may be artificially constrained" as a result. FEIS at A-81. The EPA noted that the Corps' methodology used to project future water demand—i.e., multiplying historic water use factors by projected population growth—"tend[s] to overestimate future water demand." *Id.* Therefore, 40,000 acre-feet of projected need is likely an inaccurate estimate, and its use as a screening criterion "could have eliminated viable alternatives." *Id.* In response, the Corps insists that, "[i]f water use factors decreased over time, the Participants would still need the 40,000 AF of firm yield from NISP;

FEIS at A-111. The FEIS furthers states that the amount would be capped at 20,000 acre-feet (presumably, but not explicitly stated, per year). *Id.* Finally, the response to comment concludes without support that because "NISP would not increase nor change the timing of withdrawals of water from the West Slope, effects on West Slope resources were not described in the FEIS." *Id.* This assertion that either providing storage for or use of (depending on your interpretation) of 20,000 acre-feet of water from the C-BT system would have no impact on the operations of the C-BT system, including in the amount of water that could be diverted from the West Slope fails to pass the straight face test. At the very least, transfer of the C-BT water to Glade Reservoir opens up additional storage somewhere else in the system and could provide the opportunity for additional diversion of the Colorado's flow in wet years when physical and legal water is available. The Corps' must either provide a meaningful defense for its assertion of no change to amount or timing of C-BT operations or must model the impacts on the Colorado River of the transfer of 20,000 acre-feet to Glade Reservoir over a variety of hydrologic conditions, in order to comply with NEPA's "hard look" standard and the CWA.

additional future water needs in addition to NISP may be less." *Id.* This response is circular; if the Participants' future water demand is in fact less than projected, then alternatives that would provide a lower annual firm yield with fewer adverse environmental impacts are both feasible and practicable to meet the purpose and need of the project, which under the CWA would prohibit the Corps from adopting NISP at the conclusion of its decisionmaking process. The Corps' continued adherence to the 40,000 acre-feet and "regional project" requirements prevents the Corps and the public from seriously considering those options. Such an approach contravenes NEPA's purpose—i.e., "to require agencies to consider environmentally significant aspects of a proposed action, and, in so doing, let the public know that the agency's decisionmaking process includes environmental concerns," *Utahns for Better Transp. v. U.S. Dep't of Transp.*, 305 F.3d 1152, 1162 (10th Cir. 2002)—and is antithetical to NEPA's command to take a "hard look" at "all reasonable alternatives" to a proposed action, 40 C.F.R. § 1502.14(a).[5]

Turning to the analysis itself, the FEIS still fails to present a realistic picture of likely future water demand within the NISP service area. *See* Attachment A. First, the Corps' *own* analysis has been inconsistent throughout the NEPA review process. In fact, each iteration of water demand projection—from the DEIS through the SDEIS to the FEIS—has substantially lowered the end demand. *See id*. at Fig. 1. Second, as demonstrated by the expert analysis conducted by LRB Hydrology & Analytics ("LRB Demand Analysis"), the water use intensity—i.e., the rate that water is used by each person within the service area—has also steadily declined since 2000. *See id.* at Fig. 3. Despite this clear downward trend in water use intensity, the FEIS projects future water use demands based on an average of past intensity, incorporating only currently planned conservation activities as a downward pressure on water use. *See id.* 11-13. Indeed, the SDEIS' projections based on average historic water use intensity have proven to be substantially higher than the actual use for the periods for which data for comparison is available (2010 and 2015). *See id.* at Fig. 5. Further, the projections presented in the FEIS easily outstrip a simple linear extension of the recent water use record, ignoring the long-running downward trend in water use intensity. *See id.* at Fig. 5. In sum, the FEIS projections of future water demand fail to accurately reflect the changing nature of water use in the service area and Colorado in general, and substantially overstate the amount of water that the participants will need to meet their needs over the planning period.

[5] Another reason the Corps' arbitrary adoption of the need for 40,000 acre-feet of water resulting from this federal action—not a drop more, not a drop less—is unlawful is that it illegally segments the analysis of impacts under NEPA and the CWA for this 40,000-acre-foot action from the impacts that will necessarily occur if and when Northern Water seeks to meet additional demand it asserts will exist in the future. Especially where the Corps acknowledges that "[b]y 2040, the excess of combined demands over current firm supplies is predicted to exceed the 40,000 AF firm annual yield from NISP, and by 2060 projected demand over current firm supplies is projected to be almost 75,000 AF," FEIS at S-3, the Corps has not provided any legal or logically justification for failing to analyze the fully array of options available to meet the *entire* demand needs of the Participants through 2060 or some other date for which demand is reasonably foreseeable at this time. *See, e.g.*, *Del. Riverkeeper Network v. FERC*, 753 F.3d 1304, 1313 (D.C. Cir. 2014) ("An agency impermissibly 'segments' NEPA review when it divides connected, cumulative, or similar federal actions into separate projects and thereby fails to address the true scope and impact of the activities that should be under consideration.").

Relatedly, the downward trend in water use intensity is reflective of a phenomenon seen throughout the Colorado River Basin, known as decoupling. Indeed, as demonstrated by John Fleck, a well-respected expert on water issues in the American Southwest and the Director of the Water Resources Program at the University of New Mexico:

> Overall consumptive use of Colorado River water in the U.S. and Mexico peaked in 2002 and has declined by 6 percent since then, even as population and agricultural productivity have risen. . . . [T]his pattern suggests growth of population and economic activity is no longer necessarily linked to growing water use, creating opportunities for water managers attempting to cope with declining reservoirs and the threats of long term drought and climate change.

See Attachment I. Although increasingly recognized by experts and extensively documented by empirical evidence from municipalities across the region, the Corps failed to even *mention* decoupling in the FEIS. Instead, the Corps simply assumed that water demand will increase in parallel with population growth. The Corps' failure to address the most significant trend in water management and use in the Southwest in the past two decades undermines its demand projections, again calling the "need" for NISP into question.[6]

B. The Corps Unlawfully Avoided its Obligation to Consider a Full Range of Alternatives Under NEPA, Including Those that Would Reduce Adverse Environmental Impacts.

NEPA requires that the Corps "[r]igorously explore and objectively evaluate *all* reasonable alternatives" to the proposed action, including a "no action" alternative. 40 C.F.R. § 1502.14(a) (emphasis added); *see also id.* § 1508.9(b); *Custer Cty. Action Ass'n v. Garvey*, 256 F.3d 1024, 1039 (10th Cir. 2001). Because NEPA's overriding purpose is to "help public officials make decisions that are based on understanding of environmental consequences, and take actions that protect, restore, and enhance the environment," 40 C.F.R. § 1500.1, NEPA's implementing regulations, which are binding on all federal agencies, provide that the consideration of alternatives for reducing adverse impacts "is the heart of the environmental impact statement." 40 C.F.R. § 1502.14. Accordingly, EISs "should present the environmental impacts of the proposal and the alternatives in comparative form, thus sharply defining the issues and providing a clear basis for choice among options by the decisionmaker and the public." *Id*.

1. The FEIS Fails to Include a True "No Action" Alternative Because Cactus Hill Reservoir Requires a Section 404 Permit.

The no action alternative serves as "a baseline for measuring the effects of the proposed action." *Biodiversity Conservation All. v. U.S. Forest Serv.*, 765 F.3d 1264, 1269–1270 (10th Cir. 2014). "[N]o action" means that "the proposed activity would not take place and the

[6] Save the Poudre previously submitted comments to the Corps discussing decoupling and its importance in developing accurate demand projections during the environmental review for the Moffat Collection System Project. *See* Attachment J. Those comments apply equally here, and are therefore incorporated along with the attachments by reference herein.

resulting environmental effects from taking no action would be compared with the effects of permitting the proposed activity or an alternative activity to go forward." FEIS at 2-42. The Corps' NEPA Implementation Procedures further provide that the "no action" alternative is one that results in no activities requiring a Corps permit. *See* 33 C.F.R. § 325, app'x B.

The Corps regulates the discharge of dredge or fill material into wetlands and other waters of the United States under Section 404 of the CWA. Federal agencies have additional responsibilities to avoid, minimize, and mitigate unavoidable impacts on wetlands under Executive Order 11990. Corps regulations define wetlands as "those areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, a prevalence of vegetation typically adapted for life in saturated soil conditions." 33 C.F.R. part 323.2(c). Wetlands subject to the Corps' jurisdiction (i.e., jurisdictional wetlands) meet the Corps' definition of wetlands and are adjacent, neighboring, or have a surface tributary connection to interstate or navigable waters of the United States.

In the DEIS, the Corps gave a preliminary evaluation of a "conceptual" no action alternative "intended to represent the possible water supplies that each Participant could obtain" if NISP was not permitted. DEIS at 2-20. The Corps assumed that the Participants would develop various smaller projects—individually or in small groups—that would meet individual storage needs without a large reservoir project. The Cactus Hill Reservoir was proposed as a component of *action* alternatives 3 and 4. The DEIS acknowledged that while "the determination of the jurisdictional status of wetlands" for the proposed project area and alternatives had not yet been made, "[d]uring a preliminary review, the Corps determined that *all of the project alternatives* would have activities that would involve the discharge of dredge or fill material into jurisdictional wetlands and/or waters of the United States." DEIS at 3-48 (emphasis added). Moreover, "although some wetlands and other waters in the study area may not fall under the Corps' jurisdiction under Section 404, they still are aquatic resources that will be addressed by the Corps under Section 404 and NEPA." *Id.* A preliminary review of the Cactus Hill Reservoir Study Area reported 45.1 acres of potential jurisdictional wetlands, and 7.3 acres of other waters potentially falling under Section 404 of the CWA. *Id.* at 3-50.

The no action alternative underwent sudden, significant, and unexplained revision in the SDEIS. The Cactus Hill Reservoir, a large-scale construction project with "major" permanent effects, *see* SDEIS at D-12, was included as a component of the *no action* alternative because, according to the SDEIS, construction of the reservoir would not require a Section 404 permit to move forward. This assertion is directly contradicted by the Corps' own statements later in the SDEIS, where it identified fifty acres of potentially jurisdictional wetlands and waters of the United States within the proposed project area related to Cactus Hill Reservoir. *See* SDEIS at D-54. Moreover, the Corps stated that the Cactus Hill Reservoir would directly impact, among other things, 31.8 acres of wetlands and 6.5 acres of waters (e.g., ponds, lakes, canals), and will indirectly impact 218.6 acres of wetlands. *See* SDEIS at D-12. Thus, the Corps' conclusion in the SDEIS that Cactus Hill Reservoir did not require a Section 404 permit is, at best, contradicted by the agency's own statements and evidence provided elsewhere in the SDEIS.

Based on this information, it is evident that Cactus Hill Reservoir requires a Section 404 permit under both CEQ and Corps regulations, and therefore cannot lawfully serve as a

component of the no action alternative. *See e.g.*, *Ramsey v. Kantor*, 96 F.3d 434, 444 (9th Cir. 1996) ("If a federal permit is a prerequisite for a project with adverse impact on the environment, issuance of that permit does constitute major federal action and the federal agency involved must conduct an EA and possibly an EIS before granting it."); 33 C.F.R. § 325, app'x B (defining "no action" alternative in the Section 404 permitting process as one that results in no activities requiring a Corps permit). In an attempt to avoid this inevitable conclusion, the Corps insists that while the construction of the smaller Cactus Hill Reservoir would involve the discharge of fill material into drainages and wetlands, those wetlands "do not *appear* to be subject to jurisdiction under Section 404 of the CWA." FEIS at A-131 (emphasis added). This conclusory assertion does not adequately explain or support the Corps' sudden change in position regarding the proposed reservoir's impacts on jurisdictional wetlands. Moreover, it seems that such evidence will not be forthcoming—while the Corps states that it will issue an approved jurisdictional determination for the Glade Reservoir, Upper Galeton Reservoir, and the U.S. 287 realignment study area before issuing the ROD, it remains silent on the Cactus Hill Reservoir site. *See* FEIS at A-131. Without an official determination of the Cactus Hill Reservoir's impacts to jurisdictional wetlands and waters of the United States, the Corps cannot definitively conclude that the reservoir's construction would not require a Section 404 permit, especially in light of evidence presented in the DEIS and SDEIS.[7] Therefore, the Corps' no action alternative in the FEIS contravenes basic NEPA principles, and is not a genuine "no action" alternative because it requires action by the Corps under Section 404 of the CWA.

As a practical matter, the use of Cactus Hill Reservoir as the no action alternative skews the Corps' entire analysis of alternatives. The no action alternative is a measuring stick that allows for meaningful comparison between the purported benefits of the proposed action, and its environmental impacts. *See Ctr. for Biological Diversity v. U.S. Dep't of Interior*, 623 F.3d 633, 642 (9th Cir. 2010) (providing that the no action alternative is intended to "provide a baseline against which the action alternative" is evaluated). Without "[accurate baseline] data, an agency cannot carefully consider information about significant environment impacts … resulting in an arbitrary and capricious decision." *N. Plains Res. Council, Inc. v. Surface Transp. Bd.*, 668 F.3d 1067, 1085 (9th Cir. 2011); *see also Friends of Yosemite Valley v. Kempthorne*, 520 F.3d 1024, 1038 (9th Cir. 2008) (holding an agency's no action alternative invalid because it improperly

[7] Prior to submitting these comments, Conservation Organizations attempted to ascertain whether the proposed Cactus Hill Reservoir site contained jurisdictional wetlands. Conservation Organizations submitted several requests to visit the proposed site; however, both the Corps and Northern Water denied the requests, asserting that they lacked the legal authority to grant access to the property. Conservation Organizations also submitted a request to the Corps for any documentation relevant to jurisdictional wetland determinations for the proposed reservoir sites. Although the Corps provided Conservation Organizations with wetland delineation maps in GIS formats, the Corps declined to provide documents involving the Corps' development of jurisdictional determinations. By email dated September 17, 2018 the Corps informed Conservation Organizations that any further records related to jurisdictional determinations would only be provided through FOIA. Given the abbreviated timeline—comments on the FEIS are due by October 4, 2018— and the mandated twenty-day deadline for FOIA responses, Conservation Organizations would be unlikely to obtain a response from the agency in time to incorporate the records into their comments.

defined the baseline). This is precisely what occurred here, where the use of Cactus Hill Reservoir as the no action alternative deprived the Corps and the public of a meaningful opportunity to assess the impacts of a regional project against those of less environmentally destructive projects. *Accord* FEIS at A-116 (EPA comments noting that the no action alternative "miss[ed] the opportunity to incorporate alternatives that were screened out due to not being regional in nature"). Thus, the current alternatives analysis for NISP is fundamentally flawed. To comply with NEPA, the alternatives analysis must be revised to include a true no action alternative that accurately serves as the baseline for its NEPA analysis.

This point is further reinforced by the fact that, as of the date of these comments, the Corps cannot definitively state whether Cactus Hill Reservoir can even serve as the no action alternative. As noted above, the Corps previously reported the likely presence of jurisdictional wetlands at the Cactus Hill Reservoir site. Therefore, the Corps *knew* that any proposed project at the site may require a Section 404 permit, precluding its use as the no action alternative under both NEPA and Corps regulations. *See* 40 C.F.R. § 1502.14(a); 33 C.F.R. § 325, app'x B. As a practical and logical matter, where the Corps relies on the absence of jurisdictional wetlands to justify a particular no action alternative, the Corps should make the relevant jurisdictional determinations *prior to* undergoing the NEPA process both to provide a legally adequate baseline, and an accurate analysis and comparison of the proposed project's impacts. This is especially true here, where the NEPA process has spanned over ten years and consumed a significant amount of agency resources. The Corps' failure to consider such a highly relevant factor—i.e., the presence of jurisdictional wetlands at a site it proposes to use as its no action alternative—is arbitrary and capricious, and therefore, renders its analysis legally inadequate.

If it is the Corps' position that Cactus Hill Reservoir would not require a Section 404 permit, then at minimum the Corps must provide a comprehensive explanation and factual basis for this conclusion— including a delineation of the wetlands on the proposed site, and an official jurisdictional determination as to whether those wetlands fall within the waters of the United States. *See Olenhouse*, 42 F.3d at 1575 ("In addition to requiring a reasoned basis for agency action, the 'arbitrary or capricious' standard requires an agency's action to be supported by the facts in the record."). In the absence of a formal jurisdictional determination finding otherwise, the evidence presented in the DEIS and SDEIS that Cactus Hill Reservoir will, in fact, require a Section 404 permit renders the Corps' current formulation of the no action alternative arbitrary, capricious, and contrary to NEPA and its implementing regulations.[8]

2. Because the Action Alternatives are Substantially Similar, the FEIS Fails to Analyze a Reasonable Range of Alternatives.

NEPA imposes a clear-cut procedural obligation on the Corps to take a "hard look" at alternatives that would entail less significant impacts on resources affected by the project. *Balt.*

[8] Additionally, the Corps' failure to consider a no action alternative that does not contemplate the construction of a large-scale reservoir project suggests that the Corps skewed the analysis to require the selection of Northern Water's preferred alternative. *See Davis*, 302 F.3d at 1119 (explaining that an agency cannot "define the project so narrowly that it foreclose[s] a reasonable consideration of alternatives").

Gas & Elec. Co. v. Nat. Res. Def. Council, 462 U.S. 87, 100 (1983). EISs must "[r]igorously explore and objectively evaluate all reasonable alternatives" and, in particular, "should present the environmental impacts of the proposal and the alternatives in comparative form, thus sharply defining the issues and providing a clear basis for choice among options by the decisionmaker and the public." 40 C.F.R. § 1502.14. The regulations further mandate that the EIS must "[i]nclude reasonable alternatives not within the jurisdiction of the lead agency," but that may nonetheless meet the overall objectives of the action while ameliorating environmental impacts. *Id*.

The FEIS violates these requirements. The *only* alternatives afforded "rigorous" treatment—i.e., a *comparative* analysis of impacts, thus affording a "clear basis for choice among options," *id.*—are those that involve the construction of the Upper Galeton reservoir, which will have a capacity of 45,624 acre-feet, and one other large-capacity reservoir. The Corps considered only two options for the second reservoir—Cactus Hill Reservoir, a component of the no action alternative, Alternative 3, and Alternative 4; and the Glade Reservoir, a component of Alternative 2 and the preferred alternative (Alternative 2M). As the EPA observed, there is not "a major environmental impact difference among the action alternatives." FEIS at A-98.

The Corps' failure to rigorously explore a single action alternative that would result in lower impacts on wetlands, the Poudre River, and other resources[9]—e.g., an alternative that would not require the construction of large reservoirs—is a flagrant violation of NEPA. Importantly, a central purpose of the proposed action (issuance of a 404 permit) is (and, under the CWA, *must* be) to evaluate whether less environmentally damaging practicable alternatives are available for non-water dependent projects. This definition of the "purpose" of the proposed federal action *necessarily* requires the Corps to consider reasonable action alternatives that would *better* protect wetland and riparian habitat, and minimize the adverse impacts on these important habitats, than Northern Water's preferred approach. *Cf. Union Neighbors United, Inc. v. Jewell*, 831 F.3d 564, 577 (D.C. Cir. 2016) ("Accordingly, because the Service in these circumstances did not consider any other reasonable alternative that would have taken fewer Indiana bats than Buckeye's plan, it failed to consider a reasonable range of alternatives and violated its obligation under NEPA.").

Courts have rejected precisely this type of avoidance approach by agencies in the past. *See Muckleshoot Indian Tribe v. U.S. Forest Serv.*, 177 F.3d 800, 813 (9th Cir. 1999) (concluding that the EIS violated NEPA when the two action alternatives considered in detail were "virtually identical"). Indeed, "the evaluation of 'alternatives' mandated by NEPA is to be an evaluation of alternative means to accomplish the general goal of an action; it is not an evaluation of the alternative means by which a particular applicant can reach his goals." *Van Abbema v. Fornell*, 807 F.2d 633, 638 (7th Cir. 1986). While an agency must take a private

[9] For example, as the Corps admits, "[a]ll alternatives would have a reservoir site, either Cactus Hill or Upper Galeton, where past oil and gas development has occurred." FEIS at S-44. Thus, all alternatives will expose water users to potential contamination from past oil and gas development, heightening the need to explore alternatives with fewer adverse environmental impacts.

applicant's objectives into account when developing the purpose and need statement, it is the agency's responsibility to "defin[e] the objectives of an action and then provide legitimate consideration to alternatives that fall between the obvious extremes." *Colo. Envtl. Coal.*, 185 F.3d at 1175. Here, however, it appears that the Corps merely accepted Northern Water's objectives as its own,[10] and developed alternatives that skewed the analysis towards the applicant's preferred alternative.

The Corps' analysis is devoid of *any* meaningful consideration of alternatives that fall between the "obvious extremes"—i.e., a regional project involving the construction of large reservoirs, and smaller local projects involving less environmentally damaging alternatives. Even the *no action* alternative contemplated the construction of a 120,000 acre-foot reservoir, and deprived the FEIS of a meaningful baseline against which to measure NISP's anticipated impacts. Moreover, by considering only alternatives that involved large-scale reservoir projects with no "major environmental impact difference," the FEIS essentially considered *only* the impacts from alternatives representing *one* of the extremes. Such an approach cannot satisfy the agency's obligations under NEPA to examine "*all* reasonable alternatives," including those that lie outside the jurisdiction of the agency. *See Citizens for Envtl. Quality v. United States*, 731 F. Supp. 970, 989 (D. Colo. 1989) ("Consideration of alternatives which lead to similar results is not sufficient under NEPA[.]"); *Friends of Yosemite Valley v. Kempthorne*, 520 F.3d 1024, 1038 (9th Cir. 2008) (finding that SEIS "lacked a reasonable range of action alternatives" because "the [three action] alternatives are essentially identical" and thus are "not varied enough to allow for a real, informed choice"). NEPA does not prohibit the Corps from ultimately adopting a proposal to build a regional water diversion project; however, it is deeply "troubling that the [agency] saw fit to consider from the outset only those alternatives leading to that end result." *California v. Block*, 690 F.2d 753, 768 (9th Cir. 1982).

While NEPA does not require the Corps to "consider every possible alternative to a proposed action, nor must it consider alternatives that are unlikely to be implemented or those inconsistent with its basic policy objectives," *Seattle Audubon Soc'yy v. Moseley*, 80 F.3d 1401, 1404 (9th Cir. 1996), it is particularly troubling here that the Corps failed to consider *any* alternatives that were more consistent with the basic policy objectives of the CWA and its Guidelines than the alternatives subjected to detailed consideration. As the Corps acknowledged, NISP is not a "water dependent" project. Therefore, there is a presumption that "practicable alternatives that do not involve special aquatic sites" exist, and that these alternatives "have less adverse impact on the aquatic ecosystem." 40 C.F.R. § 230.10(a)(3). These presumptions hold unless "clearly demonstrated otherwise." *Id.* Yet, the Corps failed to examine in detail *a single alternative* that would not involve the construction of a large reservoir, the destruction of jurisdictional wetlands, and large-scale water diversion.[11] Accordingly, the Corps' alternatives

[10] Indeed, as discussed *supra* at page 4-5, it appears that the Corps conflated the need for additional water with the need to obtain that water *from NISP*, and merely accepted Participants' request for 40,000 acre-feet of annual firm yield from NISP without meaningful evaluation of the reasonableness of that request.

[11] The Corps' actions are especially egregious in light of comments from the EPA, Conservation Organizations, and others suggesting specific alternatives that would have fewer adverse impacts

analysis fails to present a reasonable range of alternatives, and violates NEPA. *See Muckleshoot Indian Tribe*, 177 F.3d at 813-14 (holding that consideration of only "two virtually identical" action alternatives was inadequate).

3. The Corps Cannot Rely on Overly Restrictive Screening Criteria to Artificially Constrain the Range of Alternatives and Preclude Reasonable Alternatives from Detailed Consideration.

The Corps developed screening criteria to assist in the development of its range of alternatives. The purpose and need screening process used two primary screening criteria to determine whether alternatives could satisfy the project's purpose and need: firm yield and "regional" project. FEIS at 2-3. The firm yield criterion required that "viable water sources . . . . must be able to provide at least 30% of the total requested firm annual yield of 40,000 [acre-feet], which is 12,000 [acre-feet]." FEIS at 2-3. According to the Corps, reducing the number of potential water sources to four is "logistically reasonable for a water supply project of this magnitude." FEIS at 2-3. Notably, the Corps did not provide any support for this assertion. The regional project criterion required that project components considered "assist in providing the Participants with a common solution" to their water supply needs. FEIS at 2-3 to -4.

As described *supra* at Section A, the Corps narrowly defined the project purpose and need such that viable, less environmentally damaging alternatives were improperly excluded from detailed analysis, in violation of NEPA. The Corps' screening criteria, designed to eliminate alternatives that fail to meet the overly restrictive purpose and need, violate NEPA for the same reasons. NISP is premised on the false assertion that a regional project providing 40,000 acre-feet of annual firm yield is the *only* way to meet the Participants' future water needs. Accordingly, the Corps' purpose and need screening criteria are designed to ensure that only large regional water projects are given serious consideration. *See* FEIS at 2-3 to -4. For example, the 12,000 acre-feet requirement is designed to limit the number of water supply sources, but does not leave any room for considering a combination of lower-yield water supply sources, or combining a lower-yield supply source with two or three higher-yield water supply sources.[12]

---

on the environment, while meeting the overarching purpose and need of the project. *See, e.g.*, FEIS at A-113. For example, the EPA criticized the Corps' failure to consider conservation methods and agricultural transfer methods as components for reasonable and feasible alternatives. Far from giving the EPA's comments serious consideration, the Corps instead relied on its impermissibly narrow purpose and need statement and arbitrary screening criteria to dismiss these suggestions from detailed analysis. *Id.* at A-113 to -114.

[12] For example, the HRA proposed by Conservation Organizations was dismissed because it only supplied 35,000 acre-feet of annual firm yield. Additionally, two of the components of the HRA were dismissed in part because they did not meet the firm yield criteria. However, as discussed *supra* at page 3, the 40,000 acre-feet firm yield "need" was derived not from an actual quantitative determination of need, but from the Participants' requests for additional water. Moreover, as Conservation Organizations noted in their comments on the SDEIS, the small difference between the annual firm yield of the HRA and the desired firm yield goal could be "flexibly augmented" in a variety of ways, including aggressive conservation measures,

The Corps does not explain why combining water sources in this way is infeasible. Nor does it explain why limiting the number of supply sources to four is more "logistically reasonable" than five, six, or even more.[13] Without such explanations, the Corps' firm yield screening criterion is arbitrary. As a result, the Corps' use of the criterion to constrain the range of alternatives considered violates NEPA.

Similarly, the Corps automatically excluded project components that were not "regional" in nature from detailed consideration. *See* FEIS at 2-4 ("[A]lternatives that would not assist in providing the Participants with a common solution were eliminated from further review."). The only justification the Corps gave for relying on the "regional project" criterion was that "NISP is a regional water supply project addressing a portion of the current and anticipated water supply needs of the Participants." *Id.* at 2-3. However, this circular logic cannot suffice as an explanation for *why* a regional project is necessary where viable—and less environmentally impactful—"local" solutions to meeting the Participants' collective future water needs exist. For example, the Healthy Rivers Alternative ("HRA") proposed by Conservation Organizations incorporated the use of development displaced water ("DDW") as a potential water supply source for the Participants. The Corps applied its screening criteria to DDW to determine whether it could serve as a feasible component of an alternative. *See* Hydros, *Evaluation of the "Healthy Rivers Alternative" Proposed by Save the Poudre: Poudre Waterkeeper Using the NISP Alternatives Screening Criteria* (Oct. 18, 2012) ("HRA Evaluation"). The Corps' analysis indicated that DDW was a viable solution to meeting the Participants' future water demand needs. In fact, the Corps reported that "NISP Participants *anticipate* DDW as a supply source of water." HRA Evaluation at 47. However, because DDW is "local in its nature and would not constitute a regional project," the component was excluded from detailed analysis *even though* its inclusion could lessen the demand on NISP and reduce the negative environmental impacts from the Project.[14] *Id.* By setting such an arbitrary floor, the Corps screened out feasible alternatives that were less environmentally damaging, in violation of NEPA.

---

purchases of water rights in existing reservoirs, and agricultural transfers. SDEIS Comments at 16-17. Yet, because these reasonable alternatives did not satisfy the arbitrary firm yield screening criterion, they were excluded from detailed consideration altogether.

[13] By its own assertion, Northern Water's boundaries include 960,000 people and 1.6 acres, and in the growing season "Northern Water also delivers water to more than 120 ditch, reservoir, and irrigation companies serving thousands of farms and more than 640,000 acres." N. Water, *Who we are*, http://www.northernwater.org/AboutUs/WhoWeAre.aspx (last visited Oct. 4, 2018). Thus, considering Northern Water's extensive experience managing a complex system of multiple water sources and storage facilities on both sides of the Continental Divide, developing a project with a mere handful of additional components would not be an impossible task.

[14] The Corps' failure to adequately assess the utilization of farmland irrigation water displaced by land development—which in nearly all cases is purchased and converted out of agricultural use and into developed land use—was also arbitrary for its complete failure to account for demonstrated development and population trends in Northern Colorado, even as it relied on flawed population trends to justify the purported "need" for NISP. In assessing the feasibility of water supply sources, the Corps neglected to analyze how the vast majority of farmland in

Additionally, the Corps' screening criteria were not uniformly imposed, with favored alternatives allowed to inappropriately pass. For example, the "Practicable Screening Criteria" are intended to eliminate alternatives that, among other standards, are located on designated hazardous material sites or abandoned mineral or coal mines. FEIS at 2-5. Despite these criteria, all of the alternatives that are advanced to final consideration, including the preferred alternative, "have a reservoir site, either Cactus Hill or Upper Galeton, where past oil and gas development has occurred." FEIS at S-44. The Corps proposes to "minimize adverse effects of oil and gas development on reservoir water quality" without presenting a complete analysis of the current conditions of the abandoned wells at these sites, instead relying on a review of reported spill incidents." FEIS at S-44, 4-559, 4-561 – 562. Further, in its discussion of Alternatives 3 and 4, the FEIS states that, "[i]t is not known if Northern Water would be successful in changing the point of storage for these water rights to Cactus Hill Reservoir." FEIS at 2-90. Consequently, two of the action alternatives that were given final consideration are speculative at best and should have been eliminated as not meeting the standard of "capable of being done." 404 (b)(1).

The FEIS clearly states that "[t]he firm yield screening criterion requires that viable water supply sources must be capable of providing a firm annual water yield." FEIS at 2-3. Firm yield is further defined as "[t]he annual yield that is available during a defined drought period." *Id.* at xxxiv. The defined drought period is the drought period in the hydrologic record developed for hydrologic modeling. *Id.* Inexplicably, however, the FEIS selected as the basis for its drought standard a less severe drought period (1954–1956) than has been recently recorded. The Corps explains that the alternatives selected for detailed consideration "are not sized to meet full firm yield requirements during more severe droughts, such as the recent drought (2000–2005)." FEIS at 2-76. Therefore, the NISP Participants would need to pursue other water supply options including interruptible water supply agreements implemented on a temporary basis. *Id.* These statements illustrate the bias in the FEIS that results from the Corps' adherence to a drought standard based on periods of less severe historic drought. *See* Attachment C at 3. Indeed, the

---

northern Colorado will be sold off, subdivided, and developed through 2060. STP conducted an independent analysis of the growth patterns in the Northern Front Range Metropolitan Planning Organization ("NFRMPO") Growth Management Areas ("GMAs") to determine the amount of water that would be made available following the conversion of irrigated agricultural land to developed land. *See* Attachment G at 1-2. STP's analysis demonstrates that the DDW available to Participants is far greater than the FEIS predicted. *Id.* at 1. In fact, the analysis predicted that by 2060, DDW could supply between 85,071 acre-feet and 152,812 acre-feet of water, which is 188% to 338% of the projected "need" under the No Action Alternative. *Id.* at 2. Further, the development that NISP is *intended to support* will inevitably result in the transfer of agricultural water and "dry-up" of farmland. *Id.* Thus, contrary to the Corps' insistence that without NISP, Participants will have to "buy and dry" thousands of farm acreage, land development will displace a large amount of water independent of NISP, and that water will be sold on the open water market. *Id.* In other words, NISP will not cause the largescale "buying and drying" of agricultural lands. The FEIS fails to consider DDW as a viable, less environmentally impactful water supply source, and as such, is arbitrary and capricious, and fails to support the conclusion that the preferred alternative is the least environmentally damaging practicable alternative.

Corps' use of the outdated drought standard led to the detailed consideration of project concepts that would not meet the water supply goals stated in the Purpose and Need based on *recent* observed hydrologic conditions. *Id.* Therefore, it would be inappropriate for the Corps to approve the Preferred Alternative and any of the actionable alternatives based on the recent hydrologic record and on the uncertainty in future hydrologic conditions based on climate change. *Id.* The Corps must provide a reasoned and well-supported justification for its use of this screening criteria when it appears to be based on an arbitrary selection of the hydrologic cycle, and further, does not appear to screen for alternatives that actually accomplish the Participants' objectives.

In sum, the Corps' screening criteria were too restrictive and eliminated from detailed consideration reasonable alternatives that would meet the project's basic purpose and inflict less damage on sensitive areas and resources. The goal of NEPA is not to reinforce a predetermined conclusion. Rather, NEPA is designed to provide a range of alternatives—including, but expressly not limited to, the applicant's preferred alternative—that present decisionmakers and the public with a reasoned choice. *See Colo. Envtl. Coal.*, 185 F.3d at 1172 (noting that NEPA "prohibits uninformed . . . agency action, and to further that goal, an EIS' form, content, and preparation must "foster both informed decision-making and informed public participation"). By creating a screening method designed to preclude consideration of any alternative that deviated significantly from Northern Water's desired project—yet would still satisfy Northern Water's overarching objective—the Corps artificially constrained the range of alternatives and failed to present the information necessary to make a reasoned choice. *See id.* ("What is required [in an alternatives analysis] is information sufficient to permit a reasoned choice of alternatives as far as environmental aspects are concerned.").

Accordingly, for all of these reasons, it is clear that the Corps cannot issue a permit for NISP until the serious flaws in its NEPA analysis are corrected.

C. The Corps' Issuance of a Section 404 Permit Authorizing Construction of NISP Will Violate the CWA.

The CWA is a comprehensive statute designed to "restore and maintain the chemical, physical, and biological integrity of the Nation's waters." 33 U.S.C. § 1251(a). To this end, the CWA generally prohibits the discharge of dredged or fill materials into waters of the United States unless authorized by a permit ("Section 404 permit"). *Id.* § 1311. When reviewing Section 404 permit applications, the Corps must follow binding guidelines jointly established by the Corps and the EPA ("404 Guidelines" or "Guidelines"). These Guidelines are codified at 40 C.F.R. part 230.

The Guidelines prohibit the Corps from issuing permits for projects where there "is a practicable alternative to the proposed discharge which would have less adverse impact on the aquatic ecosystem, so long as the alternative does not have other significant adverse environmental consequences." 40 C.F.R. § 230.10(a). The Guidelines further prohibit the Corps from issuing a permit where it "will cause or contribute to significant degradation of the waters of the United States," which includes adverse effects on the "life stages of aquatic life and other wildlife dependent on aquatic ecosystems," "loss of fish and wildlife habitat," and "loss of the capacity of a wetland to assimilate nutrients, purify water, or reduce wave energy." 40 C.F.R. §

230.10(c). The Corps is also prohibited from issuing a permit where it "[c]auses or contributes . . . to violations of any applicable State water quality standard." *Id.* § 320.10(b).

In applying these criteria, the Corps must make detailed factual determinations as to the potential environmental effects of the proposed action, *see id.* §§ 230.11, 230.12(b) and it must indicate whether the project complies with the Guidelines in the record of decision based on the FEIS. *See* 33 C.F.R. § 325.2(a)(6). For the reasons discussed below, the FEIS utterly fails to demonstrate the Corps' compliance with these Guidelines. Accordingly, the Corps cannot lawfully permit the Project.

1. Because the Corps Failed to Demonstrate that Less Damaging Practicable Alternatives to NISP Do Not Exist, It Cannot Lawfully Issue the Permit.

The Corps' burden in finding the least damaging practicable alternative under the Guidelines is heaviest for non-water dependent projects planned for a "special aquatic site," such as a wetlands area. *See Holy Cross Wilderness Fund v. Madigan*, 960 F.2d 1515, 1524 (10th Cir. 1992). To be "practicable," an alternative must be "available and capable of being done after taking into consideration cost, existing technology, and logistics in light of overall project purposes." 40 C.F.R. § 230.10(a)(2).

Where projects are not water dependent, there is a presumption that "practicable alternatives that do not involve special aquatic sites" exist, and that these alternatives "have less adverse impact on the aquatic ecosystem." 40 C.F.R. § 230.10(a)(3). These presumptions hold unless "clearly demonstrated otherwise." *Id.* The Tenth Circuit has explained that in such a case, the Corps may not issue a § 404 permit unless the applicant, "with independent verification by the [Corps] , . . . provide[s] detailed, clear and convincing information proving " that an alternative with less adverse impact is "impracticable." *Utahns for Better Transp.*, 305 F.3d at 1186-87 (requiring denial of a permit "where insufficient information is provided to determine compliance"); *see also Greater Yellowstone Coal. v. Flowers*, 321 F.3d 1250, 1262 n.12 (10th Cir. 2003) ("[U]nder the CWA, it is not sufficient for the Corps to consider a range of alternatives to the proposed project: the Corps must rebut the presumption that there are practicable alternatives with less adverse environmental impact.").

The FEIS does not demonstrate that the preferred alternative would be the least damaging practicable alternative. To the contrary, the Corps itself acknowledged that the basic purpose of the project—to provide water to the Participants—is not "water dependent," and therefore, practicable alternatives to NISP "are (1) presumed to exist and (2) presumed to be less environmentally damaging than the proposed action, unless clearly demonstrated otherwise." FEIS 1-5. The FEIS fails to rebut this presumption, and is therefore the Corps' approval of this project would be unlawful under the CWA.

As discussed *supra* at Section A, the Corps adopted a narrow statement of purpose and need, impermissibly constraining the Corps' analysis of practicable alternatives and rendering it inadequate under NEPA and under the CWA. As reported in the FEIS, the Corps and Northern Water jointly developed NISP's purpose and need statement. While the Corps "has a duty to take into account the objectives of the applicant's project," those objectives must be "legitimate."

Greater Yellowstone Coal. v. Flowers, 359 F.3d 1257, 1270 (10th Cir. 2004) (citations omitted). The Corps cannot permit developers to "artificially constrain the Corps' alternatives analysis by defining the projects' purpose in an overly narrow manner." *Nat'l Wildlife Fed'n v. Whistler*, 27 F.3d 1341, 1346 (8th Cir. 1994). Yet, that is precisely what happened here. Neither the agency, nor Northern Water, ever explained *why* a regional solution to meet individual Participants' water needs was necessary to meet the overarching purpose of the project, i.e., to meet a portion of the Participants' future water needs.

Moreover, the Corps relied on narrow screening criteria to arbitrarily exclude less environmentally damaging practicable alternatives to meeting the Participants' future water needs from detailed consideration. *See supra* Section B. By screening out alternatives that do not provide 12,000 acre-feet of annual firm yield, or are not regional in nature, the Corps ensured that the only alternatives given meaningful consideration are large-scale regional projects. However, it is clear from comments by Conservation Organizations, local governments, and the EPA that a regional project is not the *only* alternative that could meet the Participants' water needs, nor are such projects the least damaging practicable alternatives that could satisfy the project's basic purpose. *See, e.g.*, *supra* Section B; STP, *Healthy Rivers, Healthy Communities: A Balanced Proposal for the Cache la Poudre River in Colorado* (2011) ("Healthy Rivers Alternative" or "HRA"); City of Fort Collins, Resolution 2015-082 Directing the City Manager to Submit to the U.S. Army Corps of Engineers the City's Comments on the Supplemental Draft Environmental Impact Statement for the Northern Integrated Supply Project (Sept. 1, 2015) ("Fort Collins Comments");[15] FEIS at A-112 to -113.

Indeed, the EPA, which has special expertise and jurisdiction over Section 404 permits, repeatedly criticized the Corps' use of a narrow purpose and need and screening criteria to preclude alternatives from detailed consideration. In comments on the DEIS, the EPA protested the Corps' use of "regional project" in the purpose and need statement and screening criteria, noting that the term "has the effect of eliminating several alternatives" prematurely. FEIS at A-83. The EPA also requested that rotational fallowing and conservation measures be given serious consideration as alternatives. *Id.* at A-84. The Corps dismissed the EPA's concerns and retained the purpose and need and the screening criteria because "Northern Water is a regional water supply entity with responsibilities for water supply planning and management for the region and they are proposing a regional water supply project to meet the water supply needs of the [] Participants." FEIS at A-82. However, this circular logic—NISP is a regional project, and therefore a regional project is necessary—cannot satisfy the Corps' obligation to provide a reasoned explanation for its actions, nor does it demonstrate that other, less damaging alternatives do not exist. Moreover, "[t]he CWA test is not, however, whether features of a proposal would make a more desirable project. Rather the Applicant and the [Corps] are obligated to determine the feasibility of the least environmentally damaging alternatives that serve the *basic* project purpose." *Utahns for Better Transp.*, 305 F.3d at 1188-89. Thus, the

[15] The Fort Collins City Council recently voted unanimously to send its comments of nonsupport of the FEIS to the Corps. *See* Nick Coltrain, *Fort Collins Won't Support NISP Reservoir Project*, COLORADOAN (Oct. 2, 2011), *available at* https://www.coloradoan.com/story/news/2018/10/02/fort-collins-wont-support-nisp-reservoir-project/1507391002/.

Corps cannot exclude practicable alternatives from its analysis under the CWA simply because Northern Water wants to build a regional project.

The EPA raised the same concerns in its comments on the SDEIS, stating that it "remain[s] concerned that the selected screening criteria and a narrow purpose and need statement in the SDEIS appear to constrain the alternatives available to meet demand. These constraints may result in exclusion of potentially less damaging practicable alternatives." FEIS at A-111. The EPA again urged the Corps to consider conservation measures, rotational fallowing,[16] and acquisition of water units from the C-BT, and DDW as less damaging, practicable alternatives. *Id.* at A-113 to -116. However, again, the Corps brushed aside the EPA's concerns, asserting simply and without support that "[t]he purpose and need statement did not unreasonably limit the range of alternatives," and reiterating its determination that "the 'regional project' criterion was appropriately formulated and applied." *Id.* at A-112. However, these conclusory statements do nothing to address the EPA's substantive, *repeated* concern that flaws in the alternatives analysis render it inadequate to demonstrate that NISP is the least damaging practicable alternative under the CWA. The Corps' failure to meaningfully engage with the EPA—a federal agency with expertise in interpreting and applying the CWA to projects of this kind—to consider and address the EPA's criticisms preclude the Corps from relying on the FEIS to demonstrate its compliance with the CWA. *See All. to Save the Mattaponi v. U.S. Army Corps of Eng'rs*, 606 F. Supp. 2d 121, 132 (D.D.C. 2009) (holding that the Corps must "demonstrate that it has considered significant comments and criticisms by explaining why it disagrees with them; it may not dismiss them without adequate explanation").

In sum, Conservation Organizations and others—including the EPA—proposed several alternatives that would be objectively less environmentally damaging and would also meet the portion of the Participants' future water needs for which they seek coverage in this Section 404 permit. Yet, those alternatives were never analyzed in any meaningful way. Nor did the Corps or Northern Water provide sufficient information as to why the proposed alternatives would be impracticable, beyond the empty assertion that they did not meet the arbitrary screening criteria. As a result, the Corps cannot overcome the strong presumption that practicable alternatives to NISP exist, and are less environmentally damaging. *See Utahns for Better Transp.*, 305 F.3d at 1187 ("[W]here insufficient information is provided to determine compliance, the Guidelines require that no permit be issued.").

[16] The Corps also rejected rotational fallowing as a viable alternative—or component of an alternative—as "unproven technology" because it does not provide a firm yield. *See* FEIS at 2-9. As discussed *supra* note 3, both the EPA and Conservation Organizations vigorously dispute the Corps' assertions as to the feasibility of this component. Additionally, the Corps' statement regarding rotational fallowing seriously misconstrues the "firm yield" and "proven technologies" standards. Although individual rotational fallowing projects may be interruptible, a provider could chain a number together to generate a firm supply.

2. The Corps Did Not—and Cannot—Demonstrate that Issuance of the Permit Will Not Result in the Significant Degradation of Wetlands.

Under the 404 Guidelines, the Corps may not permit discharges of fill material that will "cause or contribute to significant degradation" of wetlands. 40 C.F.R. § 230.10(c). Effects contributing to significant degradation include "significantly adverse effects" on: "the life stages of aquatic life and other wildlife dependent on aquatic ecosystems"; "aquatic ecosystem diversity, productivity and stability" including "loss of fish and wildlife habitat"; and "recreational, aesthetic, and economic values." *Id.* The Corps is directed to make factual findings on the potential short-term and long-term effects of the proposed discharge on various physical, chemical, and biological components of the aquatic environment. *Id.* § 230.11. The extent and duration of the impacts on wetlands, as well as the wetlands' uniqueness, are relevant considerations. *See Bering Strait Citizens for Responsible Res. Dev. v. U.S. Army Corps of Eng'rs*, 524 F.3d 938, 949 (9th Cir. 2008). If the Corps finds that the project would significantly degrade wetlands, it may issue a permit conditioned on minimization of, or compensation for, impacts. *See City of Olmstead Falls v. EPA*, 435 F.3d 632, 637-38 (6th Cir. 2006); *Ohio Valley Envtl. Coal. v. U.S. Army Corps of Eng'rs*, 674 F. Supp. 2d 783, 790 (S.D. W. Va. 2009). However, inadequacies in plans for minimization or compensation may invalidate the decision to allow discharge. *See All. to Save the Mattaponi*, 606 F. Supp. 2d at 134.

As a practical matter, it is clear that the Corps' preferred alternative will permanently destroy or degrade aquatic habitat that is crucial to the survival of the threatened Preble's meadow jumping mouse, and will destabilize the Poudre River's ecosystem, precipitating an ecological regime shift that will adversely impact hundreds of acres of high-functioning wetland and riparian habitat. The overwhelming evidence to these effects alone requires denial of the permit. *See* 40 C.F.R. §§ 230.10, 230.11, 230.30 (404 Guidelines); *Olenhouse*, 42 F.3d at 1575 (requiring agency decisions to be supported by substantial evidence in the record). As a legal matter, the Corps' failure to adequately analyze these impacts, meaningfully respond to expert comment, and satisfactorily explain its decision render the FEIS legally inadequate to support the issuance of the permit. *See Wyo. Outdoor Council v. U.S. Army Corps of Eng'rs*, 351 F. Supp. 2d 1232, 1238 (D. Wyo. 2005) (providing that when issuing decisions under the CWA, agencies must "examine[] all relevant data and articulate[] a satisfactory explanation for its action, including a rational connection between the facts found and the choice made"); *Friends of the Earth v. Hall*, 693 F. Supp. 904, 945-46 (W.D. Wash. 1988) (noting that where the Corps' decision to issue a permit relies on a NEPA document, flaws in the underlying analysis may call into question the Corps' finding that the project would not result in significant degradation of wetlands).

First, NISP will have significant adverse effects on the conservation and recovery of the Preble's jumping mouse. 40 C.F.R. § 230.10(c) (prohibiting the issuance of a permit where it would adversely affect the life stages of wildlife). Specifically, the construction and operation of NISP will cause the "impairment or destruction of habitat" to which the Preble's meadow jumping mouse is limited. 40 C.F.R. § 230.30(b)(2) (directing the Corps to consider the proposed discharge's impacts to habitat for endangered and threatened species). The construction and operation of NISP will permanently destroy over 40 acres of Preble's jumping mouse habitat, all of which is "occupied." FEIS at S-33; FEIS at 4-383. NISP will also result in the "temporary"

degradation of over 25 acres of habitat, *id.*; however, it must be noted that "areas that have been disturbed in the past have often failed to recover." Comments on NISP DEIS Treatment of Preble's Meadow Jumping Mouse from Save the Poudre, to U.S. Army Corps Eng'rs 4 (2015) [hereinafter STP Comments]. Therefore, it is likely that the "temporary" disturbance of habitat will nevertheless result in permanent loss.

Important wetland and riparian habitat will also be impaired by the indirect effects resulting from the construction and operation of NISP. Reductions in flow from the Poudre River will impact the composition, density, and health of the riparian vegetation on which the Preble's meadow jumping mouse depends. Indeed, in the Service's Draft Recovery Plan for the Preble's meadow jumping mouse, it acknowledges that "[c]hanges in the timing and abundance of water may be detrimental to the persistence of Preble's in these riparian habitats," and warns that the depletion of groundwater via water diversion projects results in the conversion of habitats from the "mesic, shrub-dominated systems" suitable for Preble's mice to "drier grass-dominated systems [that] would preclude Preble's from these areas." STP Comments at 2. The loss of this habitat will have dire consequences for the conservation of the species. These consequences will only be compounded by NISP's impacts on hydrology and water quality—e.g., changes in water temperature, increases in pollution and sewage, and reductions in the habitat's capacity to dilute pollutants and move sediment—which will impair and destroy not only habitat of the Preble's meadow jumping mouse, but may also impact the habitat of other aquatic obligate species in and downstream of the Poudre River.

As discussed *infra* at Section C.2.2, the Corps' analysis of water quality and hydrology are fundamentally flawed. As a result, NISP's impacts on the *occupied habitat* of the Preble's jumping mouse were never accurately analyzed in the FEIS or the 2007 Biological Opinion. For the same reason, NISP's impacts on the four listed, aquatic obligate species that occur downstream of the project and that the Corps acknowledges will be adversely affected by the project—namely, the whooping crane, the least turn, the piping plover, and the pallid sturgeon—were not accurately assessed. Without such an analysis, the Corps cannot demonstrate that NISP will not result in significant adverse effects to wetland and riparian habitat. Accordingly, the Corps cannot issue the permit.

Second, NISP will adversely impact the diversity, productivity, and stability of the aquatic ecosystem in several significant ways. 40 C.F.R. § 230.10(c). Specifically, the construction and operation of NISP will lead to the significant degradation of riparian habitat, alter and degrade water quality and circulation, contribute to the loss of significant environmental values, and adversely affect recreational and economic opportunities in the region. The proposed mitigation measures are insufficient to offset these substantial impacts.

1. Degradation of Riparian Habitat

As an initial matter related to the above, NISP will severely degrade hundreds of acres of high-functioning riparian habitat, including occupied habitat for several listed species. For example, occupied habitat for the Preble's meadow jumping mouse will be adversely affected by the construction and operation of the project. However, NISP's adverse impacts to riparian habitat are not limited to Colorado. As reported in the 2007 Biological Opinion appended to the

FEIS, the water depletions associated with NISP are likely to reduce flows on the Platte River *through Nebraska*. Thus, the construction and operation of NISP will harm four threatened and endangered species in addition to the Preble's meadow jumping mouse: the whooping crane, the least turn, the piping plover, and the pallid sturgeon. FWS maintains that the continued existence and recovery of these four species depends upon protecting and restoring water flows to the central and lower Platte River ecosystems. *See* FWS, *Programmatic Biological Opinion on the Platte River Recovery Implementation Program* 11 (2006) ("The committee is firmly convinced that upstream storage, diversion, and distribution of the river's flow are the most important drivers of change that adversely affect species habitat along the Platte River."); *accord* Nat'l Res. Council, Endangered & Threatened Species of the Platte River 243 (2005) ("The committee is firmly convinced that upstream storage, diversion, and distribution of the river's flow are the most important drivers of change that adversely affect species habitat along the Platte River."). If built, however, NISP will cause water depletions and decreased peak flows in the Platte River Basin. Constructing a new water diversion project that will instead *decrease* water flows to those ecosystems is antithetical to the meaningful recovery of listed species, and to the statutory purpose of the CWA—i.e., to "restore and maintain the chemical, physical, and biological integrity of the Nation's waters," 33 U.S.C. § 1251(a).

These impacts were given short shrift in the FEIS. Indeed, the Corps' analysis of NISP's impacts on the Preble's meadow jumping mouse primarily relied on the very outdated 2007 Biological Opinion, which was written prior to the designation of critical habitat in the Project's analysis area. Moreover, the FEIS *does not even address* impacts to listed species that occur downstream, despite the fact that reductions in flows to the Platte River threaten those species' recovery. These impacts are clearly secondary effects, and must be disclosed to the public and to the decisionmaker before a Section 404 permit can be issued. *See* 40 C.F.R. § 230.11(h) (defining secondary effects as those effects on an aquatic ecosystem that are associated with a discharge of dredged or fill materials, but do not result from the actual placement of the dredged or fill material"). A full picture of the impacts to riparian habitat is required before the Corps can issue a permit that will have serious direct, indirect, and cumulative impacts on the aquatic environment.

2. Alterations to Water Circulation, Fluctuation, and Salinity

The construction and operation of NISP will degrade the overall water quality throughout the analysis area. 40 C.F.R. § 230.11(b). The proposed discharge will dramatically alter water flows and temperature, which will alter the composition of vegetation communities along the Cache la Poudre River. The proposed reservoirs would also seriously increase the salinity of water in the Poudre and South Platte Rivers, leading to deleterious impacts to water quality and riparian habitat.[17] As a result, the ecosystem services provided by wetlands and riparian vegetation and habitat will be jeopardized.

[17] The increased salinity of the water in the Poudre and South Platte Rivers caused by NISP will also negatively impact the region's agricultural industry. *See* Farm Fact Sheet. Due to several factors—including the replacement of water from the Poudre River with water from the far saltier water from the South Platte River, the diversion of saline water into the Galeton Reservoir for use by farmers who are now using water from the less saline Poudre River, and the

In response to comments critiquing the water quality analyses in the DEIS and SDEIS—including comments from the EPA, *see* FEIS at A-103 to -104—the Corps updated its analysis. However, the severe, chronic analytical problems that were present throughout the DEIS and SDEIS remain present in the FEIS, and render the analysis woefully inadequate to support the issuance of a Section 404 permit. To begin with, "[t]he NISP FEIS water quality analysis section fails to describe the water quality environment of the Poudre River that will be potentially impacted, and to describe and measure the impacts to the Poudre River." Attachment E at 2. While the FEIS describes the quantitative changes to water quality that will result from the construction and operation of NISP, it does not meaningfully *describe* how those changes will *impact* the aquatic environment.[18] *See id.* As a result, the FEIS failed to provide a meaningful benchmark analysis to aid the public and the agency in determining how specific changes in water quality would impact the aquatic environment. *See id.* at 2-3.

Additionally, the Corps' water quality analysis is littered with internal inconsistencies—e.g., conflicting data in different chapters, and conclusions that conflict with statistics and analyses completed in the FEIS and its supporting documents. There are multiple places in the FEIS where different quantitative values for water quality measures are reported with an insufficient—or absent—explanation for the discrepancy. *See id.* at 3. *Compare, e.g.*, FEIS at 4-111 (reporting a total phosphorous concentration at the Fossil Creek Outlet in Segment 12 of the project of +0.05 to +0.26 mg/L from May to July), *with* FEIS at 5-68 (citing a total phosphorous concentration of +0.07 to 0.38 mg/L at the Fossil Creek Outlet in Segment 12 of the Project over the same period). The public and expert commenters were unable to determine which values were accurate and why. *See* Attachment E at 3. Consequently, the FEIS fails to provide information vital to establishing the Project's compliance with the Section 404 Guidelines, i.e., whether the Project will degrade water quality.

Exacerbating this issue is the fact that many of the fundamental analyses about key water quality measures are entirely missing, grossly lacking, or blatantly inaccurate, and further, seriously obfuscate the actual impacts of the proposed project. The issues with the Corps' analysis of specific water quality measures is thoroughly discussed in the Aquatic Resources Assessment of the U.S. Army Corps of Engineers' FEIS for NISP ("Aquatic Resources Assessment"), which are attached to these comments and incorporated by reference. *See* Attachment E. A particularly egregious omission cited in the Aquatic Resources Assessment is

---

exacerbating effect that evaporation will have on the salinity of the water in Galeton Reservoir—will lead to crop yield issues and the permanent salinization of up to 20% of fields receiving water from Galeton Reservoir. *Id.* As previously reported by Conservation Organizations, "this could lead to a significant decrease in crop yields and the loss of over 3,000 acres of irrigated agriculture." *Id.*

[18] Such a perfunctory analysis is also forbidden under NEPA, which requires that impact analyses "provide a useful analysis of the . . . impacts" of an action. *See Kern v. U.S. Bureau of Land Mgmt.*, 284 F.3d 1062, 1075 (9th Cir. 2002) (quoting *Muckleshoot Indian Tribe*, 177 F.3d at 810); *see also Nat. Res. Def. Council, Inc. v. Hodel*, 865 F.2d 288, 299 (D.C. Cir. 1988) ("These perfunctory references do not constitute analysis useful to a decisionmaker in deciding whether, or how, to alter the program to lessen cumulative environmental impacts.").

the Corps' failure to include "a fact-based discussion . . . that describes dissolved oxygen levels or patterns in [the] Poudre River." *Id.* at 6. "Dissolved oxygen is one of the most important water quality constituents," *id.* at 17, yet the FEIS utterly fails to provide an accurate baseline against which to evaluate NISP's impacts. Nor does it provide any data with regard to how NISP will impact the attainment of dissolved oxygen standards in certain affected segments of the Poudre River. *Id.* Similarly, the Aquatic Resources Assessment lays plain that the FEIS' conclusions regarding periphyton growths—i.e., the algae, Cyanobacteria, fungi, protozoans, and inorganic and organic debris that cover the surface of a river's substrate—are not only unsupported by the scientific literature, but are *specifically refuted* by the literature. *See* Attachment E at 20-26. In particular, the FEIS alleges that a flow rate of 0.3 m/sec was sufficient to disrupt periphyton accumulation on the river substrate, thereby preventing the long-term water quality degradation associated with undisrupted periphyton accumulation. However, the available literature demonstrates that much higher flow rates are necessary to slough periphyton from the river bottom.

Finally, the Corps repeatedly cited a "lack of data" as the reason for its failure to include key water quality analyses in the FEIS. *See* Attachment E at 4. The Corps has had fourteen years from the initial project proposal to the issuance of the FEIS during which the project and analyses have undergone multiple iterations and revisions. Thus, the Corps had ample time within which to consider and fill the data gaps that preclude its ability to fully analyze NISP's impacts on water quality. Yet, it failed to do so. In the past decade, sensor and datalogger technology has continued to improve, and it is inexcusable that the Corps and/or Northern Water failed to collect the data required to adequately disclose NISP's impacts. Accordingly, given these and the other deficiencies in the Corps' water quality analysis identified in the Aquatic Resources Report and comments previously submitted by Conservation Organizations and others, it is once again clear that the FEIS is insufficient to support the issuance of a Section 404 permit.

Throughout the NEPA process, Conservation Organizations exhaustively catalogued the flaws in the Corps' effects analysis, and communicated their expert findings to the Corps. However, these efforts were to no avail; the Corps dismissed Conservation Organizations' concerns with little to no meaningful analysis. Significantly, Conservation Organizations are not alone in their concerns regarding the Corps' water quality analyses. Indeed, in comments on the SDEIS, the EPA noted that the Phase I water quality analyses were inadequate to predict the magnitude of NISP's effects on water quality. EPA further noted that "without adequate mitigation, the project's flow reductions *are likely to cause or contribute to temperature impairments on the Poudre River*, and may exacerbate other water quality impairments through loss of dilution flow." FEIS at A-98. EPA reminded the Corps that "[u]nderstanding the magnitude of water quality effects is necessary to demonstrate the project can be implemented consistent with [CWA] requirements," and concluded that "[a]t this time, the EPA is not able to determine whether this project can avoid objectionable or unacceptable impacts to water quality." *Id.*

The Corps claims that the FEIS corrected the flaws in its water quality analysis; however, as demonstrated here, those analyses remain woefully inadequate to support a finding that NISP will not cause significant degradation to wetlands. As a result, the FEIS cannot support the

Corps' conclusion that NISP will not result in significant degradation to wetlands. *See Friends of the Earth*, 693 F. Supp. at 945-46. Although the Corps is only obligated to "consider and respond" to expert agencies' and scientists' comments, the Corps still "must demonstrate that it has considered significant comments and criticisms by explaining why it disagrees with them; it may not dismiss them without adequate explanation." *All. to Save the Mattaponi*, 606 F. Supp. 2d at 132 (citing *ARCO Oil & Gas Co. v. FERC*, 932 F.2d 1501, 1504 (D.C. Cir. 1991) ("[C]onclusory statements cannot substitute for the reasoned explanation that is wanting in this decision[.]")). Before it issues any permit, the Corps must fully address the comments raised by the EPA, Conservation Organizations, and other experts.

3. Loss of Environmental Values

Moreover, the FEIS failed to capture the full extent of the "loss of environmental value" caused by NISP. 40 C.F.R. § 230.11(e). Reductions in flow volume alter riparian vegetation and habitat, adversely impacting the life cycles of species such as the Preble's meadow jumping mouse. Likewise, NISP's impacts to water quality, which include higher water temperatures, will combine with lower water flows and higher water pH, which will likely result in increased concentrations of ammonia, decreases in dissolved oxygen, and adverse effects to other water quality constituents. These impacts could be so severe as to place multiple affected segments of the Poudre River on Colorado's list of impaired waterways. Even small surface water drawdowns can have dire consequences for ecosystems during the driest months of the year. Yet, the FEIS failed to meaningfully discuss these impacts.

4. Loss of Recreational and Economic Value

As noted in comments by Conservation Organizations and corroborated by comments from local governments, NISP will also result in significantly adverse effects on "recreational, aesthetic, and economic values" in the region. Pursuant to the 404 Guidelines, the Corps must take into account both the impacts of the proposed discharge on human use of the impacted waterway, 40 C.F.R. § 230.10, and the secondary effects (i.e., the indirect effects) of the proposed discharge, 40 C.F.R. § 230.11. *See also Fox Bay Partners v. U.S. Army Corps Eng'rs*, 831 F. Supp. 605 (N.D. Ill. 1993) (approving of the Corps' reliance on impacts to recreational use of the lake that would result from a proposed marina project to deny a Section 404 permit). However, the Corps' analysis of NISP's impacts to recreational opportunities in the region fails to properly disclose the full extent of the anticipated effects.

For example, the City of Fort Collins has spent a significant amount of money investing in conserving and restoring the segment of the Poudre River that runs through its boundaries. It has also developed a Master Plan to guide future development of recreation and economic opportunities, including a proposed "whitewater park." These opportunities will be significantly adversely affected by a major water diversion project such as NISP. An analysis completed in 2011 by Dr. Loomis at Colorado State University indicated that maintaining river flows in the downtown segment where the Whitewater Park is being constructed supports total economic activity up to $745,000 per year. *See* Attachment H at 10. Increasing river flows could increase annual revenues by an additional $83,000 per year above that value. *See id.*

Moreover, the FEIS fails to meaningfully consider impacts to recreational activities other than boating. The Corps assumes that NISP will not result in "discernable visual effects on the recreation experience along the Poudre River and Poudre River Trail," and concludes without support that "effects on the recreation value of the Poudre River Trail would be negligible." FEIS at 4-482. However, this statement ignores the significant impacts that reduced flows will have on wetland and riparian habitat. To the contrary, it is far more likely that as wetland and riparian habitat along the Poudre River degrade, the recreation value of the Poudre River Trail will decrease. Indeed, as reported by Fort Collins in its comments on the SDEIS, a reduction in peak flow of 50% would reduce visitation to the Poudre River for recreational opportunities (other than boating) by 33%. *See* Fort Collins Comments at 11. The loss of these visitors and the economic value they bring to the city cannot fairly be categorized as negligible or minor. At minimum, the Corps should quantify the economic consequences of approving NISP using well-established methodologies for measuring lost recreational opportunities and the associated reduction in spending in the community.

The Corps' assessment of the impacts of NISP on the recreational and economic opportunities provided by the Poudre River is cursory, inaccurate, and inadequate. Accordingly, the Corps cannot demonstrate compliance with the Guidelines, and cannot issue the permit.

5. Inadequate Mitigation Plan

Nor are the proposed mitigation measures sufficient to avoid the significant degradation of wetlands. A finding that NISP will not cause or contribute to the significant degradation of the waters of the United States requires that the Corps ensure that the loss of wetland functions and values caused by the Project are adequately compensated. However, the Conceptual Mitigation Plan appended to the FEIS, *see* FEIS at App'x B,[19] fails to satisfy this obligation. The record is replete with letters from experts—including the EPA—expressing serious concerns with the effectiveness and adequacy of the Corps' "conceptual" mitigation. The failure to adequately offset project impacts is grounds for the denial of a permit application, *see Norfolk v. U.S. Army Corps of Eng'rs*, 968 F.2d 1438, 1449 (1st Cir. 1992) (providing that the basic proposition of CWA law is that if mitigation measures are insufficient the permit should be denied), and it is not clear from the FEIS that Northern Water is able to fully compensate for NISP's impacts.

The Corps' regulations require that "mitigation measures will be clearly assessed" in an EIS. 32 C.F.R. § 651.15(b). Such an assessment requires a clear disclosure of potential mitigation measures and a thorough review of their practicability, coupled with details on monitoring and enforcement to ensure implementation 32 C.F.R. 651.15(b), 32 C.F.R. 651.15(h). The proposed Conceptual Mitigation Plan ("CMP") fails to meet those standards. In fact, the CMP cannot possibly provide a clear assessment of mitigation for impacts that are not understood. *Ohio Valley Envtl. Coalition v. United States Army Corps of Eng'rs*, 479 F. Supp. 2d 607, 627 (S.D. W. Va. 2007). Until the Corps completes a competent environmental impact

[19] Because the Conceptual Mitigation Plan ("CMP")—appended as Appendix B to the FEIS—is not consecutively numbered with the other appendices, these comments reference the CMP's page numbers as reflected in that document. It should be understood that references to the CMP are to Appendix B of the FEIS.

analysis, addressing the concerns raised by the Conservation Organizations and many others, any consideration of mitigation must be seen as hypothetical at best. The vague measures presented in the CMP do little to advance a meaningful review of NISP.

In general, although potential mitigation measures are listed and some level of description is provided, there is little to no attempt to assess the practicality of these measures. For example, the CMP asserts that "Northern Water commits to developing, establishing and maintaining the compensatory wetlands sites in a timing and manner that maintains the need for no more than a one-to-one ratio." CMP at 32. However, no analysis accompanies this assertion, and no basis for the consideration of the applicable standard is provided. The CMP itself indicates that the ability to meet the standard is based on "the likelihood of success, differences between functions, temporal losses, difficulties in restoring, or long distances between the affected and replacement sites are expected," CMP at 32, yet provides no investigation into the impact of any of these factors on mitigation.

The lack of critical examination of the mitigation measures is illustrated throughout the CMP:

- "Northern Water will remain in contact and coordinate with the [oil and gas] operators as these activities progress," CMP at 25, without any indication of how Upper Galeton Reservoir might be impacted by changes of the operators plans or how this might impact the overall NISP;

- "For the wetlands along the Poudre River south of CO Highway 14, *it is likely* that ground water associated with the Poudre River is close to the surface in this location" CMP at 31 (emphasis added), without any attempt to groundtruth the likelihood of this statement (with a similar statement concerning Cactus Hill wetlands at 32);

- "The riparian areas would be surrounded by upland habitat that would be restored to near native conditions for Preble's habitat," CMP at 31, without any examination of the potential effectiveness of habitat restoration or presentation of a monitoring regime to determine such;

- "Northern Water would continue to work with the ditch companies to determine both instantaneous and long-term blending ratios that significantly reduce the potential for crop yield reduction that could be caused by the SPWCP," CMP at 41, without any consideration of how such blending ratios might be achieved or how such an effort would impact NISP operations;

- "Northern Water will investigate opportunities to augment ditch company diversions to compensate for potential losses in crop yield," CMP at 42, without any discussion of how the potential sources of water listed might impact NISP operations of modify the project's impacts on the environment as described in the FEIS.

These examples of the CMP's failure to establish the practicality of the proposed mitigation measures clearly illustrate that the CMP fails to meet the basic standards required by the CWA

and NEPA. As it stands, the CMP is little more than speculation of what might be done if it were to be shown to be possible and the resources to implement it were found.

Moreover, the CMP relies heavily on the State of Colorado's 2017 Fish and Wildlife Mitigation and Enhancement Plan ("FWMEP") to flesh out the meager offerings in its pages; indeed, 52 of 72 listed mitigation measures come directly from the FWMEP. *See* CMP at 3, 4; *see also* FEIS at S-9, 1-23, 2-65, 4-418. But the FWMEP is itself fatally flawed.

As STP has explained in prior comments on the FWMEP:

> [T]he draft plan proposed by the NCWCD fails to include required elements, and the elements it does include are not grounded in the best available scientific information or best professional judgment [...] does not present a complete discussion of the impacts of the NISP, including both direct and indirect impacts, and cumulative impacts [and] the mitigation proposed in the draft plan is not certain to occur 'concurrently with or prior to project development;' it is not proportional to project impacts; and it is not proposed to last for the entire period in which impacts to wildlife resources persist.

Attachment K at 2.

In addition to providing an expert review that found that the plan's implementation of adaptive management could not meet the goals of that process, STP also specifically identified the following shortcomings:

- The draft plan makes promises, but extensive loopholes implemented at the discretion of the NISP applicant, NCWCD, provide no assurances to the public that essential mitigation actions will be implemented when necessary. Consequently, *the draft plan fails to provide any meaningful enforcement or accountability for mitigation outcomes* and is instead structured to support NCWCD's desired water yield.

- *The draft plan offers no analysis of the likelihood of success, or the benefits of the proposed mitigation actions, in relation to the impacts of the project*. Although the draft plan presents a number of proposed actions, it fails to establish that any actions, individually or collectively, would meaningfully mitigate the impacts of the proposed project. Further, the draft plan repeatedly states that it is mitigating impacts described in the NEPA process Draft Environmental Impact Statement (DEIS) and the Supplemental DEIS (SDEIS) documents, but those documents do not fully describe the impacts of NISP and are highly controversial.

- *The draft plan proposes mitigation for water quality and water temperature impacts even though such impacts have not been fully analyzed or even disclosed in the NEPA process*. Further, the SDEIS, the most current NEPA documentation, is based on a river flow analysis that ignores the most recent ten years of flow data collected on the river. If the analysis had incorporated all of the best available data – as is required by law – the SDEIS' statistical findings and expected impacts would have been dramatically altered.

The draft plan fails to explain how effective mitigation can be implemented for impacts that are not yet fully understood.

- *The draft plan does not consider the effects of ongoing and accelerating climate change effects on NCWCD's ability to achieve its mitigation goals*. Without such an analysis, the draft plan fails to account for how the proposed mitigation actions will function in the real world.

- HB 1158 requires that NISP "maintains a balance between the development of the state's water resources and the protection of the state's fish and wildlife resources," but *the draft plan completely fails to address the fact that 63% of the flow in the Cache la Poudre River has already been diverted out of the river before the river reaches downtown Fort Collins*. Thus, the river is already terribly out of "balance."

- The proposed "conveyance realignment" mitigation in the draft plan [now the basis of the preferred alternative] stops at the Timnath Inlet which is just past Lemay Avenue in Fort Collins. As such, *the entire downstream stretch of the Poudre River*—including at the Colorado State University "Environmental Learning Center" and out to the confluence with the South Platte River near Greeley—*would not be mitigated with any base flow and suffer the extreme negative impacts of NISP*.

Attachment K at 2-3.

To the extent that the FWMEP is incorporated by the Corps' into its evaluation of the alternatives and the mitigation of those impacts, the Corps' must consider the attached comments on the FWMEP. This is especially true given that the FWMEP was adopted prior to release of the FEIS and could not have fully considered the impacts that are described in the recently released FEIS. The State of Colorado failed to meet the standards of its own laws (*see* Attachment K at 1-2), but the Corps must not compound that error by uncritically accepting this fatally flawed mitigation plan and adopting the FWMEP as its own. Although the state adopted the plan, the Corps has an independent duty to develop and analyze a robust and enforceable mitigation plan under the CWA, and reliance on the state's deficient FWMEP as proposed in the FEIS fails to meet the overarching legal requirements imposed on the Corps. Additionally, the Corps must adopt permit conditions that require updates to the FWMEP that would ensure that it is an effective and enforceable plan that fully considers the impacts identified in the FEIS and subsequent analyses identified through public comment and subsequent review.

Importantly, the CMP fails to adequately address the most significant impact that would result from implementation of the Alternative 2M —the nearly complete loss of the peak flows that are critical to river health. The CMP relies on FWMEP to address this issue; STP has provided an informed critique of that approach in earlier comments. *See* Attachment K at 5-6. Due to this reliance on the state's incompetent mitigation proposal, the CMP fails to provide any meaningful mitigation for these impacts even though there is no controversy that Alternative 2M will significantly curtail these flows.

Reliance on the FWMEP also removes certainty from the mitigation proposal by the FEIS's statements that the FWMEP may be modified following adoption of an alternative or due to the Corps' permit conditions. *See, e.g.,* FEIS at 2-80, 2-85, 2-88, 2-93. The CMP does not clarify if the measures it incorporates would remain even if modified or struck from the FWMEP. Consequently, it is impossible for a reviewer to know which of the proposed measures will actually be executed in the future.

Similarly, although a proposal is presented for compensatory mitigation, the CMP asserts that "Northern Water will develop a final wetlands and Preble's mitigation plan for review and approval by the Corps between the Final EIS and the record-of-decision. . . . The wetlands and Preble's mitigation areas and plans may be adjusted from the descriptions provided below depending on final mitigation requirements, site conditions, and other factors." CMP at 28. This will obviously eliminate the opportunity for public review of that final plan and renders consideration and comment at this point moot, in violation of NEPA and the CWA.

The CMP further obfuscates the final real-world impact of the various alternatives by limiting the application of several of the measures incorporated from the FWMEP to only the preferred alternative. *See, e.g.,* CMP at 35 ("Because the comprehensive mitigation and enhancement package presented in the FWMEP was developed specifically for Alternative 2M as described in the FWMEP, it is not included as mitigation for the other alternatives"). Although some of the measures constrained to this alternative are specific to Glade Reservoir, at least three are not and could be applied to all of the alternatives including the No Action Alternative. *Id.*; CMP at 36 (identifying AG-03, AG-05, and WQ-05). The CMP fails to provide any justification for restricting the application of these measures to the preferred alternative, other than that they are classified as "enhancement" in the FWMEP. *Id.* If these measures are not credible mitigation for impacts of the project to the river, and instead are enhancement that instead corrects past damage, the benefits of the measures must either be considered for all alternatives or for none. If Northern has the capability of conducting these measures, they should be implemented regardless of which alternative is ultimately adopted by the Corps.

A theme of failing to take mitigation seriously pervades the CMP. Seemingly without a sense of irony, the CMP claims as avoidance and/or minimization components of the project that have been removed from the consideration by the applicant prior to development of the CMP.

> Two of the most significant changes in the NISP/Glade Reservoir that avoid environmental effects are the movement of the proposed reservoir from an on-channel reservoir site to an off-channel reservoir site, and the elimination of a potential point-of-diversion that would have been upstream of the North Fork confluence with the Poudre River.

CMP at 13 (citation omitted).

In reality, the project proponent gave up on the in-channel reservoir, for its own purposes, two decades ago. *See* CMP at 30 ("Through these processes, Northern Water determined that an on-channel reservoir was not environmentally or publically acceptable, and moved its preferred alternative to its current location at Glade Reservoir"). Further, an in-channel reservoir

apparently would not have passed the Corps' own screening analysis. *See id.* ("All on-channel reservoirs were eliminated through the NISP screening process"). The diversion point change was voluntarily discarded by the proponent. *See id.* ("These options were eliminated due to environmental effects"). The CMP fails to meet the intent and application of mitigation by seeking to claim that actions taken *before* the project has been proposed can be considered as "avoidance" of impacts that will result from NISP. The knowledge that the proposal might have had more environmental impact than it does in its final form cannot be rationally considered as mitigation.

The reconfigured preferred alternative, 2M, is also presented as a form of mitigation. *See id.* 15 ("Conveyance Refinement: Convey 18 cfs (winter) to 25 cfs (summer) of deliveries to NISP participants via the Poudre River by releasing from Glade Reservoir."). While possibly less impactful than the originally proposed alternative, this remains a component of the *action*, not a mitigation measure. Courts have previously rejected similar attempts to masquerade mitigation measures as baseline data. While "[m]itigation measures may help alleviate impact *after* construction, [they] do not help to evaluate and understand the impact before construction." *N. Plains Res. Council, Inc. v. Surface Transp. Bd.*, 668 F.3d 1067, 1084 (9th Cir. 2011). Reliance on mitigation measures to preclude a full discussion of the impacts of a proposed action impermissibly "presupposes approval" because "[i]t assumes that—regardless of what effects construction may have on resources—there are mitigation measures that might counteract the effect without first understanding the extent of the problem." *Id.* at 1084-85. Compounding this problem in the specific context of NISP, it is unclear to what extent this option will even operate and contribute any beneficial effect.[20]

Similarly, the CMP cites the proponent's willingness to comply with water court decrees on its water rights and curtail diversions when required to do so. *See* CMP at 37. Such compliance, fundamental to its implementation of the Grey Mountain right to NISP, fails to qualify as meaningful mitigation of the impacts from the diversions that are allowed under the Grey Mountain right.

In short, the Corps must develop a competent mitigation plan through a clear assessment of practicable mitigation measures, and ensure the monitoring and enforcement of any adopted

[20] The description of the potential operations of NISP makes it clear that the "conveyance refinement" will not always be in effect and leaves it unclear as to how much difference this will make to stream diversions and downstream river impacts. *See, e.g.*, N. Water, *Draft Operations Plan* 20 (Dec. 1, 2017) ("Diversions cannot be made through the Poudre River Intake if there is insufficient demand from the Participants. Therefore, there may individual days when the delivery rates cannot be reached, and deliveries to the Poudre River Intake cannot be made. At full operations, this should not be the case per the design methodologies described above, but could infrequently occur. However, during initial NISP operations before full NISP demands are met, this may happen more frequently. "); *id.* at 37 ("Prior to full buildout conditions, NISP commits to conveying no less than 36 percent of total NISP deliveries through the Poudre River Intake[,]" where this clearly refers to deliveries to participants but not timing or quantities of diversions from the river).

measures, if any of the NISP action alternatives are permitted. The Corps must base such a plan on a thorough environmental impact analysis and must complete and implement the plan in a manner that provides for meaningful public review. Accordingly, the Corps must deny the permit, or at the very least, fully address NISP's impacts and explain how proposed mitigation measures are sufficient to compensate for the anticipated losses.

3. The Corps Cannot Issue the Permit Because NISP Will Contribute to the Violation of Several State Water Quality Standards.

The Guidelines prohibit the issuance of a Section 404 permit where the activity will "[c]ause[] or contribute[] . . . to violations of any applicable State water quality standard." 33 C.F.R. § 320.10(b). Applicants for Section 404 permits must provide the Corps with a Section 401 certification, made by the state where the discharge will occur, declaring that the discharge will comply with the applicable provisions of the CWA, including state water quality standards. *See* 33 U.S.C. § 1341. States maintain a list (a "303(d) list") of water bodies that do not meet water quality standards, i.e., "impaired waters." 33 U.S.C. § 1313(d).

The Corps has not yet provided the results of the state water quality certification required under Section 401 of the CWA. The FEIS further asserts that the water quality models used to assess the Project's predicted impacts to water quality cannot be used to predict compliance with water quality standards. FEIS at 4-95. Therefore, the public lacks sufficient information regarding NISP's impacts on the Poudre River's compliance with state water quality standards to offer informed comment and ensure the Corps has made a reasoned choice.

From the information available, it is apparent that NISP will impact segments of the Poudre River that are on Colorado's 303(d) list of "impaired waters." Diversions from the Poudre River to NISP are likely to trigger or exacerbate these violations of state water quality standards. These include ammonia, pH, water temperature, phosphorus, dissolved oxygen, and potentially several other indicators of water quality. Therefore, the Corps cannot issue a permit.[21]

D. The Corps Must Undergo Formal Consultation and Obtain an Updated Biological Opinion Assessing the Impacts of NISP on Newly Designated Critical Habitat for the Preble's Meadow Jumping Mouse in the Project Area.

Pursuant to Section 7 of the ESA, before undertaking any action that may have direct or indirect effects on any listed species, an action agency must engage in consultation with the FWS in order to evaluate the impact of the proposed action. *See* 16 U.S.C. § 1536(a). The FWS has

[21] The Larimer County Environmental and Science Advisory Board also raised concerns with the FEIS's "[i]nadequate data or analysis," [i]nadequate presentation of material," and "[u]nder-developed mitigation plan" related to several key water quality issues implicated by NISP. Attachment M at 2. The advisory board concluded that "the language and data figures/tables in the FEIS underestimate the probable adverse impacts and consequences of the NISP upon the Poudre River," and that "the simple description of models, data figures/tables, and simulations, without interpreting the meaning and impacts, is not sufficient to provide understanding given that the FEIS is intended for public review." *Id.*

defined the term "action" for the purposes of Section 7 broadly to mean "all activities or programs of any kind authorized, funded, or carried out, in whole or in part, by Federal agencies," 50 C.F.R. § 402.02, "in which there is discretionary federal involvement or control." *Id.* § 402.03. An agency may only avoid this consultation requirement for a proposed action if it determines that its action will have "no effect" on threatened or endangered species or critical habitat. *Id.* § 402.14(a).

The purpose of consultation is to ensure that the action at issue "is not likely to jeopardize the continued existence of any endangered species or threatened species or result in the destruction or adverse modification of [designated] habitat of such species." 16 U.S.C. § 1536(a)(2). As defined by the ESA's implementing regulations, an action will cause jeopardy to a listed species if it "reasonably would be expected, directly or indirectly, to reduce appreciably the likelihood of both the survival and recovery of a listed species in the wild by reducing the reproduction, numbers, or distribution of that species." 50 C.F.R. § 402.02.
